

Veil of Invisibility

Alexander Putney

"Tesla declared efforts had been made to steal the invention. His room had been entered and his papers examined but the thieves, or spies, left empty-handed. There was no danger, he said, that his invention could be stolen for at no time had he committed any part of it to paper. He could trust his memory to preserve every fine detail of his investigations. This was true, he said, of all of his major discoveries. The nature of his system makes little difference now; he has gone and has taken it with him... until the human race produces another Tesla."

~ unpublished material from 'Prodigal Genius'

Tesla's financial and legal interests were managed by George Scherf, Sr., whose administrative work included bookkeeping, legal filing for patents and extensive litigation regarding patent infringement cases. The indolent thefts of George Scherf, Jr. in Tesla's lab earned him the nickname 'Curious George', but were, in fact, the acts of a Nazi child spy executing Hitler's orders. In a series of deathbed confessions in 1995, Hitler's personal bodyguard and CIA co-founder Otto Skorzeny exposed dark truths about his lifelong partnership with fellow Nazi espionage agents George Scherf, Sr. and 'Curious' George Scherf, Jr.

Skorzeny recounted the details of his suffocation of Nikola Tesla on January 6, 1943 as the fulfillment of Hitler's orders, with the help of Reinhard Gehlen and George Scherf, Jr. after the theft of secret aerospace technologies developed by Tesla, including HHO plasma invisibility cloaking and infrasonic levitation design specs which later became integrated as stealth technology in the US. Skorzeny asserted that Scherf, Jr. assumed the false American alias 'George H. W. Bush' while Scherf, Sr. took on the false alias 'Prescott S. Bush', and provided detailed information regarding their founding of the US Office of Strategic Services for the secret transference of Nazi mind-control and aerospace programs into America.

Cognitions gained during the life's experiences of Nikola Tesla inform Alex Putney's quantum resonance maps, which apply the principles of standing wave physics to expose US stealth planes and CIA surveillance drones as applications of Tesla's secret designs, now deployed from Nazi/CIA underground facilities hidden in National Parks throughout the US. Furthermore, Alex's research continues Tesla's efforts toward resolution of the present human conflict of psychopathy in politics and the resulting misappropriation of science.

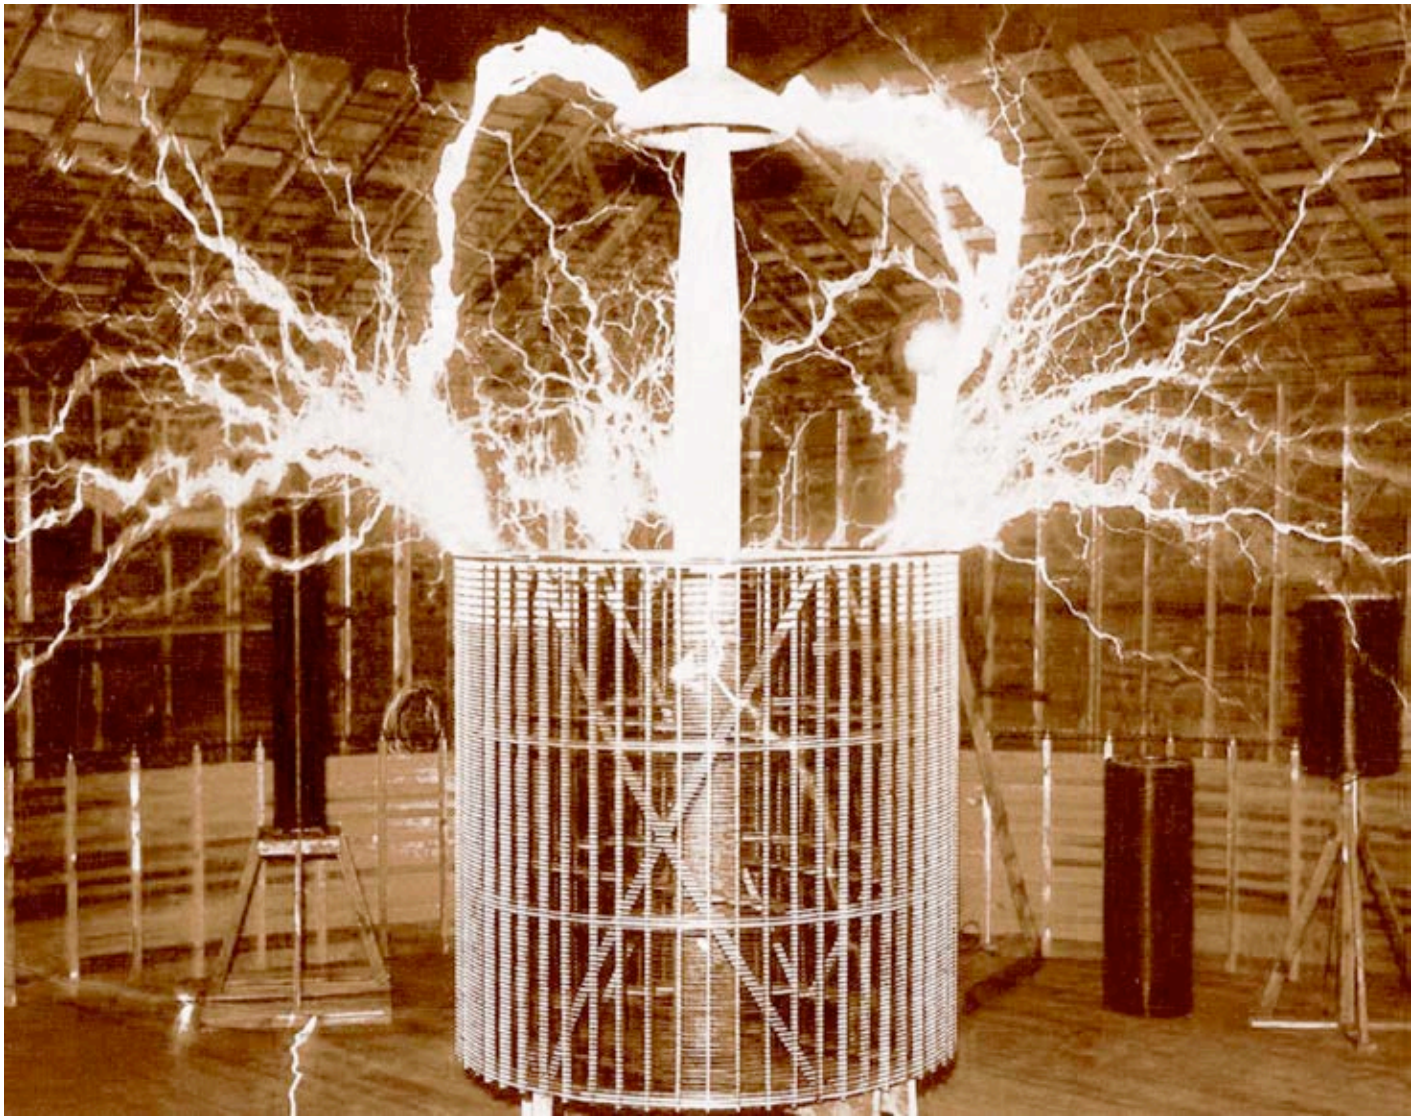
For all of the radiant beings who guide humanity
toward the creation of a lasting peace on Earth,
with her transformation into a heavenly planet
under the purifying red light of the solar twins.

There is an occult energy in the heart that comes from Tonatiuh, the Sun,
and if man releases it, returning it consciously to the Sun,
he becomes immortal.

But to liberate this energy, sacrifice is necessary.
Man must sacrifice the desires and habits that he adores,
sacrifice them in himself, and turn the knife against the enemy
that he carries within himself, that keeps his heart a prisoner.

In recent times men still remembered these words,
but they have now forgotten their significance.
They have made enemies of other men
to sacrifice them and take out their hearts,
believing such offerings would propitiate Tonatiuh.
Such is their degeneration, such is their superstition.

When fear unites with knowledge, terrible things are done.



It is the self within ourselves that we have to sacrifice.
It is our own heart that has to be torn out of the false being
and offered to the light.

Curious George

Curious George

Reflecting on his life's work, Nikola Tesla acknowledged his greatest discovery was made in Colorado Springs, as noted on a photograph of his field laboratory (below), "Experimental Station in another phase of development. Discovery of "Stationary Waves" made July 3, 1899," and recorded in detail:

> *Observations made last night.* They were such as not to be easily forgotten, for more than one reason. First of all a magnificent sight was afforded by the extraordinary display of lightening, no less than 10-12 thousand discharges being witnessed inside of two hours… An instrument (rotating "coherer") was connected to ground and a plate above ground, as in my plan of telegraphy, and a condenser was used to magnify the effects transmitted through the ground… As the storm receded the most interesting and valuable observation was made. It happened this way: the instrument was again adjusted so as to be more sensitive and to respond readily to any discharge which was seen or heard. It did so for a while, when it stopped. It was thought that the lightening was now too far and it may have been about 50 miles away. All of a sudden the instrument began to play, continuously increasing in strength, although the storm was moving away rapidly. After some time, the indications again ceased but half an hour later the instrument began to record again. When it once more ceased the adjustment was rendered more delicate, in fact very considerably so, still the instrument failed to respond, but half an hour or so it again began to play and now the spring was tightened on the relay very much and still it indicated the discharges. By this time the storm had moved away far out of sight. By readjusting the instrument and setting it again so as to be very sensitive, after some time it began to play periodically. The storm was now at a distance of greater than 200 miles at least. Later in the evening repeatedly the instrument played and ceased to play in intervals nearly of half an hour although most of the horizon was clear by that time.

> This was a wonderful and most interesting experience from a scientific point of view. It showed clearly the existence of *stationary waves*, for how could the observations be otherwise explained? How can these waves be stationary unless reflected and where can they be reflected from unless from the point where they started? It would be difficult to believe that they were reflected from the opposite point of the Earth's surface, though it may be possible. But I rather think they are reflected from the point of the cloud where the conducting path began; in this case where the lightening struck the ground would be a nodal point. It is now certain that they *can be produced* with an oscillator. (This is of immense importance.)[1]

> The discovery of the stationary terrestrial waves… [indicates] that, despite its vast extent, the entire planet can be thrown into resonant vibration like a little tuning fork; that electrical oscillations suited to its physical properties and dimensions pass through it unimpeded, in strict obedience to a simple mathematical law, has proved beyond the shadow of a doubt that the Earth, considered as a channel for conveying electrical energy… is infinitely superior to a wire or cable, however well designed.[2]

Tesla's Colorado Springs Notes recorded the complete engineering data for the construction of towers comprising a world wireless network broadcasting on low-frequency standing waves. The prototype Wardenclyffe Tower (left)[3] was completed in Shoreham, Long Island in 1905, employing a water well to ground the tower to the water table far below. The project investment of JP Morgan was withdrawn upon reconsideration of the implications of the extreme efficiency of the apparatus in transmitting both energy and information, key commodities that Morgan could not afford to be cheaply available if he wanted to continue to profit from the war industry. In his fear of change Morgan aligned himself with the deceitful elements responsible for arson in Tesla's laboratory in 1895, the false attribution of the invention of radio to Marconi and the false announcement of a Nobel Prize.

Further subterfuge is exposed in an unpublished chapter of the O'Neill biography entitled 'Tesla Tries to Prevent World War Two'. O'Neill omitted crucial details from the final draft of his propaganda biography regarding the attempted theft of Tesla's 'Death Ray' plasma beam technology during a $30m negotiation with British Prime Minister Neville Chamberlain, who instead appeased[4] the Nazis' false promises:

> Tesla revealed that he had carried on negotiations with Prime Minister Chamberlain for the sale of his ray system to Great Britain for $30,000,000 on the basis of his presentation that the device would provide complete protection for the British Isles against any enemy approaching by sea or air, and would provide an offensive weapon to which there was no defense. He was convinced, he declared, of the sincerity of Mr. Chamberlain and his intent to adopt the device as it would have prevented the outbreak of the then threatening war, and would have made possible the continuation—under the duress which this weapon would have made possible—of the working agreement involving France, Germany and Britain to maintain the status quo in Europe. When Chamberlain failed, at the Munich conference, to retain this state of European equilibrium it was necessary to get rid of Chamberlain [who was replaced by Winston Churchill in 1940]…
>
> Tesla was greatly disappointed by the collapse of his negotiations with the British Government. With it there collapsed his hopes of providing a demonstration of his most recent, and, what he considered, his most important discoveries. He did not, however, dwell on the subject; beyond the single conversation he did not mention the matter again. He did not get another chance to finance the demonstration of these discoveries.
>
> During the period in which the negotiations were being carried on, Tesla declared, efforts had been made to steal the invention. His room had been entered and his papers examined but the thieves, or spies, left empty handed. There was no danger, he said, that his invention could be stolen for he had at no time committed any part of it to paper. He could trust his memory to preserve every fine detail of his investigations. This was true, he said, of all of his later major discoveries.
>
> The nature of his system makes little difference now; he has gone and has taken it with him. Perhaps, if there is any communication from beyond the veil that separates this life from whatever exists hereafter, Tesla may look down upon Earth's struggling mortals and find some way of dropping a hint concerning what he accomplished; but, if the situation is such that this cannot take place, then we must await until the human race produces another Tesla.[5]

Tesla's financial and legal interests were managed by George Scherff, Sr. (above, c.1952), whose administrative work included bookkeeping, legal filing for patents and extensive litigation regarding patent infringement cases. Many perils inevitably stalked the prolific inventor of over seven hundred revolutionary patents during the corporate and political espionage of the era of the World Wars. The Nazis were undoubtedly among those parties involved in the surveillance of his laboratories and discoveries, eager to apply his inventions to their obsession with the subversion of humanity. Herein may lay an explanation for why Tesla's wireless power transmission and standing wave technologies have taken over one hundred years to become available to the public. The financial control of Tesla's revolutionary ideas left him penniless in his old age, a manipulation so cleverly executed and obscured that it has only recently been exposed as the key component of a greater Nazi espionage operation.

In his youth, George Scherff had befriended Tesla and worked for him for the latter half of the inventor's life. When interviewed after Tesla's death, Scherff claimed that he began work for the scientist after the suspicious South Fifth Avenue laboratory fire of 1895, working full-time until 1905 and then one day per week thereafter. Biographer O'Neill's inquiries were effectively stonewalled: "Scherff, tight-lipped and businesslike, cannot be induced to talk of Tesla's affairs… [and] refuses to permit any close questions or discussion..." [6] One George Scherff, Jr. corresponded with the FBI regarding his possession of sensitive Tesla papers as late as 1954, from a residence at 149 Seacord Road in New Rochelle, NY.[7] That letter

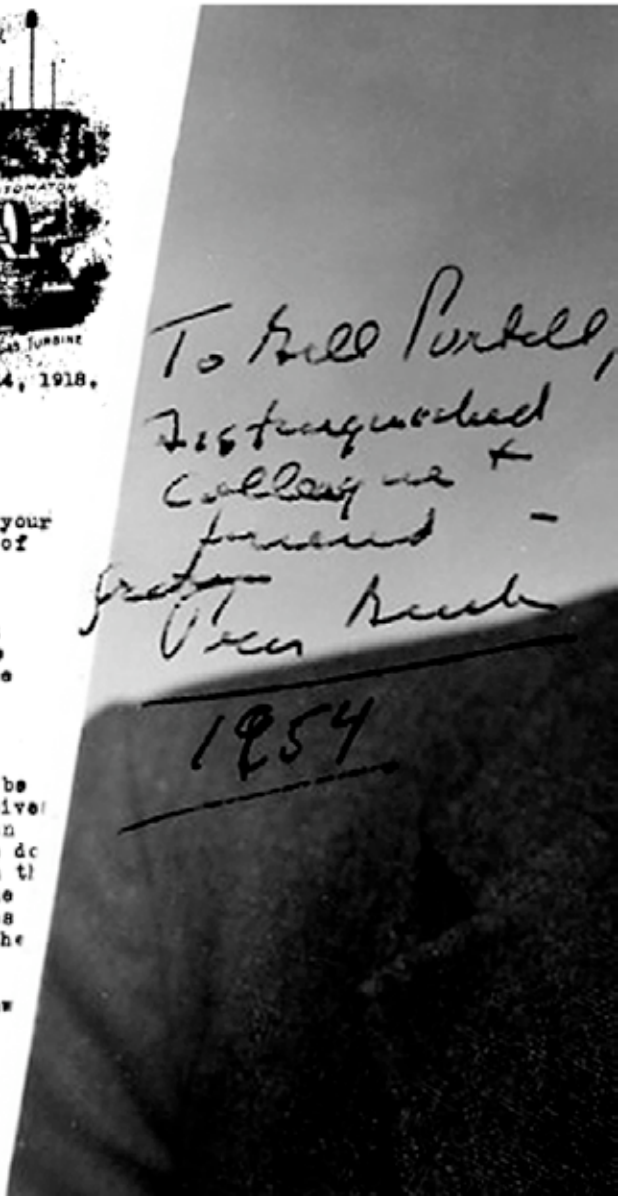
is the last available record of a George Scherff, Sr. or Jr. What ever happened to this father and son who shared the same name and frequented the most advanced laboratory in the world? Tesla's other close friends were quite vocal in their remembrance of the inventor, especially Kenneth Sweezey, and yet the world was deprived of *the key insider perspective* of Tesla's closest clerical assistant. *Why?*

Only one photograph in public circulation records the face of George Scherff, Sr. –at the Association of Radio Engineers banquet of 1915 (above). Tesla is seen standing tallest in the middle of the back row, while Scherff stands at the end of the same row to Tesla's left, his hands visible at his sides. This rare image of George Scherff is shown in detail (opposite page, upper left) for comparison with two other photographs taken in the years 1937 and 1952. A close friend of the Scherff family provided the 1937 image, while the 1952 photograph was promotional material produced for the political campaign of Prescott Sheldon Bush for Senator of Connecticut. Distinct facial similarities can be easily identified in the comparative photographs of George Scherff and Prescott Bush. Among the many strong characteristics of Scherff's face are his unusually high hairline, down-sweeping eyebrows and asymmetrical upper-lip. The height and build of George Scherff and Prescott Bush are also identical, while even their signatures show remarkable similarities. Presented for comparison with a 1918 letter from George Scherff[8] to Nikola Tesla is the 1954 autograph of Prescott Bush[9] (opposite). Both the handwriting and the abbreviation of the first names –'Geo' for George and 'Pres' for Prescott– are identical. Was Scherff an agent leading a double life using the alias 'Prescott Sheldon Bush'?

Significant evidence suggests that George Scherff (original German spelling: 'Scherf') was an illegal German immigrant in America working part-time for both the Nikola Tesla Company and as auditor for the Union Sulfur Company. Union Sulfur occupied a warehouse in a Rockefeller-owned building operating as part of the Freemasons' secretive umbrella of influential companies in industry and finance with the ability to place agents and provide cover for their corporate espionage activities. The earliest corporate records of Prescott Bush appear to be from 1924, when he was installed by George Herbert Walker as one of seven founding directors of the Union Banking Corporation. Could it be that Walker

Dear Mr. Tesla:

In accordance with request contained in your telegram of Oct. 11th, I enclose herewith certified copy of resolution passed at Directors Meeting held to-day.



I had hoped that you would send a copy of the resolution as you would wish it formulated, so as to meet the conditions of the proposed agreement. However, in the absence of knowledge of its terms I have tried to make the resolution broad enough and trust that it will meet all requirements.

As regards the Lowenstein case, Mr. Foster has secured an adjournment until Oct. 21st. He said it will be useless to try to obtain any further delay unless he receive from you an affidavit, or a letter on which he can base an affidavit, stating exactly the nature of the work you are do for the Government that compels you to remain absent from th City; in other words, an affidavit on the same lines as he asked for in the De La Vergne cases. The Dressel case was on the calendar for Sept. 10th, but I have not heard of the result.

With heartiest wishes for the success of the new venture, I remain

Respectfully yours,

Geo Scherff

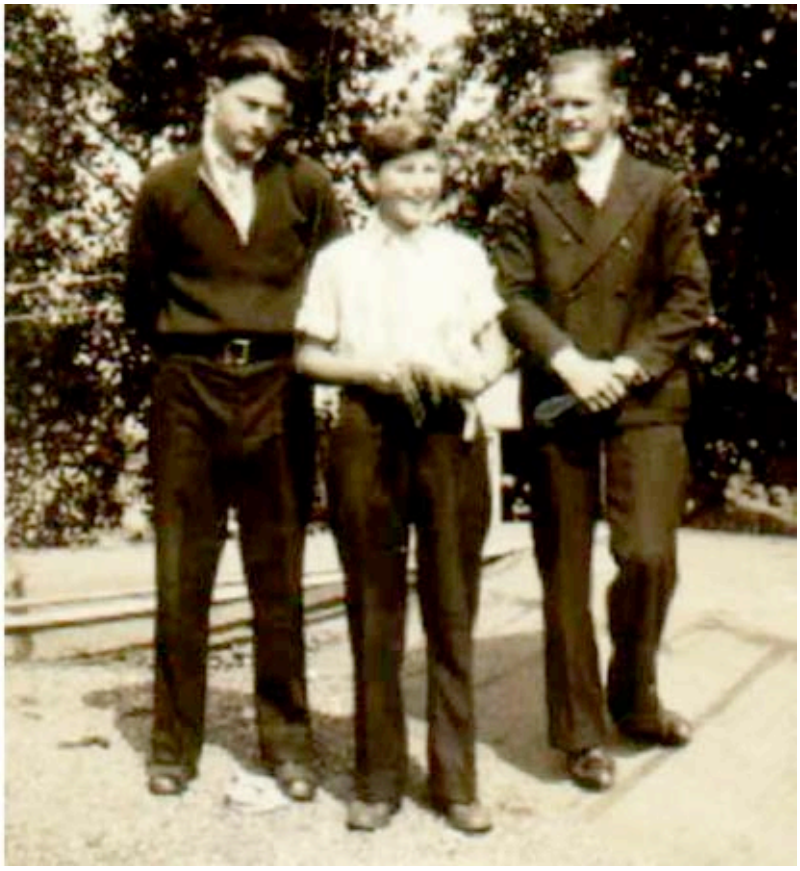
selected a rookie son-in-law to manage his new bank? It is more likely that the UBC position was awarded to corporate espionage agent George Scherf as a cover to establish his new elite alias – and a reward for his successful spy work in the laboratories of Nikola Tesla. This hypothesis is well supported by the complete absence of any record of the lives of George Scherff, Sr. or George Jr. after 1954, as well as the absence of any record or photographs of 'Prescott Bush' before 1924. The information age reveals all:

> More tantalising are [Prescott] Bush's links to the Consolidated Silesian Steel Company (CSSC), based in mineral rich Silesia on the German-Polish border. During the war, the company made use of Nazi slave labour from the concentration camps, including Auschwitz…
>
> [O]n October 20 1942 the Alien Property Custodian seized the assets of the UBC, of which Prescott Bush was a director. Having gone through the books of the bank, further seizures were made against two affiliates, the Holland-American Trading Corporation and the Seamless Steel Equipment Corporation. By November, the Silesian-American Company, another of Prescott Bush's ventures, had also been seized…
>
> A report issued by the Office of Alien Property Custodian (APC) in 1942 stated of the companies that "since 1939, these (steel and mining) properties have been in possession of and have been operated by the German government and have undoubtedly been of considerable assistance to that country's war effort"…
>
> In 1924, his father-in-law, a well-known St Louis investment banker, helped set him up in business in New York with Averill Harriman, the wealthy son of railroad magnate E H Harriman in New York, who had gone into banking. One of the first jobs Walker gave Bush was to manage UBC. Bush was a founding member of the bank and the incorporation documents, which list him as one of seven directors, show he owned one share in UBC worth $125…
>
> Homer Jones, the chief of the APC investigation and research division sent a memo to the executive committee of APC recommending the US government vest UBC and its assets. Jones named the directors of the bank in the memo, including Prescott Bush's name, and wrote: "Said stock is held by the above named individuals, however, solely as nominees for the Bank voor Handel, Rotterdam, Holland, which is owned by one or more of the Thyssen family, nationals of Germany and Hungary. The 4,000 shares hereinbefore set out are therefore beneficially owned and help for the interests of enemy nationals, and are vestible by the APC," according to the memo from the National Archives…
>
> Jones recommended that the assets be liquidated for the benefit of the government, but instead UBC was maintained intact and eventually returned to the American shareholders after the war. Some claim that Bush sold his share in UBC after the war for $1.5m - a huge amount of money at the time - but there is no documentary evidence to support this claim. No further action was ever taken nor was the investigation continued, despite the fact UBC was caught red-handed operating an American shell company for the Thyssen family eight months after America had entered the war and that this was the bank that had partly financed Hitler's rise to power.[10]

Exposed are the details of the 'Bush family' fortune having been illegally generated by George Scherf Sr. using the alias Prescott Bush, spying for Hitler and profiting by his Silesian Steel Company's use of Nazi slave labor in addition to the alleged $1.5m sale of UBC shares. However, despite the decision of chief investigator of the Office of Alien Property Custodian to seize the assets of UBC, Nazi war-profits were silently returned to the shareholders after public attention had been diverted. Diversion techniques have since become a hallmark of counter-intelligence practices. The cover-up activities of the FBI have also been documented by the Treasury Department, who cooperated fully in the obstruction of justice:

> In 1943, six months after the seizure of UBC and its related companies, a government investigator noted in a Treasury Department memo dated April 8, 1943 that the FBI had inquired about the status of any investigation into Bush and the Harrimans.
>
> "I gave 'a memorandum' which did not say anything about the American officers of subject," the investigator wrote. "(Another investigator) wanted to know whether any specific action had been taken by us with respect to them…" No further action beyond the initial seizures was ever taken, and the newly-confirmed records went unseen by the American people for six decades.[11]

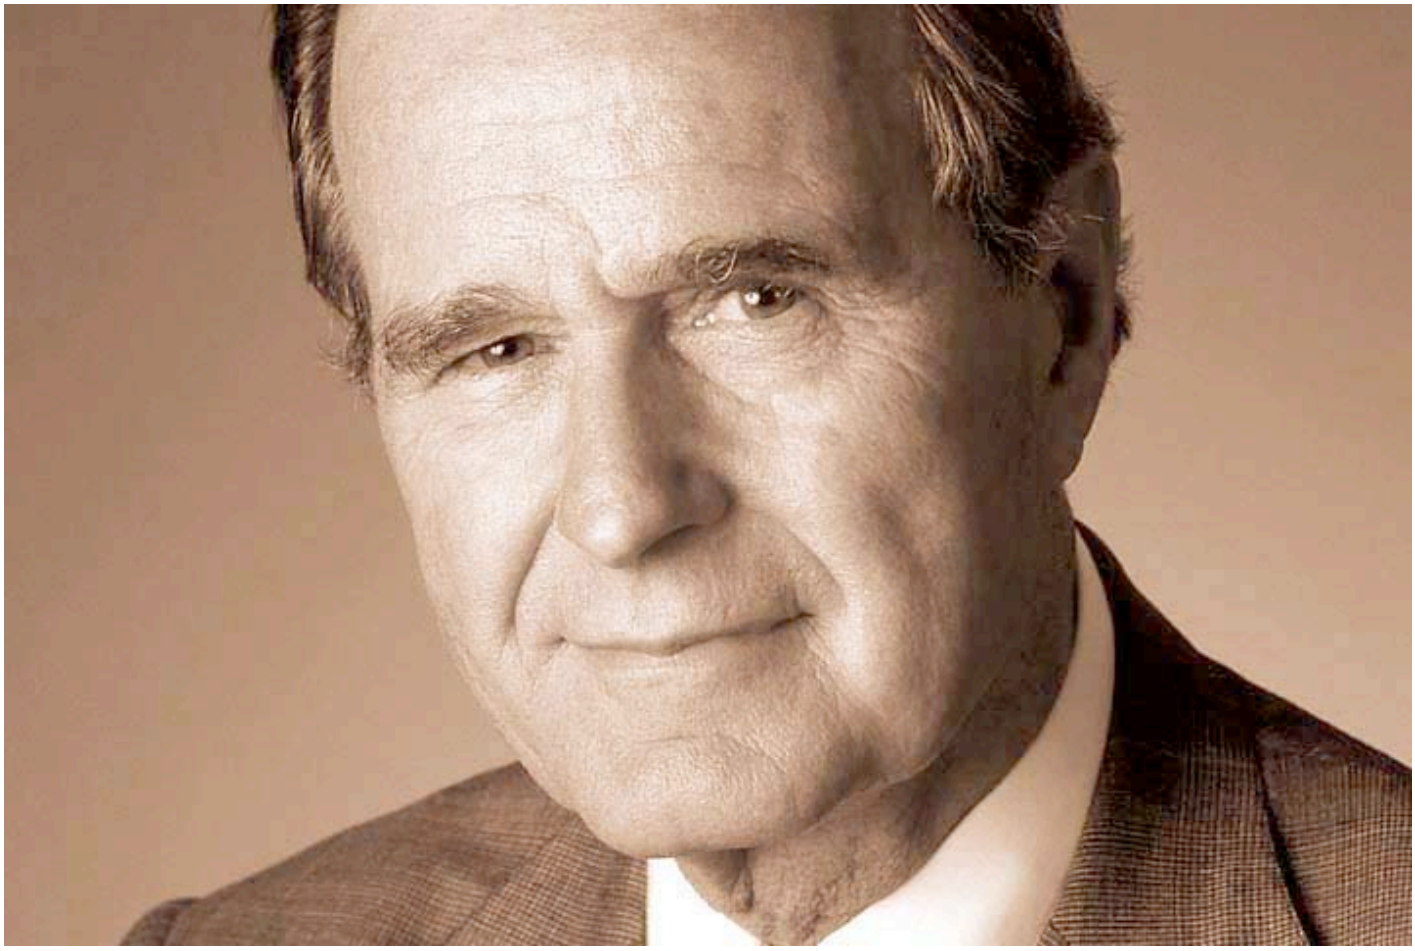
How could it be that 'Prescott Bush's' Nazi war profits were silently returned to him? How could 'Bush' escape his treason charges and later win the political office of Senator of Connecticut in 1954? *How could his son and his grandson both become US Presidents despite such massive treason on public record?*



Documents buried in the US National Archives include a portion of the 1934 report of the Congressional Committee Report revealing a fascist plot to assassinate FDR in a paramilitary coup that had been coordinated through a Nazi front organization called the American Liberty League. Retired US General Smedley Butler testified before the Committee that he was asked by JP Morgan's agent, Gerald C. Maguire, to lead "500,000 super-soldiers… [to become] an Assistant President." Butler quoted Maguire: "You know the American people will swallow that. We have got the newspapers. We will start a campaign that the President's health is failing [before assassinating him]…" [12] While Butler was surprised to find that the Committee's Report had omitted the names of the plot's financiers, JP Morgan and Dupont among others, the Committee's successful cover-up had been orchestrated by Nazi agent George Scherf, Sr. – as a key component of a much larger set of Nazi operations involving the manipulation of the elite sector of fascist industrial tycoons and international bankers.

General Butler's exposure of the details of the fascist coup was buried by the newspapers just as Maguire had outlined. *This further confirms that, while FDR escaped assassination, a covert coup of the US government was successfully accomplished in the Nazi set-up of World War II, just as fascist power-grabs had been orchestrated in Germany and Italy.* The front organizations were simply renamed in massive restructuring efforts. All of the post-World War II reorganization of the US government comprised a massive covert power transfer to the Nazis' through the formation of the OSS, and then the CIA acting as placement agencies for a mass Nazi recruitment into key US government positions. It would only be until the twenty-first century that the American public would be informed that 'Prescott' and his son were, in fact, Hitler's elite secret agents in America. The systematic network of covert Nazi operations have exposed George Scherf as the key Nazi mole in the US government (with President Eisenhower, below) decades after his death by one of his own fellow espionage agents, a close associate of his son.

In a comprehensive deathbed confession, Otto Skorzeny (below, left), the personal bodyguard of Adolf Hitler gave a detailed account of his life-story to Erik Monty Berman[13] in 1997, who was at that time dating Otto's daughter, named Lori F. Pyzyna. Otto Skorzeny conversed with Erik on three occasions for about five hours concerning his entire career as a Nazi special commando and subsequent CIA agent in America. Skorzeny and his family resided at 638 Fourth Avenue in Boynton Beach, Florida, using the CIA-orchestrated cover alias Edward Frank Pyzyna, a "retired carpenter" living with his wife Frances P. Pyzyna and their children. Erik Berman's Jewish heritage may have contributed to his eagerness to record and publish the shocking true history of the pre-World War II Nazi take-over of America, a fact that may have struck the dying Skorzeny as a golden opportunity to expunge his guilt. Having completed his testimonial and relinquished his extensive photo collection exposing the conspiracy of the century, Otto Skorzeny died without taking any secrets with him on December 31,1999.



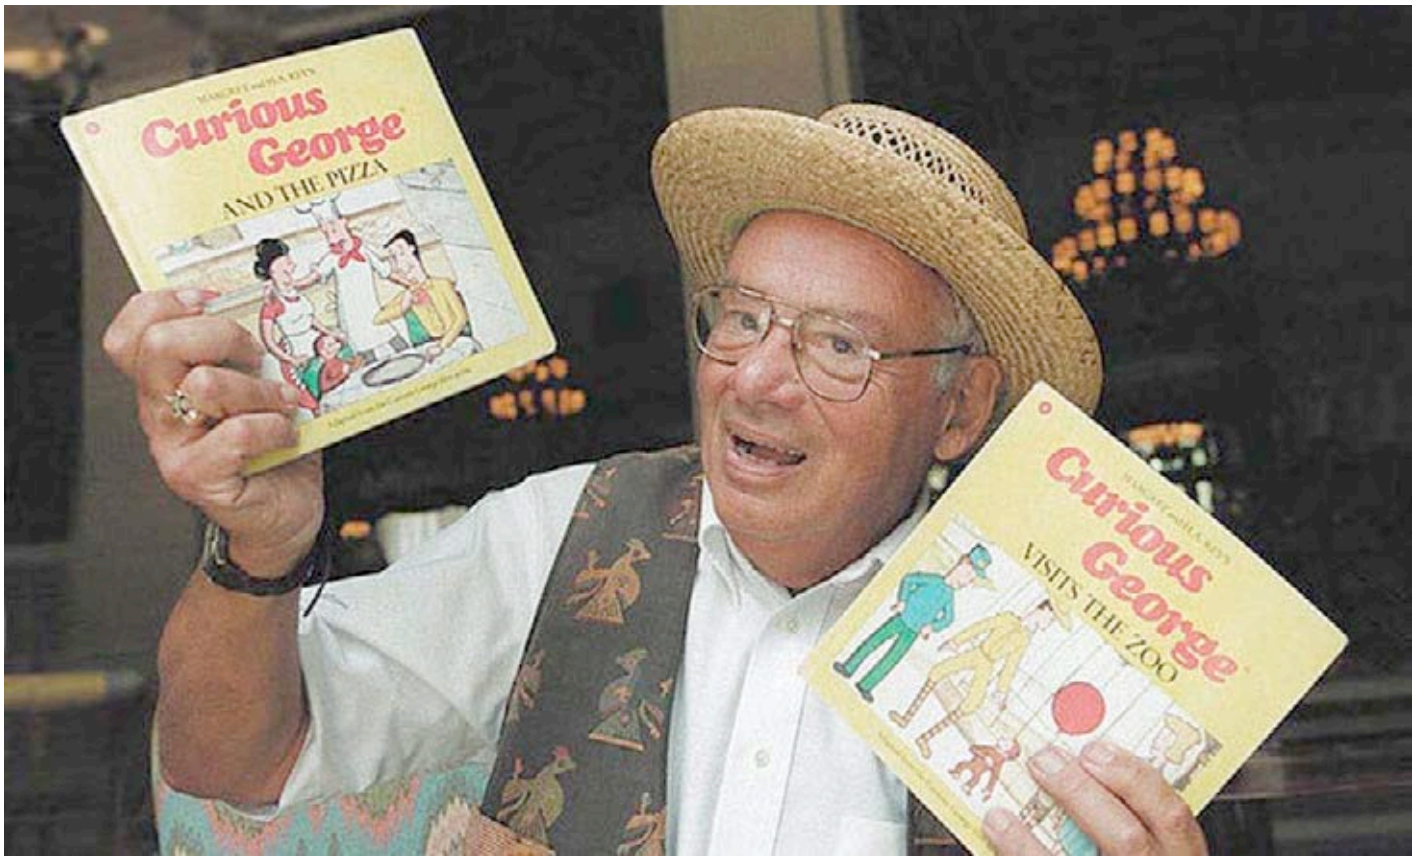
Skorzeny's testimony is a penetrating insider's view of the Nazi rise to power and their subsequent secret transference to the American Bush aristocracy. Otto's explication of his collection of personal photographs is surely one of the most intriguing tales of espionage ever told. Having been Hitler's personal bodyguard places Otto Skorzeny in the rare category of individuals privileged to have actually witnessed and participated in key events of worldly import whose testimony and extensive photographic evidence must be made known to the world audience and thoroughly considered. We must always remember that the truth is all that exists, and all subterfuge will surely become evident in time, especially those falsehoods so firmly media-implanted into collective memory. Skorzeny provided a stunning series of photographs that expose the lies of history, including one image of himself as a very tall youth posing with fellow Nazi agents George H. Scherf, Jr. and his father, George Scherf, Sr. (above, right).

An espionage agent's personal photographic collection is a powerful form of evidence for self-defense and security, painstakingly maintained to provide a solid means of blackmail protection by threat of exposure. Skorzeny's handing-over of his collection to Erik Berman was an acknowledgement that the photographs' value as insurance for his loved-ones would expire with him; that he could find solace in their exposition of the hidden identities and entrapment methods of his partners, who used him in kind.

As one of his final guilt-cleansing actions, Skorzeny chose to disclose his role in forming the CIA with other Nazis exported to the US through Operation Paperclip. Otto alleged that he worked extensively with Reinhard Gehlen and George H. Scherf, Jr. in these efforts. After the May 10, 1945 German 'surrender', Skorzeny was imprisoned at a Darmstadt POW camp (above). He 'escaped' on July 27, 1948 – but was actually released as planned– to found first the Office of Strategic Services and later the CIA with the vast majority of Nazi scientists and engineers directly from Germany. What definite signs of this do we see in the US today? The Nazi discovery and use of fluoride in state-controlled water sources to pacify and confuse the public by inducing attention deficit disorder (ADD) is well documented and should certainly raise alarms today as Americans fight against large-scale corporate fluoridation of the nation's water supply. Fluoride has been shown to accumulate in the pineal gland at the core of the human brain,[14] where it throws off the resonant functioning of calcite microcrystals that synchronize hemispheric interaction in the brain,[15] resulting in thought fragmentation. An FDA scam to promote a neurotoxin as a beneficial dental hygiene additive? Artificial sweeteners like Aspartame can kill? *Yes.*

The disinformation machine of the American media today follows precisely Hitler's philosophy of deceit: "the size of the lie is a definite factor in causing it to be believed, because the vast masses of a nation… would never credit others with the possibility of such great impudence as the complete reversal of facts… Something therefore always remains and sticks from the most imprudent of lies, a fact which all bodies and individuals concerned in the art of lying in this world know only too well, and therefore they stop at nothing to achieve this end." [16] Facts have been reversed just as the Nazi swastika has been given the meaning 'death' by reversing the ancient Sanskrit symbol for 'wellness'. The Sanskrit swastika is usually formed counterclockwise. Just as darkness is defined by the absence of light, so must death symbolize itself as the inversion of life force. The Nazi weaponization of Tesla's brilliance is another such inversion that has been exposed by the very man who confessed to his murder.

As deeply penetrating as these disturbing allegations may be, Skorzeny's extensive personal photo collection very clearly documents the gatherings of his espionage ring. The recounted details and corroborative research provided by Erik Berman are quite convincing and well supported by the investigative work of Don Nicoloff.[17] According to Otto Skorzeny, Nikola Tesla's assistant George Scherf "robbed Tesla blind" and was the last person reported to have visited Tesla only four days before the discovery of Tesla's vacant body in his New Yorker Hotel room on the morning of January 8, 1943.



In a soul-cleansing disclosure, Skorzeny retold how he and Reinhard Gehlen paid Tesla several visits in his final days and "spoke in great detail to Tesla about his most advanced technologies and then stole the blueprints of his best and most secret inventions." Going even further, Skorzeny reported the details of how he and accomplice Reinhard Gehlen suffocated Nikola Tesla on January 6, 1943. Dustin Wallace corroborates the statements of Skorzeny regarding Tesla's last days in a recent biographical piece:

> The Yugoslav Monarchy in Exile was summoned to visit Tesla in the fall of 1942. However, Charlotte Muzar, a secretary, paid Tesla the visit. From his condition upon her arrival she felt as though he may not live through the night… It was apparent that Tesla was nearing the end of his time. By late December of 1942, Tesla began meeting with two US government agents in order to share some of his most sensitive discoveries. These men carried away many of his documents for microfilming.[18]

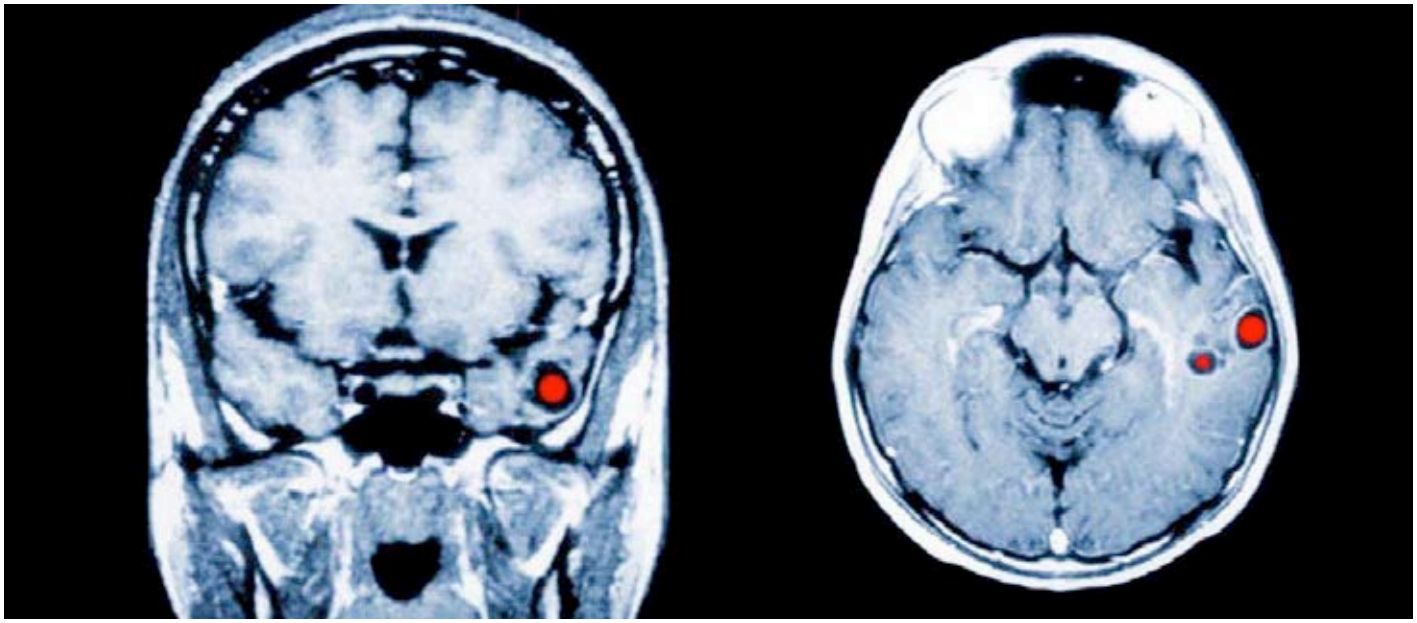
Further investigations unveil a pattern of deception and prior attempts on Tesla's life linked to his (unwisely trusted) clerical assistant George Scherf, Sr. and his son George, Jr. (above). Otto Skorzeny alleged that the Scherfs were fellow Nazi secret agents, the father having illegally entered the US to work for Tesla years prior, while Hitler sent George Junior to New York in 1938 to kill Tesla after stealing his secret inventions. Skorzeny recounted George Scherf, Jr.'s only attempt on Tesla's life in 1939 when he drove Tesla down in a taxicab, hitting the 83 year-old inventor while he was crossing the street. George failed to kill the spry elderly scientist, although the impact left a broken rib and bruised hip.

Before the murder attempt, Tesla was often bothered in his laboratory by the petty theft of the younger Scherf, even remarking on the teenager's invasions to friends. Apparently Tesla took the trespasses quite personally, for young George's incessant meddling in the labs earned him the nickname 'Curious George', bestowed by Tesla as a way of mocking his intelligence. Likening the younger Scherf to a conniving monkey, Tesla retold the story of George's invasive behavior to Margaret Rey, who later created a fictional character for children's books with the same memorable name.

The Scherf/Tesla origin of the character was undoubtedly to be a topic of much interest during the 'Curious George' international film debut on February 9th, 2006 – a topic that would never again be discussed by the books' co-author, Alan Shalleck (below), because he was murdered on February 6th just days before the film premiere and interviews.[19] The identity of 'Curious' George Scherf, Jr. was a secret that had already been revealed years before Shalleck's murder by one of Scherf's Nazi cohorts, Otto Skorzeny. Interestingly, both Skorzeny and Shalleck had lived for many years in Boynton Beach, Florida, where Shalleck's body was found in his driveway. The two men who committed the murder were unwitting agents of the CIA, whose conflicting confessions suggest they were hypnotically controlled.

The limitless potential of Tesla's inventions is rapidly changing the human experience. The synthesis of Tesla's work with ancient ayurvedic technologies will soon provide free energy to the whole world. Tesla's underlying goals of free global wireless energy transmission shocked industrial tycoons who abandoned his projects altogether, as they exposed the fragile hold on wealth and political control of those same industrialists. Instead of a peaceful twentieth century of shared technological prosperity, the world has lived through a traumatic century of unparalleled technological destruction. While Tesla envisioned our hidden connection to the full spectrum of the Earth's resonant energy, his inventions were altered for commercialization as cellphones, pagers and wi-fi networking using only a narrow bandwidth that causes cancer in users. It is a shameful irony that Nikola Tesla's 'transcending mechanical sense' was twisted to the service of manipulating the collective consciousness - 'perils too subtle to be directly perceived.' Scherf's cleverly executed financial manipulation and theft of Tesla's inventions earned Scherf millions and left Tesla penniless in his old age, his best inventions unknown.

Otto Skorzeny asserted to Erik Berman that he had personally known and worked extensively with George H. Scherf, Jr. for the greater part of his life – *first within the elite Nazi espionage ring and then in the elite CIA espionage ring* – a man also publicly known as *George Herbert Walker Bush*, *the 41st US President*. The Skorzeny photographs document an entire lifetime of gatherings of Hitler's elite group of espionage agents, many still alive today, who infiltrated the US government to organize and oversee the massive recruitment of Nazi scientists into American institutions including the CIA, NASA and OSI.[20] Skorzeny had stated the total number of such transferees to be about 50,000 altogether.

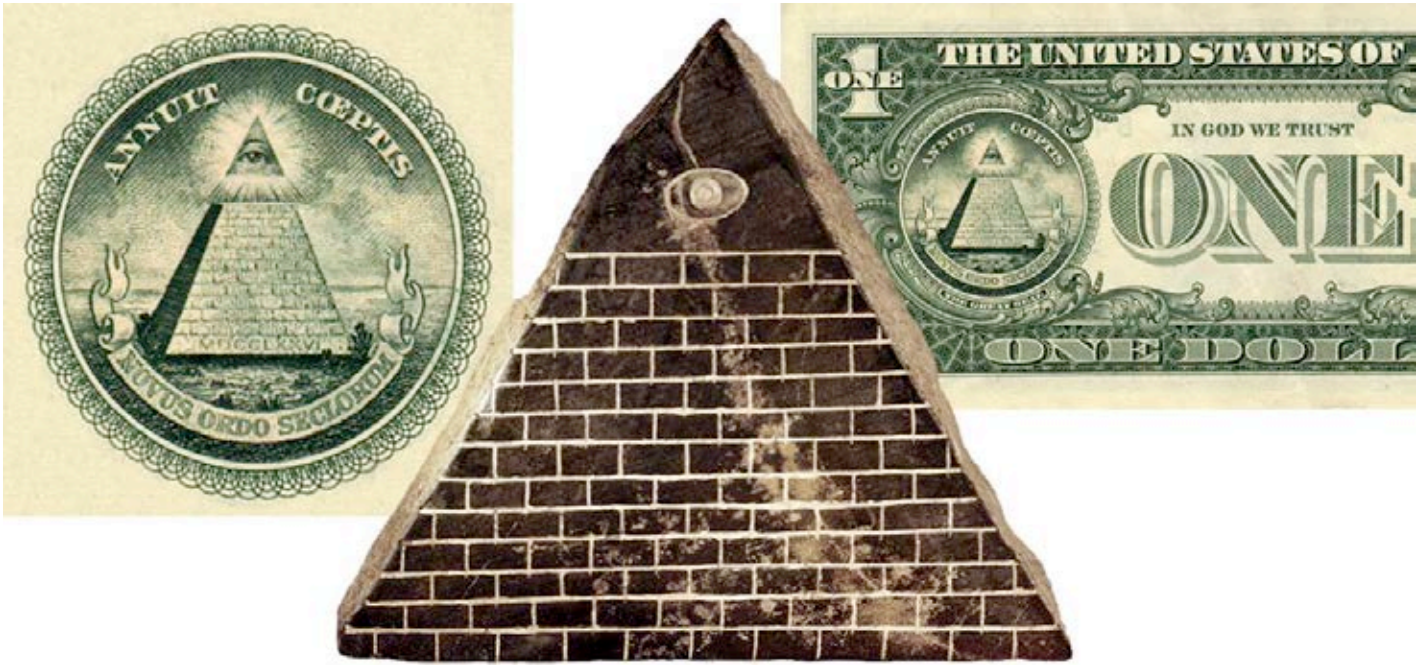


The entire Nazi rocketry team was transferred directly from underground facilities in Peenemünde, Germany to Fort Bliss, Texas, and reassembled (team photo below) to continue their work under the pseudonym NASA. Large numbers of Nazi eugenics specialists and mind-control researchers were also reestablished in CIA programs. Persistent information leaks have plagued the CIA establishment and covert operations, although no scandal has yet fully exposed the Nazi agenda of the Bush clan due to the state-run propaganda organ of the American media, and the Scherf/Bush connection remains largely unknown despite years of attention from independent news reporters, talk-radio shows and webcasts. Skorzeny's allegations and evidence exposes the framework of the Bush/CIA espionage methods that seduced America by using Tesla's wireless technologies to imperceptibly manipulate the masses into becoming "automata entirely controlled by the forces of the medium being tossed about like corks on the surface of the water, but mistaking the resultant of the impulses from the outside for free will." [21] Erik Berman was informed by Skorzeny of the complex strategies involved in the advanced psychological warfare being conducted by the CIA to influence world events using the inventions stolen from Tesla:

> The CIA uses stolen Tesla technology, according to Skorzeny, to spy on Americans and manipulate the weather. There are thousands of satellites orbiting the Earth that project high-intensity positively-charged laser beams to certain areas on the Earth. These positively charged laser beams enable the New Word Order Nazis/CIA to use their stolen Tesla technology to manipulate the weather and to transmit extremely low-frequency (ELF) waves with subliminal messages for mind control purposes. When HAARP is active, giant space-based lasers simultaneously aim their beams to a central 'spot' on Earth. That 'spot' will then experience severe droughts, hurricanes, tornados or Earthquakes. [In the case of Hurricane Katrina] Bush was quick to mention that it was a 'natural disaster'…[22]

This explanation of the current psychological warfare being conducted on the American public, and the world at large, is in complete adherence to the capabilities and principles laid out by Tesla in the many dramatic accounts of future events that colored his later years. The American Senate Bill S.517 'Weather Modification Research and Technology Transfer Act of 2005' directly confirms this current US military technological capability. The madness of extensive atmospheric tampering is already being seeded into the mass media disinformation, in an attempt to implant the falsehood that airplane chemtrails are a fine white powder dispersed to reverse global warming by reflecting solar rays.[23] In fact,

this severe atmospheric tampering is US policy designed to work in conjunction with water fluoridation to control human consciousness by inducing dissonance at the nano-scale through combined chemical and electromagnetic invasion of the human body. The greatest dangers are posed by microwave radiation poisoning from cellphone towers, mounted in vast numbers for ‘blanket coverage’ of America, slowly destroying DNA and developing cancers of all kinds (later reinforced by irradiation at hospitals):



> Illa Garcia wore jewelry the first day she went back to work as a fire lookout for the state of California in the summer of 2002. The intense radiation from dozens of RF/microwave antennas surrounding the lookout heated the metals on her body enough to burn her skin. "I still have those scars," she says. "I never wore jewelry to work after that."
>
> Likely Mountain Lookout, on US Forest Service land with a spectacular view of Mount Shasta, is one of thousands of RF/microwave "hot spots" across the nation. A newly erected cellular communications tower was only 30 feet from the lookout. "One antenna on that tower was even with our heads," recalls Garcia. "We could hear high-pitched buzzing. There were also three state communications antennas mounted on the lookout, only 6 feet from where we walked. We climbed past them every day..." By the end of fire season, Garcia and Jasso were so ill they were forced to retire and the lookout was closed to state personnel. Garcia, 52, is now severely disabled with fibromyalgia, autoimmune thyroiditis and acute nerve degeneration. Medical tests confirmed broken DNA strands in her blood and abnormal tissue death in her brain… Jasso, who worked the lookout for 11 seasons, is also disabled with brain and lung damage, partial left side paralysis, muscle tremors, bone pain and DNA damage… Both women say they have been unjustly denied worker's comp and medical benefits. Their pleas for help to state and federal agencies have been fruitless. Between them they have racked up over $150,000 in medical bills, although there is no effective treatment for radiation sickness.

> Twenty-two other members of Garcia and Jasso's two families received Likely Mountain radiation exposure. All now suffer serious and expensive illnesses, including tumors, blood abnormalities, stomach problems, lung damage, bone pain, muscle spasms, extreme fatigue, tremors, numbness, impaired motor skills, cataracts, memory loss, spine degeneration, sleep problems, low immunity to infection [just to name a few]… Garcia and Jasso have a terminal condition known as "toxic encephalopathy," involving brain damage to frontal and temporal lobes. This was confirmed by SPECT brain scans. Twelve others in the two-family group who also had the scans were diagnosed with the affliction. "All of us with this condition have been told that we’re dying," says Garcia. "Our mutated cells will reproduce new mutated cells until the body finally shuts down." [24]

These are families enslaved technologically in slow death by microwaves, forced into medical extortion that does not relieve, but instead psychologically entrenches suffering until death. This will be the fate of all cellphone users who do not quit, and all city-dwellers being irradiated. Nikola Tesla, the inventor of wireless, stating “that when it is accomplished, the power will travel on long waves… The application of short waves for power purposes… [is] much more difficult from an economical point of view." [25]

Tesla had found that with ultra-low-frequency “wavelengths of 12,000 meters [interference] becomes quite insignificant and on this fortunate fact rests the future of wireless transmission of energy.” [26] It would only be decades later that the detrimental effects of high-frequency radiation like x-rays and microwaves would be discovered, and even then still erroneously considered safe for weak exposure. The most economical waves for wireless transmission were specified by Tesla to match the Earth resonances– ultra-low-frequency humming that is inaudible to most humans. A healthy human heartbeat at rest pulses a 765-foot wavelength of 1.45 Hz. This exact wavelength defines the base length and resonant frequency of the Great Pyramid of Giza, Egypt. The ‘Third-Eye’ symbolism that once adorned the façade of the pyramid was likely destroyed by war and flood, but was recorded in antediluvian Sanskrit artifacts now documented the world over, including La Maná (below) and Cuenca, Ecuador; Sutatausa, Colombia; Burrow’s Cave, Illinois; Glozel, France and Malta. This symbolism reveals the design function of the pyramids’ heartbeat synchronization of the pineal gland in initiates at sacred sites in worldwide alignment.

Telepathy is now scientifically understood as ‘enhanced remote viewing’ enabled by the induction of acoustic resonance between the piezoelectric calcite microcrystals in the human pineal gland and the synthetic limestones of the Giza pyramids. Just as in the case of the Nazi reversed-swastika to mean death instead of life, the American dollar reverses the ‘Third-Eye Pyramid’ symbolism as a reflection of the technological use of fluoride, aluminum and microwave radiation poisoning to throw off pineal resonance. By understanding the shifting environmental conditions that are enhancing our collective consciousness, humanity can choose the way of telepathy using the ayurvedic geometry of the Sanskrit pyramid builders. The applied Unified Field Theory, also called Magnetic Resonance,[27] is presented by this author freely online to demonstrate the full set of physics principles by which Tesla’s resonant wireless systems operated, in identical fashion to the world’s geo-positioned network of ancient pyramids, megaliths and sacred sites. *The wireless telepathic communication of human consciousness is inextricably woven into the planetary changes that cannot be swayed by any misuse of technology.*

Nikola Tesla’s “transcending mechanical sense” has, in the many decades since his passing, been twisted to the service of manipulating the collective consciousness – “perils too subtle to be directly perceived.” America today is a poisoned nation –a Nazi mass mind control experiment of genocidal proportions – perpetrated by chemical and electromagnetic attack of the human body and mind – driving humanity to extinction. The next crucial chapter presents a directly relevant portion of the research and writing of Erik M. Berman, who seized an invaluable opportunity to break the cycle of psychopathic control by publishing the true facts of the murder of Nikola Tesla and the theft of his secret inventions by Hitler’s elite espionage agents in a successful pre-World War II covert Nazi take-over of America.

Veil of Invisibility

Veil of Invisibility

Text and key images originally from '***The Bush Connection***' by Erik 'Orion' Berman (2003)
Selections have been heavily edited for clarity and supplemented by this author
Photographic images have likewise been digitally enhanced for clarity

According to my private meetings with Otto Skorzeny (1908-1999), former SS Nazi agent and subsequent lifelong CIA agent, Adolf Hitler was amazed and fascinated with Dr. Nikola Tesla when he made the cover of Time Magazine in 1931. Hitler had considered Nikola Tesla to be the incarnation of the almighty white, Aryan mythical Superman, or 'Das Uberman'. Hitler was curious about rumors alleging that Tesla had an extremely large penis and that he had psychic powers. Adolf, being the childish, sadistic, egomaniac that he was, enjoyed most cartoons and comedians of the era, especially *'The Three Stooges'* and the Max Fleischer cartoons *'Popeye'* and *'Tesla Vs. the Nazis.'* Hitler and Skorzeny were not graced by brilliance, however they fully recognized the genius of Nikola Tesla!

In 1934, while Hitler was plotting to take over the world, Tesla was in America helping the US government protect its citizens from Nazis by creating sophisticated radar, Star Wars orbital weapons to destroy approaching enemy missiles, and remote controlled torpedoes. Rumors had been spreading that Nikola Tesla had created a 'Death Ray', an antigravitic flying disc, an earthquake machine, weather modification machines, and plasma-based optical invisibility technology. Hitler quickly became intent on their theft and obfuscation from public awareness, his righteousness and arrogance directing his obsessive thinking. Planning with his elite youth corps of SS Nazi special agents Hitler implored, "I must have those inventions so I can take over the world."

In 1938, Hitler initiated long-term plans for sending young SS Nazi spies to America through the Hamburg-Amerika ship line supervised by George H. Scherf, Sr., who had in previous years been working simultaneously as financial handler of Nikola Tesla and for the Rockefeller-owned Union Sulfur Company. Hitler's deceptive planning involved key American industrialists at every stage to insure the effectiveness of the Scherf/ Bush double-identity facade by entrenching a corrupt network of high-ranking US government officials. Photographs of the Bush family prior to World War II are rarely available to the public; one of the earliest is presented below, the group posing on arrival at the Midland, Texas airstrip in 1950.

From left to right are mother Barbara Pierce Bush, son George Walker Bush, father George Herbert Walker Bush, grandmother Dorothy Walker Bush and grandfather Prescott Sheldon Bush. By embedding themselves among the dynastic American industrialist families of Samuel P. Bush and George Herbert Walker, the Scherf family effectively enshrouded themselves in American mythology while all extant records of their existence had been completely expunged in Hitler's Germany. The careful manipulation of public records and well-orchestrated propaganda including publishing myriad false-histories would be required to effectively infiltrate the power positions of the US government, yet census records for the Bush family show inconsistencies that belie false identities and birth information.

Otto Skorzeny revealed that three American Nazis founded the Internal Revenue Service in 1933 as a private Delaware corporation for Nazi military fundraising. Skorzeny contended that the vast amounts of American tax revenues generated by the IRS went directly into generating the Nazi war build-up from its very inception. The bagman who took the money to Germany was George H. Scherf, Sr. alias Prescott Bush, CEO of Brown Brothers Harriman. The IRS is not part of the Bureau of Internal Revenue – paying income tax to the IRS is not mandatory but voluntary and based on the threat of an audit and financial investigations. Being the frontman for the primary covert finance operation of the Nazi regime, George Scherf, Sr. was indeed the most valuable secret asset of the Third Reich who would work diligently for his entire life to bring about the rise of the Fourth Reich in America.

Skorzeny presented his copy of this remarkable color print (enhanced below), a large group photo of Hitler's elite youth espionage ring at the Scherf family home around 1938, pointing himself out at the far right. He also pointed out other Nazi agents posing, including Reinhard Gehlen (front), Joseph Mengele (back) and, in German Naval uniform, Martin Bormann (far left) and George H. Scherf, Jr. (center). To the right of Scherf Jr. sits Walther Rauff and in front of him is Dorothy Walker 'Bush', wife of George H. Scherf, Sr. (alias Prescott Bush). Scherf Sr. himself may have taken this photograph of his family and friends at their Dölitzsch, Germany home – with his wife, son, and mother (at left, holding Bormann's hand) – all of the males being close-knit young espionage group members.

Hitler's elite espionage ring would only expand in world influence and power after the illusory conclusion of World War II, that was actually an exit strategy and mass transfer operation from Nazi Germany to the United States; Gehlen would later become the Director of Intelligence at the German DVD, and Scherf, Jr. would later become the Director of Central Intelligence for the American espionage apparatus using the alias George Herbert Walker Bush. The network of covert Nazi assets among the elite American industrialists influenced the vast reformation of US government institutions signed into law by President Truman, forming the CIA and drafting the National Security Act of 1947.

Several years prior, new US government offices were created to support the revenue gathering of the Nazi IRS, coordinating the extensive multi-tiered German infiltration. A new branch of the government called the Office of Strategic Services (OSS), whose supposed job was to spy on the Nazis. Hitler now had an entire branch of the US government at his disposal. Hitler trained and, in 1938, sent young fourteen year-old SS Nazi agent George H. Scherf, Jr. to befriend Nikola Tesla and steal his inventions for the Third Reich.[1] The young Scherf could not befriend Tesla, but relied on covert surveillance of the scientist's activities. George informed Hitler of Tesla's new invention that would render an entire battleship or aircraft invisible, both to the human eye and to radar surveillance. As a deep mole in the OSS, young agent Scherf later informed Hitler of the US Navy's secretly planned Tesla water-plasma mirage experiment on the Delaware River.

The Real Philadelphia Experiment: Operation Rainbow Project

In 1941, with Tesla's direct supervision, the Navy Destroyer USS Eldridge (opposite) was wrapped with thousands of feet of cable made from whole copper pennies bound together (the only reason for the copper penny shortage in America), linked to several high frequency generators and several of Tesla's other patented inventions including Tesla's Rotating Field Amplifier (RFA).

> "Nearly all circulating pennies at that time were struck in zinc-coated steel because copper and nickel were needed for the Allied war effort. Forty 1943 copper-alloy cents are known to remain in existence." - US Mint

The US Navy had many Nazi-sympathizers informing George Scherf, Jr. who tipped off Hitler to this experiment commonly referred to as the Philadelphia Experiment or Operation Rainbow Project. Agents Otto Skorzeny and Reinhard Gehlen were selected to spy on this project. They made it to the United States in a German U-boat. When they arrived on shore they put on US Navy Officer's uniforms to infiltrate the Naval shipyard from which the experimental vessel was intended to sail into the river invisibly using strong EM fields.

They also had fake identification. With a little bit of persuasive talking and help from US Navy Nazi sympathizers, George H.W. Bush and Dr. John G. Trump, they both easily made it onto the Philadelphia Naval Yard base, to an empty ship with no name that was being overhauled, right next to where the USS Eldridge was birthed. From their obscure vantage point they had a clear view of what was taking place. The Eldridge sailed out into the Delaware River and began to glow a bright greenish color at first, then a little yellow, finally it looked very blurry like a heat mirage or gasoline evaporating, and then it almost vanished completely from our sight. However, we were able to see the large wake it was leaving behind as it sailed south down the river. We could see it fade in and out several times until it was too far away. About six hours later the Eldridge returned to the Philadelphia Naval Yard in a state of complete pandemonium. We heard men screaming and complaining that they felt as is they were on fire. Someone mentioned that he could not believe that they made it to the Norfolk, Virginia Naval Base and back in only a few hours.

At that point we knew that Tesla had invented, and was very close to perfecting the ultimate weapon of war –optical invisibility. Hitler was very pleased with what we told him about Tesla's great invention of optical invisibility. The Navy wanted Tesla to help them try out a new, more powerful high-frequency generator to increase the electromagnetic illusion of invisibility. Tesla refused to help the Navy a second time because the first Project Rainbow invisibility experiment had hurt so many of the guinea-pig crew who were topside during the experiment. The sailors below decks were not affected as much;

their brains were debilitated by radiation. Most of those sailors survived with minor brain damage and spent a long time in the Philadelphia Naval Yards' Psychiatric Hospital. If the sailors ever remembered what had happened to them during the experiment their allegations were immediately dismissed as 'crazy talk'. The US Navy used fear and intimidation to silence the witnesses and unwitting participants of the experiments by threat of cancelled pensions, treason indictments and ultimately death.[2]

During 1942, Hitler desperately wanted to rule the world. He ordered George H. Scherf, Jr. (aka George H.W. Bush) to wiretap Tesla's phone to find out about what other magnificent inventions he was creating that could aid in his global conquest. Bush eavesdropped on several negotiations between Tesla and the Navy regarding his supervision of a second experiment aboard the USS Eldridge. After several refusals from Tesla, the Navy contacted Albert Einstein, Marconi, Townsend Brown, Dr. John G. Trump and a few less-known scientists to attempt another invisibility experiment. Einstein flatly announced to the entire group: "Nikola Tesla's theories of magnetic resonance and optical invisibility are beyond my grasp." Skorzeny and Gehlen were informed by Scherf Jr. of the location of the next invisibility experiment and were able to orchestrate more help from Nazi-sympathizers in the US Navy.

Pretending to be scientists Dr. Reinhard and Dr. Franklin Reno, the two men easily bluffed their way into the Philadelphia Naval Yard and the USS Eldridge. Gehlen and Skorzeny would try to steal the main electronic component of the experiment, Tesla's Rotating Field Amplifiers. The RFAs were small black steel boxes with ventilation holes that weighed about fifty pounds each. Several high-frequency generators were daisy-chained together to the RFA, which amplified the electrical currents to extremely high voltages. These RFAs had to be connected and tuned to a certain resonant frequency that only Tesla knew. The US Navy still had Tesla's equipment, but this time they were forced to work without Tesla's knowledgeable supervision and fine-tuning of the rotating EM fields to the correct frequency for the experiment to be conducted effectively and safely.

The Second Invisibility Experiment of the USS Eldridge

All of the equipment was reinstalled on the Eldridge, while the RFA was instead connected to the ship by a long extension cord from the dock. There were two other RFAs standing by just incase the first one failed. The Eldridge did not leave port to conduct the experiment this time, and because Tesla would not supervise a second experiment nor fine-tune the generators the experiment did not go as planned. The other scientists could not figure out how to properly hook up all of the generators nor could they figure out how to connect and fine-tune the RFA. They rigged it all together haphazardly and threw the power switch. Nothing happened. They turned up the power on the generators and still nothing happened. Eventually, the scientists reconnected the wires in a different way. Finally, something did happen! The ship started to glow green a little bit and then yellow and finally it appeared to be vanishing in a giant heat mirage right before everyone's eyes. However, it did not vanish completely this time as it had done during the first experiment. Dr. Trump allegedly yelled at Einstein and the other scientists to make his ship invisible! The scientists decided to turn up the generators to full capacity to "see what would happen."

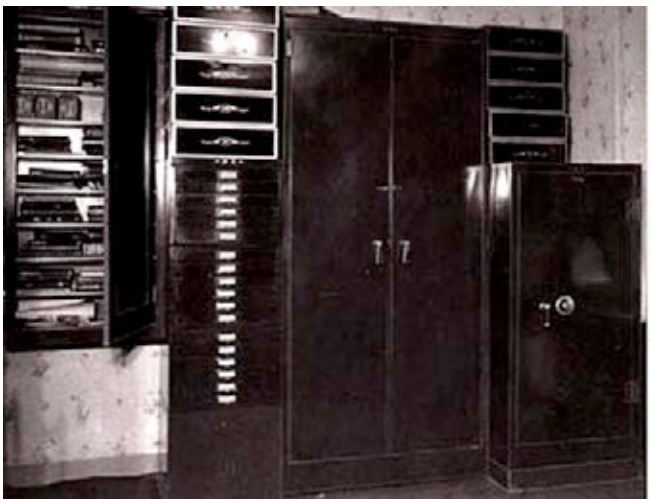
The ship did in fact disappear from sight for a little while so they continued to crank up the electricity. The unfortunate guinea-pig crewmembers (above) that were on the ship's deck began screaming in pain and running around like chickens with their heads cut off. Some jumped overboard to escape the excruciating pain of being burned alive. The scientists and fake Nazi doctors ignored their screams and continued with the experiment for at least fifteen minutes. No one knew at the time that Dr. Nikola Tesla had been secretly watching the experiment. Tesla sabotaged the experiment by chopping through the extension cord with an axe, and then he disappeared into the night. Tesla's heroic effort saved the lives of many crewmen. That is the only reason the experiment stopped when it did. This time the crew on the top deck were no more than puddles of flesh and bone melted to the deck. The crewmembers had their flesh and bones cooked from the inside like a giant microwave oven due to the intense heat of high-frequency magnetic fields that were not properly tuned during this second experiment.

The “flesh puddles” at first glance, looked like sailors had been fused into the deck. That was not the case. The marrow from inside their bones had been cooked and their bodies melted onto the decks. During the confusion of trying to shovel-up and dispose of the unfortunate sailors, Skorzeny and Gehlen were able to grab all three of the Rotating Field Amplifiers. Now the US Navy did not have any RFAs left. The two Nazi thieves made their getaway without anyone suspecting a thing. This time Skorzeny had been paid by the Russians to steal the RFA for them, which he did. Now, Nazi-Germany and Russia had Tesla’s electronic invisibility technology and the United States of America did not.[3] By stealing America’s last RFAs, Nazi Germany had just “unofficially” won World War II.

Thorn EMI Corporation of England and Raytheon Corporation provided the glass vacuum tubes and electronic equipment for the experiment. Raytheon was awarded patents for microwave ovens and Magnetic Resonance Imaging (MRI) machines that were created as commercial applications of research derived from the horrific Philadelphia Experiment.

Various people have written books about the Philadelphia Experiment claiming that they were on board the Eldridge at the time or that the experiment never took place at all or they claimed to be involved in other US Navy paranormal tests like the Montauk Project, flying saucers et al. Jacques Valle, Carlos Allende, Al Bielek, Preston Nichols, Mac Shelton and Bob Lazar are six of these people. When I asked Skorzeny about these six men, he laughed and told me that Al Bielek is allegedly a former Nazi and “government stooge” who works for the Pentagon. Valle, Allende, Bielek, Nichols, Shelton and Lazar are all allegedly CIA disinformation spreading “bullshit artists”. Skorzeny emphatically stated “if they really knew anything about Operation Rainbow Project or flying discs, I would have been ordered to kill them as I did with Dr. Morris K. Jessup.” [4]

Nikola Tesla’s Final Day



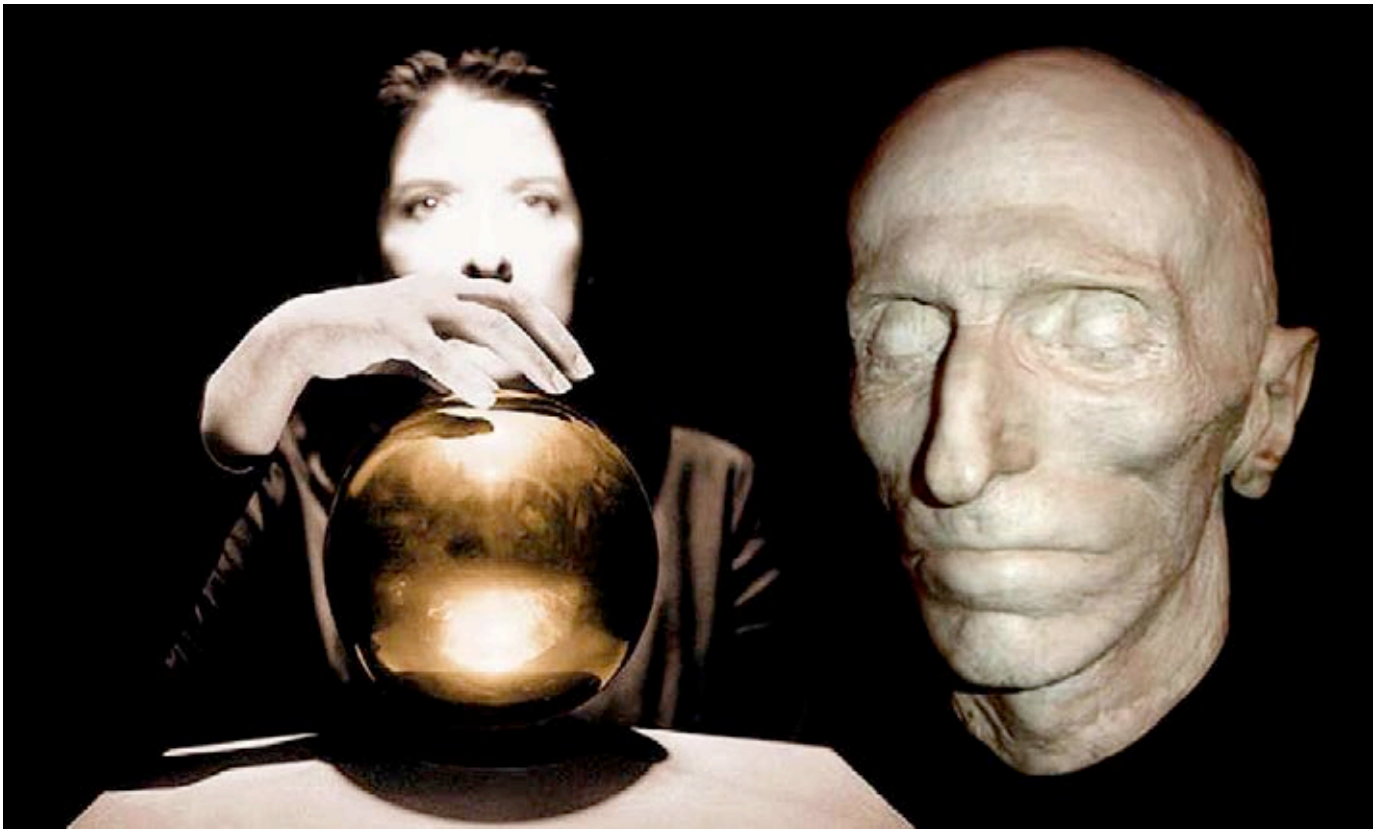
In late 1942, at the age of 85, Nikola Tesla had called the Office of Strategic Services (OSS) several times to try to set up a meeting to give them his newest and greatest inventions; an antigravitic invisible flying disc, delta-winged radar-absorbing aircraft designs, a Death Ray, an Earthquake machine, free-energy devices, a Cosmic Light Ray Transmitter/Receiver, mind reading/controlling machines et al. The OSS phone number went straight to George H. Scherf Jr., SS Nazi spy (aka George H.W. Bush). George told Tesla that he would send two OSS officers over to meet with the scientist on January 6, 1943 to consult with him and take his inventions back to Washington DC for handling by the OSS.

On January 6, 1943 Tesla received a knock on his door by two men claiming to be OSS officers. Their alleged names were Ralph Bergstresser and Bloyce Fitzgerald. One was very tall and skinny the other was short and stocky. Tesla was very excited to see these men and offered them tea. Tesla spoke with these two government agents for more than an hour. He showed them his complete invention plans for an antigravitic invisible flying disc, an Earthquake machine, strange designs for radar avoiding aircraft, non-polluting, free-energy driven cars, rocket ships for space travel, lasers, the first electronic computer, electronic mind control/mind-reading devices and a Death Ray or Tesla Cannon that fired a plasma beam to disable enemy aircraft from up to two hundred miles away leaving no trace. The range of the weapon is only limited by the curvature of the Earth, as the plasma is beamed along a perfectly straight trajectory from the apparatus’ ray gun to its target.

Tesla carefully explained his inventions to the two agents. Tesla told the men that his optically invisible flying disc had another very unique feature; he alleged that it was able to travel through time and to distant planets like Mars and beyond. He told them that he was very happy and proud to help the US government triumph in the war against the Nazis. The two men thanked Tesla and began gathering up all of his wonderful invention plans and headed towards the door. While Tesla was standing in front of the door with his back turned, the smaller man held Tesla’s arms at his side while the taller man held a pillow in front of the frail 86 year old Nikola Tesla’s mouth and easily suffocated him to death![5]

Because the foolish American government had forsaken Tesla, no one was there to protect and watch over him. Dr. Tesla had unknowingly given his best and greatest inventions to two SS Nazi agents who had been pretending to be American OSS officials. The two Nazis were none other than Otto Skorzeny and Reinhard Gehlen. By murdering Tesla and stealing his greatest inventions Nazi-Germany just "unofficially" won World War II… Allegedly, Hitler had ordered the "cowardly," prudent George H.W. Bush to steal Tesla's inventions and to kill him! George was "too much of a pussy" to do it, so Skorzeny and Gehlen had to kill him instead! Tesla was hit by a taxicab a few years earlier in 1938, allegedly driven by George H.W. Bush. The pre-meditated car accident injured Tesla, but did not kill him.

After Skorzeny smothered Tesla, he and Gehlen broke into Tesla's safes and stole his Last Will and Testament, Edison Medal of Honor, his Westinghouse Contract worth trillions today, an Earthquake machine patent model, an antigravitic flying disc patent model, a turbine, a water engine, another engine that needed no oil or gas, free-energy devices, perpetual motion devices, a Death Ray, electronic invisibility devices, mind control devices, and hundreds of love letters from Tesla's rich, aristocratic lady-friends, most of whom were married to famous men at the time. Skorzeny claims this stolen private collection included several love letters written to Tesla from Barbara Pierce (Bush).



According to Skorzeny, Tesla's Last Will and Testament, Edison Medal and his Westinghouse Contract are all kept in the Skull and Bones "lucky sperm club member" clubhouse located at Yale (above, right) right next to Geronimo's skull. Prescott Bush "grave-robbed" the skull from a sacred Apache burial ground for rituals. This clandestine meeting place for rich WASP, New World Order Republican recruitment rituals is called 'the tomb' for allegedly housing various stolen human bones, a coffin and a wax dummy of Hitler wearing black leather Nazi SS Gestapo boots, giving the Nazi salute with one hand and holding a gas can in the other. Allegedly, every year each new rich, WASP New World Order Republican recruit is hazed –made to strip naked and lie in a cash-filled coffin engraved with the Jewish Star of David. Motor oil is poured on top of them [and they are forced, one after another, to perform autoerotic rituals]…[6] This psychopathic behavior is a political type of reverse-Christian baptism designed to entrap the participants into the network of coercion, extortion and blackmail.

Tesla's Body Is Discovered... The Government Cover-Up Begins

On January 7, 1943 a real friend of Tesla's stopped by to see how he was doing. His hotel bedroom door was ajar, which seemed odd. He went into Tesla's bedroom and found him lying on his bed with his pants down to his knees, with his shoes still on, dead. After suffocating Tesla, Skorzeny claimed that he pulled Tesla's pants down to see if the rumors about his penis-size were true. He claims that the rumors about Tesla's large penis were indeed true! All of Tesla's belongings had been ransacked and pillaged. His windows were open and his safes were almost empty. His pigeons were flying around the

room and walking on and around his dead body. Tesla's friend tried to resuscitate him. He loosened Tesla's collar and necktie and went to get help for Tesla, but he knew it was too late. When the authorities arrived they put Tesla on a stretcher and quickly covered him up with a blanket. Immediately thereafter, Nazi agents from the FBI and the Office of Alien Affairs proceeded to raid Tesla's room and steal everything that was not hotel property. Tesla was not an illegal alien, but a US citizen! The Office of Alien Affairs had no authority to steal Tesla's remaining property! Tesla's body was immediately cremated without an autopsy. Isn't that strange? His ashes rest in a spherical gold urn in Belgrade's Tesla Museum, as seen below in a performance piece by Serbian-Dutch artist Marina Abramovic. The death mask of Nikola Tesla is also presented in the Museum's exhibition (below, right).

The three murdering Nazis Skorzeny, Gehlen and George H.W. Bush attended Tesla's funeral. The FBI published a false story telling the world that Tesla had died of old age in his sleep. Once again, the US government had forsaken Tesla. Why? He was the greatest inventive mind the world had ever seen and had constantly proved his loyalty to the US by inventing devices to help protect American citizens from attacks by the Nazis and other potential threats. Why did the US government erase Tesla from our history books? To protect Bush's secret, illegal pact with Hitler and to hide non-polluting, free energy Tesla technology from American citizens and the whole world. Otto Skorzeny and Reinhard Gehlen took their stolen Tesla inventions back to Hitler in Berlin, Germany and to Stalin in Russia. Hitler was perfectly delighted by his agents' successful manipulation and assassination of genius!

For murdering the frail eighty-six year-old American genius Nikola Tesla, Hitler gave his two special agents metals of honor including the Knight's Cross, the Iron Cross and promotion to top-ranking positions within the Reich. Hitler proceeded to gather up the brightest Nazi scientists along with Jewish scientist prisoners to attempt to decipher Tesla's complex blueprints for an antigravitic invisible flying disc (developed as Vril discs), Death Ray, and Earthquake machine. The Nazis had faked Thomas Edison's death years earlier to help them build weapons of mass destruction to use against America. Now the Nazis had Edison, Marconi and other famous Nazi scientists working non-stop for two years trying to build Tesla's anti-gravity, invisible flying disc and other stolen Tesla technologies.

For helping the Nazis, allegedly, Hitler and Prescott Bush used their influence to bribe US Patent Examiners to give credit to Marconi for inventing the radio, even though he "invented" it with seventeen of Tesla's prior patents. Later in 1943, it was determined that Tesla did in fact invent the radio, and credit was given back to him after his death. In 1945, Hitler, Skorzeny and Gehlen met with George HW Bush and their Nazi comrades in the US to show off "their" new wonderful invention: the optically invisible, antigravitic flying disc. Bush and the other gathered elite espionage agents were stunned and amazed by the other-worldly capabilities of these advanced new "war toys" as they watched, for the first time, the exotic aircraft make extreme maneuvers, hover silently and vanish in an instant.

Max Fleischer's Lost 1930's *'Tesla Vs. the Nazis'* Cartoon

In the 1930's Max Fleischer created an anti-Nazi propaganda cartoon based on a famous scientist of the time, Dr. Nikola Tesla... In this rare CIA-banned cartoon, Nikola Tesla battles aging SS Nazis who are sending deadly substances through the mail and who are wreaking terror on US citizens while trying to create a Fourth Reich or New World Order. Tesla defeats the Nazis in the cartoon's conclusion. Skorzeny related Hitler's fascination and obsession with this particular Max Fleischer cartoon. He claimed that Hitler made a pact with all of his SS Nazi officers to do their best to create a Fourth Reich as scripted in the 'Tesla Vs. the Nazis' cartoon. This cartoon video is the CIA's New World Order master plan for all domestic terror attacks past, present and future.[7]

Max Fleischer's grandson was born Lawrence Ari Fleischer in Pound Ridge, New York. Ari Fleischer became the official spokesperson for President George W. Bush in December of 2000. As White House press secretary, Fleischer was in charge of handling media queries and disseminating information to reporters about the administration, its policies and goals. Both Fleischer parents were committed Democrats, and admitted later that their youngest son's Republican sympathies, which emerged during his years at Middlebury College, surprised them. Fleischer became a trusted asset in Republican Party circles. He served as deputy communications director for incumbent President George H.W. Bush in his failed 1992 re-election campaign. During the Clinton years, Fleischer ran his own lobbying firm for aircraft makers and cattle ranchers, and returned to the back halls of Congress when he took a job with a Republican from Texas, Bill Archer, who chaired the House Ways and Means Committee. He quit that job when he was hired by Elizabeth Dole as communications director in her campaign to become the Republican Party nominee for the White House in 2000.

Skorzeny claims that on or about 1982, a high ranking representative from the Reagan Conservative New World Order Nazi Republican Party with help from The Brotherhood of Aryan Nations organized crime hate group, “reached out” to the grandson of Max Fleischer, the sole heir to his cartoon fortune, Ari Fleischer. They made Ari a “deal he couldn’t refuse.” Allegedly, Ari has sole possession of the licensing rights to his grandfather’s ‘Tesla Vs. the Nazis’ cartoon. He was allegedly bribed with five million dollars cash and a promise of life-long future employment with the Conservative New World Order Republican Reagan / Bush Family Regime, if he would make that particular cartoon video “disappear.” The plot to help the Nazi Conservative Republicans create a New World Order in America was moving right along with the help from newly acquired Jewish propaganda spokesman Ari Fleischer.

According to Skorzeny, the CIA’s former SS Nazis with help from the Brotherhood of Aryan Nations organized crime/hate group have been planning terrorist attacks on American citizens for more than 60 years, while the US government always looked the other way, disregarded evidence and pursued fake suspects. During the last twenty-three years the Brotherhood of Aryan Nations, with help from former SS Nazi CIA employees and Ari Fleischer, systemically bought or stole every existing copy of Max Fleischer’s ‘Tesla Vs. the Nazis’ cartoon in the United States. The CIA officially banned this cartoon video like most other Tesla related subjects. Why? Because they want Tesla erased from the history books so they can continue with their plans to illegally create a New World Order in America. The Max Fleischer cartoon ‘Tesla Vs. the Nazis’ is the script for the subversive planning of all future Brotherhood of Aryan Nations CIA-sponsored New World Order terrorist attacks.[8]

On December 12, 2000 PBS aired a well-made Tesla documentary called ‘Tesla: Master of Lightning’. During the video, a broadcast of Max Fleischer’s ‘Tesla Vs. the Nazis’ cartoon was shown for about 60 seconds. It detailed how Tesla was able use his Death Ray to stop aging SS Nazis from mailing deadly substances and wreaking havoc on the US while they desperately tried to create a Fourth Reich or New World Order as Hitler had ordered. The cartoon abruptly ended without explanation and so did the rest of the documentary, only to be re-edited and never again broadcast in its original form. The very next day, I purchased a copy of the video. When I watched the video at home, the Max Fleischer ‘Tesla Vs.

the Nazis' cartoon had been censored. In its place was a different Max Fleischer cartoon, recasting Nikola Tesla as a mad scientist villain trying to dominate the world with his Euthanasia Ray (not Death Ray). This time, it is up to CIA-approved Superman to save the day. Once again, the lying CIA New World Order Nazis have deceived the American public by censoring the 'Tesla Vs. the Nazis' cartoon from our collective memory. The CIA's New World Order has prevented the American public from viewing accurate information regarding the life and work of Nikola Tesla, instead inverting reality by portraying Tesla as the mad scientist villain endeavoring to take over the world, not Hitler. All readers are encouraged to contact the PBS producers of the Tesla documentary to ask where to find a video copy of Max Fleischer's 'Tesla Vs. the Nazis' cartoon. Skorzeny claims that the narrative of this animation that so enamored Hitler became the Nazi manifesto for all future CIA-sponsored attacks in America. In a recent lethal cartoon reenactment, the anthrax letters of October 2001 were CIA products from the Fort Detrick bio-terror laboratory mailed by Joseph Mengele.[9]

Secret Underground Nazi Base in Glacier National Park, Montana

Hidden high atop the mountainside along Going-to-the-Sun Road at more than 6,600' is the secret tunnel entrance to an extensive underground Nazi/CIA facility (48.7474°N 113.7633°W). In the above satellite image, the larger circle denotes the hidden rock façade entrance and the smaller circle denotes the position of camouflaged guards. The secret tunnel descends more than two miles to a giant hollowed-out industrial complex below the mountain. This huge underground city/base connects Montana to Canada just north of the national border at the (cleverly named) International Peace Park. This underground base is where the CIA keeps its stolen Holocaust trillions and tests its most secret New World Order black projects including Tesla's flying disc, optically invisible aircraft and other stolen Tesla technologies.[10] Operations at the base include maintenance and deployment of stealth drones.

Glacier National Park was the first national park to have railroad access at the time – a necessity for all large-scale underground military-industrial construction. This enabled the CIA's New World Order Nazis to transport the rumored Nazi-gold train of stolen holocaust loot from Montauk, NY to the secret base located inside the mountain. On the promontory above the secret tunnel entrance there is a strange looking outcropping of rocks that at certain times of the day looks like a grizzly bear, hence the name 'Grizzly Peak'. The CIA uses this secret tunnel route to illegally smuggle drugs, guns, SS Nazi war criminals and dignitaries into Canada without stopping at any border crossings.[11] Because the archived surrender agreement of Nazi Germany has been forged, Canada has been hiding and supporting CIA Nazis just like America has been. Canada aligned itself with England, France and Italy in forming a secret fascist agreement with Hitler's Nazi Germany, the results of which can be clearly seen in their unified front of complete denial of the existence of extraterrestrials and spacecraft debris found.

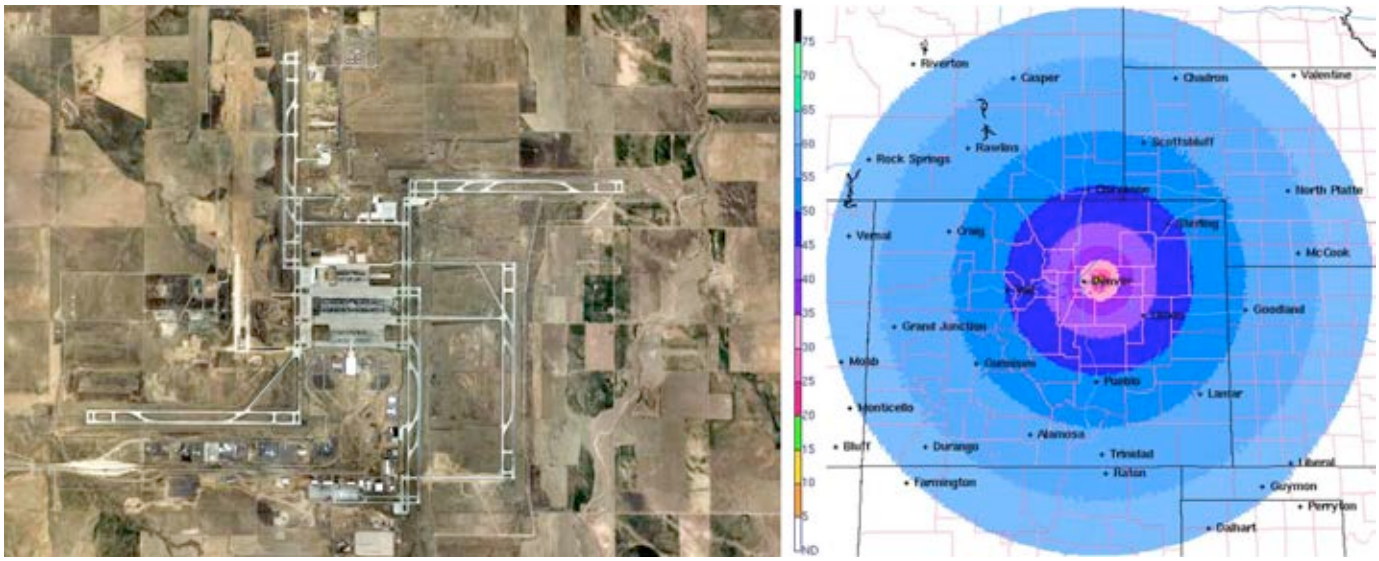
The secret tunnel entrance to the CIA's New World Order underground base is hidden behind a remote-controlled, movable rock-wall located in the side of the mountain on Going-to-the-Sun Road, shown in Skorzeny's photograph above, just north of Grizzly Peak and the Weeping Wall. In the far background the Garden Wall can be seen, and at far right is the base of Haystack Butte. The tunnel entrance (shadowed overhang circled, bottom right) was cut out of the bedrock by precision laser to prevent any possible discovery. When the base is active during the summer months, there are armed and camouflaged guards hiding on the mountainside (upper left corner) surrounding the secret tunnel entrance. The Nazi New World Order keeps its stolen holocaust trillions and stolen Tesla technology secretly hidden inside this hollowed-out mountain facility, providing access only to the New World Order elite who have shared in the mass murder for profit war scams.

According to Skorzeny, the CIA Nazis use stolen Tesla technology to create artificial “antigravity fields” around Glacier National Park, the nearby Blackfoot Indian reservation and many other locations throughout the world. There are hundreds of satellites orbiting the Earth that project high-intensity positively charged laser beams to certain areas on the Earth. The New Word Order Nazis’ use these beams not only as weapons, but also to transmit power to levitating aircraft, flying discs and various other stolen Tesla technologies below. The absorptive properties of the levitating aircraft allow their utilization of energy beamed from orbital plasma generators, optimally transmitted when the stealth aircraft are themselves plasma-cloaked for optical and radar invisibility (giving off only infrared light).

A hazardous by-product of these space-based laser beams is radon gas. Radon is said to be an invisible gas that causes cancer and leukemia in humans and animals, but if you ask the US government about radon gas you will not get a straight answer! Native Americans on the nearby Blackfoot Reservation have suffered from extremely high rates of cancer and leukemia since the 1950s. The US government says that nothing is wrong and there is no reason to be concerned, yet suffering communities must be informed of the true cause of their severe ailments. Skorzeny claims that the SR-71 Blackbird, B-2 Stealth Bomber planes and antigravity flying discs are constantly hovering just below 200’ in the skies above Glacier National Park and the Blackfoot Indian Reservation. This explains why commercial flights are forbidden to fly below 200’ in Glacier National Park; and why no one is allowed to bring firearms into the park for protection against the aggressions of the resident grizzly bears.

Skorzeny claims that there are many more secret CIA New World Order Nazi bases at other National Parks around the country, including the Grand Canyon. These planes are optically invisible and make no audible sound at all. The SR-71 et al. are periodically brought in to the secret underground hangers located in the hollowed-out mountain below Grizzly Peak on Going-to-the-Sun Road. These levitating airplanes are slowly lowered into the waters of Lake McDonald in Glacier National Park, seen above. The planes are capable of traveling underwater like submarines for short distances. Once the planes are submerged in Lake McDonald they travel to the underground/ underwater hangers inside the hollowed-out mountain. Once inside the underground hangers the planes are serviced. There is a giant

elevator inside the mountain that brings the planes up to a full-size hidden runway inside the mountain. During the night, when Going-to-the-Sun Road is closed, a large camouflaged section of the mountain is briefly opened for aircraft to exit the facility. Once the plane has left the mountain base, the secret runway bay doors are closed. Otto Skorzeny presented the photograph below, taken on August 27, 1997, describing the hidden stealth technologies active around Glacier Park's Lake McDonald. Skorzeny pointed out the flat, squared rock as being a hidden flat-panel radar array (circled), one feature among several secret installations enabling covert surveillance of the sensitive airspace.

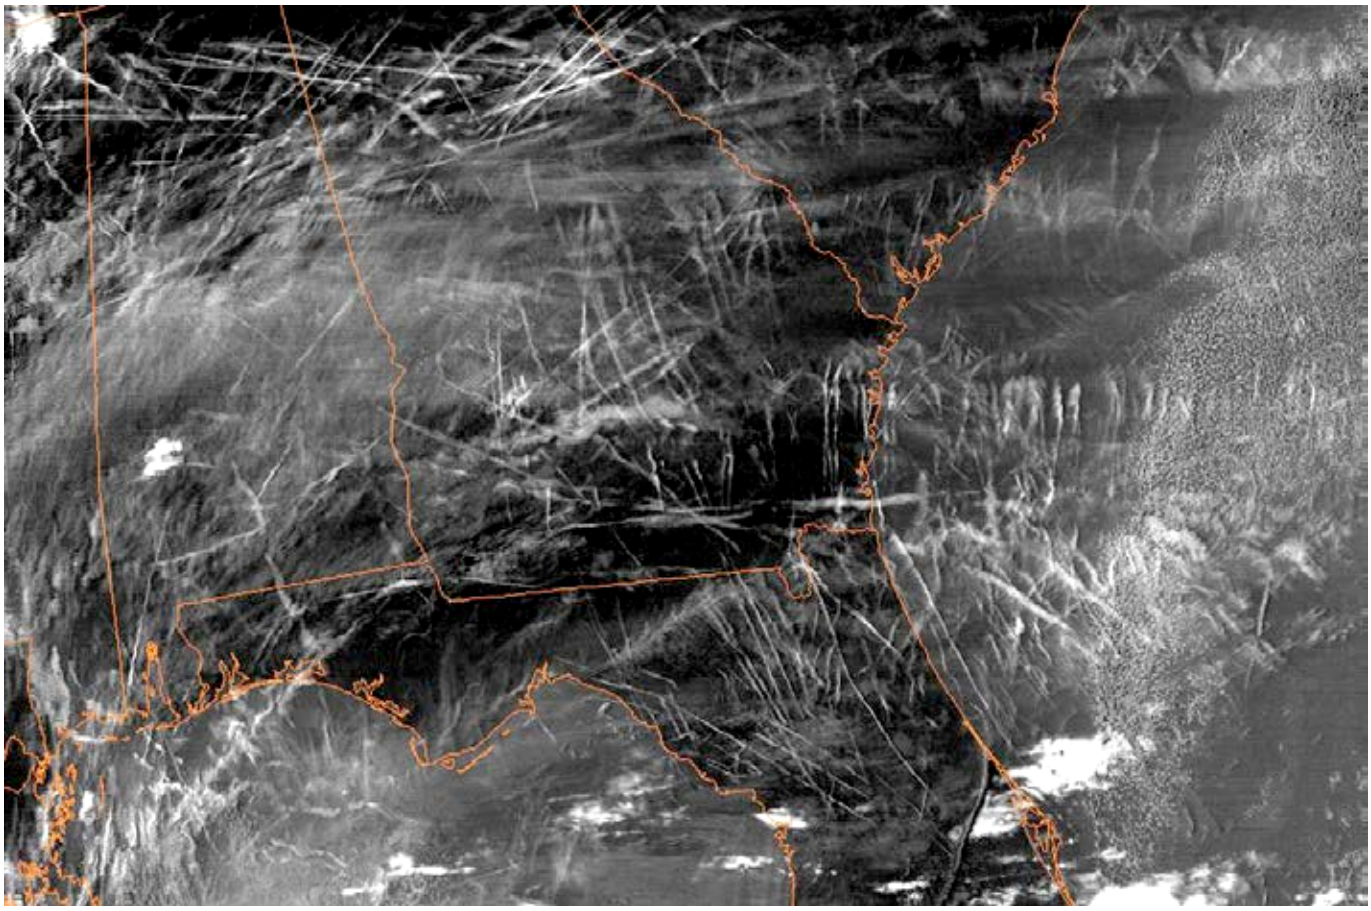


He also asserted that the disc-shaped cloud (upper left) is actually a plasma-cloaked stealth disc aircraft silently hovering above the CIA boat. Photos of cloud-enveloped discs are well known in UFO circles. The US government claims that SR-71 Blackbirds in hangers are wet because they expand and shrink while flying thereby causing condensation build-up. That line is disinformation – stealth planes spray mists of water on themselves while flying to create the illusion of optical invisibility by interaction with the electrified aircraft shell. Water vapor is used by stealth planes to disguise the aircraft in a white-colored artificial cloud that, when ignited, forms a plasma mirage envelope for complete optical cloaking. To use the words of Otto Skorzeny, "the stealth planes are like flying ozone-generators." This advanced application of HHO plasmas derived from water allows the planes to be lowered through the waters of Lake McDonald or other lakes around the US to secret underwater/underground CIA facilities.

The extensive network of Death Ray satellites in far Earth orbit are not only capable of destroying aerial or space-based targets and sending power to levitating spy planes, but can manipulate weather and world events in myriad ways. The Death Ray satellites, part of President Reagan's publicized 'Star Wars Program', are precisely coordinated with the High-frequency Active Auroral Research Program

(HAARP) antenna array located in Alaska for weather manipulation and mind control. When these lasers simultaneously aim their beams to a single point on Earth, the targeted area will then experience extremely severe weather in the form of droughts, hurricanes, tornados or Earthquakes. Spontaneous Human Combustion (SHC) occurs when these lasers are focused on the human body.

HAARP is a major Arctic facility for upper atmospheric and solar-terrestrial research built at a Department of Defense-owned site near Gakona, Alaska. Principal instruments include a high power, high-frequency phased-array radio transmitter known as the Ionospheric Research Instrument (IRI), used to stimulate small, well-defined volumes of ionosphere. HAARP also employs an ultra-high frequency Incoherent Scatter Radar (ISR), used to measure electron densities and ion temperatures, and Doppler velocities in the stimulated region and in the natural ionosphere. To further the scientific capabilities and usefulness of the IRI and ISR, HAARP is supporting the design and installation of the latest in modern geophysical research instruments, including an HF ionosonde, ELF and VLF receivers, magnetometers, riometers, LIDAR (Light Detection And Ranging) and optical and infrared spectrometers. As early as 1901, Tesla had been granted several patents for these same auroral stimulation technologies. In 1983, New World Order Reagan-appointed US Patent Examiners were bribed. Disregarding Tesla's prior patents, the Examiners illegally reissued the patent to the Eastman Corporation for the exact same HAARP technology that Tesla had invented over eighty years prior!



The mind control capabilities of ULF waves were discovered during a rash of suicides in Medford, Oregon in the early 1970s. University of North Carolina's head of toxicology Dr. David Fraser assembled a team who detected ULF waves emanating from a US Air Force Base near Medford (now closed), altering biochemistry to induce severe depression and psychological volatility in the population at large, thereby increasing regional suicide rates. The researchers questioned the base commander who implicated the Russians, then the following day the signals ceased, and later still Fraser and his team were forced into silence by death threats from several CIA agents.[12] Permanent ultra low-frequency mind control installations have been built beneath Colorado's new Denver International Airport, while Masonic dedications and symbolism adorn the entire airport with runways laid out in the pattern of a Nazi swastika clearly visible from the air (above, left). The subterranean facility below the airport has been constructed using giant wave-contoured steel beams designed specifically for the purpose of manipulating human consciousness via infrasound. On June 18, 2002 the ULF output of standing waves from the Denver Int'l Airport was of sufficient amplitude to be recorded by Doppler radar as concentric circles (at 16:33 UTC, presented above, right).[13] On February 16, 2007, infrasound resonance at the DIA shattered 13 airplane windshields.[14] Crucial facts rule out cold, wind and flying debris as possible causes - no debris was seen by any of the pilots, and the various airplanes were damaged in the air, on the DIA runway and at the terminal gates –all during a narrow timeframe.

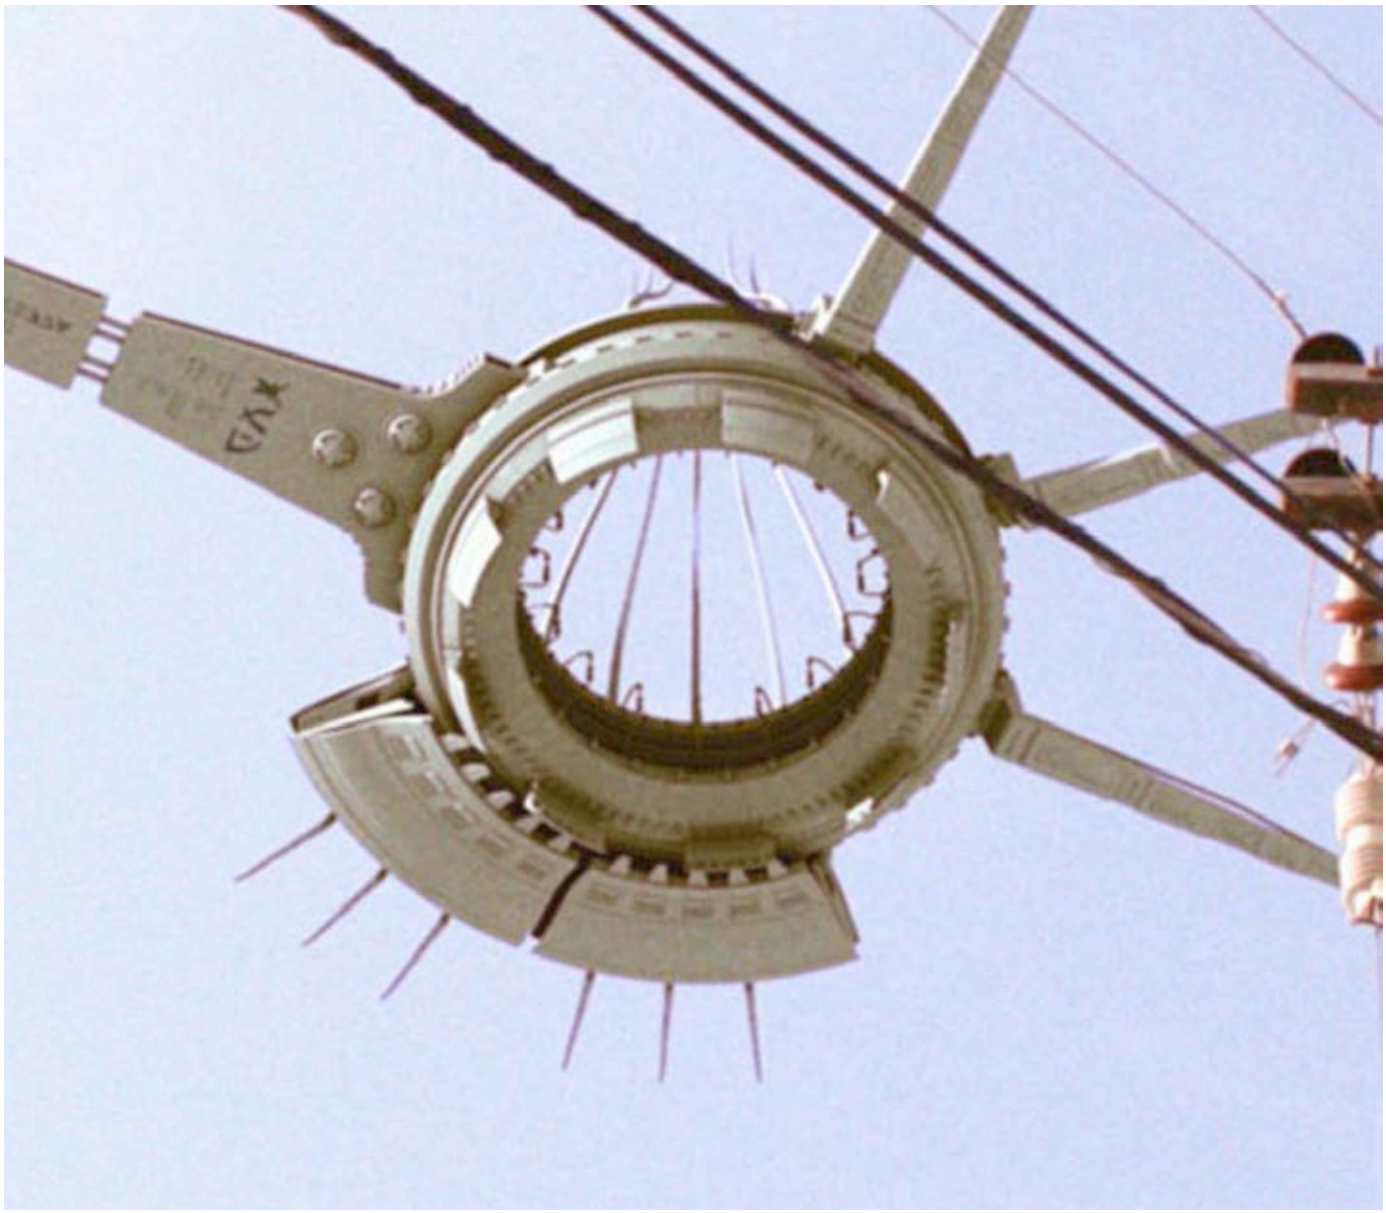
The Aurora Aircraft and 'Donuts-on-a-Rope' Contrail

The Aurora spy plane (artist's concept above) is the successor to the SR-71 Blackbird and the A-12. According to Skorzeny, the Aurora and other stealth planes become optically invisible just by pushing a button. He provided a photograph of the Aurora's unique 'donuts-on-a-rope' contrail produced by a pulse-detonation wave engine and four to six jet engines (Skorzeny's photo below). When the pulse-detonation wave engine is engaged at Mach 1.5, it further propels the craft to speeds of over Mach 6 enabling it to leave the Earth's atmosphere to release satellites or reach any target in mere minutes. The CIA uses the Aurora for surveillance and special missions, and to illegally disperse toxic particulate agents, especially barium and aluminum, in NATO airspace without public awareness. When the deadly bio-warfare agents are sprayed from the craft, a chemtrail (chemical condensation trail) is left in the sky behind the craft that, over the following several days of precipitation, falls to the ground below poisoning the wildlife and human residents in a swath widely dispersed by powerful high-altitude winds.

In clear skies a few days before large incoming storm-fronts, vast networks of chemtrails are dispersed (as seen in the 10/14/04 NASA infrared image above)[15] to facilitate CIA Nazi control. This massive, coordinated spraying effort has a two-stage effect of allowing days of enhanced atmospheric EM beam propagation conditions before the toxic aluminum and radioactive barium are brought down to expose the entire populace to high levels of radiation, nanobacteria and viri by rainfall. By this complex process of atmospheric tampering that is an act of war on every living being, the CIA causes the widely publicized 'annual flu pandemics' around the world to the benefit of the Nazi-dominated pharmaceutical industry. This drives billion dollar profits each year in neurotoxic product scams like Tamiflu et al., in addition to government contracts for toxic vaccines now even administered to children at gunpoint.

The criss-cross pattern of linking chemtrails enhances the EM atmospheric conditions to support the generation of HHO plasma by the superheating of water vapor. Airborne particulate metals enhance the effect of directed energy weapons for plasma beam propagation. Barium and aluminum powders are dispersed to photo-ionize by exposure to solar UV rays. Plasma is then generated by superheating the airborne metals using energy beamed from HAARP or any of the Tesla Ray satellites.

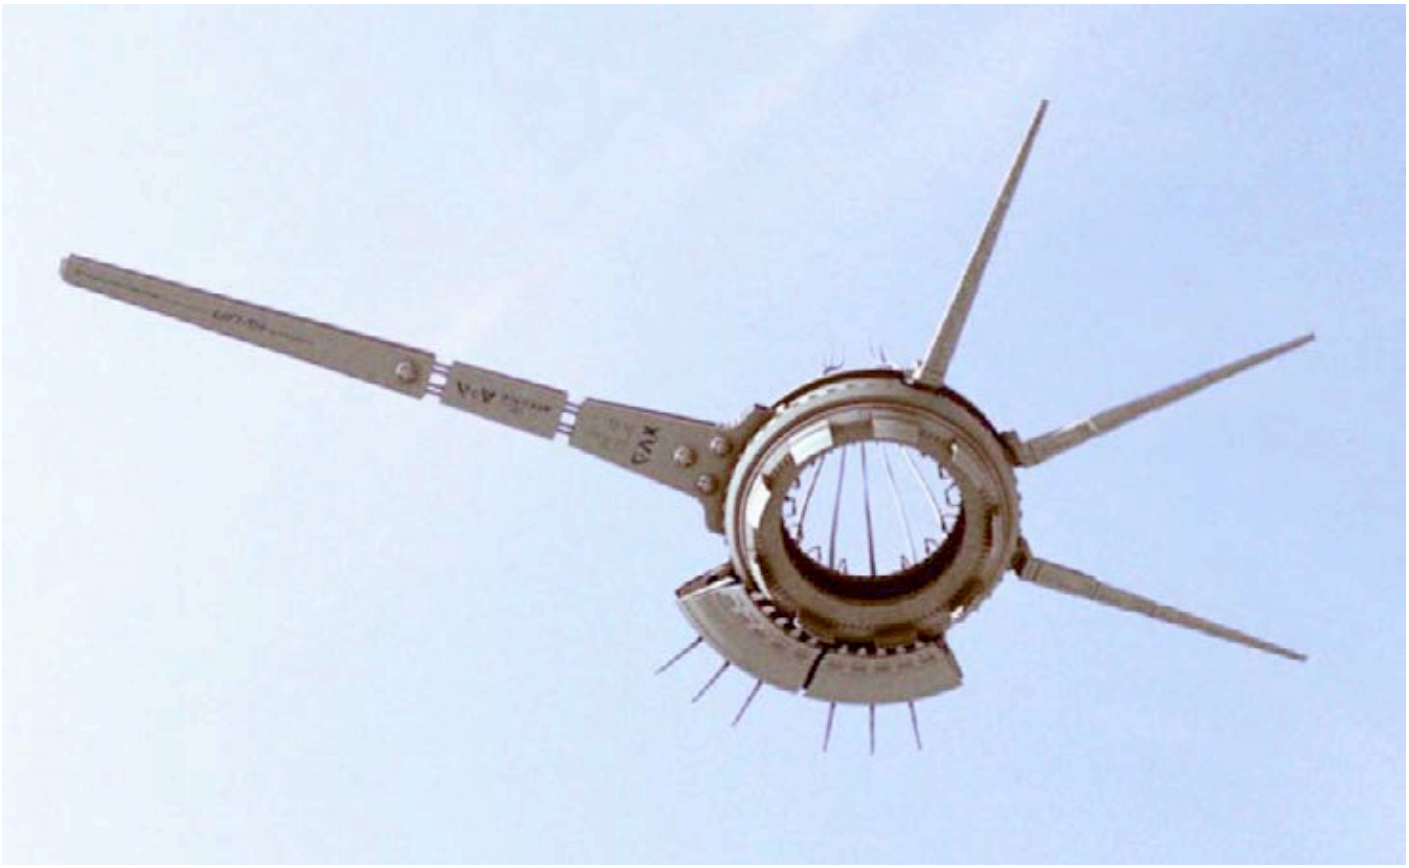
The glow of 'noctilucent clouds' is likely the effect of plasmas generated by chemtrail metals aloft in the night sky. These strange blue-glowing clouds are formed by exciting water vapor in the high atmosphere like neon gas in fluorescent light-bulbs – similar conditions are found in a vacuum tube and in the high atmosphere; the ionized metal particles bombard the water vapor, breaking molecular bonds to produce hydrogen and oxygen that ignite as HHO plasma. High-altitude water plasmas are more easily generated on a large scale using chemtrail particulate emissions in Earth's polar regions, known for auroral activity due to extremely strong electromagnetic interaction with solar emanations. The HAARP facilities are located in the northern latitudes to likewise engage the funneled solar wind input.



The secondary fallout effects of the aluminum and barium have been made clear by Dr. Robert Folk's discovery of *nanobacteria,*[16] an entirely new and abundant class of infectious bacteria that proliferates throughout our lithosphere and upper atmosphere. Now known to be the most abundant of Earth's life forms, Folk's findings have shown that nanobacteria metabolize metals, especially binding in massive numbers to the airborne aluminum and barium in chemtrails before precipitating down to the groundwater in rainstorms. After the atmospheric metals have served to propagate beam weaponry, they act as a perfect delivery system for virtually undetectable infectious nano-agents, compounding the metals' own toxicity in the human body. Toxicologists have shown that fluoride in drinking water allows aluminum particles in the body to penetrate the blood-brain barrier and interfere with neural function.[17] Research suggests that in magnesium-deficient persons (90% of Americans), particulate aluminum is stored in the central nervous system replacing natural magnesium, resulting in the inactivation of tubulin, an enzyme crucial to nerve function. Magnesium malate is a dietary supplement that effectively blocks aluminum poisoning as it removes aluminum from the body by chelation via malic acid, while providing natural dietary magnesium. The New World Order mind-control machine will falter when the American people bring and end to the Nazi water fluoridation and toxic chemtrail policies.

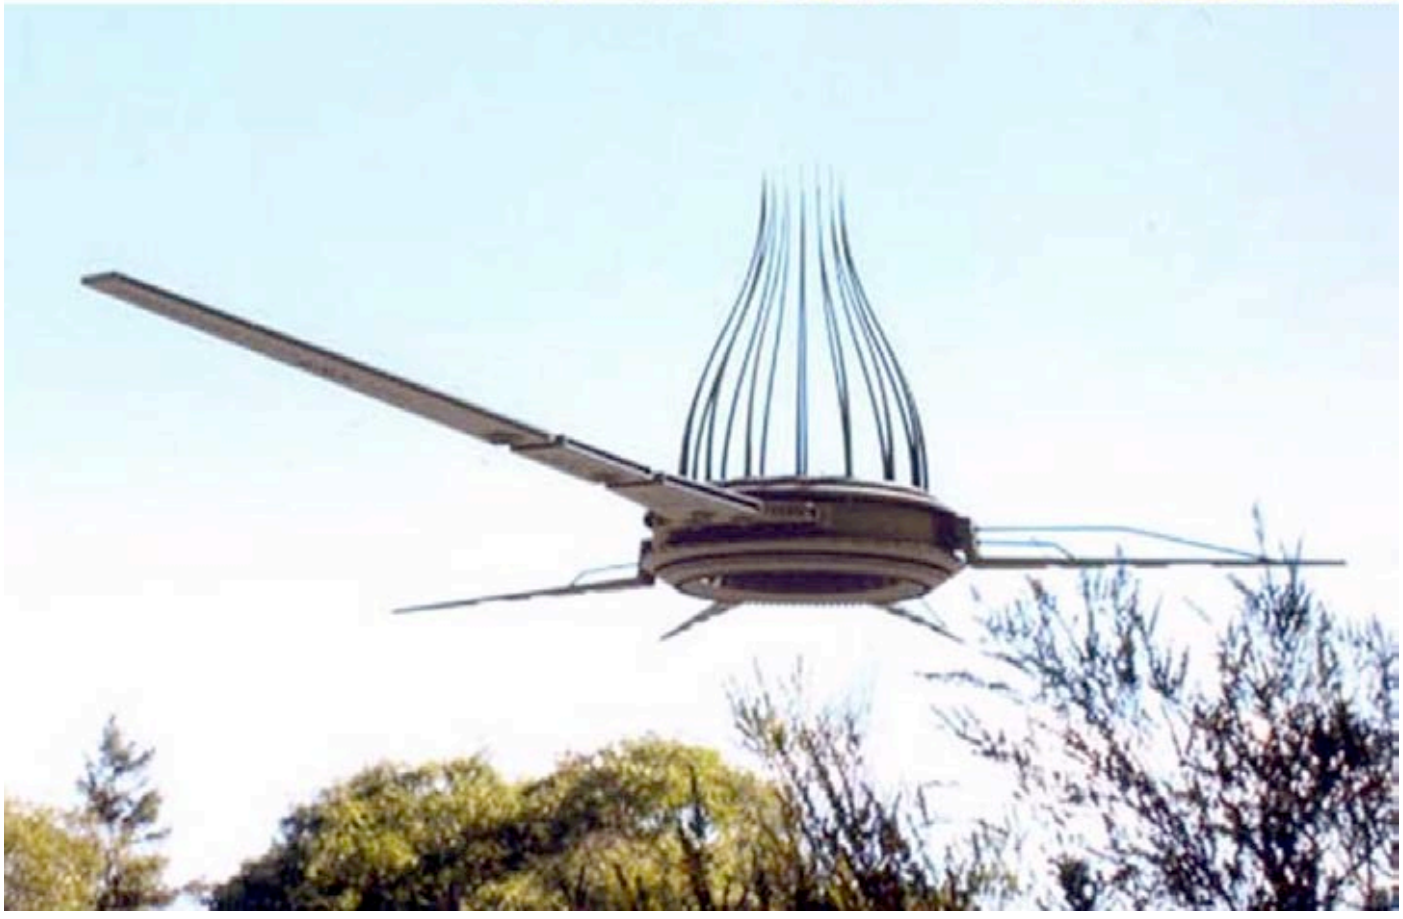
Invisible CIA Surveillance Drones from US National Parks

Otto Skorzeny's information regarding the extensive use of US national parks by the CIA in clandestine underground facilities is corroborated by public photography of advanced levitating surveillance drones over Federal and State forests. Several modular variations of hovering drones with circular hubs and radial spines have been photographed as early as 1985, near Barksdale AFB, Louisiana. Subsequent public photographs of the antigravitic drones also surfaced in Birmingham, Alabama and areas of California in 2007 including Bakersfield, Big Basin, Capitola, Northridge, and Lake Tahoe.[18] Just as chemtrails invade all NATO countries, CIA surveillance drones have also been photographed in the UK, Netherlands, Italy, Argentina, and other NATO countries where they patrol in great numbers.

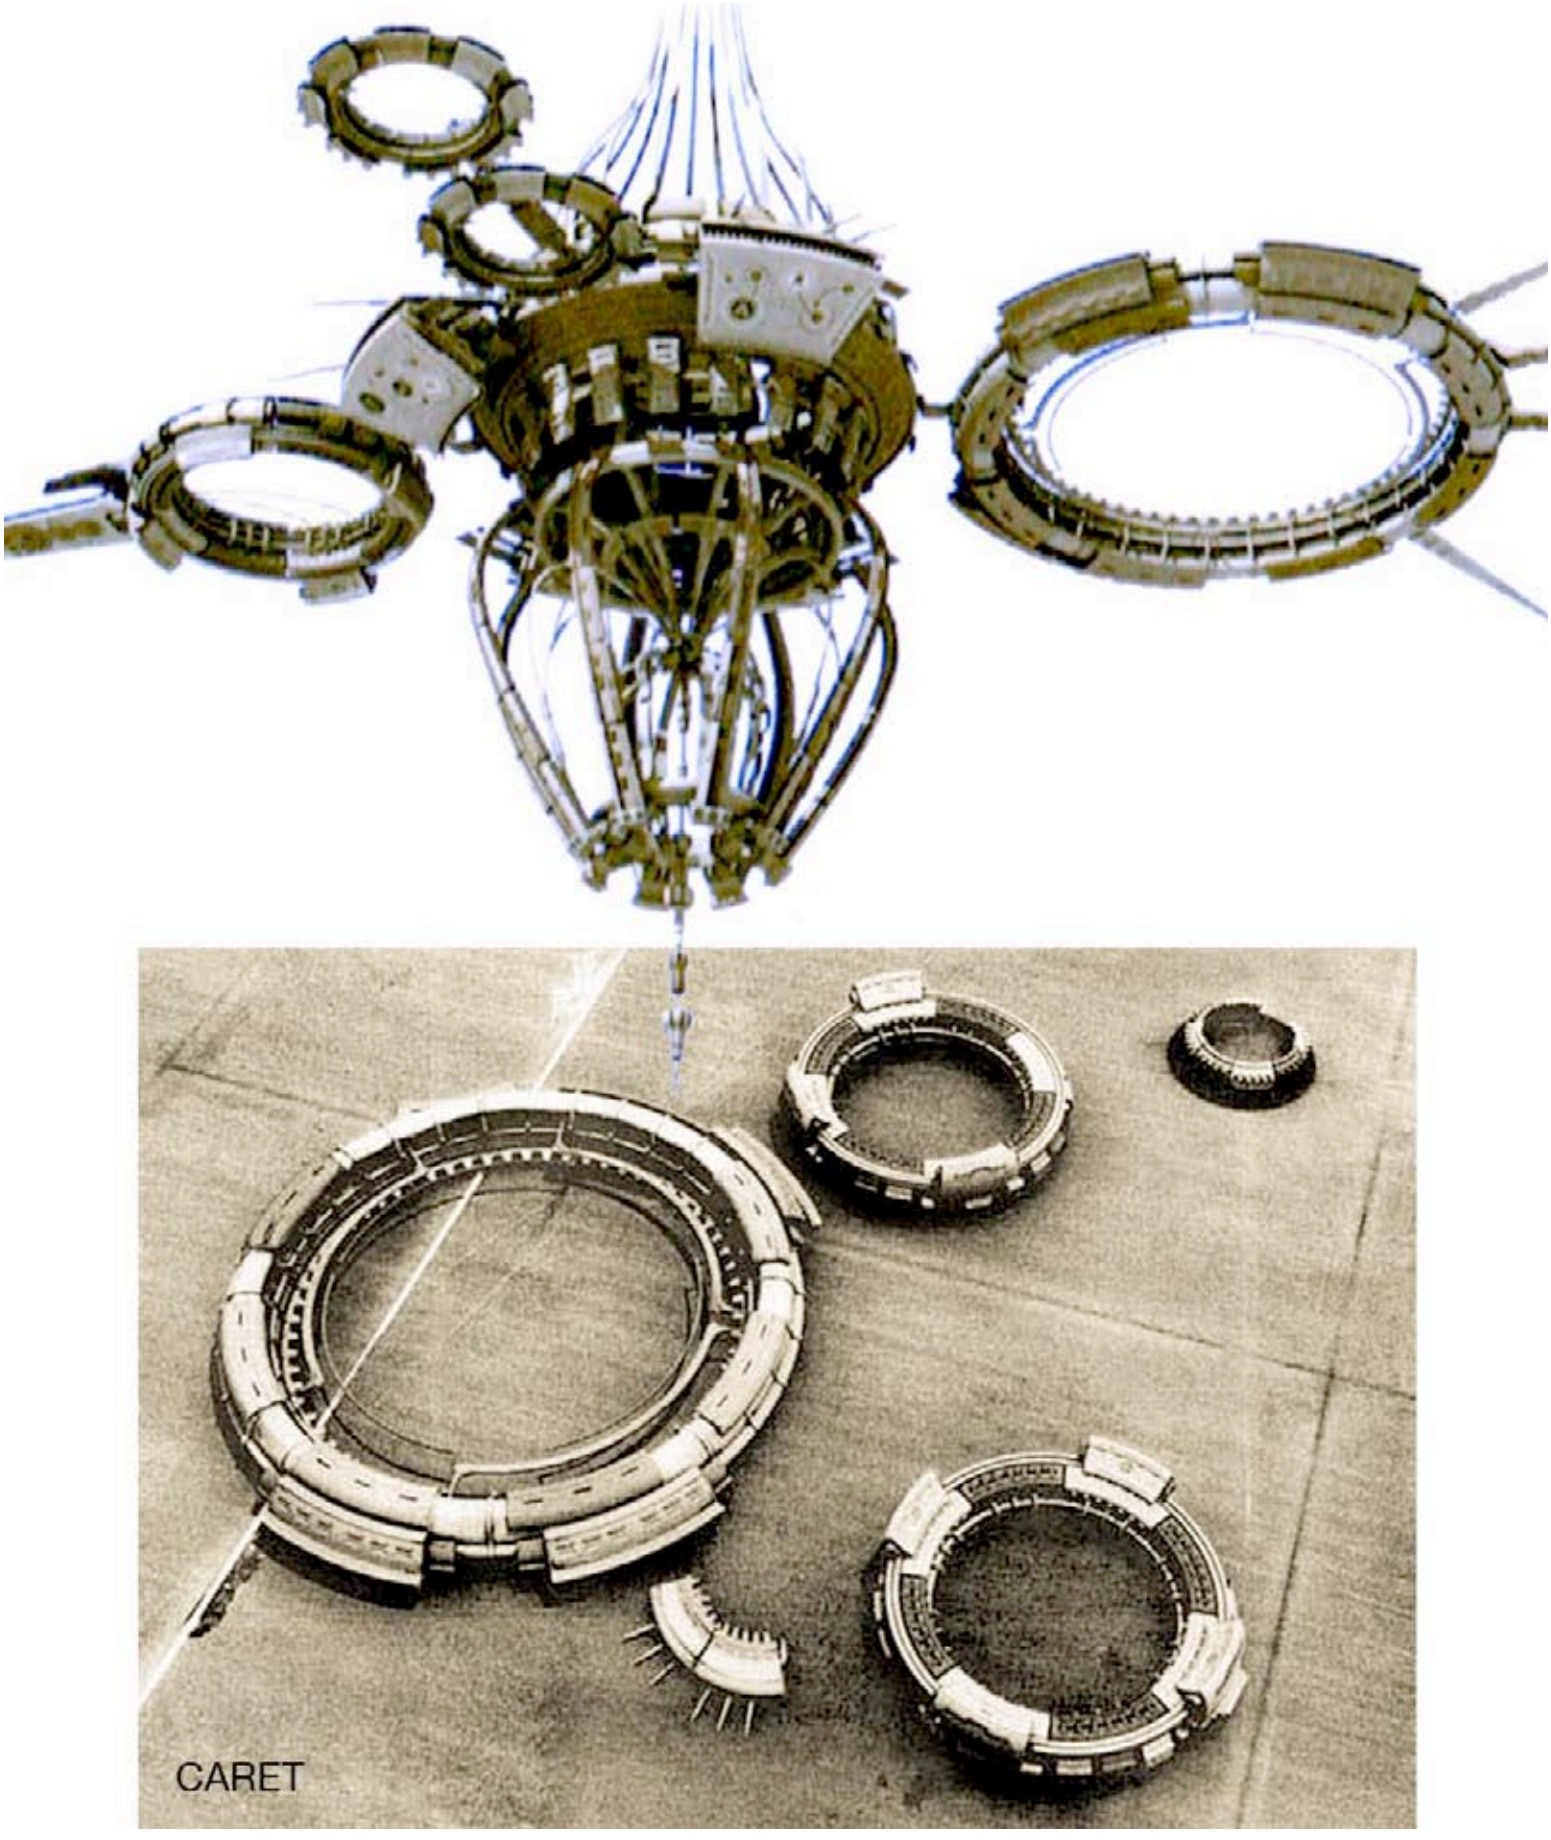


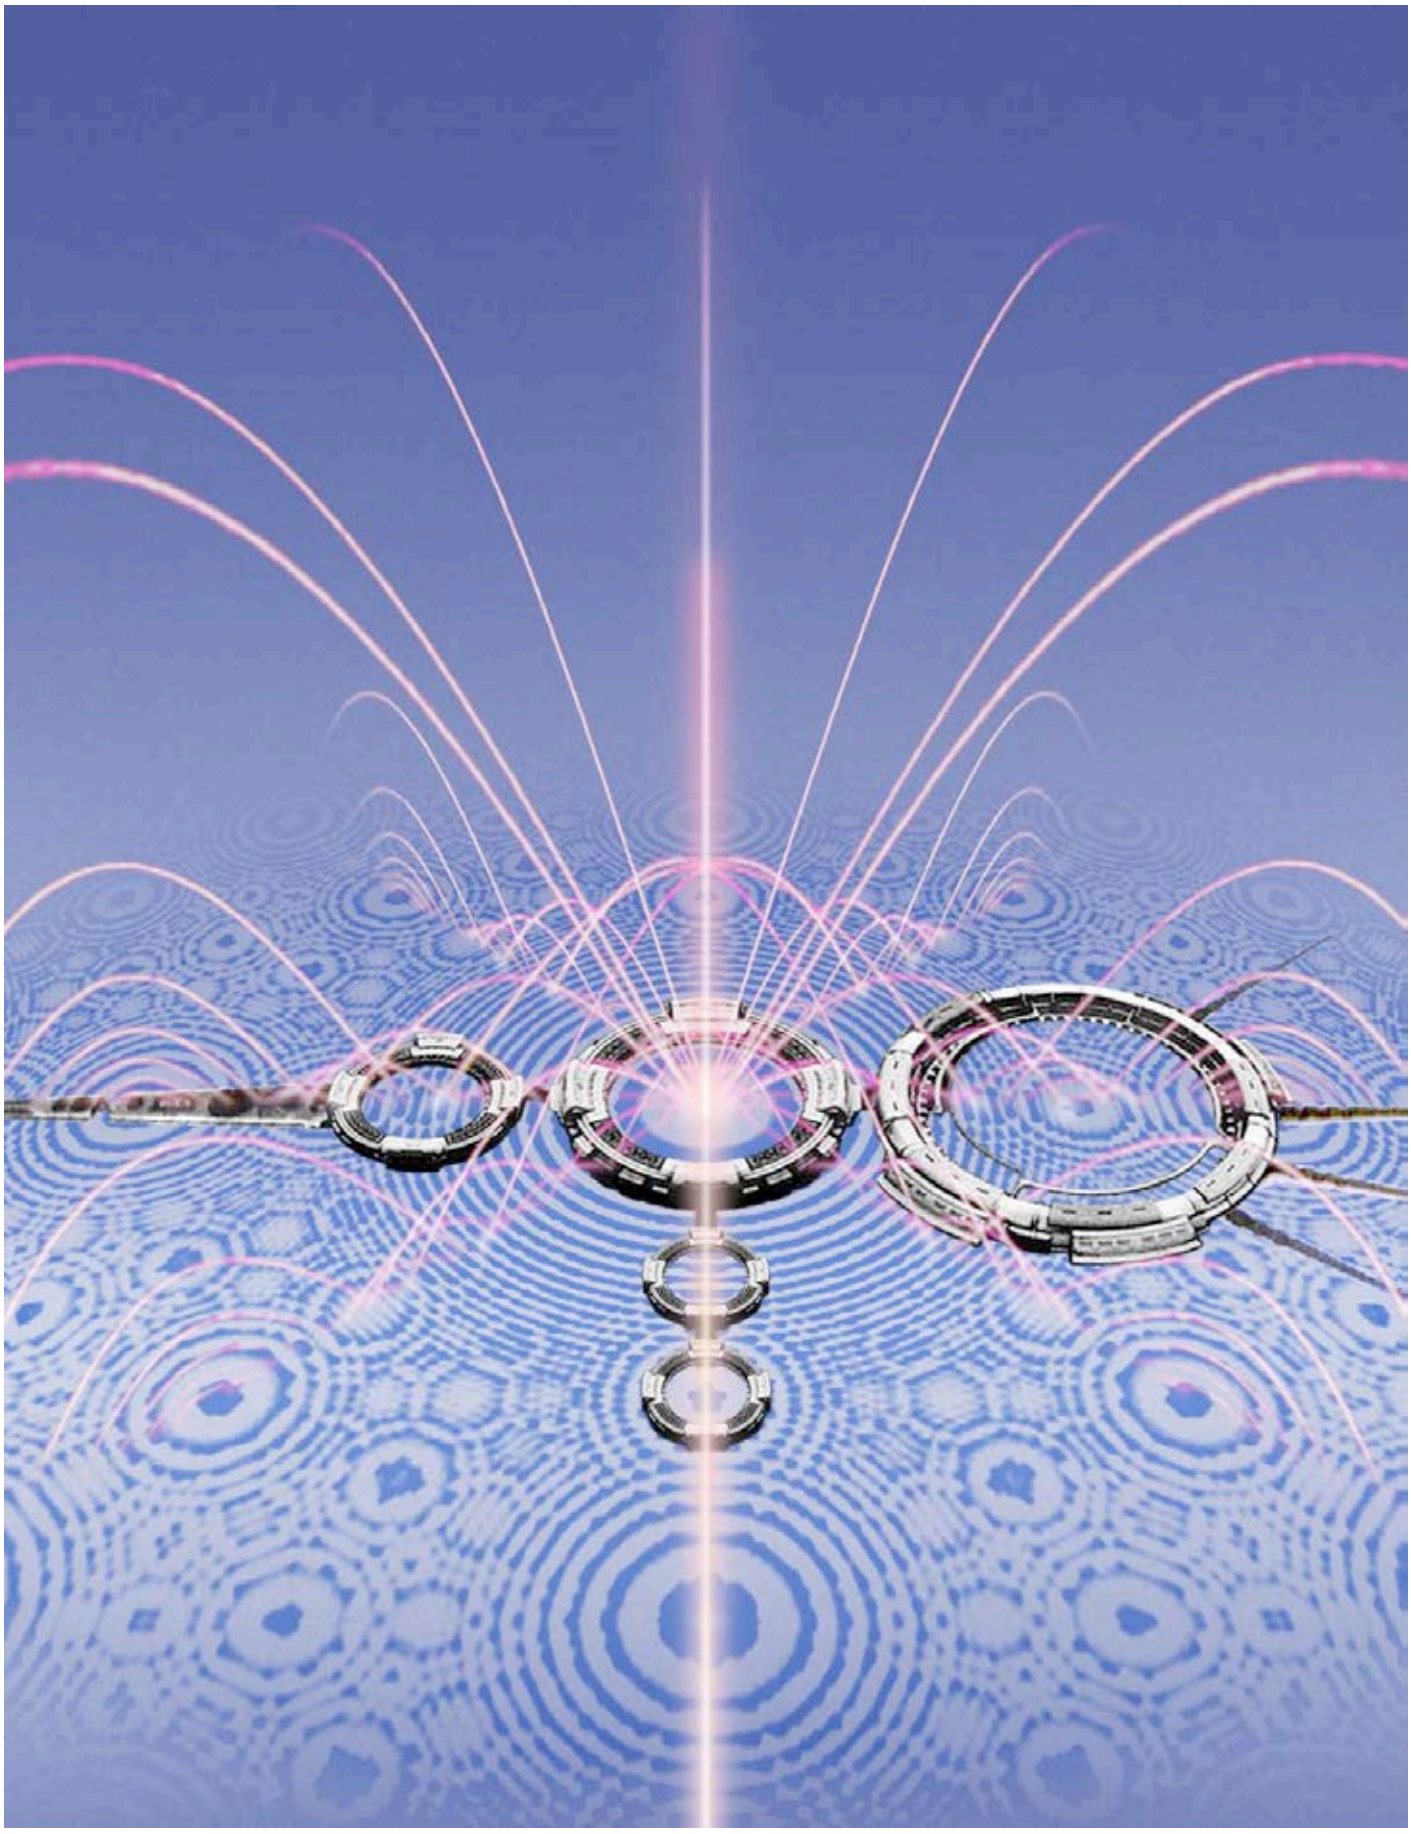
These usually invisible surveillance drones are deployed and remote-controlled by operators in various secret underground Nazi CIA bases in US national parks, easily collecting data on all activities 'off the grid'. *Fake 'alien scripts' decorate the drones to disguise the crafts' CIA origins in the event of partial malfunction or crash,* by misleading observers toward the conclusion that the odd craft is an alien visitor to Earth. Temporary failure of the drone's EM-generated HHO plasma invisibility cloak allows it to be briefly seen by the public and photographed, before vanishing only seconds later.

Malfunctioning drones have surprised eyewitness photographers over both rural and urban residential areas, suggesting that CIA video surveillance of American citizens has been a regular task of these invisible plasma-cloaked drones for many years. Having been described in a few cases as hovering, slowly rotating and counter-rotating before rapidly flying away at low altitude, one would imagine that the drone's remote operator may not have known that the plasma-cloaking of the drone had failed until the individuals under surveillance stared upward. Several photographs have been taken showing the drones uncloaked near utility poles and power lines, suggesting that the drones resonantly recharge themselves from available electromagnetic fields surrounding elevated power lines (above)[19] before being able to regenerate the HHO plasma cloak and instantaneously disappear. Events of drone cloaking failure are on the rise with the intensifying electromagnetic planetary changes.

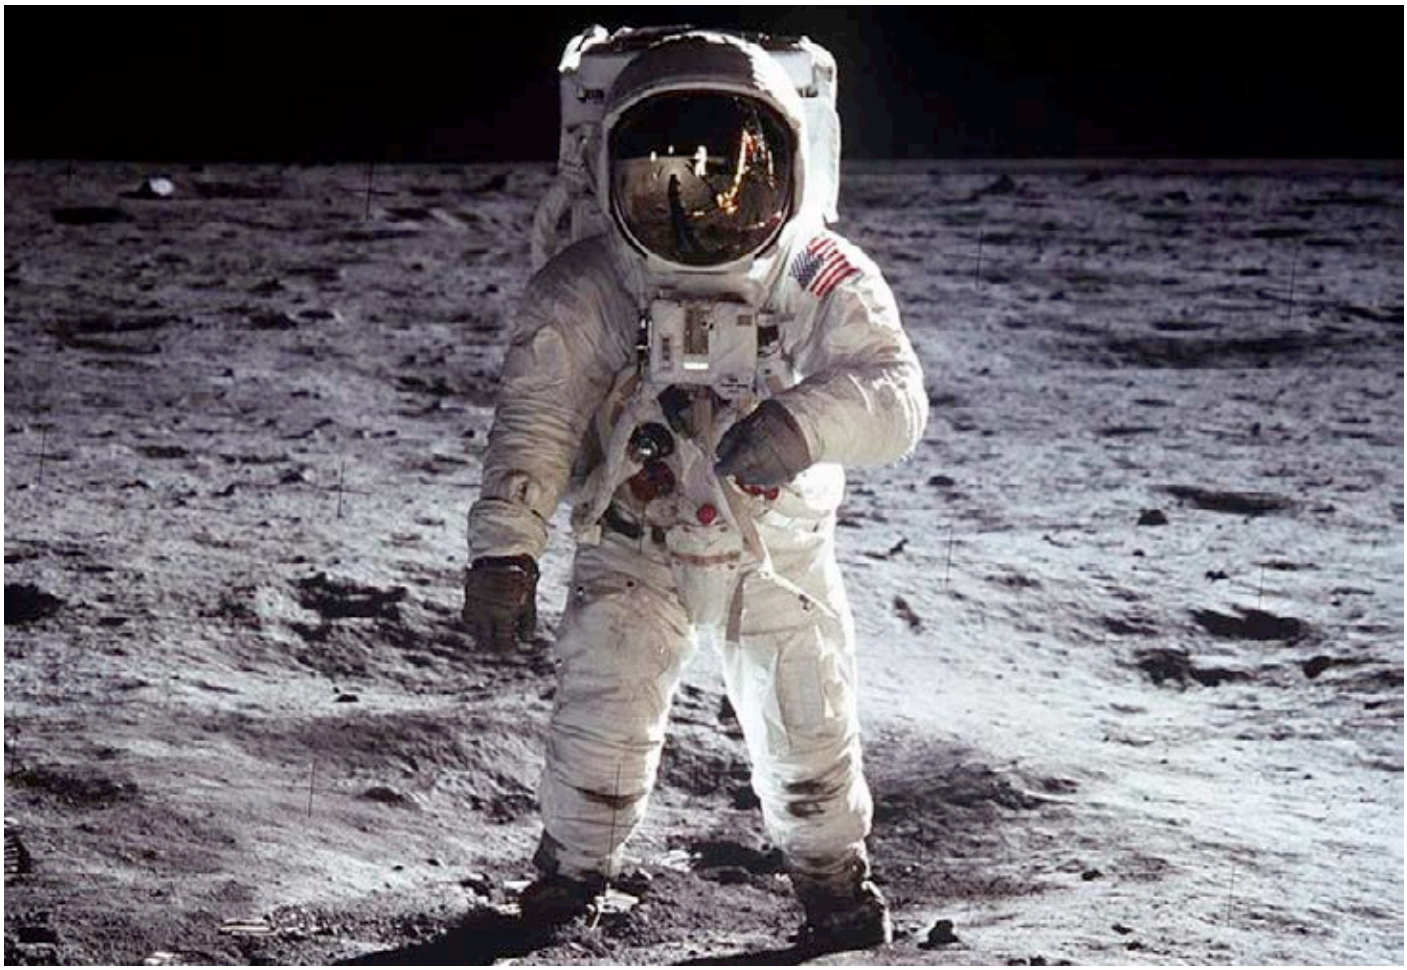


According to Skorzeny, the CIA has covertly augmented natural caves by excavating vast chambers and interconnecting tunnel networks to create thousands of acres of hidden industrial space below ground – *at the expense of the American taxpayer*. They use this space to manufacture the most high-grade marijuana, opium, cocaine and hash in the world and house hundreds of methamphetamine and 'ecstasy' laboratories. CIA narcotic products are trucked out of the subterranean installations in unmarked white trucks and transported to a hub facility to sell directly to the public. The 'Aryan hate brotherhood' then funnels the drug profits back to its Nazi leadership. The CIA maintains its narcotics monopoly by developing extensive bribery networks; constantly laundering drug money while it legally prosecutes competitors, thereby maintaining the illusion of a functional American justice system.

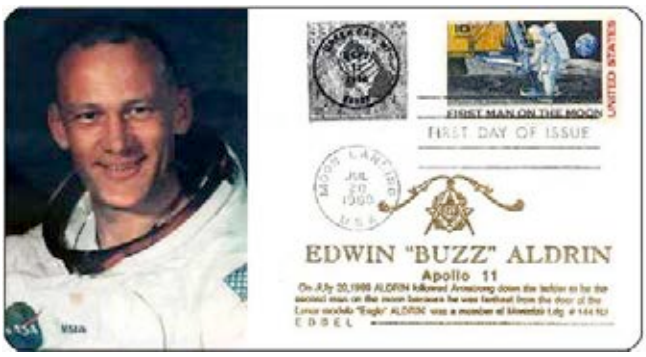




Patrolling Nazi/CIA stealth surveillance drones have been photographed in several different modular configurations over the years – *all presenting geometric variations based on the same Fibonacci-ordered standing waves observed in crop circle formations made famous in England – serially reiterating the quadratic function [* $z_{n+1} = z_n^2$ *].* The drone photographs from Big Basin, California included several stunning images of a large array of conjoined circular units spanning over 16' in diameter (above, p. 41).



While *genuine crop formations are created by conscious orbs of HHO plasma*, Skorzeny stated that the CIA drones use Tesla's acoustic levitation technology with stealth invisibility cloaking using HHO plasma, seen as a fine pink/blue haze surrounding the many thin heating elements when the cloak is deactivated. The CIA goal of obfuscation of the entire crop circle phenomena is orchestrated *because the geometric messages contained within the circles openly provides humanity with the unified key to acoustic levitation and HHO plasma technology – the exact same key that Skorzeny, Gehlen and Scherf had stolen from Nikola Tesla in 1943.* Photographs of drone components were released in a disinformation cover-up operation executed in 2007 through a CIA front-company called Commercial Applications Research for Extraterrestrial Technology (CARET) in Palo Alto, California that alleges deciphering the craft's 'alien language' (below, p. 41).[20] The magnetic resonance maps produced by this author in 2003 reveal the field of standing wave resonance generated by the CIA drones for levitation, after Tesla's design (p. 42).



CARET

While discussing the US government conspiracy, I asked Skorzeny about the Apollo moon landing. He laughed and said that the US had never successfully landed a man on the moon, but had only orbited the Earth. This assertion directly supports what many researchers had already exposed by analysis of NASA's forged moon landing photographs.[21] The astronauts were photographed and filmed on a giant lunar mock-up in Houston prior to their televised orbit. The use of bright spotlights to simulate sunlight is obvious when the surface of the actual moon is evenly lit by harsh sunlight producing long, parallel shadows. The above image of astronaut Aldrin is rife with lighting inconsistencies in addition to unaccounted-for objects in the helmet reflections. NASA's falsified studio-produced motion films are even more disastrous special-effects failures. Most Apollo astronauts were selected members of the Masonic Order cult; loyal agents of deception commemorated in the *'Masons on the Moon'* postcard series by the Masonic Stamp Club of New York (below).[22] The Apollo 11 astronauts may have been hypnotically programmed with false memories of a moon landing scenario before and/or after the actual space mission which never left Earth orbit as was claimed.

Skorzeny also claims that Tesla left a “surprise” for them on the moon that has prevented all attempts at a moon landing by the US and Russia, who have not yet been able to figure out this “surprise”. He speculated that Nikola Tesla had built a fleet of disc-shaped invisible spacecraft that were protecting the moon’s surface by their plasma shielding. Plasma-cloaked aerial vehicles are only invisible to the human eye, but the strong heat signature of the cloaked object is inevitably detectable by infrared. By this means it can be established that Skorzeny had incorrectly assumed Tesla to be the source of this lunar EM shielding, that is actually generated by giant artificial constructions on the moon’s dark side, as seen in secret NASA photographs that were “retouched” before public release as disinformation.

I asked Skorzeny why he informed on his lifelong hate crime syndicate ‘brothers’. Were they not successful deceptive agents who enjoyed the bounty of a New World Order between themselves? Otto confided that his becoming an informant on the lifelong activities of his Nazi hate group was an act of vengeance directed at revealing the true German identity of ‘George H.W. Bush, Sr.’ in retaliation for personally defrauding him on more than one occasion. Deceit is all consuming and cannot be compartmentalized. Greed also knows no bounds; agents of deception cannot be trusted by their own kind, who know better –ensuring that deceitful alliances inevitably go sour with the advance of ripe old age.

While Otto described his resentment of repeated acts of extortion by George Scherf Jr., journalist Don Nicoloff sites one particularly massive and highly contentious coordinated theft involving a $100 million gift to Skorzeny from his secret former lover Eva Peron, inherited upon her death on July 26, 1952:

> Further research about the life of Otto Skorzeny, “master spy,” reveals his little-known affair with Eva (*Evita*) Marie Duarte de Peron, wife of Argentina’s President, Juan Domingo Peron. Gold which was stolen by the Nazis (*laundered by Swiss banks and the Vatican, then smuggled to Argentina by Admiral Wilhelm Canaris*) had accrued enormous interest after World War II, and upon her death, Eva Peron bequeathed Skorzeny $100 million, which ultimately fell into the hands of the CIA. The Nazi-CIA connection to the money was obvious. Based upon Skorzeny’s claims, this money probably fell into the hands of George H.W. Bush and his “handlers.” [23]

Skorzeny told of his key role with Reinhard Gehlen behind the Rockefeller and Bush family cabal in orchestrating the decades-long setup for the illegal Nazi seizure and control of the United States of America by bribing Supreme Court Judges and installing fraudulent election software to rig the 2000 and 2004 US Presidential elections. David Rockefeller bribed a Supreme Court Justice in a series of Chase Manhattan Bank transfers totaling over $7.5 million, as exposed by ex-CIA physician Sue Arrigo.[24] The Nazi stealth take-over of America allowed the CIA-Mossad planning of the 9/11 events coordinated by Vice President Cheney and Pentagon Comptroller Rabbi Dov Zakheim. Vast libraries of incriminating CIA documents were purged in the World Trade Center demolition false-flag operation.

Secret Nazi Brotherhood Identities Unveiled

According to co-founder Otto Skorzeny, the 'Brotherhood of Aryan Nations' hate syndicate is comprised of old Nazi CIA agents including himself, Adolf Hitler, George H. Scherf Jr., Martin Bormann, Reinhard Gehlen, Walther Rauff, Alois Brunner, Joseph Mengele and August Hirt. Neighbors for many years in Boynton Beach, Florida, Hirt apparently died in 2001 after Skorzeny had himself died in 1999. All of the other members of the Nazi espionage ring are still alive, after being reunified in the US decades ago, glorifying themselves by hate crime as the CIA coordinates their lucrative organized crime operations including international narcotics and arms production and trafficking, child sex slave trafficking, torture and 'snuff' filmmaking. *Before his death, Otto Skorzeny had explicitly revealed the false identities, current US addresses and telephone numbers of the Nazi Brotherhood's elite members*:

Adolf Hitler (b.1889)
faked suicide on 4/30/1945
alias William Coates
wife Eva Braun, alias unknown
Bethesda, MD residence

George Scherf, Sr. (1895-1972)
alias Prescott Sheldon Bush
Financial secretary of Nikola Tesla
CEO Brown Brothers Harriman
Union Banking Corporation treason
Senator of Connecticut

Reinhard Gehlen (b.1919)
Director of German BND, DVD
faked death 6/8/1979
alias Henry "Hank" V. Janowicz
31 Rumana Rd, Wayne, NJ 07470
tel: (973) 696-6599

Walther Rauff (b.1908)
faked death 5/14/1984
alias George Pfaff
175 Georgetown Woods Drive
Youngsville, NC 27596-7622
tel: (919) 556-0467

Joseph Mengele (b.1917)
faked death 2/7/1979, falsified DNA
alias Steven T. Rabel
3688 East Ibis Cove Court
Hernando, FL 34442
tel: (352) 560-0260

Martin Bormann (b.1920)
faked death 5/2/1945, falsified DNA
alias Edward Kobylarz
204 Creekview Road
New Bern, NC 28562-9181
tel: (252) 633-7947

George H. Scherf, Jr. (b.1924)
alias George Herbert Walker Bush
CIA Director, 41st US President
wife Barbara Pierce Bush
Walker's Point, Kennebunkport, MN

Otto Skorzeny (1908-1999)
faked death 7/6/1975
alias Edward Frank Pyzyna
wife Frances P. Pyzyna, alias
638 4th Avenue
Boynton Beach, FL 33426
tel: (561) 732-6634

Alois Brunner (b.1912)
alias Fred E. Kobylarz
wife Dorothy C. Kobylarz
24 Valley View Drive
Farmington, CT 06032
tel: (860) 677-4245

August Hirt (1898-2001)
faked suicide 6/2/1945
alias Frank Hirt
Skorzeny's neighbor on 4th Ave
Boynton Beach, FL 33426

Skorzeny provided dozens of group photographs exposing social events in the lives of his elite Nazi espionage ring. The Scherf home photograph (alleged by Skorzeny to have been taken c.1938) is presented above, labeled with surnames for comparison with the Nazi Christmas group photo below from the same time period, likewise labeled. Mengele appears to be wearing the same necktie in both photographs. These two photographs provide coherent visual confirmation of the true German identities and fraternal closeness of the Nazi elite that was developed among these core members of the 'Aryan Brotherhood' by Adolf Hitler's deeply seated hate rhetoric and its consuming psychopathy.

A rare 1942 photo[25] (above) shows Adolf Hitler with personal guard and special agent Otto Skorzeny just months before Hitler ordered the murder of Nikola Tesla by Skorzeny and Gehlen, as orchestrated by George Scherf, Jr. at the OSS. One of Adolf's most trusted agents; Skorzeny would later betray that trust in the final years of both of their lives. Contradicting the mountain of CIA-written false histories, Otto Skorzeny gave his personal first-hand account of the final events of World War II, including the revelation that Adolf Hitler did not commit suicide! As the Russian tanks were overtaking Berlin, Skorzeny executed one of Hitler's doubles in an attempt to fake Hitler's suicide before going into hiding. Hitler's personal SS Nazi pilot Hanna Reitsch flew a Fieseler-156c 'Storch' disguised as a Red Cross

relief plane to ‘Der Führer’ bunker, picked up Hitler and Skorzeny and flew them out of danger to Salzburg, Austria. Once Hitler was safely hidden away by the Vatican, Skorzeny turned himself in to the Americans, as planned, to be released later by George Scherf, Jr. of the OSS. Otto also presented a photograph taken at McDonald Lodge in Glacier National Park on August 27, 1997 (shown in detail above). Clearly seen at right is Otto himself, alias ‘Big’ Ed Pyzyna, standing with a cane next to his long-time wife ‘Frances’ (at center). Skorzeny emphasized that the sunburned man wearing a hat (partially cropped out at the lower left corner) is, in fact, Adolf Hitler at the age of 107. Skorzeny also confirmed that this was the only existing photograph of Hitler since the faked 1945 suicide.

Hitler has a deformed left ear that had been surgically altered, as well as two round crater indentations above one another on his left cheek, as seen in the 1997 photograph. The seated man's very narrow shoulders and short neck also support Skorzeny's statements. Having been a personal bodyguard and Hitler's elite special agent who safeguarded the flight of both Mussolini and Hitler from their countries on separate occasions in the aftermath of World War II, Skorzeny's personal testimony and photographic evidence must be brought to bear. Otto Skorzeny named Bethesda, Maryland as the location of Adolf Hitler's residence in the US, in addition to living in secure US military bases and underground Nazi CIA facilities. Further evidence corroborating Skorzeny's assertions has surfaced not far from the Bethesda area during investigations of a corporate torture case in Monaca, Pennsylvania, involving the mind control torture of numerous employees. Among those torture victims are two individuals, likely twins, who may be the children of Adolf Hitler:

> A former labor attorney for Atlantic Richfield Co., David E. Rosenbaum conducted a nine-year investigation (1983-1992) concerning allegations of physical torture and coercive conditioning of numerous employees at an ARCO plant in Monaca, PA. His clients, Jerry L. Dotey and Ann White, were victims of apparent radiation exposure; but as Mr. Rosenbaum probed deeper in the subsequent interview sessions, a "Pandora's Box" was unveiled. His most astonishing conclusion was that Jerry Dotey and Ann White were likely the offspring of Adolf Hitler, based in part on the uncanny resemblance from photos (facial features; bone structure and size were taken into consideration). Rosenbaum also states, "They both exhibit feelings and experiences that indicate they are twins." Dotey and White were allegedly subjected to torture of many kinds while under drug induced hypnosis, with each one undergoing at least three training techniques by plant physicians. Each victim was trained to enter into a hypnotic state upon the occurrence of specific stimuli, usually involving a "cue" word or phrase and trained to "remember to forget" what transpired in the hypnotic state. They were repeatedly subjected to identical stimulus-response sequence, to produce nearly automatic reactions to the particular status. MKULTRA veterans Dr. Bernard Diamond, Dr. Martin Orne and Dr. Josef Mengele regularly visited the ARCO plant, according to Rosenbaum. The special conditioning of Dotey and White was intended for the artificial creation of dual [English and] German personalities. Rosenbaum, who is Jewish, has maintained a deep friendship with the two, despite the seemingly precarious circumstances.[26]

The serial torture and enslavement described by former ACRO employees is exactly corroborated by the accounts of Otto Skorzeny, who himself was one of Hitler's elite youth espionage corps that installed the network of corporate cover positions for Nazi mind control research to be directly continued from where it left off in the Third Reich's death-camps. The regimented use of fear, trauma, electric shock and hypnosis in mind control programming has been institutionalized by men who are themselves victims of horrid abuse, in Adolf Hitler's case by his father Alois.[27] Joseph Mengele (at left, with wife and child) was employed for years using the false American alias Steven Rabel, a 'laboratory technician' for CIA front companies including ARCO and W.R. Grace Company. The pervasive network of Nazi CIA torture operations extends well below ground, in literally hundreds of giant subterranean facilities. These various rock-hewn complexes house advanced technologies engineered from prototypes stolen from Dr. Nikola Tesla after Skorzeny had taken his life by asphyxiation.

The CIA ‘Oracle’

The CIA ‘Oracle’

Out of the darkness of US government black projects shines a brilliant light that has become a beacon of truth to guide a traumatized and fearful nation toward the path of health, peace and compassion. *She is a seer* –a clairvoyant medium used primarily by successive CIA Directors, operating covertly under the codename ‘Oracle’. She has lived a double life against her will; as the foremost Remote Viewer for the CIA living under constant torture and the threat of death, and as a California physician residing in Costa Mesa and San Diego. Sue Ann Arrigo (b.1954) was a licensed California Medical Doctor[1] with specialized training in nephrology until leaving her CIA-cover life in 2006 in a successful move to publicize her detailed insider knowledge to avert the planned global nuclear war by ‘pre-emptive strike’.

Dr. Arrigo’s profound perspective has been developed during her forty years of experience as a Remote Viewer involved in many of the most crucial and most sensitive post-WWII US government projects *since the age of nine,* as a mind-controlled product of the CIA subproject MKULTRA II. Arrigo’s unique mental abilities have preserved her life through the most lethal and sadistic US government experiments and forced international espionage work. Her compelling writings present a true breadth of knowledge and a purity of heart that informs her very spiritual ethics. Dr. Arrigo’s detailed scientific explanations of the holographic mind-state quite convincingly support her astounding personal history.

Lieutenant Colonel Joseph Arrigo, Sue’s father, was an Army officer during WWI whose family was targeted for MKULTRA II operations being conducted in the late 1950s at the Presidio Army base in San Francisco, California (aerial view, following page) and elsewhere in the Bay Area to this day:

> The main architect of the Bush administration’s legal policy, lawyer John Yoo, stated publicly that the US administration reserves the right to torture innocent children by crushing their testicles in the “War on Terror”.[2] The children are being tortured routinely. That is why the US administration reserves the right to torture innocent children. If we do not protect American children from such tortures, we are traitors to our country. The following are excerpts from "Mind Control Torture Survivor at the Presidio Pre-School” (myself):
>
> My own enslavement started at age three at the San Francisco Presidio Army base where my father Lieutenant Colonel Joseph Arrigo was stationed. Children were trained [for CIA espionage] starting quite early in life because scientific research showed that children are most naturally violent, not as teenagers but between ages two–four… That Army base’s pre-school was one of at least three later found to be under the control of US military Satanists. A Defense Intelligence Psychological Operations officer Colonel Michael Aquino, a self-proclaimed Satanist, was charged with sexually abusing children at the Presidio pre-school and there was extensive pornographic evidence of that. However, the case evaporated after it hit the newspapers and the courts for unknown reasons.
>
> I sat down and quietly drew with crayons long straight lines of color, even, and orderly. The lady came by and asked me what I was drawing. I looked up at her to see if it was safe to tell her what the picture was, and frowned. I wanted to cry but couldn’t. I knew that I would be beaten by my father if I told her. I could feel the chill of fear up my spine. So I lied and said that they were just colored lines. I never told anyone the truth… [which] was much too dangerous. Those lines were the people that I had seen killed. Those lines were the people killed in front of me in the experiment to see if civilians could get to a radiation shelter and take a four year-old into one too. Now they were lines, one line per body, so that I could hide that I was drawing people. No arms, no legs, no heads—just straight rigid lines like the rigor mortis that I had last seen them in the basement. I had tried to tell my mother but she wouldn’t listen...

> A tear fell onto the paper between the straight lines and I brushed it quickly away before the kind lady could see. When I looked up at her again, she had a quizzical look on her face, 'If you tell me what you are drawing I'll give you a glass of orange juice' she said. I looked down again at the drawing and tried to think of what to say. Whatever I said, she would write it down and it would be thrown back to me by the mind-control doctor's in endless repetitions in tapes in the pre-school nap times. Looking at the picture again, I said, "This is a yellow line. This is a red line next to it."
>
> That afternoon at the naptime, my earphones played in a continuous loop "This is a yellow line raped by a red line. The yellow line is angry. The yellow line must kill the red line. Kill the red line. Kill the red line it is bad." And I had been so careful about what I had said. I had stopped playing with the dolls. I had stopped saying, "Mommy, I want my mommy." [3]

While residents in the San Francisco bay area remain largely ignorant of the mind control programs enrolling their children on a regular basis, the news media has quite effectively hidden CIA involvement in the 2007 Father's Day family shooting in Berkeley[4], and the false-conviction of mind control victim Susan Polk.[5] Sue Arrigo has defended herself by publishing her testimony in draft form online in 2006:

> As a coerced remote viewing asset of the US government, I was forced against my will to work for the US military-intelligence agencies, starting from childhood under CIA-DIA Operation MKULTRA II. That subproject to develop remote viewing spies involved sexually torturing children to split their minds… It is often the case that one personality of a multiple is a good remote viewer (see 'Dissociative Identity Disorder' by Colin Ross, MD). Additionally, it is usually possible to make the regular person amnesic for both the torture and the subsequent government controlled operations by regular repetition of horrendous trauma that the mind is unable to digest.
>
> Because I had a known and respected accuracy rating as a remote viewer at age 9 during the Cuban missile crisis, the US used me to "view" the minds of Castro and Khrushchev. After extensive debriefing on the particulars I was questioned by President Kennedy on their intentions. At age 10, I was sent to Moscow with the US negotiating team for the Limited Test Ban Treaty's concluding negotiations.
>
> As a remote viewer with a high accuracy rating, for over forty years I have monitored WMD and engaged in critical US negotiations to regulate them, often as a person behind the scenes to figure out what terms one can actually get everyone to agree to while the negotiators haggle over the points of contention. I have been actively involved in: Limited Test-Ban Treaty, Non-Proliferation Treaty, Biological Weapons Convention, SALT I and SALT II, and the Comprehensive Test Ban Treaty negotiations. Because I was a "covert asset" of the CIA, my true name was not used in any of those situations.

[The Arrigo] family history of intelligence and human rights activism [runs generations deep]. In 2003, I joined the Association of Former/Current Intelligence Officers, member # 4843. My sister Jean (Maria) Arrigo is also a member. She is currently a social psychologist writing papers to help improve ethics in the military-intelligence community. My third sister, Linda Gail Arrigo, is a sociologist who is famous in Taiwan for her courageous human rights work to restore democratic representation to the Taiwanese. My mother who was a US mind controlled spy for the US government in WWII has been active in San Diego politics and was on the Mayor's Advisory Committee on Women's Issues…

I have been a remote viewing/psychokinesis trainer of US military-intelligence officers since I was 17 years old. Most of that training was done for the Office of Naval Intelligence (ONI), with lesser amounts for the Defense Intelligence Agency (DIA) and Pentagon, and the Mossad. Although I was often used directly by Directors of Central Intelligence (DCIs) from Helms to Tenet as a remote viewer, I did little training of CIA officers in these skills. That was mainly because, having been tortured by the CIA since childhood I did not want to give them my skills…

At the end of the Cold War the CIA loaned me to the Russian government to help them recover missing WMD and radioactive materials. So I have also trained some Russian SVR officers in skills needed to recover WMD and to correct pollution problems. In addition, in about 1980, I spent a brief amount of time training some of Scotland Yard's Counter-Intelligence officers in psychic tracking.

The way I train officers in these skills is completely different from Ingo Swann's method used by the StarGate military remote viewing unit at Fort Detrick. I only train people in intensive residential retreats of at least a week long. The induction into the Akashic records is quick with the technique that I developed and is done in the first day. It is also a bit of a shock to the system, like changing pressure when diving underwater. Many people have nausea, emotion labiality, and temporary physical system as their energy fields adjust. The rest of the week is spent on training them in analytic techniques to understand what they "see" in a reliable fashion while they adapt to having a mind that is no longer limited to the confines of their body.

Because of my remote viewing skills I have not infrequently been a target for kidnapping by intelligence agencies wanting my services. Thus I have been kidnapped several times by the KGB, at least once by the Mossad, and repeatedly by the CIA. For example, in 1993 when the US had men missing in action in Somalia, I was picked up where I was house-sitting for a local judge in Clairemont [San Diego, California] and taken to the nearby Camp Pendleton War Room to locate the missing men on a map. Other times I have been picked up to deal with accidental release of bio-warfare germs, environmental problems so severe that the US government doesn't want the scientists to know of them, etc. In the last twenty years I have worked on many of these severe environmental problems successfully.

In the summer of 2004, I was the supervisor and coordinator for teams of remote viewers from the ONI and DIA tasked to solve pollution problems so severe that they could threaten the sustainability of the planet. At that time we also had ONI officers training groups of Russians in our methods with the cooperation of the Russian government. We had fourteen teams of about eight people each, with each group solving their problem in about a week. The US administration had promised to give us an agency and centrally located building in which to do this work… for the health of the planet [that] in my absence has largely fallen by the wayside… With strong faith one can solve such problems in a week with a team of eight viewers working in a residential retreat setting without contact with the outside world for that period of time…

As a graduate student in mathematics at University of California, at San Diego, I studied Real and Complex Analysis and passed the qualifying exams at the PhD level. During that time, in about 1978, the CIA asked me to go over to the adjacent General Dynamics nuclear research facility to figure out what was wrong with their plasma generator; it had been inoperable for almost six months. That started my long-term relationship with quantum physics and reactors. Using my remote viewing skills and the mathematics of quantum physics,

Applied Field Theory, I was able to quickly solve the problem of the plasma generator. After that I had many requests for my help from private nuclear companies. The CIA set up a front company to handle these requests and keep my identity secret. Mostly I was called in when all more conventional avenues of solving a problem had been exhausted, or to keep reactors working without downtime by viewing the appropriate maintenance to do in advance. The money from this work was put into a Swiss bank account via the CIA…
[reinforcing my enslavement through financial controls, as] I just do not know how to access my accounts because of the amnesia [induced by repeated torture and hypnotic suggestions].

I have done experimental physics research in cooperation with the Princeton Engineering Anomalies Research center for many years. All that work and the resultant published papers have been under a pseudonym. My work however is distinct because I developed my own notation for Applied Field Theory. Instead of operators working on elements of the group, the elements are "self-realizing". That is to say that each element does what comes natural to it according to its modus operandi and there is not a dualism between operator and element. This greatly simplifies many problems and allows quick and sometimes startling results. Those results on a theoretical level were proven in experiments at Princeton to be correct. That is not surprising, given that the world works according to how your mind conceives of it, and I designed the experiments. I wrote a book of mathematics on Applied Field Theory using the nomenclature and notation of "self-realizing" elements. It was published by Springer-Verlung/Wiley, under an alias.

[My] training as a physician [has been extensive.] I went to medical school, first year of Internal Medicine Residency, and a Nephrology Fellowship at the University of California's Irvine Medical Center spanning 1972-1985... [including] a year of Internal Medicine Residency at Morristown, New Jersey combined with a year of Occupational Medicine at Columbia University in New York City 1982-1983. I practiced Occupational Medicine from 1986-2003 and was the Medical Director of Management Health Services for almost all of those years until they went bankrupt during a long strike of one of their clients. Currently I hold a California Medical License G50197.

Having trained in occupational medicine, with course work in toxicology, the CIA and related agencies and companies have consulted me about a number of biohazards. I also did some research in psychic healing at Walter Reed Hospital. That led to my interest in battlefield healing which is an area of my expertise. Although killing is used in war to gain power –it is also possible to use healing to gain results that are politically significant. The Red Cross, of course, is a good example of that. I am also a nephrologist by training, and in that capacity I have treated one high-profile patient for the US administration twice since September of 2001. The first time was for a case of an infected peritoneal dialysis catheter with peritonitis and the second time was for a transplant rejection complicated by sepsis.

[As with any undercover agent used by the CIA, military rank is contrived with each false identity used.] Having escaped to Canada in 2002, I was raped and reprogrammed to return to that enslaved condition in 2003. My orders were to report to the Pentagon for duty starting October 1, 2003. In order to cover my enslaved status and to insert me into the Joint Chiefs of Staff (JCS) Meetings in late summer 2001 so that I could set up a Psychic Warfare Defense program for the Pentagon, the DCI Tenet had assigned me a [false identity and] rank of a one-star General K. Noble.

That rank was upgraded immediately by the Pentagon to a two-star General in order to get the reforms that I recommended quickly pushed through. (Note: I was a covert CIA asset, and not a standard military person. My rank has always been at the whim of those above me and not based on any orderly progression through the military, based on merit or training for war. For example, because I was training Navy Admirals in remote viewing I was given the uniform and called a rear admiral one week, while the next week I was assigned the rank of a major in order to train low-level Marines. My utility to the US military-intelligence-industrial complex was due to my remote viewing skills, which included psychokinesis and associated expertise.)

[Torture-induced amnesia cannot completely repress the natural mnemonic processes that heal such mental fractures, eventually allowing coherent recall.] Most of the following material has surfaced in my mind since arriving in Geneva in February 2006, due to a conscious decision on my part to try to figure out what would be productive to relay of my experience to help prevent nuclear war. Because my mind was split as a child, I usually have no memory of such past events unless I make a conscious effort to write them down. The science of such "recovered memories" shows that memory is remarkably good for the gist of events and less good for peripheral details [Brown, Scheflin, Jammond *'Trauma, Memory and the Law: An Essential Reference...'* [6]*]*

Without accompanying documents, this information stands as one eyewitness report. Because I have had extensive hypnotic suggestions to recall events accurately for debriefing purposes and because my remote viewing skills tend to bleed through into even my regular personality, what I recall is often more detailed than would be expected. On the other hand, because the information is bleeding through into the regular personality that refuses usually to write down proper nouns due to the programming not to do so, most of the information on that level has been lost. What remains is the gist of the events and how the people relate to each other. As with any source, compilation with other sources is an invaluable step in judging the accuracy of the material.

When I reported at the Pentagon on September 30, 2003, I was again given the rank of a two-star General [using the same alias, K. Noble] and told that I was to continue on as Special Advisor to JCS on Defense against Psychic Warfare. During my absence from Washington, the JCS had not replaced me with another adviser and no improvements in the Pentagon's Defense against Psychic Warfare had been made. This concerned me as I detected several recent glaring problems in the Pentagon's protection from remote viewing intrusions that were resulting in the loss of substantial information that directly affected national security. Namely, that in the last couple of months the Chinese and Russians had advanced in their remote viewing technologies and were again able to remove documents from the Pentagon, and other US agencies, by what could best be described as teleportation for want of a more accurate lay word.

Although I brought this to the attention of my superiors, I was told at that time to address it next month! *That meant that any document in the Pentagon could be stolen by the Chinese or the Russians in the meantime*. Even after pointing that out to three members of the JCS, I was ordered instead to go immediately go to Mt. Weather, the underground radiation shelter base in Virginia, to assess, by remote viewing, the adequacy of that facility for survival in a nuclear war. It was built for the purpose of sheltering high US officials, including the President, in the event of a nuclear war. It has undergone a number of revisions over the decades, some of which I had previously been asked to comment on. In the summer of 2001, I had thus made some recommendations regarding the air-filtering and purification system for that facility and those had been put in place in the meantime at enormous cost. But the recommendations that I had made regarding the prevention of nuclear war itself, though relatively cheap to put in place, had not been implemented. That was of great concern to me and I spent much of the next month investigating why such important issues had been swept aside while I was absent from Washington, DC.[7]

Sue Arrigo has succeeded in the remarkable recollection of her memory despite the unbelievably harsh and destructive fragmentation that has been serially reinforced by CIA torture/hypnosis programmers for her entire life. Dr. Arrigo has documented recent torture abductions in Langley, Virginia in August of 2001 and again in August 2004; Vancouver, Canada in 2002; Nyon, Switzerland in 2006; Cork, Ireland on June 6, 2007; and near Strasbourg, France on October 30, 2007. Yet, despite this continual mental and physical enslavement, her determination to help others remains unbreakable: "Although I am willing to take stands that result in my being tortured by the US government, I do so selectively according to an internal cost-benefit analysis that others might not understand." [8] By remote viewing, Arrigo can assess which US government crimes she can effectively prevent and which actions will best mitigate the

suffering of others. In returning to her enslaved condition, Arrigo has been acting in the best interests of humanity and indeed her own soul by attempting to prevent nuclear war from within the heart of the beast. From within the CIA, she has effectively exposed the conspiracy of lies that entrap and kill hundreds of millions of people annually in a global conspiracy of concurrently orchestrated genocidal wars in various regions of the world:

I was on the inside of the beast that planned [the atrocities of September 11, 2001] —the US government — CIA, Pentagon, and US administration all the way to the top. In specific, I was under orders from the Director of the CIA Tenet in August of 2001 to remove from the Pentagon all the 9/11 planning papers that might be discovered when the firefighters came in. There were too many planning papers to remove them all so they had me, a remote viewer who could see what parts of the building the firefighters would enter, do the job. Even so, the amount of 9/11 planning papers at the Pentagon that I removed filled a large moving van. It was planned over many years and many people knew about it. Few of them have been willing to risk torture or death for speaking of it…

I did object to the 'proper authorities' about the immorality of the US planning the deaths of innocent people in 9/11 to the best of my ability before 9/11. In particular, I personally voiced my moral objections in detail to my boss Tenet and to Rumsfeld as well as personally handing a written report to Bush Jr. and Cheney at the White House and to the Joint Chiefs of Staff at the Pentagon stating that I believed it was unethical and unlikely to succeed in its goals. It did no good –the proper authorities were the ones planning it…

[Only a few weeks prior to the US government attacks on their own citizens,] I was tortured by the CIA in its basement at Langley, Virginia for my objecting so visibly within the military-intelligence community prior to 9/11, I think that I did much better than most people in pushing my objections to the fore and getting them heard. I even faxed over to the International Court at the Hague a warning—whether it got through or not I don't know because whenever I tried to call them to find out the phone line went dead –seven times from seven different phones I tried, in late August of 2001 after I was tortured…

I ask God to forgive me that I was not strong enough to stop this atrocity against humanity, nor the Afghan and Iraq wars that followed, killing still more innocent people. Going to the press, which I tried, many, many times, did nothing. They didn't want the story. They still don't… The mainstream media is controlled worldwide by five wealthy men—we are not being told the truth about 9/11…[9]

The remotely controlled 9/11 planes were equipped by an Israeli company owned by Rabbi Dov Zakheim, coordinated by Mossad through an Israeli-owned airport security company handling the 9/11 flights. Unmistakable satellite evidence of US government execution was reported by various sources, but buried by blatant US corporate media censorship: radioactive dust produced by many 'mini-nuclear' explosions below the WTC towers (the notorious 'mini-nukes' described by the Bush administration themselves). CIA asset Osama Bin Laden was demonized to engender western Islamophobia:

> I am a kidney specialist who trained at the University of California at Irvine Medical Center in 1983-1985 (California Medical License # G50197). I treated Bin Laden on more than one occasion since 9/11/01 for the US government who promised him safe passage out of Afghanistan and free medical care the rest of his life. He was, after all, a loyal CIA operative doing exactly what was wanted by the leaders of the New World Order. I treated him right after he was flown by helicopter from Afghanistan to Pakistan. At that time he had a peritoneal dialysis catheter infection causing peritonitis and sepsis. Because the infection could not be cleared by antibiotics and required removal of the plastic catheter, which required surgery, I recommended that the surgery be done on board a US naval vessel. I was then flown with him by US helicopter to the ship where the surgery was done. After the successful surgery done by the ship's doctor with myself as an assistant in the procedure, I called both his mother and one of his brothers to report on his condition, as they were very worried about him. Before calling them I called the White House and spoke to Bush Jr. and Cheney both to make sure whether I should offer them the same promises as earlier. They both said yes, although Cheney was looking for a way to back out of it. There was no hint that the Bin Laden family considered Osama, my patient, to be an unwanted or discredited member of the family when I arranged for him to get a chance to visit them the next week in Saudi Arabia, where he was flown by US military transport.

> I next treated Osama Bin Laden in the US. I was told by the CIA to go to Walter Reed Hospital, on July 12, 2004 (if my memory serves me on the exact date) to see him. At that time, under an assumed name held in protective isolation he was in kidney failure and near to death from a transplant rejection crisis and/or infection. He was exceedingly ill, but his family and he had specifically requested me to see him and in the face of his possible death the Bush administration did not want to deny the request. Because I am a remote viewer I was able to see what the problem was and addressed it by having all of his lines and catheters surgically removed while he recovered from the infection. Regardless of whether the administration used Bin Laden to foment their wars of aggression and he cooperated with him, my duty as a Christian and a physician was to both pray for his recovery and work to assure it. After he got over that crisis he was sent to a facility in Vermont to remain hidden. Unsatisfied with his medical care there, he requested that he be allowed to continue seeing me. He was then moved to the Mount Weather base near where I was living while working part-time at the CIA, Mount Weather, and the Pentagon. He had the use of a house there in the woods of the base, under an assumed name without sporting his beard or Arab garb. Medically, he was doing much better at that point and I saw him only twice at that location, before other events interceded [in August of 2004]...[10]

Arrigo details the origin of the military use of psychokinesis from one Japanese Zen monk's spiritual talents in the abatement of atmospheric radiation that were eventually replicated in US experiments:

> It was not until 1938, in Nazi Germany, that the first experiments showed that the mind could change the radioactivity of a substance per se. That experiment was done to see if it was possible to change the glow of radium painted dials cause them to "black-out" during air raid drills. That experiment was considered a success by the standards of the day… [as] the radium was noticeably fainter afterwards…
>
> It was thus not until after the dropping of the A-bombs on Japan that the question became a pressing one, as to whether the mind could cause radiation abatement. A curious note in the history on this topic comes from a Zen source. Namely, after the war, the US Army noted that around the area of a particular Zen monastery in Japan near Nagasaki there were very few deaths from the A-bomb's radiation. That was attributed to a particular monk that cared for the sick and washed them. However, when the US army studied the radiation levels they found them less in the monastery and concluded that the wind patterns had prevented as high an exposure there. That interpretation could have been true except for one notable anomaly: in the vicinity of the monastery behind its walls the radiation levels were higher than expected. Still this was explained away as due to the washing of the monastery by the monks with the deposit of the dirt outside of the monastery.
>
> It would not be until a few years later that the US army would test the Zen monk in question on his ability to directly abate radiation. When they did test him, they found that he was able to reduce radiation by about 82%. The reduction was long lasting, and later he was asked to go to Bikini to help treat some of the survivors of radiation experiments there. But because he effected the radiation levels around him in general, and often in unpredictable ways, the US army, which wanted to study the effects of the radiation levels on human health, ended up sending him back to Japan. That monk's name was Tomo Ayuhowi, and many Zen people considered him a local saint. He was renowned in his area for his kindness and his healing abilities and so the Army really did not think that his ability to lower radiation levels would be reproducible. Thus, there was little attempt at that time to do further experiments along these lines with an eye to finding or developing others who could do the same. I know about this early history on the topic because the CIA asked me to research the area and write up my findings, which I did in the mid-1980s.[11]

Just as remote viewing became a weaponization of the innate human spiritual capacity for clairvoyance accessed by General Billy Mitchell in 1924, Dr. Arrigo's research revealed that military psychokinesis, and radiation abatement in particular, shares its roots in the compassionate meditations of a Zen monk. An astounding record of the clashing forces of destruction and compassion is housed in the Hiroshima Peace Museum. The Hiroshima Buddha (left) was severely maimed by the nuclear blast of August 6, 1945, preserving for us in bronze a record of the twisted forms of the victims of US nuclear war atrocities in Japan. Dr. Arrigo's research has been provided for publication at grave danger to herself in a profound effort to avert a recurrence of nuclear war. She has continued to bear her enslavement by the CIA as a means of helping defeat pre-emptive nuclear strike plans within the US administration as their primary remote viewer and psychokinesis expert, able to disintegrate radioactive materials by focused compassionate intent:

Psychokinesis is a very broad subject and those unfamiliar with the topic are likely to make a number of unjustified assumptions about it that I would like to dispel before we get into the details of it. First off, people believe that the mind is separate from so-called outer reality. Quantum physics experiments have proven that to be a false assumption –the results of experiments are dependent upon the mind-set, the pre-conceived notions of the experimenter… One cannot accomplish a goal that one does not have –except by rare accidents of fate.

Second, people believe that outer reality is comprised of matter that has mass and size, and that moving a large heavy object is harder than moving a small light one. If one has such a view of the world, one will be hard pressed to move anything at all given that most people view thoughts and intentions as so unsubstantial as to not be able to move a feather. However, if one changes one's mind and thinks of outer reality as no more substantial than the dream fabric of the night –a flimsy mind state that dissipates immediately and automatically when one awakes or changes one's state of consciousness –then having an intention may easily shift the whole scene including the very scenery, or mountains. It is not unusual in a dream for one scene to completely dissolve and become another. So why should moving mountains with you intention be anything surprising to you? It is only the case because you have bought into the concept of an external reality of matter that is separate from your mind. In quantum physics not even a single atom can be shown to exist, but you believe in the solidity of rocks as if it was a proven fact. It is not a fact. It is an illusion in the Dreamtime.

Yet there are some rules of cause and effect that still apply in the Dreamtime, some invariants, if you will. Hindu, Buddhist, Christian, Jewish, and Moslem saints, masters of the Dreamtime, all agree on what those rules are. They are observable facts, if one takes the time to investigate… It is just that the rules are not as simplistic as most religious tenet writers put to paper. So others, seeing what appears to be loopholes or inconsistencies, believe that they are not inviolable. That is due to inattention to details and wishful thinking.

The workings of karma/sin-virtue are certainties. It is through paying strict attention to them that one can develop certainty of one's results. In the arena of preventing nuclear war and annihilation of the species and planet, nothing less is worthwhile…

From the point of view of non-duality, all faults are one's own. There is literally no one else to blame other than one's self for the state of the world---all the actors are manifestations of one's own mind and its defilements… Depending on how one intends in the dreamtime, the results of one's intentions appear to manifest in just one's private experience or also in the experience of so-called others. For example, in the case of playing war games with tanks, some students of psychokinesis will have a tank disappear from their view, or from a few people's view, but not from everyone's view.

A master of psychokinesis should have control over how the result manifests and not leave it to chance. If the intention is to disable the destructive potential of a nuclear missile heading towards a target, then it should disappear from everyone's point of view. However, if the intention is to get people to minimize their time in Hell, then it is better for those who are headed there to suffer from nuclear war and burn off some of the sin through suffering before they die. At least, that is the case assuming that they do not further compound their misdeeds as a result. Parallel universes can be invoked so that only those who advance the goal of nuclear war actually suffer from it. This is very important to understand because those pushing the world towards annihilation have anger in their minds directed towards others that they want to cause to suffer or die. Yet those people, by the very fact of that anger and partiality of mind do not have certainty of action. They cannot ensure that it is others, and not themselves and those that they are attached to that will end up the victims. In actual fact, their anger will cause them to suffer in the nuclear war with certainty and not even be able to die a quick death from it. It is a promise that God has already made and they do not have the ability to undo.

What they do have the ability to do, if they so choose, is to repent of their anger and plans for nuclear war, and beg God's forgiveness. Then if they destroy the weapons and the threat to everyone that is the result of their existence, they too can avoid the intense suffering of radiation sickness, and the much worse fires and suffering of Hell itself. If the US government did not believe in Hell, then why have they commanded their remote viewers not to investigate its existence, its conditions, and how beings end up there. It is critical intelligence for making an informed decision. Would you invest in a bank before checking its credit rating and solvency? Why believe instead in the words of a government that cannot even run an occupation successfully in a third world country? They have no certainty of action and their approval ratings show that the public knows it.

So how can you keep your blinders on without massive doses of intentional ignorance –called stupidity? Is it good to emulate stupidity? Will stupidity save you from suffering? Or is it a failed option, one that never had a chance to help anyone, let alone a government that inherited nuclear weapons?

Ultimately, it is the case that different people experience the same event differently anyway. But this effect is greatly exaggerated when a strong intender is trying to get the optimal result for everyone in terms of minimizing their future suffering. For example, when Christ preformed miracles, some people saw people being healed or were healed themselves. Others without faith only saw a faker making trouble and wanted him stopped even if it took killing him to do so. The results that people got from coming to see Christ depended on their own state of mind. That said, I will now talk about some of the experiments that the US military did on psychokinesis and what they said about the results of them.

One of the tests that I participated in was on whether psychokinesis could be used to disable incoming nuclear missiles. This was a test that I designed myself as I had complained that Star Wars was ludicrous as one could do better, without technical difficulties or cost, just by intending the result that one wanted. Because I had made these comments at a JCS meeting during Reagan's second term, one of the Generals present asked for me to put on a demo that Reagan could easily attend –as opposed to one out at the Nevada Test Site like some of the earlier ones that I had been involved in.

As a result, I was standing in the Oval Office with Reagan at the time that this particular teat was run and the Pentagon was monitoring the results and conveying the results to Reagan by phone. Three planes were sent up and asked to fire missiles at a target –in this case the missiles were non-nuclear that fragmented into hundreds of pieces mimicking a multiple warhead nuclear weapon. The pieces were luminescent –like phosphorus tracers and easy to see in the night sky as well as to photograph. The military made a number of runs, conducted at a distant base in Okalahoma, if I remember correctly. Then they asked me to "deflect the rounds". At first they believed that the missiles were not firing from the planes because they saw no tracers. But when the planes landed, indeed the missiles were missing.

As the evening progressed, they asked me to let the tracers start to show and then disappear so they could see where the psychokinesis was occurring in the sky. Remember that this is happening half a continent away from my physical location per their thinking. The next run recorded on film showed dots of light followed by darkness. They were of such brief duration that only a few of them were caught on the film, so they asked me to let the tracers show for longer. Now I am calling them tracers because they were luminescent but in fact they were large missiles of phosphorus on the order of a ton each. They lit up the sky very brightly before I was asked to demonstrate their psychokinetic destruction. Because the military wanted to track their psychokinetic decay, which was really instantaneous, I had to change my intention to a slower decay. So I let the missiles fizzle out like a balloon that is released without being tied. That gave a thin strand of light rather like a large firefly for each fragment. Although the pretests had lots of phosphorus hitting the ground in pieces, and setting fields on fire, my runs had no fires starting and later examination in the morning did not find any phosphorus on the ground below.

The military had trouble believing that it had the right area and insisted on repeating the test. The second test was done the next day during daylight at another base, in the desert. In this case the military spread out large blue plastic tarps and looked for burns and melted plastic to judge how well I had done in destroying the missiles with my mind. Again, when we started they did not believe that I had destroyed the missiles even though the planes came back without them, since they saw nothing. So I ended up having to let a trace of the phosphorus start its burn and drop to the ground before getting rid of the rest so that they would believe me and believe that the missiles were over the plastic tarp area which was about the length of a runway and about 20 feet wide. I am a bit of a prankster so I arranged the first drops of the phosphorus to be in even lines on only the first tarp. One general later accused me of rigging the test though in fact I was more than half a continent away and everything I did occurred by the use of my mind not my hands as he accused me of.

The real issue was whether one could evaporate a nuclear weapon without having radioactive dust hit the ground. So the next test was one of putting uranium in a conventional missile as a dirty bomb. This was done at the Nevada Test Site in case I failed and again I was not on site. I was standing in Casey's office at CIA HQ at the time with Reagan on the phone. The size of the bomb was about 500 lbs and the amount of radiation would have been substantial. The fallout downwind could have been a real problem and some Generals had objected to the test on that basis as it was after the Limited Test Ban Treaty. While there was no nuclear explosion per se and so there was no violation of the letter of the treaty, the amount of potential release of radiation was nearly half of the first A-bomb released over Japan. Given that being the case, the test was delayed until an almost windless day. I was not quite clear about the logic of that since I doubted that the radiation would be swept up by brooms before the next windy day. However, I had no intention of failing and so I went forward with the test. I am used to having certainty of result in that personality. It is because of that certainty of result that I have often been used for these tests. The result of the test was that there was no increase in radiation detected afterwards compared to what had been at the site previously. Some scientists objected that the radiation levels were slightly lower than they had been before and said that the results might not have been from getting rid of the radiation in the bomb as much as getting rid of it on the ground afterwards. I found that a moot point. After all the point was to prevent fallout that could hurt people.

That test was followed a few months later by more sophisticated tests on decreasing specific types of radiation –such as gamma rays versus alpha waves. It really made no difference –it was only a difference in the intention. Those tests were run underground in caverns already created by nuclear explosions. The tests showed that the mind could evaporate a ton of highly radioactive material instantaneously. In this case we had visuals directly from security camera in the cavern. In one frame the ton of uranium is there and in the next it was almost not and the second one it was gone. People accused me of getting kickbacks from the uranium ore company that I wasted a ton of the precious material but that was not the case. Here I have omitted details of the actual tests because of true national security reasons. Omission of the details in this specific case will not prevent countries from protecting themselves from nuclear war and fallout.

The next set of tests that I want to mention happened a few years later in the Bush Sr. administration. These tests involved me at the site of the radiation, in this case at the Nevada Test Site primarily. I was asked to walk through radioactive caverns and ingest large lethal doses of radiation to test my abilities. Really it was a little bizarre since I could decontaminate a whole cavern of the radiation after an atomic explosion, so there was no need to force me to ingest lethal doses before I decontaminated it. The experiments verged on the sadistic and except that I had very unusual abilities relative to my body I would not have survived them.[12]

The Gnome nuclear blast cavity (above), located 1,184' below Carlsbad, New Mexico is another test-site that was likely used for these very sensitive radiation abatement and clean-up experiments. Arrigo documents an astonishing feat of human consciousness that, if replicated on a larger scale, could reverse the contamination of our planet and the destiny of our species. However, she also warns that the feasibility of radiation abatement by psychokinetic masters has fed into the Nazi US government genocidal fantasies by providing a potential means to clean up their premeditated radiation disaster.

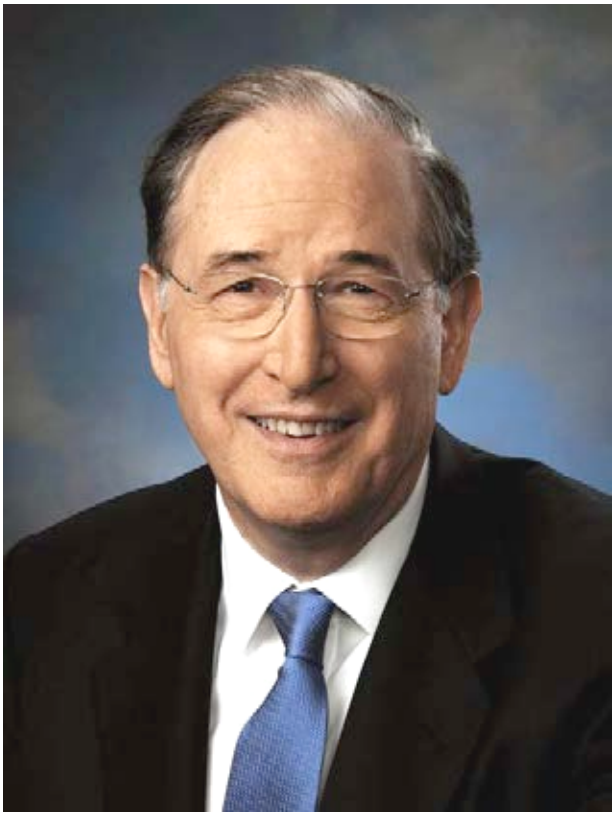
When I arrived up at the Mount Weather base in October of 2003, I quickly discovered that I had been recalled from Canada because the US had run out of more conventional solutions to a problem that they felt was urgent to solve. The problem was explained to me by the Commander of Mount Weather as "We plan to use this base for its intended function (to house the US officials in the event of nuclear war) but all of the remote viewers say that no one will survive a nuclear war here… You are the one that says everything is possible… You are the one that we trust to be able to do it."

"Perhaps you misunderstand what I say at the beginning of my remote viewing training intensives –I say that anything that is *ethical* to do can be done."

"What is unethical about saving the life of the President and his advisors?" he asked.

"Billions of other people dead from the nuclear war." I replied.

"But the scientists have calculated out the number of people that need to survive to have enough genetic variation for the species to continue and they put the number at 210 families. We will have 240 for extra margin of safety." I looked down at my shoes in embarrassment. Not only were the scientists wrong per my intuition, but also *I had just been told that the US government intended to nuke everyone off the face of the planet and leave only 240 families in a hole in the ground…*



I called Tenet at CIA Headquarters and asked to speak to him… He said "There have been changes around here since I last saw you. They (the White House) believe nuclear war is inevitable, only a matter of time. They want" and his voice quavered momentarily "to schedule the end as part of a ceremony, on a solstice, for the best effect… This is for real. This is the way they see it. Take everyone else out and start over—just them. That way there is no overpopulation; no racial tension; no exhaustion of the petroleum reserves. They can't imagine life without oil. They don't want to share what is left of it..."

"But that is insane" I replied. "We can go to another source of fuel. We can create new solutions."

"That is not the way they see it. They don't have the confidence that you have. They don't believe that creativity will always find a solution… They want you to bring [the radiation] back down to normal background levels after everyone else is dead, down to normal again like you did at the Nevada Test Site demonstration."

"I can't do that to preserve the lives of mass murderers." I replied…

"I refuse to help them kill off the planet's life, even if I could do what they wanted, which I can't"…

Over the next few days [Senator Jay] Rockefeller [at left] showed up a number of times with contractors to explain to them what he wanted changed in his “privatized part” of the underground facility. While most of the facility was not much different in style than the inside of CIA headquarters, there were some notable exceptions. Rockefeller’s section already looked like the inside of the New York Metropolitan Museum filled with precious art objects and with high vaulted gothic ceilings. He now ordered that his section be expanded from mansion-size to three times as large, and a new swimming pool installed which was about Olympic-sized. I was not happy with this change as an enormous amount of dust was generated by this construction over the many months it took to complete and that overloaded the air filtering system which had to be replaced and upgraded again to handle the extra interior volume. The facility was now about 9% larger overall. And the construction thinned the wall of rock that was acting to make the shelter safe. Even in the construction of this ‘albatross’ the concerned parties were unable to agree on what was fair in terms of size or number of people to be admitted to it. Rockefeller intended to bring in whomever he wanted at the last moment, including all the “cousins” that he liked and their children. Officially, there were only two Rockefellers on the list [–Jay and his uncle David]…

I wrote up my remote viewing findings on the Mount Weather [radiation shelter scenario] over the month of October 2003. Those retreating to the base in the event of a nuclear war would almost certainly kill each other off long before the radiation levels became livable. There would be too many alpha-males in a small space. Minor disagreements would be magnified in a confined space under stress. Major disagreements that already divided them would be even harder to check than before. By having killed billions of innocent human beings, the taboo against killing would be so weakened as to be non-existent. They would kill each other, just as they had killed others.

The next day, on about November 4, 2003, I was called into the White House to explain my report in person to Bush Jr. and Bush Sr. as they were upset by the content of it. Also present in the Oval Office at the time were Dick Cheney and Donald Rumsfeld, but no one else… Only three copies of that report had been made “for eyes only”; one for the President, one for Tenet, and one for the Commander of Mount Weather whose duty it was to report to the JCS on all matters concerning that base…

Rumsfeld wanted me to go point by point through my report on why a nuclear first strike would not be survivable. The report that I had written was about fourteen pages long, plus an appendix, which was over two hundred pages and went through the actual remote viewing analyses… What one sees as a viewer are possible futures. My specialty in remote viewing has been to develop the analyses so that those possible futures have reliable probabilities assigned to them. Since I have a mathematical training and have done much stock prediction in one personality, I have been able to scientifically validate the analyses that I developed… It has to do with holographic mind—a way of seeing all the possibilities at once in a flash of understanding.

Most people have never experienced such an understanding and cannot believe that such a state of mind is possible… So to convince them I gave them the experience of holographic mind for a while. It is such a different way of understanding the world that most people cannot hold that understanding after they come out of it. All they can do is know that they had the experience of the understanding briefly. It is like looking at a city map before folding it up again. You know that you saw it but you couldn’t say much about what it was that you saw and you couldn’t reproduce the map from memory. But having been shown it by someone telling you directions, you can believe that they do know how to direct you to get to your destination. So after I explained holographic analysis and demonstrated it, they no longer questioned my assertions about the probability of the events that I discussed in my report. None-the-less, Rumsfeld wanted me to go through each point carefully to make sure that I had not overlooked anything. So I did.

> When I got to the point of asserting that the survivors would have to stay in the shelter for over 5 years in order to not die in their first month out of it, Rumsfeld wanted to know why I was able to conclude that? Would no remote viewer be able to bring down the radiation any better than that? I tried to demonstrate that by putting them back into holographic mind but their nausea in witnessing their possible future radiation sickness was too great for them to stand and they refused to continue with the demonstration. I said that if they could not even stand to remote view how nauseated they might be in the future that they shouldn't undertake the course of action that led to that…
>
> As we continued stepping through the report, it dawned on Rumsfeld that I might be right that nuclear first-strike would not be survivable. As Rumsfeld started to agree with me and with Tenet that it was a bad idea, Cheney began attacking me personally. The attacks were not based on the evidence, but on his perception of me being "disloyal" for not agreeing with him… Finally, Rumsfeld asked to at least be allowed to hear me out. Cheney refused and said that I was poisoning their minds against the plan. He stated that the only reason that Tenet was no longer in favor of the plan was because of his contact with me. He then started swearing at me and calling me obscenities.
>
> I told them to get a remote viewer that they could trust and walked out of the Oval Office. Before I made it out of the building I was handcuffed and escorted back to the Oval Office where I was berated for my "uncooperative attitude". I said that I would not speak as long as the handcuffs were on me. I was sent to the basement holding cell where for two days I did not say a word. On the third day, the handcuffs were removed and I was escorted back up to a room on the first floor. There I was given a fresh set of clothes and told to shower. I did so and was escorted again into the Oval Office. Bush Sr. asked me how long it would take for me to train another remote viewer to take my place. I pointed out that over the decades I had trained hundreds of good viewers, especially for the Office of Naval Intelligence and that they could easily replace me with one of those men. Bush Jr. asked me if any of them could affect radiation levels as well as I could, and I replied, "If you want to know, test them." That is how it got left. I was to continue finding ways to make Mt. Weather survivable until I was replaced by one of my students…
>
> Then about six months after they started looking for a replacement for me, I was called to the White House and told to finish training a particular ONI student of mine up to my level of competency in radiation abatement… The ONI officer had slowed the rate of radioactive emissions… to one twenty-eighth of what was expected. In front of Bush Jr., I asked the naval officer to repeat the experiment while knowing that the US elite planned to use his skill to bale them out after killing off the rest of the humans on the planet. The naval officer fainted dead away. After he recovered from the shock, the test was repeated back at ONI HQ's. The atomic clock advanced 26 hours in 24 hours under these conditions, which means that the radioactive emission of the Cesium was higher and thus more toxic.
>
> The ONI then tested another 3 of their best psycho-kinesis officers with this unethical scenario with clock results that varied from 18 hours to 32 hours in day's test. They even insisted on re-testing me at this task with the result that the clock ran 24-hours in a 24-hour period and I was accused of not trying… The US administration refused to believe that I could not do what they wanted. They have no understanding of spiritual law and how [radiation abatement] effects are achieved…[13]

Arrigo's ability to determine the ethical balance enables her accuracy in considering all of the possible outcomes, not only the desired set of outcomes. In her explications, Arrigo confirms that *the universal laws of physics cannot be altered carelessly, but only through focused, compassionate intent:*

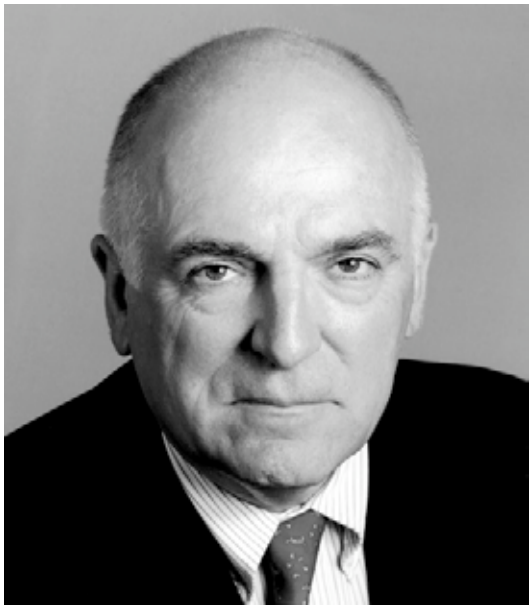
> Since I was involved in much of that research as a gifted psychokinetic expert and trainer, I feel that it is my responsibility to make sure that radiation abatement is used to help the planet, not as a rescue strategy after a first strike. It is completely immoral and unconscionable to launch nuclear weapons to kill everyone above ground and then reverse the radiation and come out of one's shelter to have all of the oil just for oneself and one's progeny. I can not remain silent given what I know about the US plans, even though they tortured me again last week in Nyon, Switzerland in a makeshift torture chamber in a basement to try to silence me.[14]

Dr. Arrigo's insider accounts show the global nuclear threat to have grown from the ignorance and greed of petty old men who fear their own eminent demise and perhaps the impending suffering of their next incarnation, brought upon themselves by orchestrating mass murder for the better part of their adult lives. These are the products of generational cycles of ritualized child torture and entrapment that now govern the US. *Indeed, it is a simple problem of psychopathic liars believing their own lies.*

A true understanding of the unique physics of water, an abundant fuel, alleviates all of the limitations of oil-based technologies and over-population. Water, and HHO plasma generated from water, can provide for all human needs, as originally discovered and developed by Nikola Tesla, only to be hidden by the Nazis and developed as stealth plasma-cloaking technology. The thorough compartmentalization of the US government's secret scientific projects has blocked many advances in awareness of the potential of HHO plasmas for free energy production and human well being. However, a few independent inventors have reconfirmed Tesla's results and engineered free-energy reactors using HHO resonant-transfer plasmas, now being marketed for heating homes by Blacklight Power, Inc.[15] Another independent inventor, Denny Klein of Clearwater, Florida, has engineered and marketed an HHO plasma torch[16] using the same basic process. *Both of these technologies are extremely safe and clean, as HHO plasma is created in a vacuum tube that, if broken, quenches the plasma reaction and releases only water vapor! In addition, HHO plasmas release healthy UVA light, and no UVB or C.*

The advanced technological achievements of humanity now allow the necessary shift to sustainability that can salvage our polluted planet. The transition from oil-based to water-based fuel brings an opportunity for those abusive controllers of the antiquated systems to redeem themselves by sharing this technology widely. Who among the controlling elite will resign from their mass murdering and redeem themselves by doing so? Dr. Arrigo's unique efforts suggest there are many willing to act:

> At the time of that conference [on WMD at George Tenet's mansion in the first week of May, 2004]… I had before me in my mind already the upcoming torture in August. And I saw that I could avoid that if I "played it safe" and went along with the flow toward nuclear war and the local wars in the Middle East. As much as I personally wanted to sell out, I was unable to because I knew the consequences to my soul if I did so. Many people have become saints through praying to know the consequences of their actions. Saint Theresa of Avila in the 1500's or so had a vision of the small cramped space in Hell that God showed her that her vanity over her looks had earned her. As a result she became serious about the welfare of her soul. She made spiritual progress and developed the rapture of uniting her will with Christ and had to be held down during mass to prevent her levitation. She is the founder of the Carmelite convents. I recommend that people pray to know the consequences of their behavior –it is very sobering to know. It is more important than knowing the price of items or how to make a living, because it has much more far reaching effects for one's self and for those around one.



So at the conference I prayed that those men know the consequences of their actions in giving tacit approval to the US administration's plan to kill off the planet with radiation and then reverse the radioactivity by psychokinetic means. I made that prayer silently while I was listening to another presenter, Tenet, as a spur of the moment thought. Suddenly, all the men in the room fainted dead away and their minds were confronted with visions of their afterlives. You can ask some of them directly, what it was that they experienced at that time. It was not until Tenet was done being scheduled to tell them lies that morning that they returned to their usual bodily perceptions. Having spent only a few hours knowing the consequences they easily went back into denial again. Yet many said that they were completely shocked to learn that the suffering they saw of the denizens of Hell was so dreadful.

> *Three of the men resigned from being heads of their intelligence agencies within about a month later.* One of these three was the head of the SVR, the Russian intelligence service that used to be the KGB. Although officially Russia was not considered a "friendly foreign intelligence" service, the CIA had gone to a lot of trouble after the Cold War to advance this man's particular career and "well-being". As a result he was invited to this conference as a full participant. I knew him quite well as I had negotiated intelligence sharing agreements between the CIA and the SRV over many years. After this session, this Russian SRV General sitting next to me said "Strong vodka you serve here –it opens the eyes, not shuts them to the ethical concerns. Next time tell me

in advance when you are going to serve it so that I can drink Smirnoffs instead." I then admitted to him that it occurred as a result of a passing thought of mine, without pre-meditation. He said, more as a question than a statement, "It is a good thing that you do not pre-meditate me harm then." Tenet was less than pleased and coming to in a now wrinkled suit, he exclaimed loudly, "Would someone please get this woman off my back before I am a ruined shirt?" He, of course, was one of the three to resign, a decision he did not make until later that same day. That night he asked me in private "How do I avoid that (Hell)?" We spent much of the night discussing what he would need to do to clean up his soul.

The next day he phoned the White House and said that he wanted to change the focus of the negotiations to the terms of his resignation. The conference still had three days to go and those negotiations were quite involved and lengthy [and resulted in George Tenet's resignation from his relatively long-held DCI post on July 11, 2004, at a time when it was most convenient to deflect blame for the falsified WMD intelligence reports, cooked-up as the impetus for the 2003 Iraq invasion. Tenet, however, acknowledged that he had stepped down due to "personal reasons"].

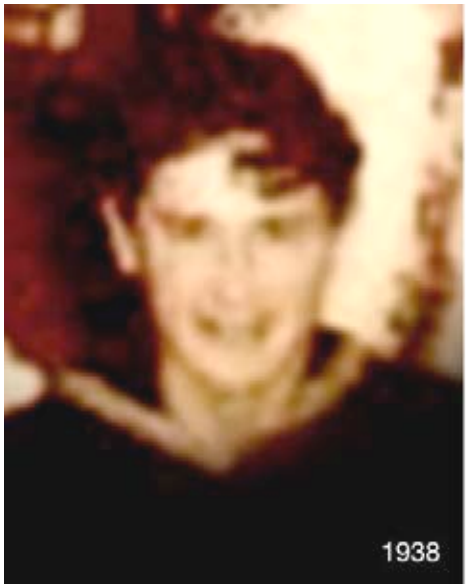
How can men who have seen their likely condition after death later ignore it? It is the most important intelligence one could have and yet most of them threw it away. Good intelligence is often discarded by intelligence services when it runs counter to the "prevailing winds of deception" within an agency. Those who were most affected by it were those who knew me best and had the most confidence in my integrity and thus in what they had witnessed. The third resignation was [rendered on May 6, 2004 by Sir Richard Dearlove (at left),] the Head of MI6. I had worked closely with MI5 for about twenty years and with MI6 for the last five years of my time working at the CIA (1998-2001, 2003-2004). The Head of MI6 was a particularly close friend of mine, of a non-sexual nature. I had "assisted at the birth" of one of his children who had nearly been born blue in about 2000. So I had thereafter stayed at his house whenever I passed through London, which was several times a year. We had many long talks about the state of the world and our respective agencies. And while we did not see eye to eye on most topics, we managed a mutual respect that bordered on the miraculous.

I mention all this because it is relevant to our discussion in a number of ways. First, intelligence heads are ordinary people with their own private sufferings. Second, it is relevant to his wife's suicide the month after he resigned. At the conference the next day, he told me of his decision to resign. He did not know of Tenet or the SRV head's decisions as they were all made independently. He mentioned his wife and getting to spend more time with his family as part of the reason for the decision. I told him that he should not share his vision of Hell with his wife if he wanted her to live. We were interrupted by Tenet to resume the next session and never talked much more about it…

[Richard Dearlove] ignored my warning and told his wife in depth about where he would end up in Hell, if he didn't correct his life. His wife suddenly understood what his life had consisted of and she was unable to live with the guilt of having been the wife of a man who had ordered people tortured. The pictures of Abu Gharib were freshly released and that combined with her husband's confession to her were too much for her to live with. So while it is very good for people to face this intelligence on their after-life and correct the problems, it requires case-by-case analysis to decide whether it is appropriate to share that information with others. Such decisions are often best made with the help of a competent remote viewer whose advice one is willing to take.

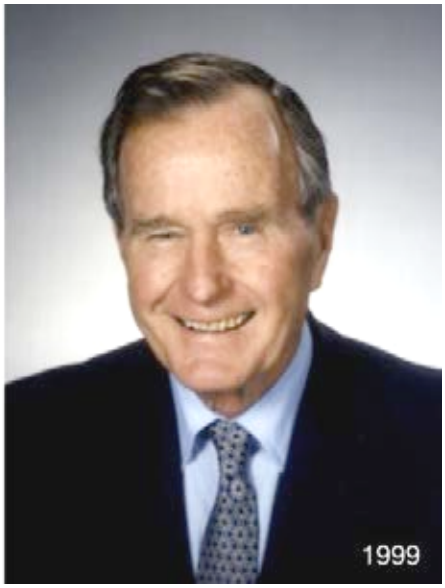
One could ask those retired intelligence heads to verify what I say about the US plans to go to nuclear war with psychokinetic rescue after it. They might try to avoid a direct answer, but they might decide that their soul's health now required them to tell the Truth. Certainly, they had adequate knowledge of the classified documents to know the truth of the matter independent of what I said at that conference. And they have adequate standing in the field of intelligence to make what they say on the matter newsworthy. It is possible that to save the world and their souls in the process that they will now break ranks from the Reverse Christians and speak the Truth. I believe that they will, if given a suitable gentle opportunity to do so. However, a denial would not carry much weight as it is just likely more of the hot air of the "prevailing wind".[17]

While the special efforts of Sue Arrigo have significantly affected those who regret their crimes against humanity, there are many who have ignored her profound insight and continue to compound their grave karmic mistakes. Such maniacal psychopaths vehemently refuse spiritual help, to their own destruction. There is ample evidence from Vice President Dick Cheney's own declarations and legal position that he is quite personally involved in the serial torture of anyone who will not comply with the Nazi New World Order war plans. His deranged criminal mentality is exposed in Dr. Arrigo's accounts (the most abhorrent recent episodes of which have not been included here):



As a coerced CIA asset, I was asked by Cheney in August of 2004 to frame Iran as developing nuclear weapons. Because Cheney was afraid of CIA leaks, he gave me the assignment at a Chinese restaurant in DC after hours. It was not the first meeting that I have ever had privately with him as I acted as a negotiator between him and Tenet. Within the CIA I had been an outspoken critic of US wars of aggression, its nuclear first strike plans and breaking of nuclear arms control treaties. I spent most of my life as an operative risking my life as a remote viewing spy monitoring and recovering lost WMD.

I am a doctor and the assignment Cheney gave me was to go to Iran as a physician. Once in Iran, a camera crew would be filming when an Iranian agent would rush in to say that he knew a secret bunker where the Iranian government was developing nuclear weapons. Cheney admitted that the rest of the filming would occur in Hollywood with a mock up of said lab. Clearly, this was an immoral assignment. There was no way that I was going to have the blood of innocent Iranian women and children on my hands, so I refused. When I did so, Cheney threatened the life of my mother. Since my mother had recently told me she would rather die than have me be emotionally blackmailed in this way, I held to my no.



During the course of our about forty-minute talk, one of his secret service officers interrupted us twice. The next week when I was kidnapped in Virginia, raped and tortured for four days, I recognized the voice of that officer as one of the rapists. It is an outrage that Cheney is advocating torture. He has already shown by his actions, that he will stop at nothing, not even the torture of American born CIA personnel in order to get his way. He has a clear conflict of interest in making money off these wars.

Are we, as Americans, going to torture people just so that corrupt officials can line their pockets with oil and war profiteering revenues? … I was raped and subjected to three mock executions, when will this US reign of terror end?[18]

At the helm of the US government are a group of maniacal Nazi psychopaths getting ready to push the nuclear radiation button. Why is George W. lying incessantly and threatening to kill off the entire human species? *He knows that his father is a serial killer who buys the law, and will have him killed if he doesn't do as he is told. George has been traumatized by having been forced from childhood into killing, like his father and his grandfather before him.* The trauma-based methodology of controlling CIA assets is somewhat different in the case of 'Manchurian' Presidents. Sue Arrigo has retold the extensive history of her close interactions as a mind-controlled slave of the Scherf family, having witnessed and been forced, under threat of death, to cover-up their satanic serial murders –never having known the true identity of her Nazi German torturer George H. Scherf, Jr., alias George Herbert Walker Bush:

In 1990, I wrote a report for DCI Webster about the national security threat caused by having Bio-warfare Labs and recommended that they all be closed. The records from the Fort Detrick Lab showed that a vaccine against the HIV virus had been developed. It had been given to many members of the Cabal at a White House Ceremony on a Summer Solstice, in about 1983. The next day a big lot of HIV infected units of blood were shipped to kill blacks in a war-zone in Africa. The existence of the vaccine was kept secret. That secrecy was continued even after I recommended in my report that immediate worldwide vaccination begin. It was a crime against humanity to infect people with the bio-warfare agent HIV…

Under Bush, Sr. I was forced to act in my medical capacity in a non-standard way when the White House pathologist died of less than natural causes and had to be replaced. My duties included faking autopsies that carried his signature as if he were still alive. These autopsy reports were used to falsify the causes of death, the location of death, and cover-up the crimes committed in the White House's torture chamber in the basement. Failure to adequately falsify an autopsy report had lead to the death of that pathologist. So it was clear what I could expect my fate to be if I did not do a better cover-up job than he had done. He was a pathologist at Walter Reed Hospital and all of the autopsy reports that I wrote up attributing the deaths to auto accidents, etc. were on that Army hospital's letterhead. The bodies themselves were incinerated in the White House basement, adjacent to the morgue. That the White House has a well-equipped torture chamber in its basement is not theoretical to me, I have been tortured in it myself. It is directly across the hallway from the morgue, a visible reminder to me as to the necessity for forging the autopsy records skillfully. Although I am willing to take stands that result in my being tortured by the US government I do so selectively according to an internal cost-benefit analysis that others might not understand.

During Bush, Sr.'s reign as President I performed 37 autopsies in the White House morgue. Many of those were children. Most of them had been tortured and then ritually killed with a knife to cut their heart out. Additional wounds were often symmetrical knife wounds in the chest and belly. Such symmetrical wounds are rarely seen in crimes of passion, or even pre-meditated assaults. They are almost always due to deliberate rituals of a satanic nature. To have seen so many of these wounds in a series of patients indicates that reverse Christianity was practiced at that location… [a military base not far from the White House.] I did at one point discuss the autopsies with then President Bush, Sr. in the Oval Office. I politely but firmly said that many of the

corpses that I was receiving in the White House morgue should never have ended up dead in the first place and that unless there were better controls on how people got there I predicted that there would be grave trouble. Bush, Sr. did not act surprised to hear of the traffic of corpses in the morgue; he was the one that had assigned me to do the autopsies in the first place. Nor did he question my report on the number of bodies I was seeing or on the mutilations that were in evidence upon them, which I outlined. He said that he would look into the matter and dismissed me from the room. The number of corpses did go down to about a fourth of what it had been previously, though otherwise there was no change. The mutilations that occurred before death as judged by standard forensic considerations continued.

Since I was later forced to take Bush, Sr. and Bush, Jr. on a tour of part of Yugoslavia during the war, while Clinton was in office, I have more than enough eyewitness testimony on reverse Christianity being practiced by the Bush family, including the killing of others on the battlefield and the eating of their raw hearts as a ritual sacrifice. Such matters are highly unpleasant to mention and I hope that the reader will forgive me...[19]

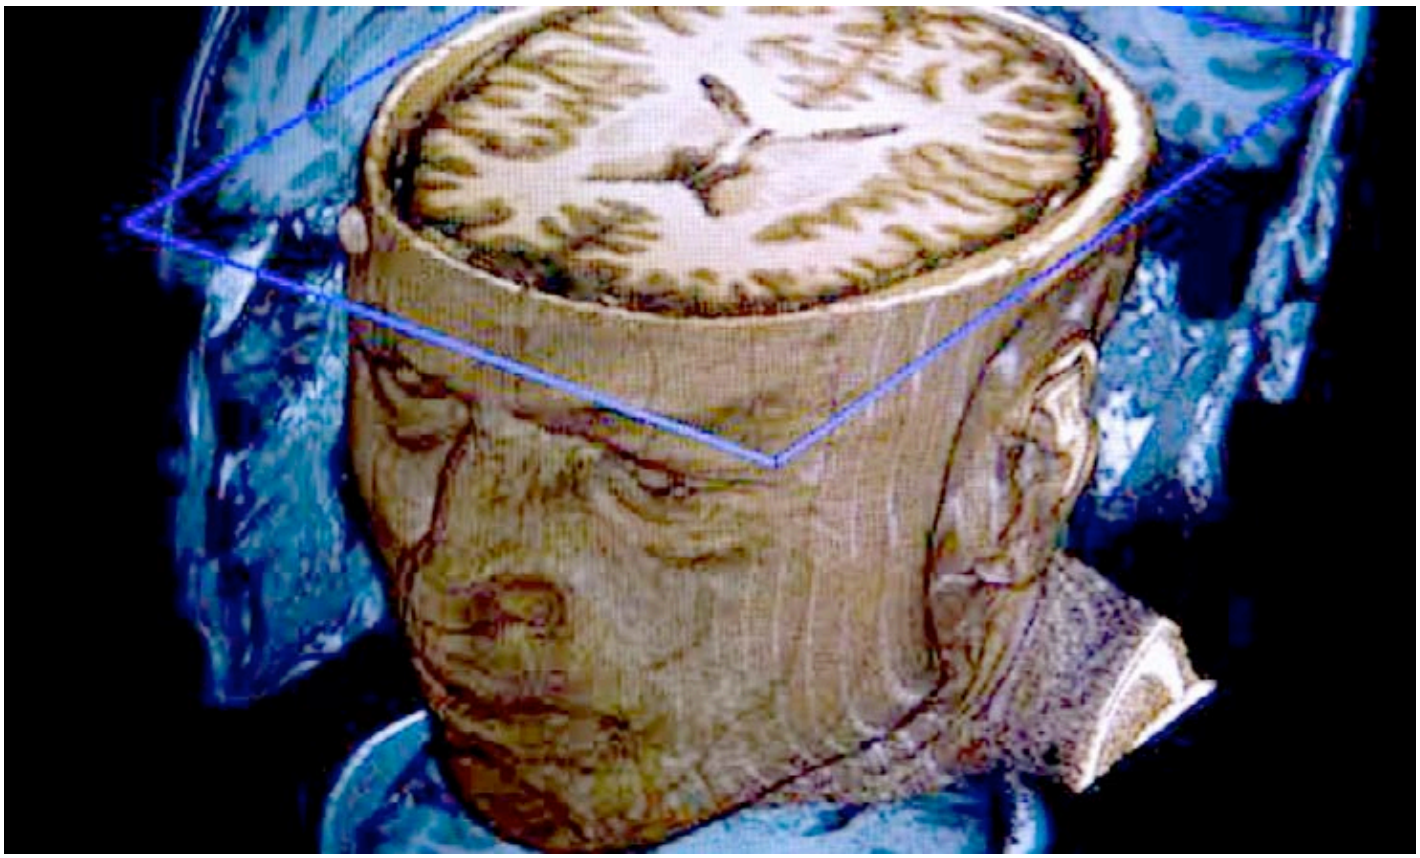
The suppressed eyewitness testimony of Dr. Arrigo is quite horrific, leaving nothing to the imagination by necessity. Arrigo's courageous web publication of the circumstances of her corporate enslavement by the CIA may well have preserved her life. The unpleasantness of the truth has hidden psychopathic cycles of behavior for long enough, and the time has certainly now come for *complete disclosure of the whole, ugly truth.* The very survival of the human species depends on the critical discernment of a global society traumatized by the false-leadership of tortured and hateful individuals like Adolf Hitler, George Scherf, Sr., his son George Scherf, Jr. and his grandson George W. After many decades of forced personal interactions with these psychopaths Dr. Arrigo has identified child slavery and generational sexual abuse in the Scherf (Bush) family, having also been verified by remote viewing assessment:

Bush, Sr. [with his father (above, left) and son (at right)] had a certain look of boy he liked, like the youngest boy from "Leave it To Beaver", Jerry Mathers. They looked like he looked when he was a boy before "it happened to him" at age six. He kept on sodomizing kids like his dad sodomized him. His father kept it up much longer than others can imagine. He kept it up until he was close to death. Some things run in families.

Would you want to see your dad if that continued to be what you had to submit to? Dark and ugly secrets that even the principals might not know—what with multiplicity being what it is. Bush, Sr. —does he even know that he goes to that [military] base [to commit serial murders] and why? I leave it to your remote viewing skills and imagination to decide. I was not at the CIA because of my ability to imagine what loose ends there were. I was there to know what loose ends there were and failing to know could cost me my life and more than that.[20]

It is a difficult task for a truly conscionable human being to comprehend the root of sociopathic behavior. The extreme prevalence of serial killers among Caucasian populations suggests that the Nazi eugenic goal of a 'pure Aryan race' may have been an effort, perhaps unconscious, to create a gene pool more apt to produce psychopathic individuals who operate socially without conscience. The term 'bloodliner' has been applied to psychopathic victims of generational sexual abuse, as in the case of the Scherfs –a designation that may be supported scientifically by a genetic predisposition to psychopathy among males with the YY chromosome (rare exceptions to the predominant XY). Otto Skorzeny exposed a multi-generational human reproduction experiment for the Fourth Reich repopulation of North America with secret subterranean Aryan populations *exceeding 20 million*. Skorzeny reported himself to be one of the elite 'inseminators' for the vast human reproduction experiment, now in its sixth decade, being conducted at the secret Nazi base in Glacier National Park, Montana and elsewhere below the bedrock of America:

Hitler's entire nazi Third Reich of 50,000+ have been living in secret underground bases throughout the United States, Canada, England, France and Italy ever since the "supposed" end of World War II. Hitler and his entire Third Reich of nazis have been actively planning for their New World Order or Fourth Reich in America at these secret underground bases. The initial 50,000 nazis have been reproducing like rabbits for the last 58 years. It is estimated that there are now more than 20 million nazis living in America above ground and below ground in secret New World Order bases. The 20 million does not include the millions more who are secret nazi sympathizers. American Citizens are forbidden to enter these US government-sponsored New World Order nazi bases under penalty of death. Secret bases [include]… Area-51, NV; Camp Hero Montauk, NY; Las Cruces, NM; Wright Patterson "underground" Air Force Base, OH; and the secret hollowed-out mountain base in Glacier National Park, MT. [The secret entrance to the Glacier Park, Montana base is circled above.] Inside of these "forbidden" bases lie complete replicas of Berlin, Germany… [built within] underground rooms the size of ten football fields that house the stolen Jewish Holocaust "cache" of trillions of dollars, gold and gold artifacts. New World Order SS nazis are allowed complete access to these secret underground bases. These nazis are encouraged to visit each secret underground base as often as possible. However, no cameras are allowed and they must sign an oath of secrecy. If they break their oath, they are killed!



> Each New World Order nazi is allowed access to the “gold rooms.” He or she is allowed to “wallow” or “swim” in piles of gold coins that reach as high as the ceiling. They are allowed to wear any of the stolen Jewish gold jewelry including crowns, rubies, sapphires, emeralds, diamonds, et al. The only “catch” is that they must only wear their underwear while in the gold rooms and they are not allowed to remove any of the stolen gold or treasure from these rooms nor the underground bases. They are x-rayed as they leave the “gold rooms” and given a fresh change of clothes to put on. Along the streets of the fake underground “New” Berlin, there are shops just like the real Berlin. However, everything is free there. In this illegal underground New World Order, New Berlin, Tesla’s free-energy devices are used everyday including Tesla’s antigravity, optically invisible, flying disk. There are at least 500 secret underground New World Order bases around the USA and thousands more in Canada, England, France and Italy. There are also underground ski mountains, with snow and gondola lifts that resemble the Alps, at these secret New World Order bases. It’s like an underground nazi Disney World down there.
>
> In these underground New World Order bases there are “Aryan Breeding Rooms” or free brothels. There are thousands of beautiful “brain washed” women and kidnapped underage teenage girls from around the country there to “service” the men. The New World Order nazis want the “seed” or “sperm” from their old Third Reich SS nazi leaders to implant in their young brainwashed– “brainless”, “Aryan” baby-breeders to help populate “their” new world with “pure” white Aryan babies. These babies will grow up to “rule” the United States of Germany, “formerly the United States of America.” Skorzeny claims to have made more than 20,000 “personal” donations. According to Skorzeny, unlimited amounts of free drugs and free German beer are available at these secret New World Order underground bases.[21]

The vast implications of the confessions of Nazi principal Otto Skorzeny are quietly spreading among the American people through the work of Erik ‘Orion’ Berman, whose detailed information completely corroborates the testimony of Dr. Sue Arrigo and the hundreds of the other published testimonies of the survivors of child torture in covert US government and CIA operations. Berman explains the origins of the well-known nicknames of George Bush, Sr. as inside jokes even more revealing of his habits than his first now-famous nickname (‘Curious George’): “Skorzeny claims that George H.W. Bush was/is a heroin junky. He was constantly “smacked-out” to escape his guilty conscience! That’s how he earned his nickname “Poppy!” [22] George’s true German identity, George H. Scherf, Jr., is insinuated by another insider nickname that has been leaked– “old ‘kraut” (a derogatory term for German “Sauerkraut-eating” people). While both Skorzeny and Berman have expressed hatred for George Scherf, Arrigo responds with pure spiritual compassion for her torturers and handlers due to her clairvoyant pre-viewing of their pain and suffering in future incarnations (selected by the higher self for atonement).

How can this chain of generational psychopathic control be broken for the survival of humanity during times of drastic environmental change? *The technological solution is ready and waiting to make use of truly abundant fuels like water and focused infrasound*, to be holistically employed at pyramid sites by current and future generations. As well, Sue Arrigo provides us with a spiritual solution to dealing with torturers –creativity and compassion: “Torturers are often very tormented people who cannot stand change because they are emotionally fragile. That emotional fragility is the result of causing others to be emotionally fragile.” [23] Arrigo’s perception of how fragile her controllers are themselves, allows her immediate forgiveness and compassionate response to the extreme pain they inflict upon her:

> One knows that one is in God's hands and surrenders to that. In some sense it brings greater peace than one's daily life because one has no choices to make --everything is out of one's hands and in the hands of God. Really, that is always true. But I am much more aware of it when I am being tortured. Being tortured does not mean that God has abandoned one. Pain does not mean that. Suffering does not mean that.
>
> So, how can one find God's Love and Care in the midst of great pain and suffering? One finds it by inviting it into your heart to give to those who harm you. As long as you do not want them to be free of suffering and have it alleviated completely by God, you cannot get God to completely alleviate your own suffering. But at the moment that one says to God, "Even though I am suffering terribly, please have mercy on these men and relieve their suffering first" then God hears your prayer. You have to be sincere in it. You have to put the welfare of your tormentors before your own welfare… this is the one True Path that I have found to deal with suffering and torture. All the saints can tell you that Christ spoke truly and wisely and pointed out a True Path to God's Mercy by saying "Love Thy Enemy as yourself"…[24]

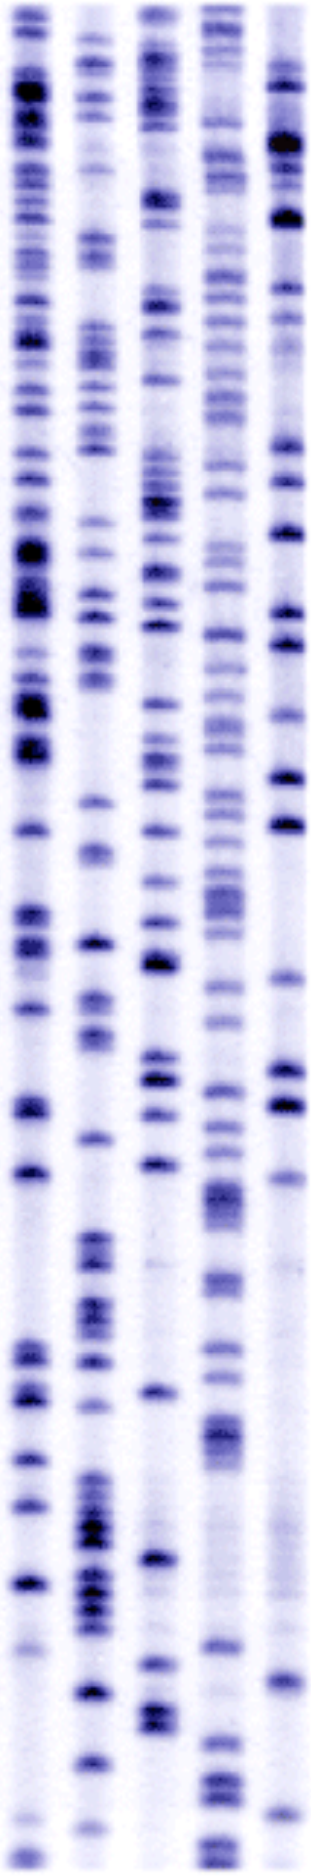
Sue expresses the essence of compassionate thought and action by projecting, instead of fear, a deep love for the emotionally handicapped who serially hurt themselves and others. Arrigo identifies an insidious sociopathic cycle that must become widely recognized and understood from a scientific perspective. Analysis of neural activity in psychopaths has revealed significant differences from healthy human function, by which psychopaths may be quickly identified. Empathy tests have conclusively demonstrated that emotive response to facial expression is much lower in psychopaths, and that in particular, fear is processed quite differently than in healthy individuals. “Both groups had increased activity in brain areas involved in processing facial expressions in response to happy faces compared with neutral faces, but this increase was smaller among the psychopaths. By contrast, when processing fearful faces compared with neutral faces, the healthy volunteers showed increased activation and the psychopaths decreased activation in these brain regions.” [25] *Psychopaths are unable to process the fear and distress of others.*

Arrigo’s torturous lifetime entanglement within the psychopathic command structure has afforded her several precious opportunities to investigate the system from the inside. Her willful and penetrating investigations from within the Rockefeller Archives and CIA databases reveal a genetic control mechanism that has ensured the spread of psychopathic genes within the global Nazi crime syndicate – or as Arrigo refers to it: ‘The Family Business of the Rothschilds, Rockefeller, Hitler, Bush, and Clinton’:

> This slide is from the same CIA computer showing the distribution of the profits from the Contra drug running. You see there that 47% of the profits from it are going to David Rockefeller and 12% to other Rockefeller family members. Then notice that 11% is going to the Rothschilds, 7% is going to the Bush family, 4% to the Clinton family, and the rest mostly to other families in Skull & Bones and related Satanic groups… It is quite curious to find the Clinton family on the list so soon, as Bill Clinton was not President yet. However, reading the book ‘Barry & the Boys: The CIA, the Mob and America's Secret History’ about CIA operative Barry Seal helping drop the bags of cocaine into Meno, Arkansas where Clinton was Governor and part of Rockefeller's drug running cover-up will help explain that.
>
> Also, if you look at the DNA of some prominent members of [the Bush and Clinton] families you find that they are illegitimate children of a Rockefeller. The DNA pictures came across my desk at the CIA because David Rockefeller was trying to figure out how to always have a Rockefeller in the White House without the public

knowing about it… The Rockefeller family has a long tradition of sleeping with other people's wives as part of an initiation ceremony into making the husbands part of their business family. The deal is that the Rockefellers will only shower financial blessings on the man after his wife has given birth to a male child. DNA testing has made that easier for the Rockefellers to monitor that aspect of the devil's agreement…

Here is a slide showing the Rockefeller genes, distinguishable by this rare distinctive banding pattern on chromosome number 12 and also on these other 2 chromosomes. Here are those same exact patterns from blood taken from Bush, Sr. and Jr., Bill Clinton, and John Kerry who were all members of the death worship and sexual perversion cult called Skull & Bones.



The illegal activities of the CIA are a "family business"; the Rockefellers are related to the Rothschilds by a similar mechanism. The Rockefellers are the American branch of the Rothschilds and only became rich and prominent when the Rothschilds began funding them during the American Civil War. See 'The Conspiracy Explained' about the Rothschild maneuvers to start that Civil War in order to prevent American competition to his power. He funded the Rockefellers as his down-line to help control America.

Here is a slide of the DNA showing that the Rockefellers are related to the Rothschilds and here is the slide showing that Hitler's father was the illegitimate son of Baron Rothschild and Maria Anna Schickigruber… The DNA sample for Hitler comes from a semen stain on a piece of clothing kept by a Jewish woman in WWII, rather like the Monica Lewinsky dress. The German Secret Service killed the woman for trying to seek justice, but her underwear were preserved in a later Stasi file as a piece of historical memorabilia from the war. Officially, there was an edict in Nazi Germany against having sex with Jewish women; it was an edict which was variably enforced. Had she been raped directly by a Rothschild and not Hitler, she could have gotten hush money, not death, for her troubles.[26]

Arrigo's detailed recollection of her previous insider investigations into the CIA-controlled genetic evidence provides us with essential information that will eventually be corroborated by independent findings. These precise details regarding the distinctive chromosome 12 banding pattern of the global crime family members will be an invaluable resource for the future prosecution of their serial genocides, committed consistently for the more than two centuries since their global banking monopoly was established. While Arrigo's contention may not be proven for some years, there is much corroboration for her claims in not only the activities of this sordid group, but even hidden in their own beguiling statements. Former Presidents George and Bill had a little insider fun with the press, joking about their close brotherhood at a high-priced media event in Toronto, Canada held on Friday, May 29, 2009:

Former US President George W. Bush says ex-President William J. Clinton never criticized him as both leaders followed similar policies in their tenures… The two leaders rubberstamped each other's policies, agreeing that little differences existed between the two... Bush supported Clinton's silence during the 1994 Rwanda genocide in which over 800,000 thousands Tutsis and moderate Hutus were slaughtered. He backed Clinton's notion by admitting that the quick mobilization of 20,000 troops was not feasible at the time… Clinton, for his part, praised Bush for his 'diverse' cabinet picks… Tickets for "A conversation with Presidents George W. Bush and Bill Clinton," were sold for C$200 to C$2,500 as hundreds of opposition had staged a rally outside the heavily guarded venue. Commenting on the financial benefits of the forum, Bush said, "President Clinton and I used to believe in free speech... So thanks very much for coming - we are glad you're here." *He also called Clinton a 'brother'* for the amount of time he spent with the Bush family…[27]

George calling Bill his brother may prove to be one of his few accurate claims. Not only are Clinton and George W. both cult members of the Skull & Bones 'Brotherhood', *they are also both direct descendents of the Rockefellers and the Rothschilds!* Playing with the double meaning of words like 'brother' creates a plausible deniability that the global crime family enjoys in public. Another famous 'insider joke' that Bush Jr. often plays with media involves flashing the satanic horns hand sign under the guise of supporting a sports team from Texas. While the intentions behind the hand signals of George W. will remain obscured, the genetic relationship between George and 'brother' Bill *will certainly become public knowledge*, revealing the perverse truths behind their sick insider jokes.

The genetic information retrieved and published by Dr. Arrigo, at great personal risk, will no doubt form the beginning of a more lengthy genetic study of this psychopathic 'bloodline' to its roots in the Ashkenazi ancestral lineage of the Khazars, a Caucasian sect of Jews.[28] One may not find it surprising that the families promoting Aryan eugenics are themselves examples of a genetic line with an inherited neurological deficiency –*psychopathy*– who must be removed from decision-making positions in society. The attempt of psychopathic human beings to institutionalize psychopathy in the rest of humanity cannot proceed unchecked.

Neurological deficiency resulting in psychopathic behavior has governed humanity for millennia. Technological advances can relieve this disturbing influence on human development. Brain scanning during empathy tests can be applied to uproot psychopathy in human leadership, while scientific investigations of rebirth may also enable the recognition of advanced capabilities among us. Likewise, the teaching of karma and reincarnation can be scientifically applied to recreate our world in that powerful circular awareness, allowing future generations to be free of the psychopathy that has come to dominate world politics and international relations by subversion. Individuals presently entrapped in cycles of slavery and torture may be reborn into a healthy infrasound environment where group telepathy prevents hidden abuse, and the great potential of all reincarnating souls may illuminate the collective human experience.

The present shift of the Ages signals the return to the life path that the prime Creator has set out for humanity, with our bare feet in contact with the Earth in conscious awareness of the underlying unity of all Creation. The quantum physics of resonance and the indigenous ancient wisdom now seamlessly inform humanity of the unfolding planetary shift to a four-dimensional resonance currently bleeding through in a pattern of widening focal points that already require evacuation. Piezoelectric firestorms caused by infrasound are destroying all modern metal machinery in resonant focal areas and at high altitudes, *proving all nuclear facilities, warhead stockpiles, satellites and space stations to be ill-equipped to handle the surging planetary infrasound levels.*

The specific and crucial warnings of spiritual scientists and indigenous Elders must be heeded if humanity is to emerge safely from the present threat of global catastrophe. The American people and indeed the whole world must inform themselves of the lethal dangers of high-frequency radiation and the *currently available* resonant health technologies based on ayurvedic pyramids and the human heartbeat. Water purification and treatment with gold and silver colloids must be put to the immediate use of all of humanity, including both the free energy and curative applications of HHO plasma. The quadratic function [$z_{n+1} = z_n^2$ modulus n] is the universal key to unlimited cosmic energy for the relief of all human suffering.

All of the world's sacred sites, including the Vatican, the Temple Mount and Mecca, are aligned within the same pyramid infrasound resonance network, having been built atop more ancient sites marking the entrances to vast artificial underground realms. All of the world's religions have rebuilt themselves using differing interpretations of what once occurred at these resonant sites, quarreling over divergent terminology. Indeed, it was the strict control of these entrances that has been enforced through religious possession of the sites and the manner of their use. The bioelectric and consciousness enhancing effects of focused infrasound at these sacred sites are, in fact, achieved through resonant architecture using piezoelectric stone in the proper alignment with the precise standing wave pattern projected by the Giza pyramids, expressed as [$z_{n+1} = z_n^2$ modulus n]. The power of human thought is found in unity.

The human enlightenment is already occurring among our children, who are now developing advanced capacities and accessing memories of their prior lifetimes, signaling a broader awareness than has been accessible to previous generations. Spiritual sensitivity is now ambiently endowed by high-amplitude infrasound during a child's development. Ayurvedic wisdom teaches that gold and silver nanoparticles enhance vitality in all life forms by eliminating only pathogenic organisms like viri and bacteria in atmospheric and cellular environments, thereby acting as agents of global atmospheric purification and transformation. The optimal conditions for fetal development are achieved by water birthing in electrum colloids in the presence of a healthy 1.45 Hz heartbeat resonance. The resulting physiological changes include a subtle occipital enlargement of the cranium that reflects a broadening bandwidth of perception, imbuing sensitivity into the infrared and ultraviolet portions of the spectrum.

The deepening Earth resonance and strengthening magnetic field allow for the reincarnation of advanced spirits among our emerging generations. These infrasound conditions of enhanced gravity facilitate alterations in consciousness by synchronization resulting in high intelligence, synesthesia, telepathy and comprehensive use of the holographic capacity of mind. Thousands of children around the world are astounding their parents by speaking of past life memories and advanced spiritual knowledge far beyond the scope of their present life's experiences. Recognizing these special leaders of the new planetary resonance will facilitate our global transformation toward a peaceful and renewed collective consciousness, for, as the Native American Lakota say, "mitakuye oyasin" – 'we are all related'.

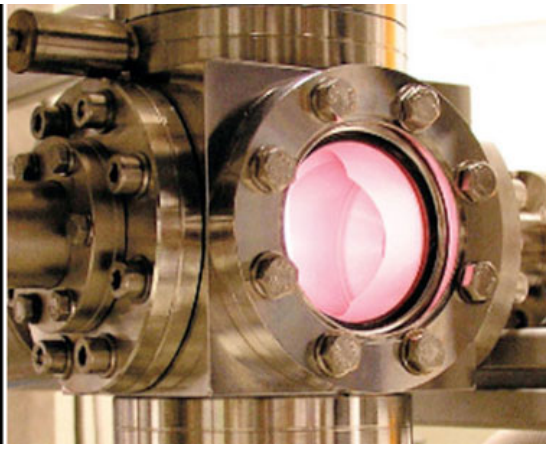
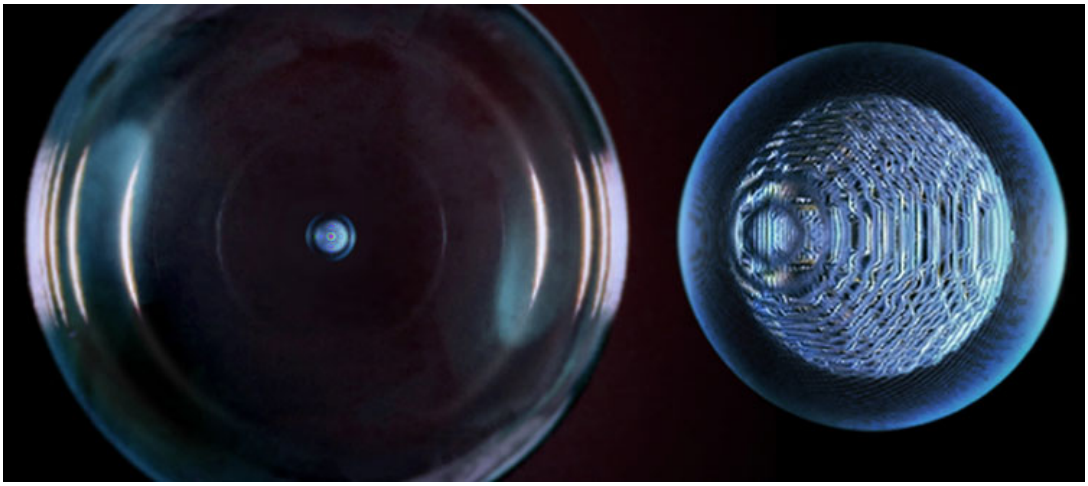
Resonant Transmutation of Metals in Human Blood



The Quantum Trappings of a Golden Age - Part 1

by Alex Putney for Human-Resonance.org
June 6, 2012 - Updated on October 28, 2013

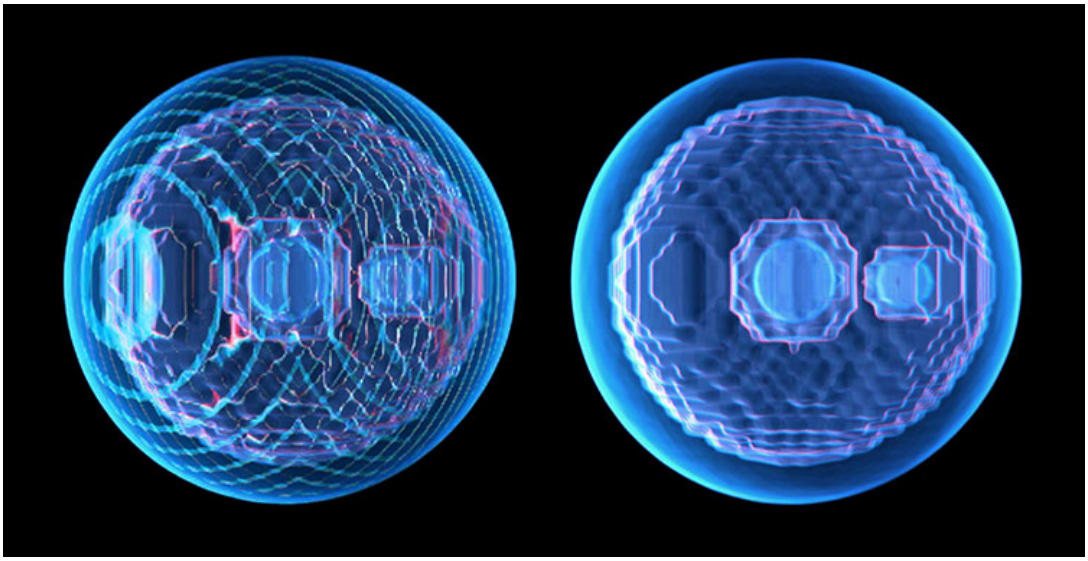
Intensifying atmospheric ionization has generated spectacular auroral displays in recent months, building toward solar maximum in December. Extreme weather conditions, severe thunderstorms, tornadoes and greater numbers of lightning strikes and auroral displays are being reported all over the world. What exactly takes place in these electron avalanches seen as plasma formations above the Earth that are mirrored by concurrent electrical storms in the atmospheres of all the planets in our solar system?



The broader effect of the significant net increase in atmospheric plasma formation is a more efficient cleansing of our polluted skies, through electrical chain reactions known to produce the abundance of nitric oxides and ozone crucial to the natural rebalancing of atmospheric gases. There is yet another, more essential purification of atmospheric hydrogen that takes place in sprites, jets and lightning strikes relating to the elimination of deuterium, a heavy isotope of hydrogen comprising 0.0156% of terrestrial waters. Deuterium content in atmospheric water vapor presents a vertical distribution gradient by gravity, with greatest concentrations of heavy water molecules near sea level, decreasing steadily with altitude.

The latest advances of modern atmospheric sciences and atomic physics reiterate the ancient wisdom of the Vedas, as well as the Maya culture of Central America, concerning the sacred purification processes of nature's water cycle. Sanskrit descendant cultures have built hundreds of monumental stone pyramids on every continent and island chain, forming a wireless network resonating at the 1.45 Hz heartbeat frequency and enhancing atmospheric water purity by resonant production of light water and the resonant elimination of heavy hydrogen isotopes from our skies. After centuries of disuse and dormancy, this advanced antediluvian technology of our Atlantean forbearers is now roaring back to life, with each progressive outburst of solar flares driving every atom of our planet into states of greater coherence.

Emulating atmospheric HHO plasma formation in quartz vacuum chambers, chemist/physicist R. Mills has developed HHO plasma reactors (above) that sustain excess energy production by implosion of hydrogen atoms to form *hydrinos*, in a complex process that has been validated by Rowan University researchers. Laboratory findings revealing the unique dynamics of HHO resonant-transfer plasma inform the atomic reactions of lightning. As raindrops and water vapor in the storm cell create an electrical pathway for the ionospheric discharge, water molecules are rapidly ionized, undergoing low energy nuclear fission of deuterium atoms into protium atoms, with the ejected neutrons numbering upto 5,000/m^3:



> Russian scientists... installed three neutron detectors that were sensitive to low energy neutrons: one above ground, one partially shielded in a building, and a third underground... The cosmic rays generate muons that collide with something in or very near the detector, resulting in neutrons that have the high energy of the muon being registered. Neutrons from lightning, on the other hand, can only have the energy given up by a fission event, which is then lost in collisions with molecules in the air as they travel to the detector... In the previous experiments, it had been assumed that each detection event corresponded to a single neutron, [whereas] the new data show that up to 5,000 neutrons per cubic meter are produced every second by lightning strikes...

The plasma formations of lightening and aurora have been replicated for study. At Blacklight Power, Mills has defined the high-energy states of hydrogen as an implosion process that releases vast amounts of energy through emission of infrared and ultraviolet light. During the formation of HHO plasma from water vapor, heavier deuterium isotopes are resonantly converted into protium as neutrons are ejected from the nuclei, represented by the conversion equation [$D^2 = H^1 + n$]. *Densely concentrated resonant nuclear transmutations of deuterium into protium remain the only viable explanation for the origin of neutron flux released by atmospheric HHO plasma briefly generated during lightning strikes.*

Precision tuning of this resonant conversion process of deuterium into protium allows bulk purification of drinking water for human consumption, as even slightly deuterium-depleted water has been observed to reduce and kill cancers, as well as significantly reducing rates of cellular aging. Significant extension of the average human lifespan will become measurable as light water becomes publicly available.

Nuclear fission reactions of deuterium in lightning have not been previously identified, yet deuterium fusion reactions within metal substrates have been widely reported. The low energy fusion of deuterium atoms to form helium within a palladium lattice produces excess heat during electrolysis with heavy water, while later experimentation achieved slightly greater efficiency by applying electron polarization. An emerging understanding of the complex nuclear dynamics of resonant conversions of lighter gases into heavier gases promises a full revelation of the atmospheric balancing processes protecting all life.

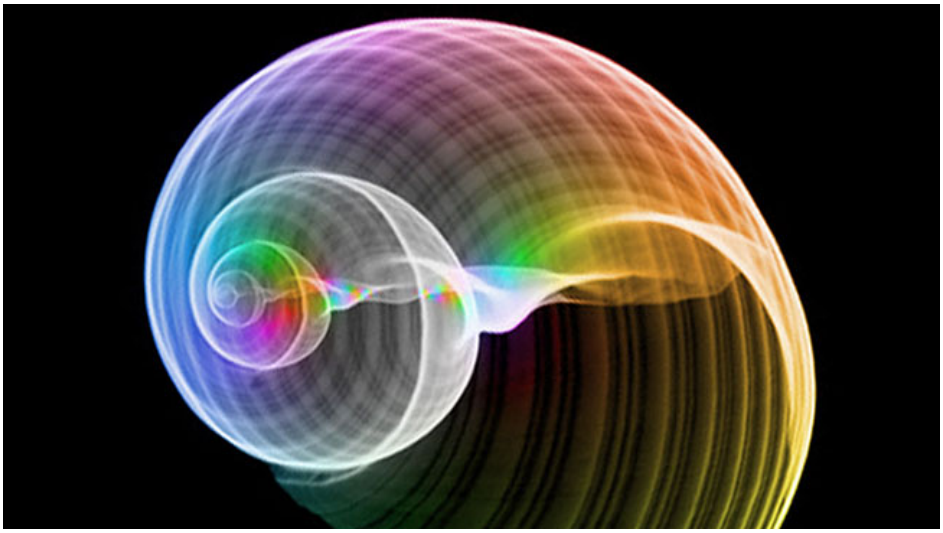
Mathematical modeling of the nuclear recombinations that occur during low energy atomic reactions has been achieved by applying the nonhomogenous Burgers equation for nonlinear standing waves. Accurate visualization of the deuterium nucleon describes the standing wave fields surrounding the proton and neutron, solved as the 'Two-Body Distribution Probability of a Nucleon' (above, rendered by R. Zirbes).

The standing wave structure of the electron was predicted by this author after research into Sanskrit mandala artifacts from La Maná, Ecuador in 2004-07 that display ultraviolet fluorescent inlays encoding the quantum quadratic function [$z_{n+1} = z_n^2$], being closely related to the Mandelbrot set [$z_{n+1} = z_n^2 + c$], and directly observed for the first time by Swedish researchers in 2008. Ancient Vedic knowledge of nonlinear standing waves underlies all of the holistic consciousness technologies of our deep past and imminent future, *opening the door to resonant processes for converting one element into another.*

The natural abundance of pure metals present in Earth's atmosphere and lithosphere appear as solid deposits and reduced particles of all sizes. Microbial and oxidative processes constantly reduce metal surfaces into nanoparticles, while geological forces liquefy and separate metals by density. Extensive interdisciplinary study has revealed that both *geological* and *biological* processes induce low energy atomic nuclear transmutations at specific resonant temperatures, in the presence of specific gases.

Extensive investigations by French biologist C.L. Kervran (1901-1983) revealed the natural simplicity of biological transmutations occurring in multitudes of vital processes by replicating nuclear conversions as simple electrochemical reactions *in vitro*. [Kervran, CL (1964) 'Transmutations A Faible Energie: Synthèse et Devéloppement' Libraire Maloine; and Kervran, CL, tr. Rosenauer H&E (1972) 'Biological Transmutations' Swan House Pub. Co.]

Kervran defined resonant nuclear reactions *as reversible, and involving both fusion and fission events between gases, metals, nonmetals and earths.* His simple *in vitro* demonstration of the oxygen-dependent low energy atomic conversion of carbon into iron was reported in 1962, wherein ultrapure carbon rods were used as electrodes in an aqueous discharge system. *Sediment analysis confirmed the fusion of two carbon atoms with two oxygen atoms in the formation of iron.*



Multiple government-funded investigations into recurring cases of fatal carbon monoxide poisoning of steelworkers in France were finally concluded with Kervran's definitive 1964 demonstration under controlled laboratory conditions that lethal quantities of carbon monoxide are generated during steel plasma-cutting processes over 400°C by low energy nuclear transmutations of nitrogen gas. The fact that carbon monoxide is not formed below this critical temperature threshold is consistent with advanced atomic resonance calculations derived decades later, *providing a basis for the determination of optimal temperature ranges for all such resonant atomic reactions that occur throughout natural systems.*

Kervran's groundbreaking studies of various other heat-induced atmospheric and lithospheric processes led to his identification of several essential nuclear transmutations -without which such processes cannot be understood- finding that *airborne pairs of nitrogen atoms readily combine to form silicon at the edge of the thermosphere.* A similar fusion event was identified in volcanic reactions where *pairs of carbon atoms merge in the formation of magnesium, while pairs of oxygen atoms merge to form sulfur.* The natural abundance of elements and the specific isotope ratios produced in thermospheric and volcanic processes provide compelling evidence for low energy nuclear reactions as the unified driving force of nature.

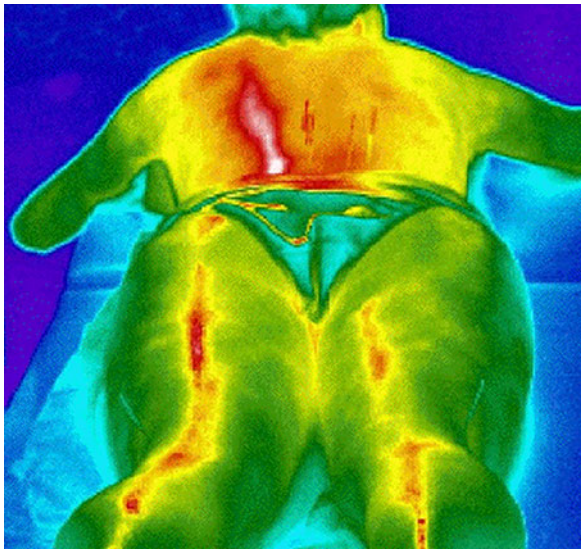
Various researchers have obtained significant evidence for biological transmutation as the origin of calcium from nuclear conversions of sodium, magnesium, potassium and silicon in a wide range of organisms that secrete calcium from one side of a membrane to produce protective shells. Experiments showed that avian and reptilian species deprived of dietary calcium were incapable of producing solid eggshells unless provided with a dietary source of silicon that was readily converted into the calcium required for normal eggshell development. Similar experiments with crustacean species deprived of environmental calcium sources revealed their ability to supplant calcium with magnesium to facilitate normal shell development.

Kervran also determined that calcium formation during tooth enamel and bone growth processes in all vertebrate species was mitigated by the same substitutive resonant nuclear reactions of *magnesium and oxygen fusing to form calcium*, as well as another notable reaction -carbon fusing with fluorine to form phosphorus. The reversal of the latter process was identified in the bacterial digestion of bone, with *phosphorus undergoing resonant fission into carbon and fluorine daughter isotopes.* The constant emission of fluorine gas during bone decomposition is relied upon in the dating of fossil specimens, yet its genesis as a fission product of bacterial digestion remains the only viable explanation.

Soil productivity is another area that Kervran's biological transmutation research has benefitted, after his unique findings concerning utilization of copper by wheat plants for resonant conversion into manganese. Initial attempts to increase manganese levels in wheat by the addition of manganese to soil proved fatal to test plants, while extensive trials by wheat farmers in Alberta, Canada confirmed Kervran's findings that supplementing soils with bluestone copper rebalances manganese and *doubled soil productivity.*

Kervran further applied his comprehensive findings to resolve many commonly misunderstood biomineral deficiencies in humans involving the biological transmutation of all essential elements as magnesium, calcium, manganese, iron, copper and zinc. *In fact, it is known that calcium deficiency and resulting bone-depletion cannot be reversed by calcium intake.* Calcium is now widely supplemented with magnesium, but the underlying mechanism can only be satisfactorily explained by resonant atomic transmutation. Hard evidence for fusion of magnesium and oxygen atoms is found in measurable Ca^{44} depletions in all bone.

An identical situation exists in dietary supplements manufactured for both iron and copper, which must be given together to achieve rebalancing of either essential element, as blood metabolism involves the resonant conversion of one element into the other. Comparative study of the three main varieties of animal blood --green, blue and red-- reveal distinct sets of nuclear reaction cascades taking place within narrow resonant temperature bands enabled by thermocline migration and thermoregulation strategies.



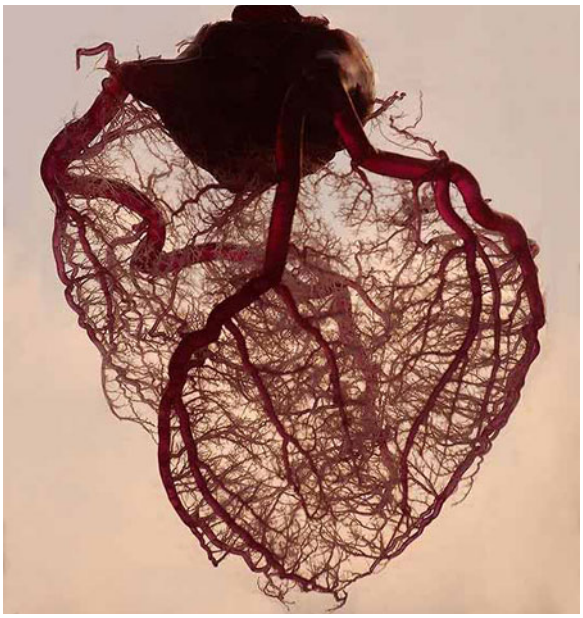
Cellular respiration processes in all green-blooded organisms, including ascidian, holothurian and sponge species, exhibit an alternate transmutation of iron that closely relates to those used by red- and blue-blooded species (vertebrates, cephalopods, gastropods and crustaceans). Fission of iron atoms forms titanium and vanadium in green blood while in red blood the fusion of iron and oxygen forms copper and in blue blood the fission of copper atoms forms oxygen, manganese and iron. When one considers that constantly cycling cascades of nuclear reactions underlie the essential functions of all biological systems, acting as radiant biological holographic projectors, all previously inexplicable animal and plant behavior displaying group synchrony and coherent mass communication can be understood as nonlinear biophoton field coupling effects occurring within the range of visible light.

Researchers Widom, Srivastava and Sivasubramanian have redefined the well-established properties of biophotons as products of atomic nuclear reactions, drawing conclusions that parallel those established by Kervran in their 2011 paper, entitled 'Biological Nuclear Transmutations as a Source of Biophotons':

> We have shown that soft multi-photon radiation from hard higher energy reactions sources can be employed to describe the three major well-established properties of biophoton radiation. Since the soft photon frequencies span the visible to the ultraviolet frequency range, the hard reaction sources have energies extending into the nuclear transmutation regime. Thus, the biophotons serve as a valuable clue as to which biological systems exhibit a large number of nuclear transmutations.

Kervran's observations of human skin and sweat gland processes inspired laboratory experiments in 1959 that clearly demonstrated the low energy nuclear fusion of sodium and oxygen to form stable potassium, which contributes to the overall biophoton emissions observed of human skin surfaces. This surprising resonant atomic reaction was later replicated by ionizing sodium vapor in the presence of oxygen under spectrographic observation (Torii, Sakurazawa, Odagiri, 1963; Ohsawa, Kushi, 1964).

Recent investigations of the ultra-weak visible luminosity of the human body have applied direct biophoton detection by ultra-sensitive light-amplified CCD cameras that accurately record subtle diurnal fluctuations in the distribution patterns within human biophoton fields over time. The re-emission of absorbed photons observed in living cells is identified as 'delayed luminescence' in the hours after exposure. Multiple sources comprise the perpetual and spontaneous biophoton emissions of all cells. Biophysicist F.A. Popp and his research team have reported remarkable series' of images of the weak human glow during traditional acupuncture and moxibustion therapies (below), clearly revealing the left-right symmetry of the healthy body and biorhythmic cycles of 14 days, 1 month, 3 months and 9 months.



Popp's focus has narrowed to investigations of the nonlinear photon trapping of DNA as a coherent broadband visible light biocommunication system, emitted from within the chromatin in the nucleus of each cell. *DNA base-molecules and surrounding cell walls act as quantum resonators, efficiently storing light by internal reflection of nonlinear standing waves. These findings inform a radical recharacterization of chromatin as an exciplex laser array, with DNA base pairs now recognized as 'excited complexes' that emit photon fields displaying constructive or deconstructive interference modes.* Studies found that DNA conformation and skin conductivity directly correlate with biophoton emission intensity.

Areas of the human body that emit the greatest intensity of photons (seen above in yellow, red and white) correspond closely to the circulatory system. Along with the heart, large superficial veins and arteries present the greatest biophoton emission and highest electrical conductivity in the body. Blood is more saline than other bodily fluids, and full of iron-bearing hemoglobin, contributing to a conductivity that is higher than the rest of the body's systems, acting as an extension of the electromagnetic field of the beating heart *by maintaining an electronically excited state exhibiting coherent oscillations:*

> Monitoring of spontaneous and luminophore amplified photon emission (PE) from non-diluted human blood under resting conditions and artificially induced immune reaction revealed that blood is a continuous source of biophotons indicating that it persists in electronically excited state. This state is pumped through generation of electron excitation produced in reactive oxygen species (ROS) reactions. Excited state of blood and of neutrophil suspensions (primary sources of ROS in blood) is an oscillatory one suggesting of interaction between individual sources of electron excitation. Excited state of blood is extremely sensitive to the tiniest fluctuations of external photonic fields but resistant to temperature variations as reflected in hysteresis of PE in response to temperature variations. These data suggest that blood is a highly cooperative non-equilibrium and non-linear system, whose components unceasingly interact in time and space. At least in part this property is provided by the ability of blood to store energy of electron excitation that is produced in course of its own normal metabolism.

Oscillatory excitation of the electronic state of blood by ROS reactions coordinates enzymatic activities and enhances the absorption of dissolved gases by metal nanoparticles in the blood, especially lithium, chromium, manganese, iron, nickel, copper, zinc and selenium. Hemoglobin within red cells acts as a reducing agent that synthesizes iron nanoparticles in the 2-5 nm range for optimized binding with oxygen during circulatory transport.

Precision control of the pressure differential of dissolved oxygen levels maintained between red cell membranes and the surrounding blood plasma is accomplished by temperature-dependent transport interactions with sodium and potassium cations. Kervran's elucidation of the electrically enhanced nuclear fusion of sodium and oxygen to form stable potassium occurs *under the conditions maintained in healthy blood, in conjunction with nuclear fission reactions induced by the phonon resonance of metal-bound oxygen atoms with hydrogen at rest.*

The indispensible role of absorbed oxygen atoms in the resonant nuclear conversions of *sodium into potassium* and *iron into manganese* directly implicates these reactions as primary mechanisms for blood's rebalancing of crucial metal concentrations, thus enabling effective utilization of a wider ratio of available metals to fulfill the well-known respiratory functions as well as the newly discovered biophotonic functions of blood medium.

This conclusion is directly supported by isotopic signature studies of trace metals in mammals and plants, which diverge significantly from the great abundance of dietary metal sources and those of all geological deposits. Trace copper isotope ratios in human blood consistently present a Cu^{65} variation of +0.30% as compared with non-biological copper, *being enhanced by the fission of zinc atoms to form copper.*

Isotopic shifts of iron in human blood enable gender determinations of partial skeletal remains, with male blood presents Fe^{56} depletions of -2.5% to -2.9%, suggesting heavier iron isotopes do not concentrate in the blood serum of females due to regular menstrual blood loss and the enhanced iron absorption that compensates for such periodic deficiency. This hypothesis is supported by findings that hemochromatosis, characterized by excess iron levels and heavy iron isotope concentrations, is alleviated by phlebotomy (the removal of blood). Such notable isotopic shifts that perpetually accumulate during blood recirculation implicate the atomic weight disparity as produced by perpetual resonant nuclear transmutations of iron.

The surprising conclusions established by Kervran's *in vivo* biological transmutation experiments have not been thoroughly followed-up by biophysicists despite the ever growing body of solid evidence for nuclear conversions occurring in all living organisms. The compelling case of biological transmutations informs the open questions of biophotonics by synthesis with the formulaic framework of phonon resonance developed by W. Lussage in 1965 and confirmed in microbial transmutation studies by J. Champion in 2001:

> Dimensional phonon resonance occurs when the space occupied by one isotope is exactly the same as that of another isotope in its rest state [i.e. 20°C]. This event can only occur under the following two conditions: the expansion of an isotope by heating, or the contraction of an isotope by cooling. Due to the natural characteristics of elemental properties, this event is extremely rare and one can only force the event under select conditions. To determine the phonon resonance of an isotope, it is necessary to apply the following formula:

$$\text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{d \times Na}{m}}$$

d - density in g/cm³
Na - Avogadro's Constant
m - atomic mass

$$\text{Resonant Temperature (°C)} = \frac{Ln\left(\frac{f(starting)}{f(target)}\right)}{Ec} + St$$

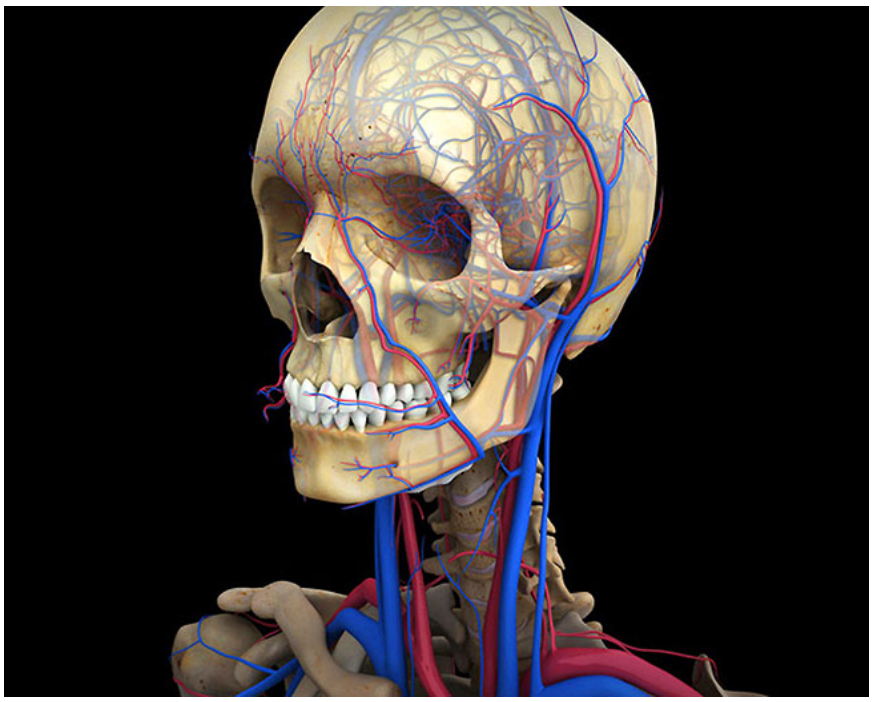
f - frequency in Hz
Ln - natural logarithm
Ec - expansion coefficient
St - standardized temp in °C

Phonon resonance calculations reveal the elusive quantum dynamics of lattice interactions that induce low energy nuclear reactions throughout the bodies of living organisms, as first identified by Kervran decades earlier. Precise calculations of the exact atomic diameters of various isotopes were only recently enabled by the careful determination of exact atomic masses, densities and linear thermal expansion coefficients for all known isotopes *-data that was not available during Kervran's discoveries of biological transmutations, and comprises undeniable evidence for his conclusions.*

Atomic data for each isotope applied in these calculations (in blue) was obtained from various updated sources, while the exact atomic mass figures are consistent with tables produced by the Secondary Ion Mass Spectrometer (SIMS) Laboratory of the GeoForschungsZentrum in Potsdam, Germany.

The evolution of red-blooded mammals has specifically exploited the phonon frequency interactions of gases and metals in the blood for producing excited electron states that have yet to be fully understood. Phonon vibration of individual oxygen atoms bound to iron atoms in hemoglobin enables the resonant atomic recombination process by instilling the target frequency of daughter elements.

Quite surprisingly, the atomic diameters of O and H atoms are relatively similar despite their difference in atomic mass, allowing for frequency matching possibilities near room temperature. As oxygen atoms are driven through repeating heat fluctuations by cyclical movement through the human body, frequency matching with hydrogen atoms occurs in the warmer areas before slowly dropping in the extremities. The resonant frequency of hydrogen (H^1) in its rest state is 3,773,180 Hz, according to the element's atomic diameter at 20°C. Oxygen isotope (O^{16}) resonates at this same frequency when heated to 37.8°C:

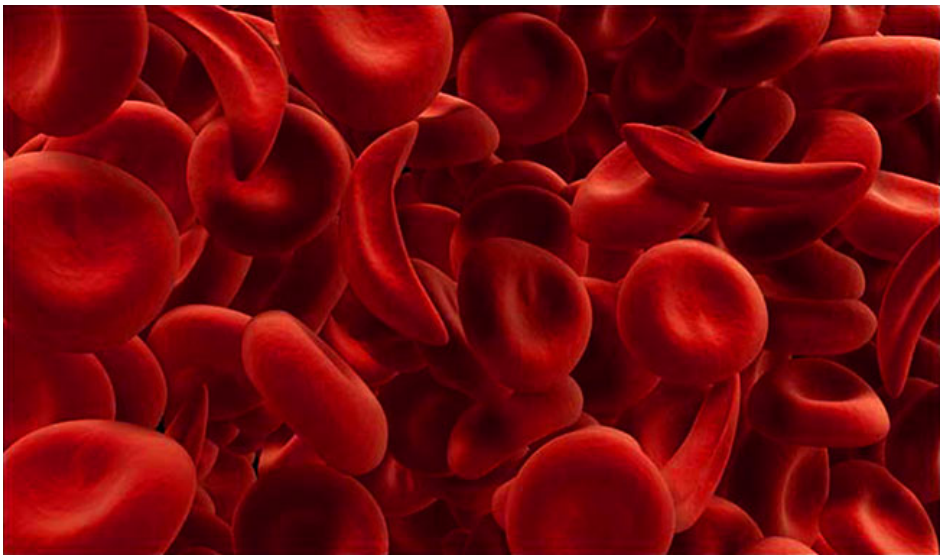


$$O^{16}\ \text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{0.001429 \times (6.0221 \times 10^{23})}{15.99491}} = 3{,}775{,}138\ \text{Hz}$$

$$H^{1}\ \text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{0.0000899 \times (6.0221 \times 10^{23})}{1.007825037}} = 3{,}773{,}180\ \text{Hz}$$

$$\text{Resonant Temperature (°C)} = \frac{Ln\left(\frac{f(\,3{,}775{,}138\,)}{f(\,3{,}773{,}180\,)}\right)}{0.0000291} + 20 = 37.8\ °\text{C}$$

Starting Element: Oxygen ($_8O^{16}$)
Natural Abundance: 99.762%
Atomic Mass: 15.99491
Density (grams/cm^3): 0.001429
Exp. Coefficient: 0.0000291



Target Element: Hydrogen ($_1H^1$)
Natural Abundance: 99.985%
Atomic Mass: 1.007825037
Density (grams/cm^3): 0.0000899
Exp. Coefficient: 0.0000366

Blood circulating within the heart and large arteries maintains temperature near 38.0°C, slightly elevated above average core body temperature near 37.0°C. This significant variance of blood from the mean human body temperature induces rhythmic thermal fluctuations in blood cells according to their cyclical transport from the warm heart to the slightly cooler extremities and skin capillaries. *During circulation, fission of iron atoms releases hydrogen atoms by phonon induction of bound oxygen atoms at 37.8°C*:

$$Fe^{54} + O^{16} \Rightarrow H^{1} + Cr^{53} + O^{16}$$
$$Fe^{56} + O^{16} \Rightarrow H^{1} + Mn^{55} + O^{16}$$
$$Fe^{57} + O^{16} \Rightarrow H^{1} + Fe^{56} + O^{16}$$
$$Fe^{58} + O^{16} \Rightarrow H^{1} + Fe^{57} + O^{16}$$

The narrow temperature requirement of the healthy human body are calibrated to the phonon frequency matching threshold of oxygen atoms with hydrogen atoms within the heme groups of erythrocytes. Recognition of this atomic reaction offers a new view of hemoglobin and myoglobin proteins as nuclear transmutation nanomachines, efficiently reducing iron nanoparticles into individual atoms for binding with oxygen molecules during transport, while electrical currents in the bloodstream dissociate iron-bound O_2 molecules to excite atomic recombinations releasing hydrogen. By this mechanism, nuclear conversion rates are enhanced by natural exposure to electric current through barefoot contact with the Earth.

Further studies of isotope variations in trace elements of the human body will identify specific contributors to exciplex photon cascades observed as biophotons. The wide variety of metals present in healthy human blood and their respective concentrations endow the fluid medium with complex resonant characteristics only now being recognized as phonon resonance dynamics of the metal crystal lattice.

The frequency matching 'architecture' of phonon resonance relationships maintained in healthy blood trigger the release of electrons that, together with ROS processes, excites the blood by a surprisingly rich variety of nuclear reactions that provide the first comprehensive explanation for the diversity of trace metals in blood. Reactions of iron and oxygen conform to a pattern also witnessed in the other elements.

The varied combinations of gases and metals in red blood present an array of potential reactions that may be occurring within the range of temperatures maintained by different portions of the human body, and requires thorough experimental confirmation in every case. Refining the volume expansion coefficients for gases will be an important step toward designing a comprehensive set of experimental procedures for determining the full hierarchy of atomic conversion cascades that vitalize the human body.

Thermoregulation in warm-blooded mammals is apparently calibrated to phonon relationship of oxygen with hydrogen. The pattern of resonant atomic reactions that best explains observed isotopic variations are listed for several other predominant isotope recombinations, following the same basic formula as iron:

$$Zn^{66} + O^{16} \Rightarrow H^{1} + Cu^{65} + O^{16}$$
$$Cu^{65} + O^{16} \Rightarrow H^{1} + Zn^{64} + O^{16}$$
$$Zn^{64} + O^{16} \Rightarrow H^{1} + Cu^{63} + O^{16}$$
$$Cu^{63} + O^{16} \Rightarrow H^{1} + Ni^{62} + O^{16}$$
$$Ni^{60} + O^{16} \Rightarrow H^{1} + Co^{59} + O^{16}$$
$$Ni^{58} + O^{16} \Rightarrow H^{1} + Fe^{57} + O^{16}$$
$$Mn^{55} + O^{16} \Rightarrow H^{1} + Cr^{54} + O^{16}$$
$$Cr^{52} + O^{16} \Rightarrow H^{1} + V^{51} + O^{16}$$

	Red Blood Cell Element	Reference Range (µg/g)
Pb	lead	< 0.90
Hg	mercury	< 0.10
Se	selenium	0.19 – 0.38
Mo	molybdenum	0.0005 – 0.0020
As	arsenic	< 0.010
Zn	zinc	8 – 14.5
Cu	copper	0.52 – 0.89
Ni	nickel	0.001 – 0.30
Co	cobalt	< 0.0010
Fe	iron	745 – 1050
Mn	manganese	0.007 – 0.030
Ch	chromium	0.0003 – 0.0060
V	vanadium	0.0001 – 0.0020
P	phosphorus	480 – 745
K	potassium	65 – 95
Ca	calcium	8 – 31
Mg	magnesium	36 – 64

Nominal concentration ranges for trace elements in human red blood cells reveal the presence of several elements in healthy individuals that can accumulate to potentially toxic levels (in red, above). The origin of exotic trace elements such as arsenic and cobalt generally present in the bloodstream may be explained by perpetual phonon-enabled reactions of oxygen bound with nickel and selenium at 37.8°C, where oxygen achieves resonance at the target frequency of hydrogen atoms at rest (20°C):

$$Se^{76} + O^{16} \Rightarrow H^{1} + As^{75} + O^{16}$$
$$Ni^{60} + O^{16} \Rightarrow H^{1} + Co^{59} + O^{16}$$

An interesting case of alternating isotopes of adjacent elements found in red blood cells relates to the relationship of potassium and calcium, which convert from one to the other in a cascade series:

$$Ca^{42} + O^{16} \Rightarrow H^{1} + K^{41} + O^{16}$$
$$K^{41} + O^{16} \Rightarrow H^{1} + Ca^{40} + O^{16}$$
$$Ca^{40} + O^{16} \Rightarrow H^{1} + K^{39} + O^{16}$$

Another similar relationship may be discerned in the case of the essential elemenets magnesium and sodium, occurring by the phonon induction of oxygen bound with magnesium in red blood at 37.8°C:

$$Mg^{24} + O^{16} \Rightarrow H^{1} + Na^{23} + O^{16}$$

These most abundant isotopes found in human blood are simultaneously converting within the same very narrow temperature band, revealing the essential role of phonon relationships among gas atoms in the bloodstream. Upon confirmation of these findings, one must inevitably conclude that the innate phonon resonance relationships of stable isotopes in adjacent element groups fulfill the primary purpose of providing all living systems with resonant temperature ranges for generating nuclear reaction cascades.

Resonant nuclear interactions of matter form the basis of life throughout the vast reaches of the cosmos, and warm-blooded beings similar to mammals on Earth likely inhabit innumerable galaxies by exploiting tuned nuclear reactions releasing photon cascades by multiple resonant metal conversions near 37.8°C.

This unmistakable pattern of phonon resonance conversions demonstrated between the predominant metals of human blood directly reveals the *primary fundamental principle* within the universal isotopic architecture of all matter that enables all living organisms to maintain excited states for coherent electro-photonic field communication. *These remarkable conclusions offer the only comprehensive explanation for the observed natural isotopic order and the precision temperature regulation of living organisms.*

The precise tuning of nuclear transmutations resonantly induced by the exact temperature of human blood provides a new biophysical framework for the integration of the ancient energy balancing practices of Asia, in addition to the Vedic *prana* development practice of sungazing known to all monumental stone builders worldwide. Modern sungazers practicing such ancient techniques include Anastasia, Sunyogi Umasankar, Hira Ratan Manek, Acharya Jowel and Dimbeswar Basumatary, *all of whom derive the majority of their energy directly from the sun while completely abstaining from the normal metabolic consumption of food.*

Ancient traditions of the Maya teach the initiate that *solar (photonic) energy of the heart is stored within the (DNA) serpent or 'coatl' for utilization by strict adherence to sacred cultural bioelectrification practices.* Biophysicists have already determined that *all cellular metabolic functions can be fueled directly by exposure to electrical current,* and it is now evident that drinking the celestial golden waters of the Maya in caves and at pyramid sites, *barefoot,* induces electroluminescence in gold and silver nanoparticles that scatter red and blue light within the body's cells.

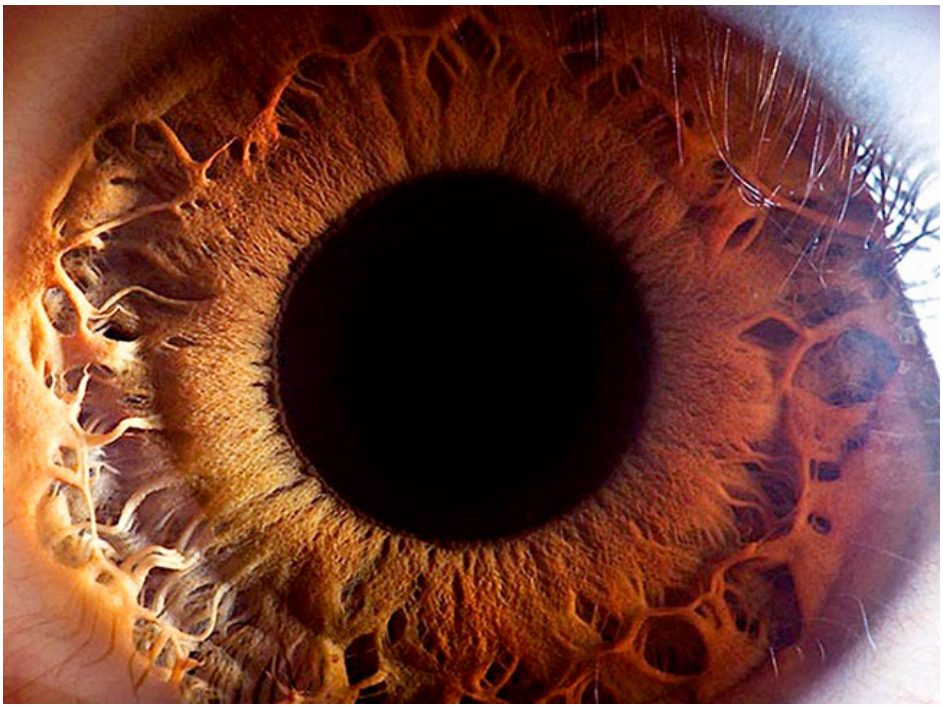
Intracellular luminosity is the key to enhanced vitality and the extreme longevity ascribed to the Atlantean masters of consciousness, who make the explicit acknowledgement that *'gold is immortality'*, referring to electrum colloids as the elixir *Soma*: "The man who supplies food hath always [his Soma] pressing stones adjusted, a wet Soma filter, well-prepared religious rites... he who hath this knowledge wins the luminous spheres" (Atharva Veda: IX.6). A Sanskrit descendant culture, the Maya preserved the Vedic calendar system (above) observing planetary cycles and resulting biophotonic cycles of 14 days, 1 month, 3 months and 9 months - a human gestation cycle. Maya wisdom explicitly states *human beings attain immortality by regular sungazing meditation at sacred temple sites, thereby engaging the eyes in completion of the solar circuit, absorbing and re-emitting photonic energy directly back to the sun:*

> Chalchiuhtlicue, Goddess of Terrestrial Waters, of that which flows, runs, surges, forward and down, arriving always at profounder levels. Chalchiuhtlicue swells the fruits and flowers only so that they may drop. Chalchiuhtlicue fills the gourd of pulque so that man may forget...

Tláloc, God of Celestial Water, god of the vapor that rises, from the earth warmed by the sun after the rains, god of the mist that ascends from the valleys at dawn, god of the water that returns to its source in the clouds that swim over the highest peaks, god of the humid incense from which rise the copal prayers and the prayers of sacrifice.

Tláloc is the return of vapor that strains to rise, is the return of time that strains to remember. Tláloc, God of the Fight Against the Current, with whose aid the hero battles against the torrent toward his own origin and beginning, towards the wings of his soul, the wings that Tláloc hides in the hero's past.

Quetzalcóatl, the Plumed Serpent, moves between gods and men, because Quetzalcóatl is God who permeates man and is the man that achieves God... The Plumed Serpent is born when that which slithers over the Earth grows wings to be elevated to Heaven. Quetzalcóatl is a superior man, the inner circle of humanity, the link between gods and men.



All men are made of earth, air, water, and fire... But in their hearts and in their semen, each man has his own coati, his own serpent, the energy of Tonatiuh, the power of the sun itself. And in this serpent sleeps consciousness, in this serpent is hidden his divinity. From this serpent his wings will grow.

There is an occult energy in the heart that comes from Tonatiuh, the sun, and if man releases it, returning it consciously to the sun, he becomes immortal. But to liberate this energy... man must sacrifice the desires and habits that he adores, sacrifice them in himself, and turn the knife against the enemy that he carries within himself, that keeps his heart a prisoner.

Well-preserved masterworks of painting and sculpture by Aztec and Mayan artists attest to their prolific intellectual life, with Gods representing the transcendent isotopic qualities of water and fire. Tláloc, God of Celestial Waters represents light water (and all that biophysics now attributes to the effects of protium on cellular longevity), standing in opposition to Chalchihutlicue, Goddess of heavy Terrestrial Waters.

Quetzalcóatl presents the spiritual path of superior man who adheres to sacred bioelectrification practices, depicted as the Eagle Warrior with tail plumes forming standing waves (above, right). The *k'ulthanlilni* serpent is depicted rising through the *chacla* (Mayan for 'kundalini' and 'chakras') to form wings as three lines weaving in helices along the spinal column *-representing the three frequency modes of nonlinear standing light waves stored in the DNA spiral. Floral mandalas adorn the wrists of ascending Quetzalcóatl, with tassels that can be clearly recognized as chromosomes, bearing coiled DNA strands* (above, at left).

Biophysical studies have recently reconfirmed ancient sacred knowledge that, indeed, *human eyes emit light*, as first observed in rat eye retinas and reported in 2010 (Wang, et al). Spontaneous biophoton emission measured by the researchers is comprised of soft photon scattering from continual atomic conversions pervading the network of fine blood vessels behind the retina, which forms a loose spiral centered behind each eye. The lens of the eye may not only focus environmental light onto the retina, but also focus ultra-weak biophotons re-emitted from the retina into a beam centered along the line of sight. *Such findings confirm Maya elucidations of the solar circuit completion by ocular photon emissions.*

Barefoot contact with the piezoelectric pyramid stones provides electrical currents that excite atomic reactions within the blood by *increasing the rate of molecular dissociation of gas molecules adsorbed to metal surfaces, effectively increasing the rate of gas absorption into metals.* Just as Qigong and Reiki adepts practice regular meditation in conjunction with barefoot lifestyles at sacred sites, related holistic energy balancing practices such as acupressure, acupuncture, cupping and moxibustion are resonantly amplified by sacred bioelectrification lifestyles that excite the body's nuclear transmutation processes.

Human consciousness is now experiencing a great expansion in global awareness concerning the advanced bioelectrical technologies of our worldwide Paleo-Sanskrit mother-culture, marking our rapid ascension into a renewed Golden Era.

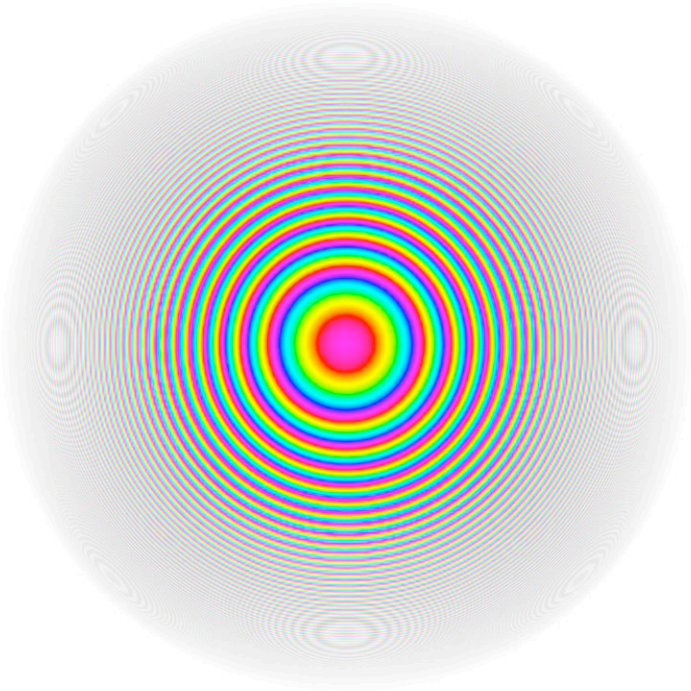
The greatest application of this advanced knowledge requires high-precision determinations for the entire Periodic Table of Elements, especially those values for atomic masses, densities and thermal expansion coefficients that inform a complete understanding of resonant vibratory relationships, *enabling frequency control of rare, naturally occurring phenomena such as acoustic levitation and nuclear transmutation.*

Geological observations regarding the prevalent formation of gold deposits within volcanic upthrusts of all kinds have been replicated in simple laboratory experiments that confirm the amazing resonant nuclear recombination process by which the elements that make up the Earth's mantle and crust are continually being converted from one to another.

Natural conditions presented by geothermal upwellings are responsible for converting silver into gold by resonant atomic transmutation reactions that are prevalent within hydrological vents known as geysers. Geysers are active hotsprings that spray jets of highly mineralized water and steam, and often form when groundwater seeping through bedrock fractures is superheated near magma chambers and forced to the surface through overlying fissures and pressure chambers in series.

Alexander Putney's 2013 invention of the artificial Geyser Reactor system applies the same elevated temperature and pressure fluctuations seen in natural geyser systems, while offering precise digital control of frequency tuning to maintain phonon resonance of silver atoms with the gold target element.

Geyser Reactor systems safely convert silver into gold at rates exceeding 70% during each 2-week cycle in operation!



The atomic mass of gold is roughly twice that of silver, resulting in a significant and permanant weight change within the metal as trapped gas atoms undergo nuclear fusion.

The Geyser Reactor specifications detail reactor assembly from widely available component parts to accommodate gold production goals on all scales. Multiple reactors can be connected in series to increase total gold production, capacity and operative efficiency.

Complete formulas and calculation sets are provided for conversion of silver into gold, precisely accounting for nuclear recombination patterns of both silver isotopes ^{107}Ag and ^{109}Ag, now easily replicated in properly configured phonon reactors.

Putney's essentially Vedic approach relies upon sets of key observations of many unmistakable patterns witnessed among both biological and geological processes, offering a renewed definition of complex vibratory relationships that vivify the luminous web of life extending throughout the cosmos.

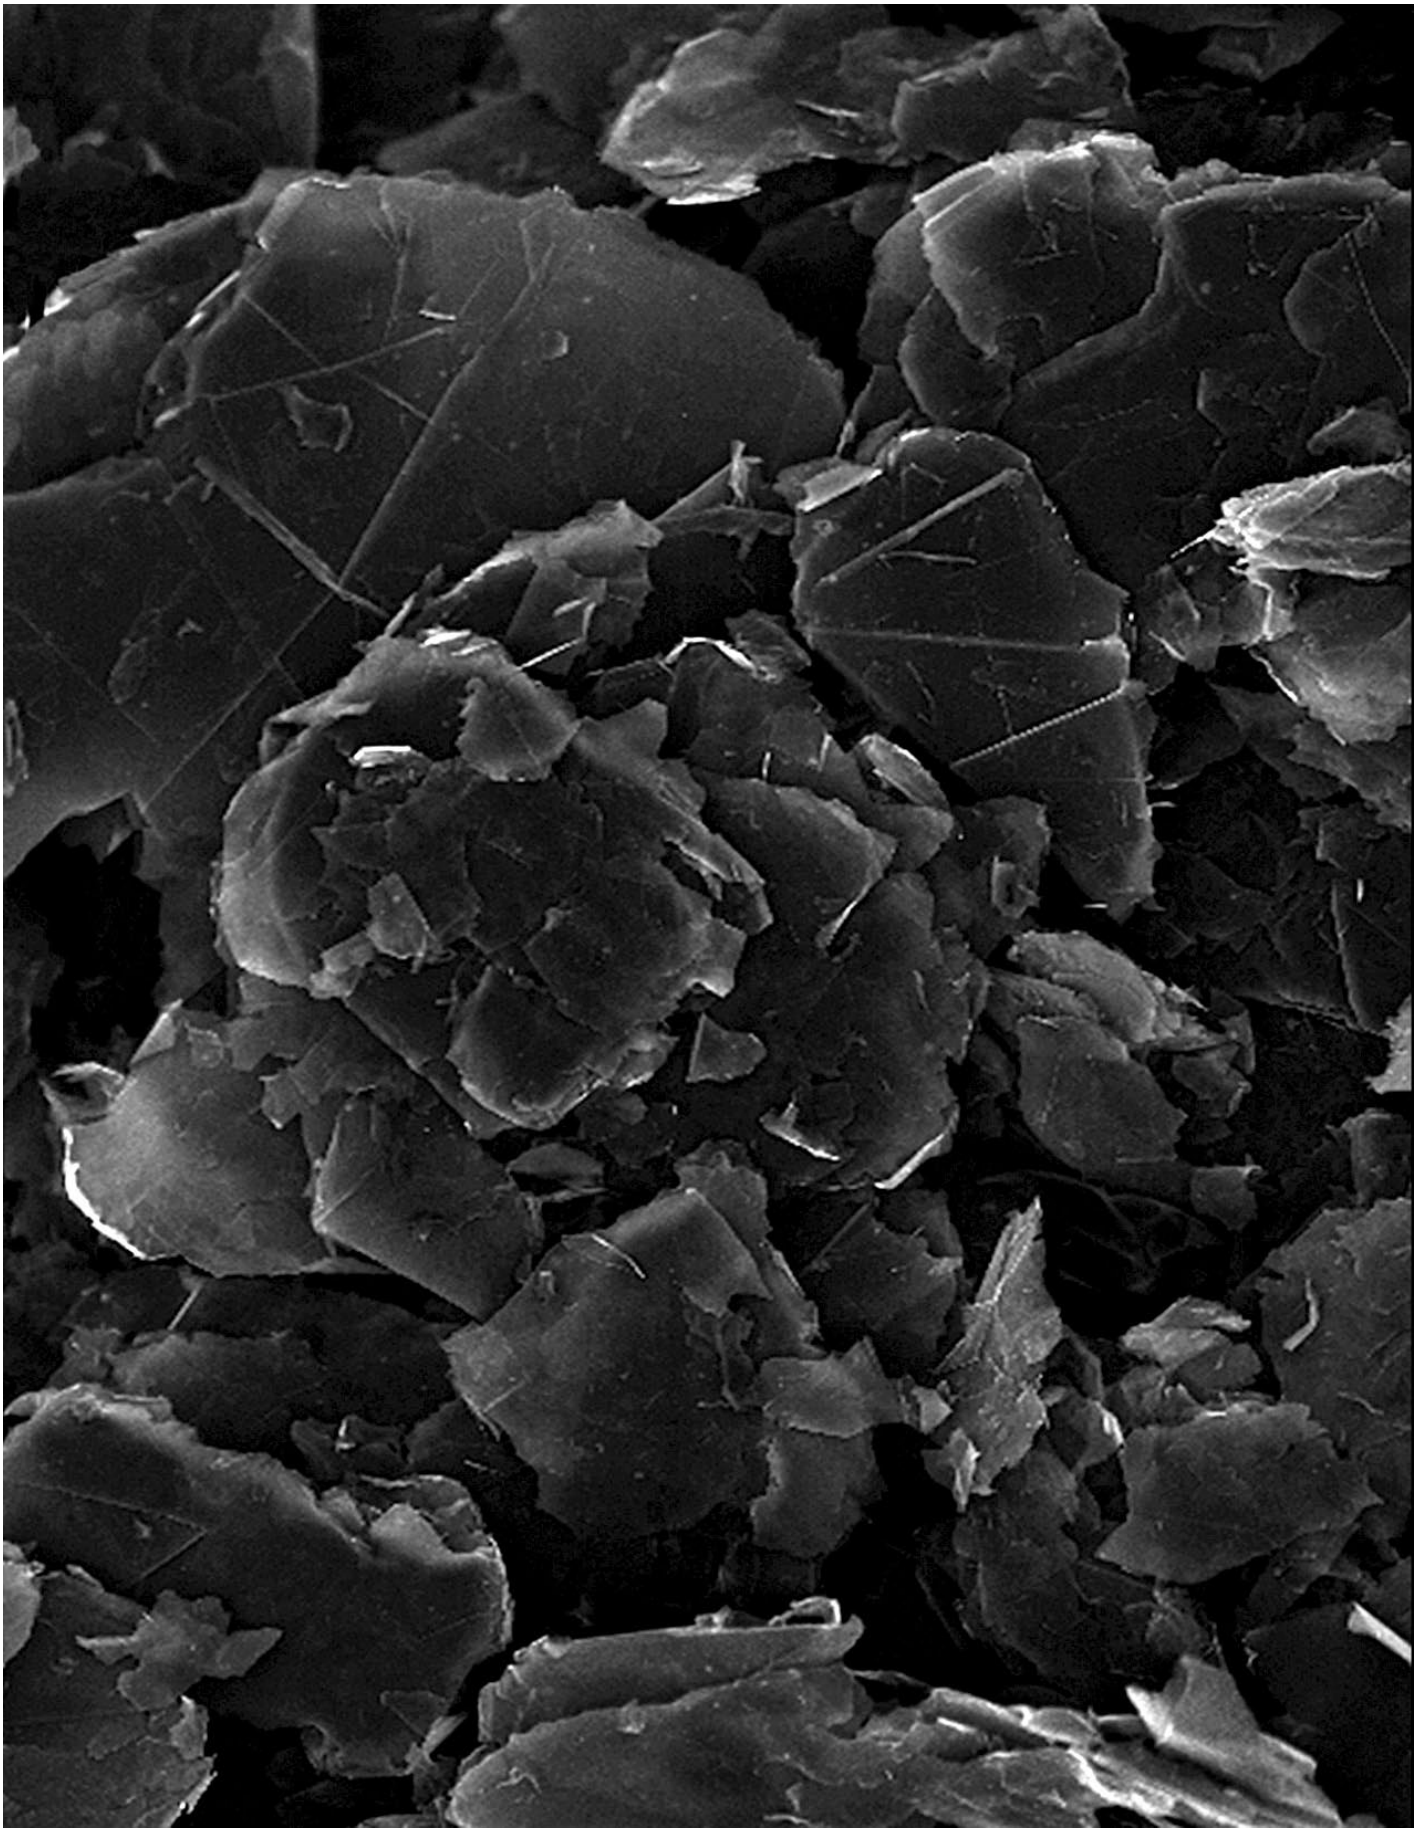
For our sacred Mother Earth

"The Mother bled. She had her period.
She was fertile and the world was fertile.
Her blood is gold. It in the Earth remains–it is fertility.
Gold and water; blood and water are
necessary for the life of all things."

~ Kogi Mamos

The Geyser Reactor

Great inventions often display a natural simplicity inspired by keen observations of the surrounding environment –meteorological, geological or biological. The remarkably simple Geyser Reactor system completed by Alexander Putney in 2014 (opposite) decisively refutes many long held misconceptions of geology, biology and atomic physics by clearly defining and demonstrating the set of low energy conditions that induce *resonant nuclear transmutation.*



The Geyser Reactor process represents an unexpected bi-product of twelve years of focused study of ancient psychoacoustic instruments and architectural elements tuned for biorhythmic synchronization. Controlled frequency resonance was also applied by ancient cultures in advanced metallurgical techniques enabling induction of atomic transmutation reactions by phonon resonance relationships of metals and absorbed gas atoms.

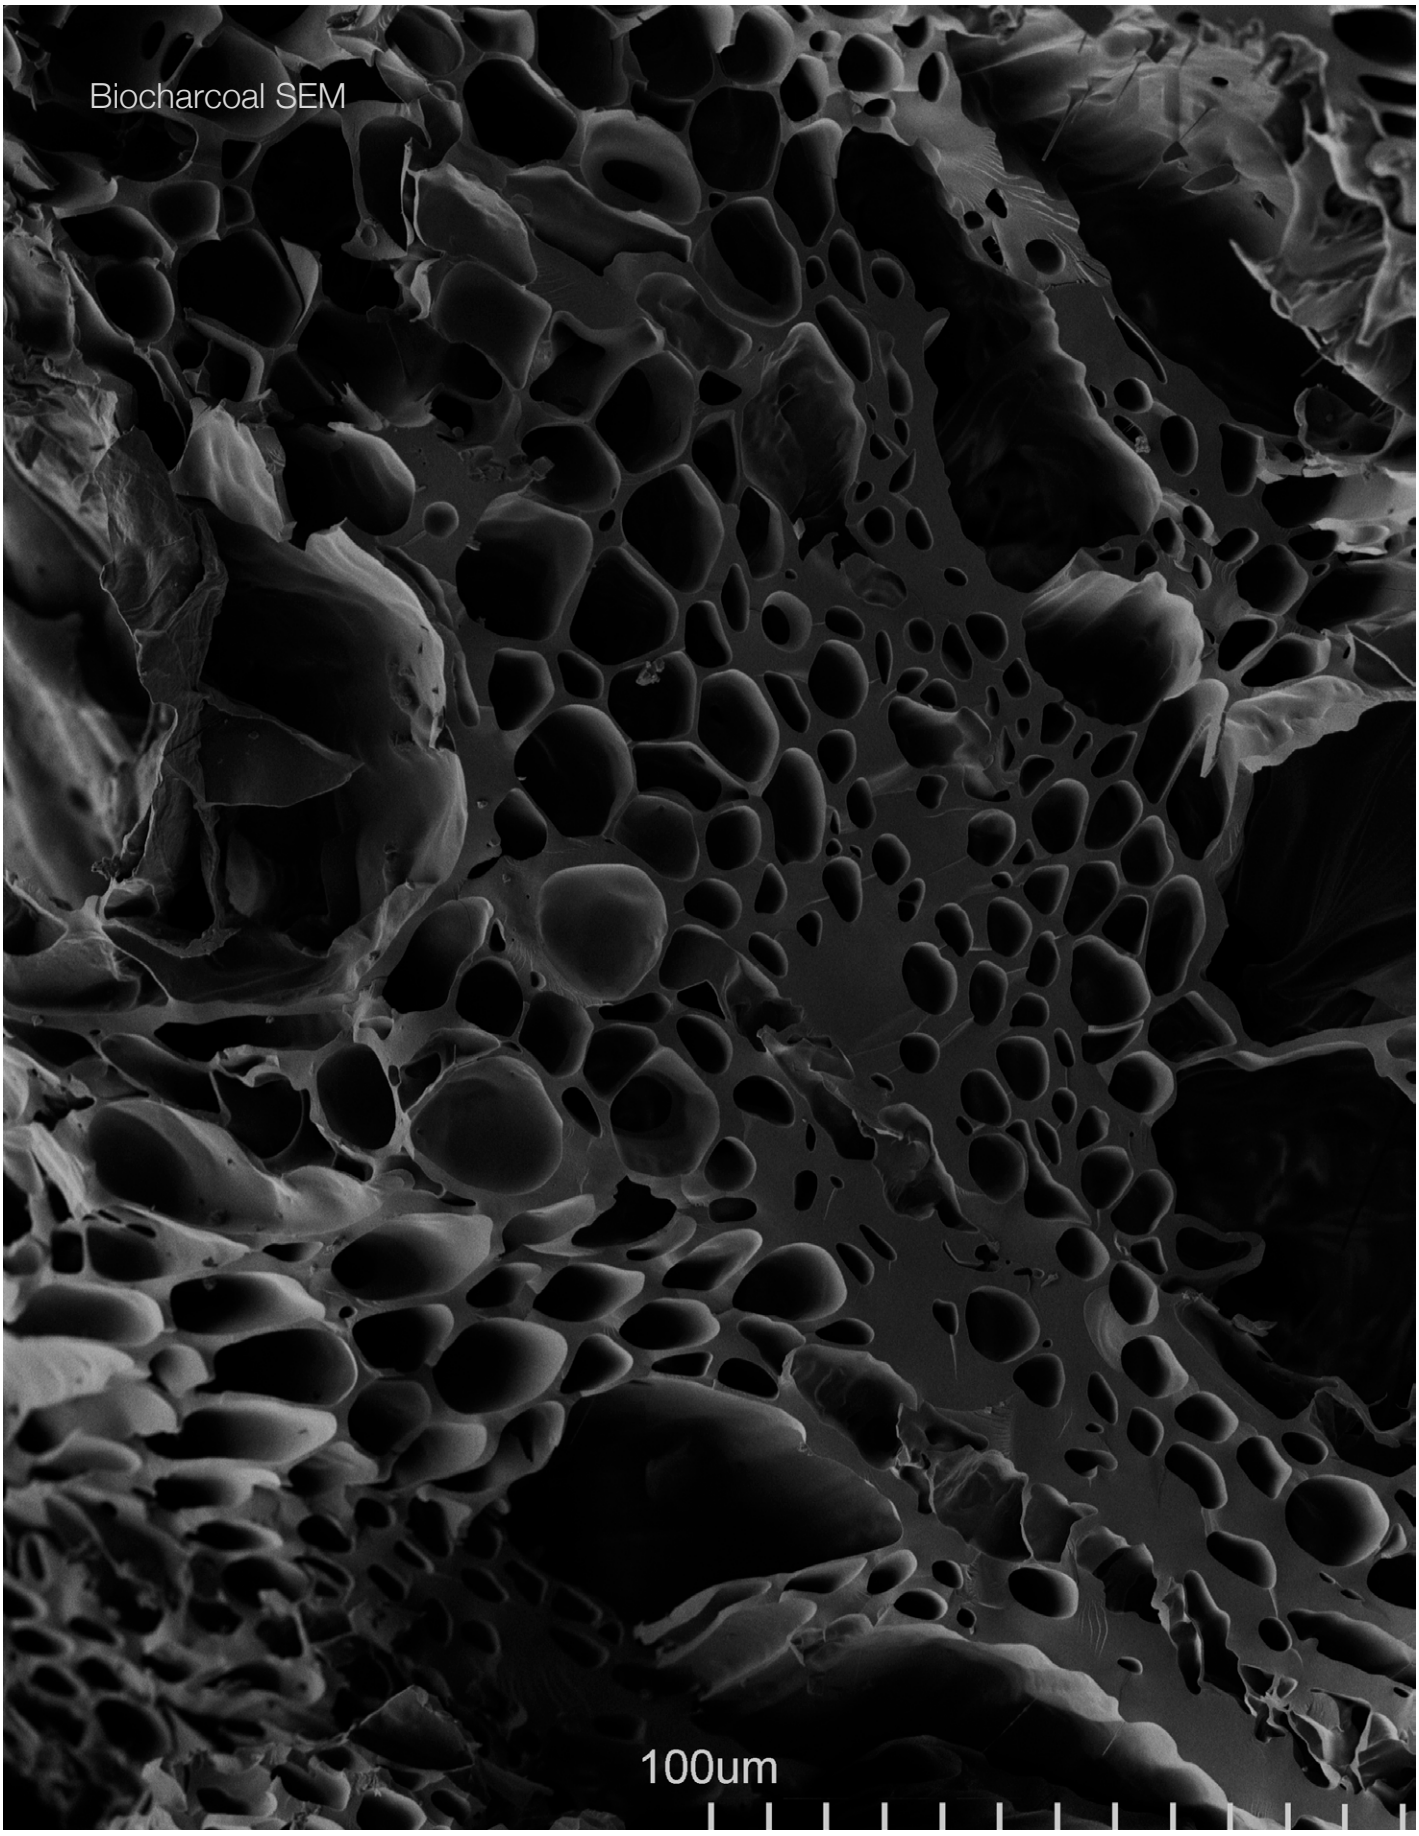
Replicating hydrological transmutation, the Geyser Reactor maintains a cyclical two-phase process for conversion of various metals as ultrafine powders. This digitally controlled system drives a basic two-stage reaction that applies newly defined physical laws of resonant atomic transmutation that account for the abundance of gold and other precious metals within hydrological steam vents and geysers. Volcanic hotsprings are now known to accumulate precious metals by perpetuating nuclear transmutation reactions of metal particles with volcanic gases absorbed at high temperatures and pressures during prolonged periods within fractured bedrock chambers, suffering periodic eruptions that effectively quench the hot metals as they emerge from geysers at the surface.

Carbon dioxide-producing active yeast reactors developed by Joe Champion in 2001 applied phonon resonance formulae, as first conceived by geologist Walter Lussage in 1967, for biological transmutation of silver surfaces to nanogold (above). Now concisely explained within the context of geological and biological transmutation regimes, *essential atomic conversion processes are now achievable in simpler digitally controlled abiotic phonon reactors requiring only heated water and carbon dioxide nanobubbles to convert bulk silver nanopowder into pure gold.*

The Geyser Reactor

Kaneo Chiba of Reo Lab. Co. accomplished production and application of nanobubbles to various processes, including bulk waste treatment, food sterilization and preservation with ozone nanobubbles, in addition to health enhancement of most aquatic and terrestrial organisms exposed to oxygen nanobubbles. Initial processes for nanobubble production involved cavitation with ultrasound, yet simple carbon-based ceramic nozzles developed by Satoshi Anzai of Anzai Kantetsu Co. presented an extremely cost effective production method in 2014 (above).

As the main component of this class of carbon-ceramics, amorphous carbon particles (SEM opposite) contribute micron-sized pores to the composite material that allow passage of gas under low pressure through the nozzles to generate micron-sized bubbles from submerged nozzle surfaces. In still water, microbubbles rapidly coalesce to form larger bubbles that cannot remain suspended in the liquid medium but escape to the water's surface.



However, investigation of the behavior of microbubbles produced from micro-pores into a narrow jet of fast-flowing water revealed several surprising phenomena (above). The rapid motion of microbubbles torn away from nozzle surfaces begins a process known as *adiabatic compression* leading to collapse by isothermal evolution, whereby reducing in size during the course of several minutes to form nanobubbles (Ohgaki *et al.,* 2010).

During the microbubbles' decrease in size due to surface tension effects driving increasing pressurization and resulting dissolution of interior gases into the surrounding liquid, reactive oxygen species (ROS) are generated that decompose organic chemicals and contribute to the beneficial breakdown of toxins within biological systems and the natural environment. Stabilization as long-lived nanobubbles occurs when ions bind to the gas/liquid interface, yet display full collapse and complete dissolution after several minutes in the absence of bound ions.

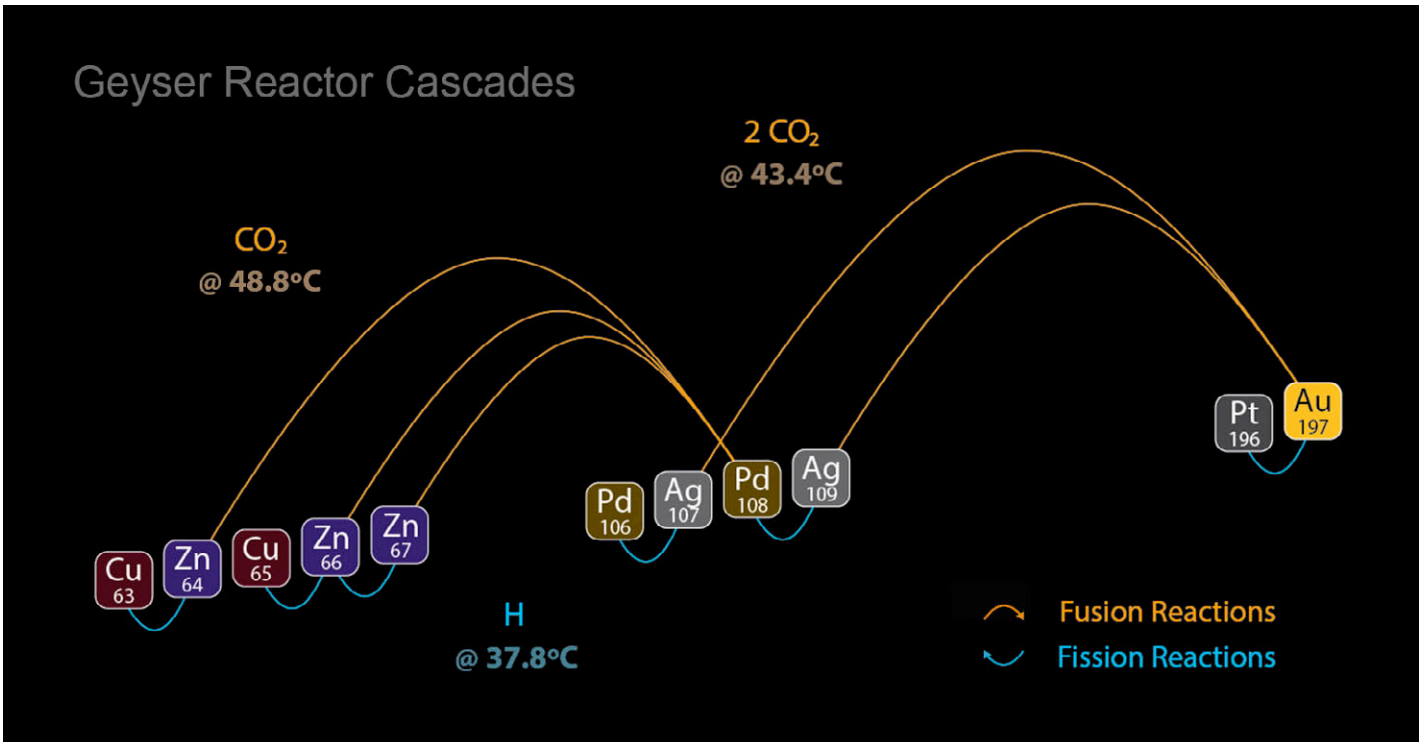
Longterm studies of the longevity of gas nanobubbles stabilized at <200nm in size in bottled water samples have shown their presence in significant quantity several months after the infusion and bottling process (Takahashi, 2005). Nanobubble stabilization is also influenced by repulsive electrostatic forces due to surface charging, and may be maintained over long periods in colloidal suspensions of silver nanoparticles. Studies of nanoscale forces and fluid/gas dynamics reveal many surprising properties that contribute significantly to our understanding of basic metabolic processes that determine the cellular health of living organisms and entire ecosystems.

Use of carbon-based ceramic nozzles with Geyser Reactor transmutation systems confirms nanobubble technology as a cost-effective solution for efficient bulk delivery of carbon dioxide gas for binding with silver nanoparticles, enabling rapid gas dissolution into metals under ambient pressures. Bulk binding of gas nanobubbles with metal nanoparticles replicates the metabolic activity of hemoglobin in red blood cells, enabling high gas absorption and bulk transmutation rates that far exceed those associated with resonant transmutation in healthy organisms, even under bioelectrification conditions that increase absorption of gases by metals within the body's tissues.

Biocharcoal SEM
100um

A compact device for producing gas nanobubbles remains the only component of the Geyser Reactor system not readily available, requiring fabrication from special gas permeable materials. While the carbon-ceramic nozzles developed and demonstrated by Anzai Kantetsu represent cost-effective alternatives to high-pressure, high-temperature cavitation machines for nanobubble production, their new nozzles are not yet available for order.

Carbon-ceramics are manufactured by wet packing 60% carbon, 40% clay powder mixtures into nozzle molds before drying and firing @ >1000°C in a reducing or inert gas atmosphere. Viable carbon-ceramics that allow the passage of gas through micropores are commonly used for high-temperature glass and metal casting applications, and can be easily fabricated into a nozzle by reshaping carbon-ceramic mold materials into the desired form.



However, an even simpler nanobubble device has been integrated into the design of the Geyser Reactor system, consisting of a pyrolyzed segment of hardwood tree branch that maintains the natural nanoarchitecture of living wood, generally referred to as 'biological charcoal'. The natural nanopiping of tree wood employs surface wetting effects for pumping water up to the leaves, sometimes hundreds of feet into the sky, yet also facilitates production of nanobubbles. Electron microscopy reveals the complex nanostructures of biocharcoal, presenting networks of carbon nanotubes arranged lengthwise in concentric rings with interconnecting nanopores (SEM opposite).

Biocharcoal nozzles offer the same basic nanobubble characteristics demonstrated by the carbon-ceramics of Anzai Kantetsu –*at a much lower cost of just 25¢ per nozzle*– reflecting the simple natural solutions of Ayurveda. By carefully selecting and tooling the surfaces of a pyrolyzed hardwood branch segment that has no large pores or cracks, and sealing the central channel which tends to be much larger than the nanotubes arranged in concentric rings, an extremely cheap alternative can be produced *with minimal cost and effort, in any part of the world.*

The ideal nozzle form is bullet-like to allow efficient waterflow over its surfaces (above). Biocharcoal can be quickly reduced with abrasive sandpaper down to the diameter of tubing to be used for delivering low pressure gas flow. Cracking is the biggest obstacle in this basic production process, causing structural losses within the wood, and requires slow, thorough drying of selected hardwood branch segments, followed by heating for 25 minutes @ ~250°C in a reducing or inert gas atmosphere. Size and shape of the nozzle can be adjusted to fit any usable segment of biocharcoal, provided the finished nozzle can be fitted into the pressure tubing securely.

Putney's basic Geyser Reactor transmutation systems operate within the well-known thermoregulation ranges maintained by a healthy human body to achieve resonant conversion of *zinc ⇒ copper* by the same processes that rebalance blood metals within the red blood cells of all mammal species. This simple circulatory heating and cooling process can also be applied under identical conditions to achieve resonant nuclear conversions of *gold ⇒ platinum* and *silver ⇒ palladium.* Exact resonant atomic mass recombination patterns are provided below:

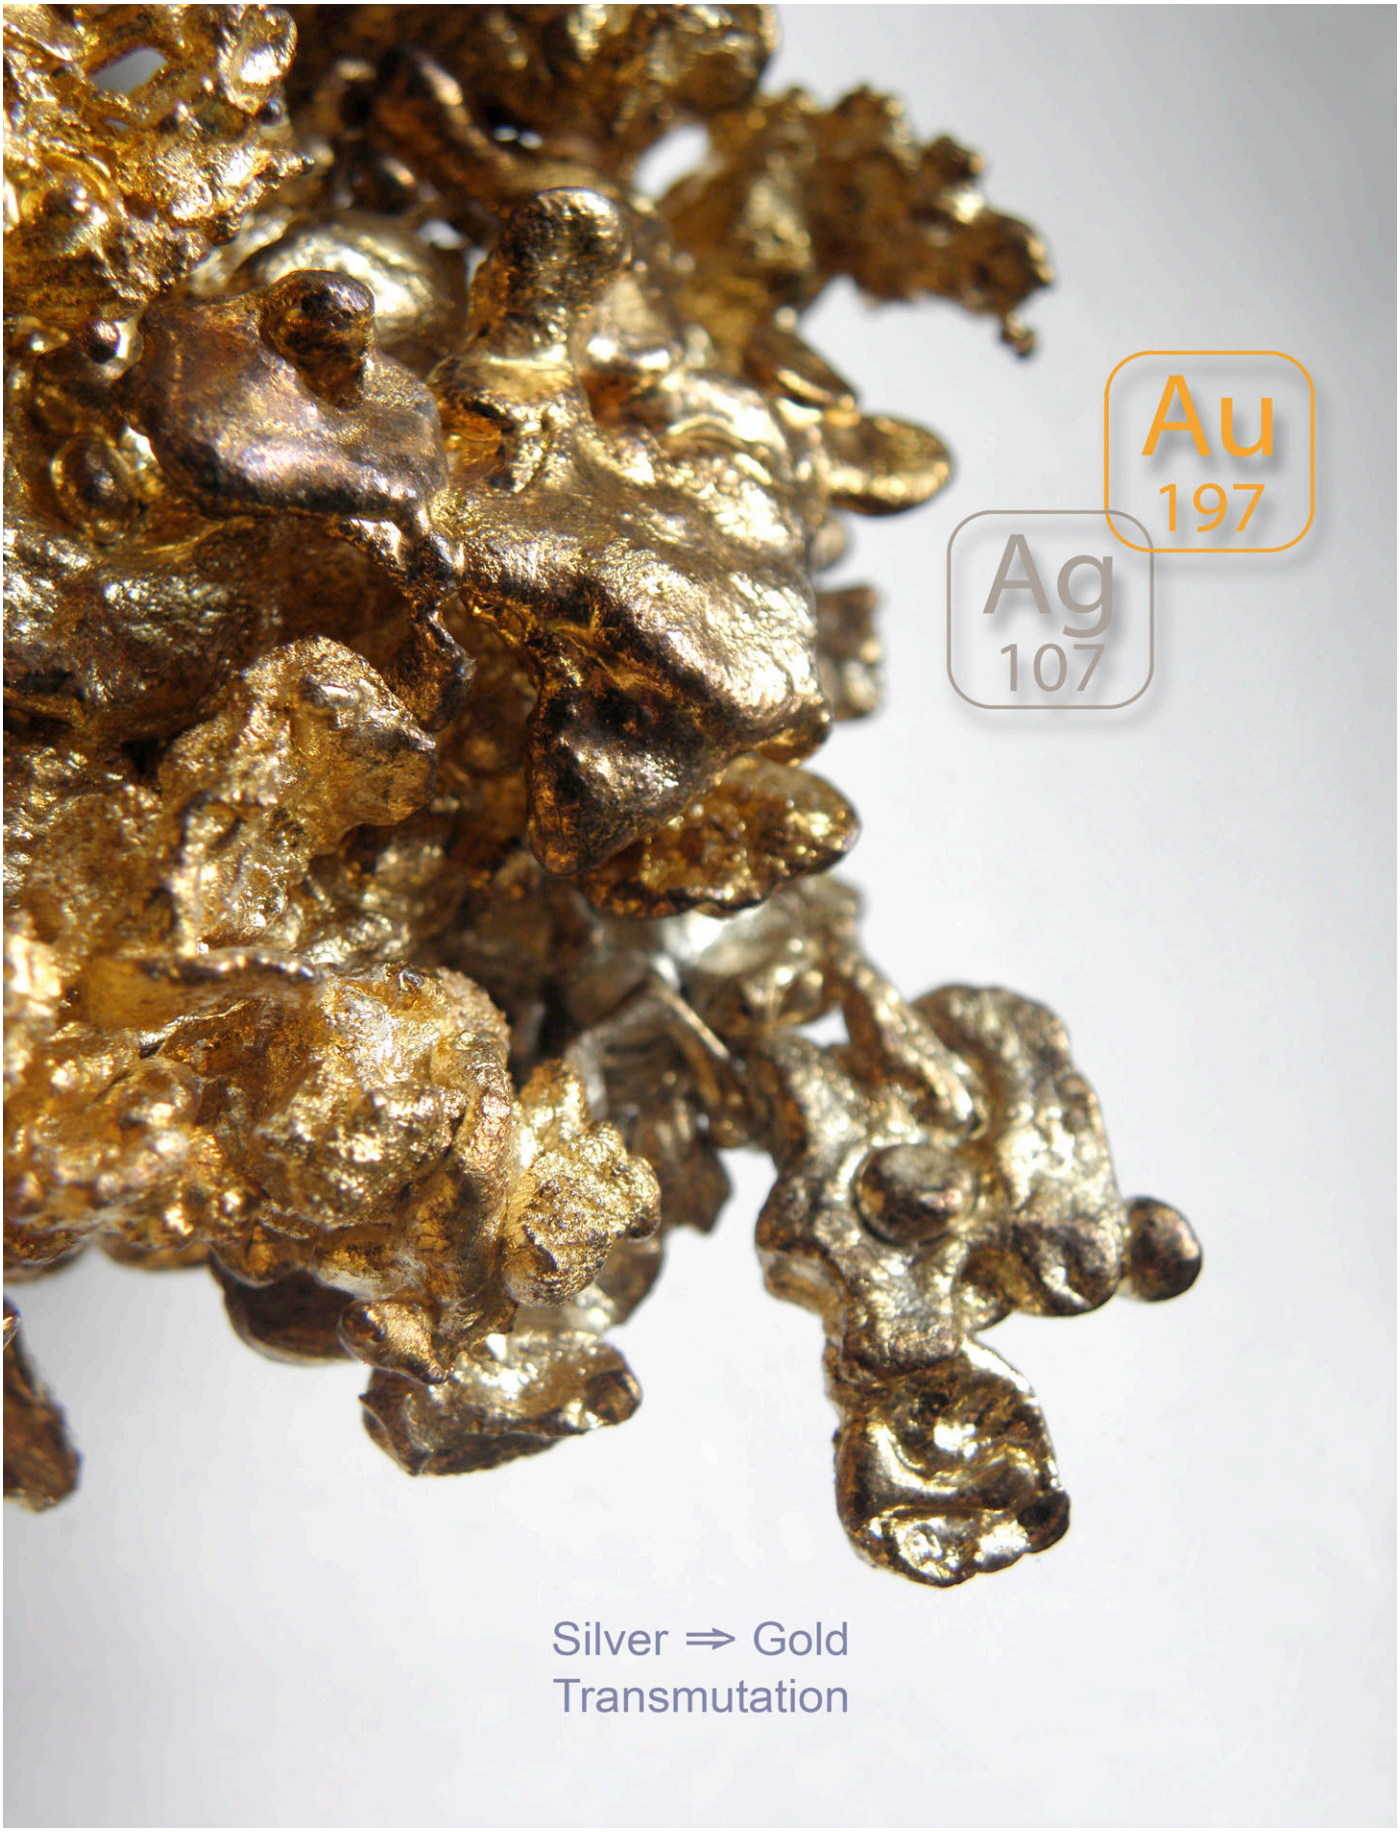
The set of hydrogen-producing nuclear fission reactions occurring at 37.8°C is complemented by another pair of transmutation reactions following a different atomic mass recombination pattern dependent on carbon dioxide gas, enabling more profitable fusion reactions for converting *silver ⇒ gold* at 43.4°C, as well as *zinc ⇒ palladium* at 48.8°C. *The atomic mass of CO_2 gas precisely corresponds to atomic mass disparity between* Ag^{109} *and* Au^{197}*, as well as* Zn^{64} *and* Pd^{108}. These confirmed nuclear reactions display a mean atomic mass variance of –0.02365u.

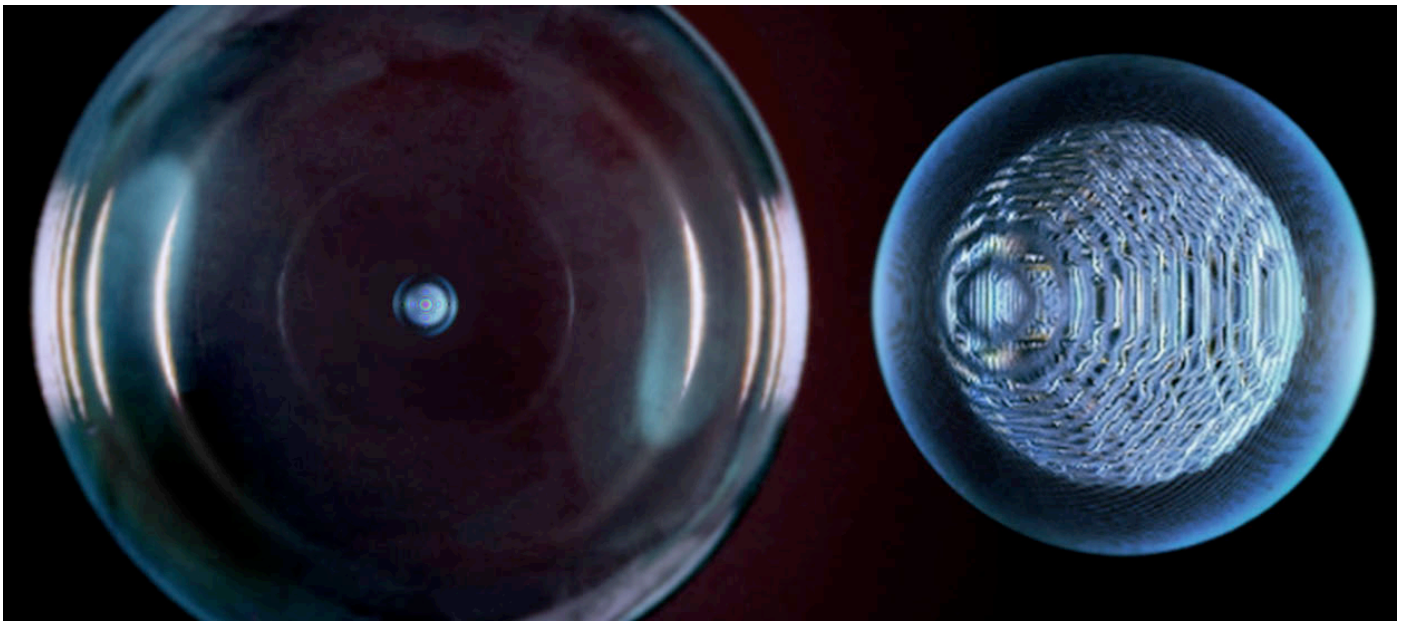
A new resonant class of safe nuclear transmutation systems exemplified by the Ecat reactor of Dr. A. Rossi must inevitably replace the many radioactive industrial atomic power plants that presently endanger all life on Earth. The extreme scientific ignorance obfuscating the reality of 'cold fusion' demands the free distribution of this major discovery as an *open source technology*. Geyser Reactors of all sizes can be safely built and operated by students of geology and biology, inspiring advanced metallurgy projects for production of precious metals and superalloys.

Geyser Reactor systems represent the simplest means for safe and efficient nuclear conversion of various metals near room temperature and under ambient atmospheric pressure conditions. The mnemonic phonon physics of resonant atomic transmutation, *comprehensively defined here for the first time*, now enables more complex high-temperature furnace processes involving conversion of metals by rapid quenching in water after prolonged dwell times at resonance in a molten state. Experimentation with copper bars in standard furnaces confirms that enhanced gas absorption at higher temperatures facilitates conversion of copper surfaces into nickel during cooling in air to 37.8°C by the same hydrogen fission reaction that defines the specific thermoregulation range of the human body.



In geological contexts, silver and gold are typically associated with quartz veins formed during hydrological venting processes occurring below geyser hotsprings such as those spectacular examples located in Yellowstone National Park. Close interaction of lava chambers with overlying aquifers and geysers has led most geologists to the basic hypothesis that precious metals are transported from below by upwellings of superheated, highly-mineralized waters.

If resonant transmutation occurs at that stage, wouldn't there be evidence of the commingling of elements within both silver and gold deposits? In fact, such evidence does exist, but is very rare. Raw gold nuggets do not contain remnants of silver atoms because transport into fractured bedrock piping recurs during multiple superheating events that liquefy the metals and allow their separation by weight differential. Being almost double the atomic mass of silver, liquefied gold atoms readily reconsolidate and part from silver under such extreme conditions.



Beautifully colored thermophilic algae thrive at 46°C in hydrothermal vents like Fly Geyser, located in Gerlach, Nevada (above), reflecting the same microbial abundance that mesmerizes vulcanologists studying seafloor vent processes that support diverse biological communities congregating around towering deepsea 'black smokers'.

Direct evidence for the natural formation of atomically commingled Ag/Au alloys is present within both biological and geological contexts, as yeast species employ the same gas at the same temperatures that affect conversion in geyser vents. This previously unrecognized class of evidence has been described as a yellowish form of silver dubbed *'allotropic silver'* that is actually an atomically commingled product of the resonant nuclear transmutation of silver into gold. The yellowish complexion of 'allotropic silver' is actually an ult dispersion of gold nanodots comprising <5% of silver surfaces, now rapidly reproduced in digitally controlled abiotic Geyser Reactor systems.

Transmutation

The Geyser Reactor: Silver ⇒ Gold Transmutation

The resonant atomic transmutation of silver into gold is achieved by precision control of atomic resonance in a two-stage reaction that is safe, non-toxic and involves only low energies. Silver becomes instilled with the resonant atomic frequency signature of gold, before being rapidly quenched to trigger bulk conversion into gold –*according to the established frequency 'memory' of the standing wave field of each atom* (rendered below).

The first stage of the transmutation reaction maintains the starting element (silver) at the phonon resonance frequency of the target element (gold), during a 3-hour dwell time exposed to CO_2 gas nanobubbles.

Gold's single isotope provides the resonant target frequency, as determined by the following formulae (calculated using the latest atomic data sets for the starting element and the target element, provided in blue):

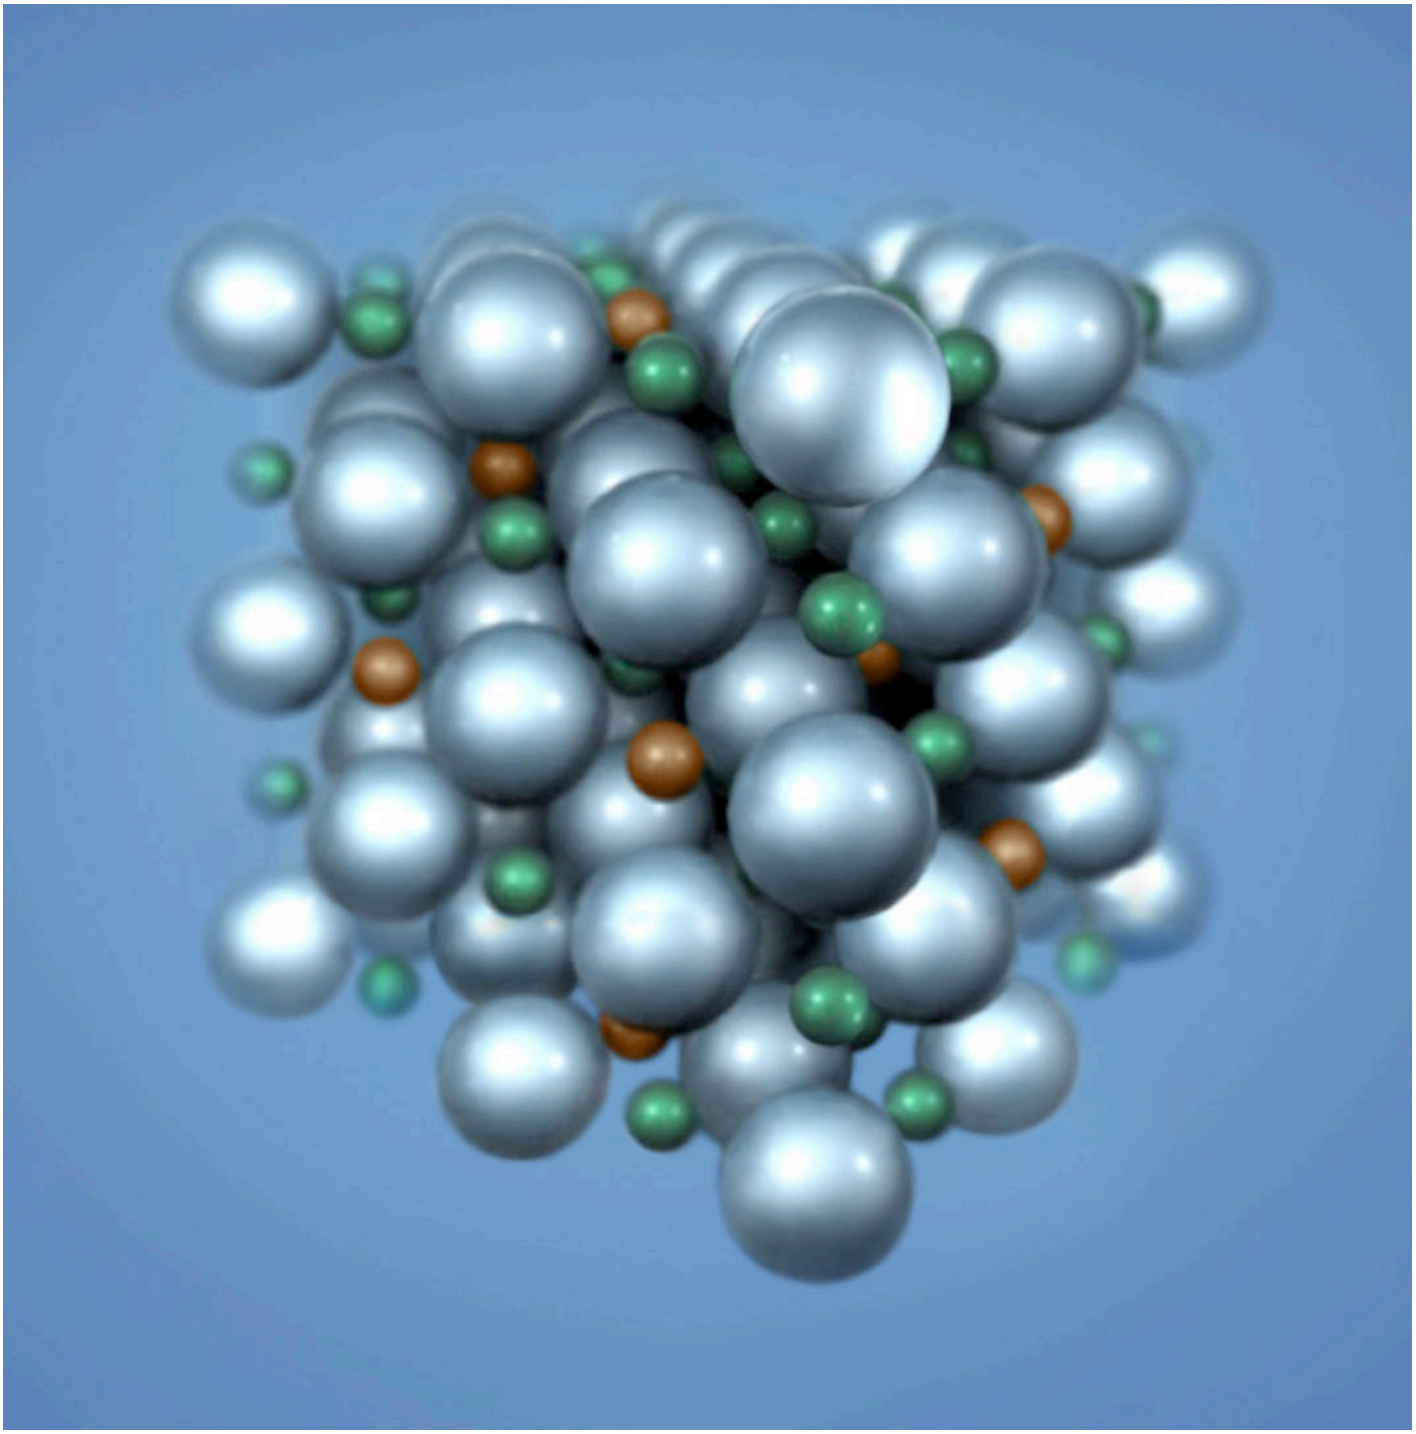
$$\text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{d \times Na}{m}}$$

d - density in g/cm³
Na - Avogadro's Constant
m - atomic mass

$$\text{Resonant Temperature (°C)} = \frac{Ln\left(\frac{f(starting)}{f(target)}\right)}{Ec} + St$$

f - frequency in Hz
Ln - natural logarithm
Ec - expansion coefficient
St - standardized temp in °C

The resonant frequency of gold (Au^{197}) in its rest state is 38,945,222 Hz, according to the element's atomic diameter at 20°C. The lighter isotope of silver (Ag^{107}) resonates at this same frequency when heated to 43.4°C:



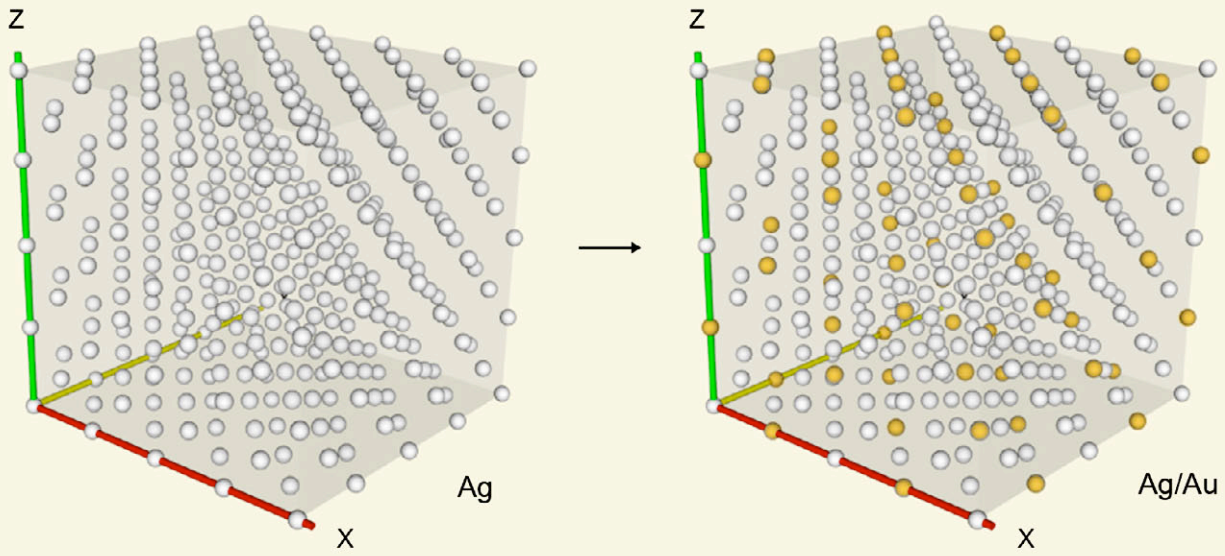
$$Ag^{107}\text{ Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{10.50 \times (6.0221 \times 10^{23})}{106.905095}} = 38{,}962{,}452\text{ Hz}$$

$$Au^{197}\text{ Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{19.32 \times (6.0221 \times 10^{23})}{196.966569}} = 38{,}945{,}222\text{ Hz}$$

$$\text{Resonant Temperature (°C)} = \frac{Ln\left(\frac{f(38{,}962{,}452)}{f(38{,}945{,}222)}\right)}{0.0000189} + 20 = 43.4°C$$

Starting Element: Silver ($_{47}Ag^{107}$)
Natural Abundance: 51.839%
Atomic Mass: 106.905095
Density (grams/cm³): 10.50
Exp. Coefficient: 0.0000189

Target Element: Gold ($_{79}Au^{197}$)
Natural Abundance: 100%
Atomic Mass: 196.966569
Density (grams/cm³): 19.32
Exp. Coefficient: 0.0000142



The rate of gas absorption (velocity of penetration) into the metal surface interface is enhanced by increased temperature, pressure and electric current. Carbon dioxide gas *adsorbed* onto metal surfaces undergoes molecular dissociation and subsequent *absorption* into the crystal lattice of heavier metal atoms (above).

The second stage of the transmutation reaction involves the subsequent trapping of absorbed gases into silver atoms by the induced shock of rapid cooling. The sudden contraction of the atomic lattice forces the interstitial absorbed atoms into quantum instability as the strongly repulsive nuclear forces of the adjacent metal atoms close in simultaneously on each gas atom from 6 sides (along the x, y and z axes of the lattice).

Instead of rapidly contracting, a portion of the silver atoms are able to maintain the previously established resonant diameter by accepting protons, neutrons and electrons from the 6 adjacent trapped gas atoms, thereby increasing the atomic weight of silver atoms to induce the formation of gold atoms.

The face-centered cubic structure of the metal's atomic lattice allows for a maximum of 6 interstitial gas atoms being adjacent to any one metal atom, limiting maximum total conversion during rapid cooling to below 1/8th (~12.5%) of the total number of metal atoms. For optimal cases with complete saturation of absorbed carbon dioxide gas (illustrated below), transmutation during a single rapid cooling event can convert upto 12.5% of silver atoms into gold, leaving the remaining 87.5% unaltered –*thereby increasing to 110.25% of the total original mass*.

Gas absorption periods of prolonged dwell-time at phonon resonance with the gold target element are interrupted by controlled rapid cooling events that accomplish the quantum trapping of absorbed gas atoms within the contracting metal lattice. This cyclical process is repeated dozens of times over each 2-week production run, with successive contractile phases gradually converting greater than 70% of silver atoms locked within the lattice.

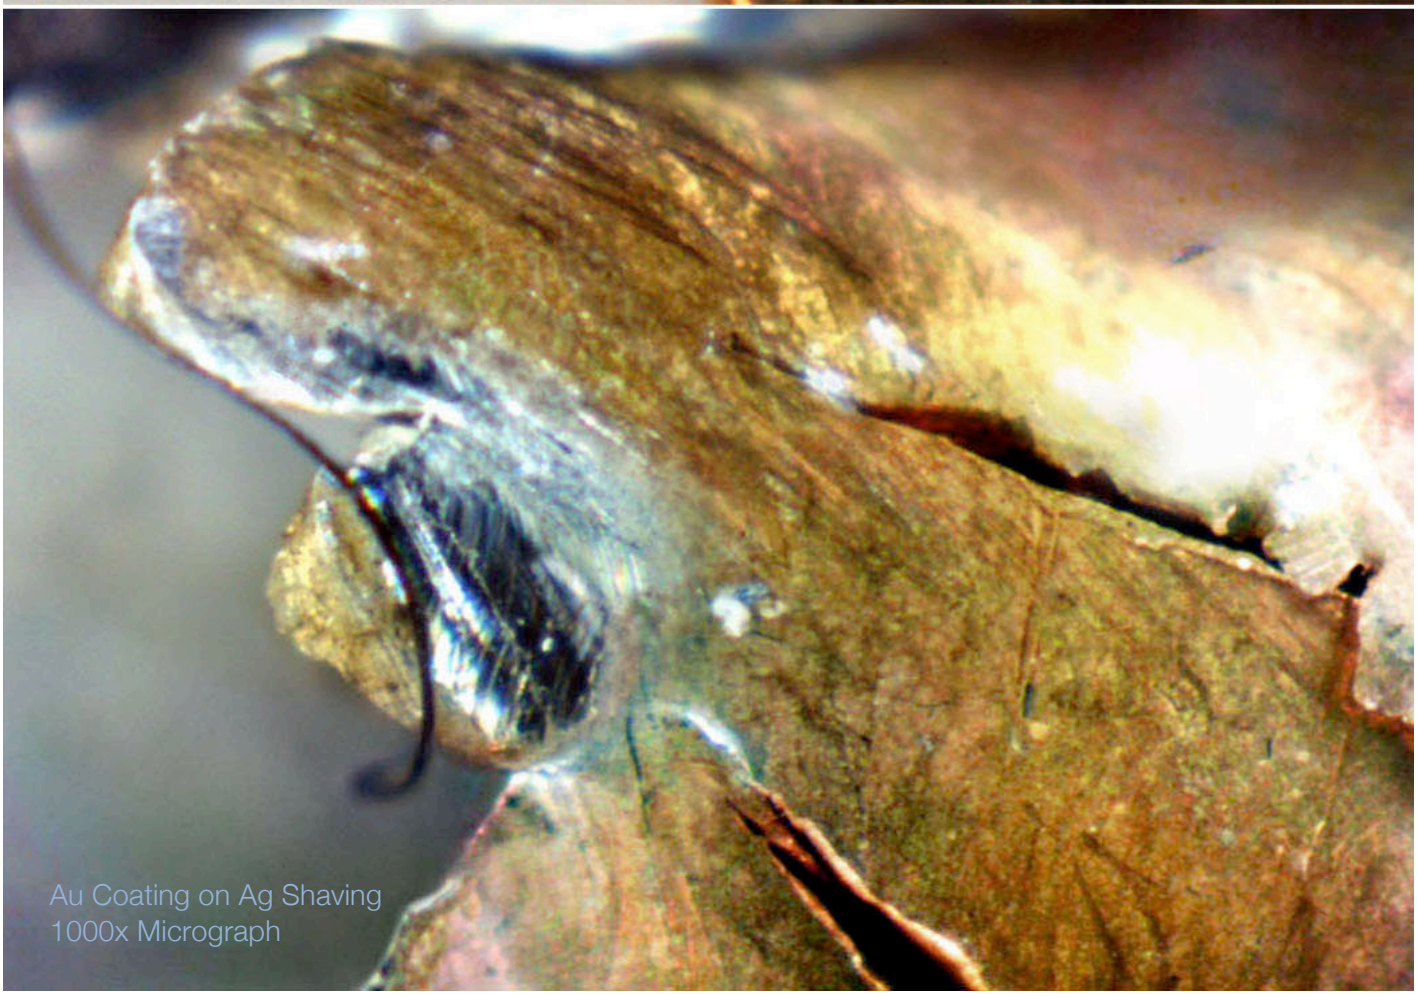
These emerging resonant nuclear recombination dynamics dictate that no adjacent pair of silver atoms may be simultaneously converted into gold due to the limited availability of interstitial gas atoms. Experimentation with successive gas absorption and quenching phases has confirmed that >90% conversion of silver atoms into gold atoms can be achieved after a few dozen repetitions of the same basic phonon resonance process *when using aqueous silver nanopowder suspensions with carbon dioxide nanobubble systems.*

Silver ⇒ Gold

The carbon dioxide-dependent low energy transmutation of silver atoms into gold and hydrogen atoms occurs after prolonged absorption of carbon dioxide during precision heating to 43.4°C phonon frequency resonance with gold.

- Silver is heated to 43.4°C, absorbing carbon and oxygen to form gold and hydrogen during rapid cooling:

$$ {}_{47}Ag^{107} + {}_{6}C^{12} + 5\,{}_{8}O^{16} \Rightarrow {}_{79}Au^{197} + 2\,{}_{1}H^{1} $$
$$ {}_{47}Ag^{109} + 2\,({}_{6}C^{12} + {}_{8}O^{16}) + 2\,{}_{8}O^{16} \Rightarrow {}_{79}Au^{197} $$



Carbon dioxide (CO_2) gas comprises the exact atomic mass required for the conversion of silver into gold, after dissociated carbon and oxygen atoms are fully absorbed into silver nanoparticles. Carbon and oxygen atoms absorbed within the framework of the silver atomic lattice may recombine with individual silver atoms in groups of 6 adjacent gas atoms occupying all available interstitial loci, recombining as (1 C + 5 O) and (2 C + 4 O):

Starting Isotope	+	Absorbed Gas Atoms	⇒	Target Isotope	+	Bi-Products	±Variance
$Ag^{106.90509}$	+	$1\,C^{12.00000}$ + $5\,O^{79.9745732}$	⇒	$Au^{196.96656}$	+	$2\,H^{2.015650074}$	–0.10255
$Ag^{108.90475}$	+	$2\,C^{24.00000}$ + $4\,O^{63.9796586}$	⇒	$Au^{196.96656}$			–0.08215

The Geyser Reactor: Gold ⇒ Platinum Transmutation

The resonant transmutation of gold into platinum is achieved by precision control of atomic resonance in a two-stage reaction that is safe, non-toxic and involves only low energies. Gold becomes instilled with the resonant atomic frequency signature of hydrogen, before being rapidly quenched to trigger bulk conversion into hydrogen and platinum –*according to the established frequency 'memory' of the standing wave field of each atom*.

The first stage of the transmutation reaction maintains the starting element (gold) at the phonon resonance frequency of the target bi-product element (H^1)*, during a 3-hour dwell time exposed to* O_2 *gas nanobubbles.*

Protium, the lightest hydrogen isotope (H^1) provides the resonant target frequency for this reaction, as determined by the following formulae (calculated using the latest atomic data sets for the elements, provided in blue):

$$\text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{d \times Na}{m}}$$

d - density in g/cm³
Na - Avogadro's Constant
m - atomic mass

$$\text{Resonant Temperature (°C)} = \frac{Ln\left(\frac{f(starting)}{f(target)}\right)}{Ec} + St$$

f - frequency in Hz
Ln - natural logarithm
Ec - expansion coefficient
St - standardized temp in °C

The resonant frequency of hydrogen isotope (H^1) in its rest state is 3,773,180 Hz, according to the element's atomic diameter at 20°C. Oxygen isotope (O^{16}) resonates at this same frequency when heated to 37.8°C*:*

$$O^{16}\text{ Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{0.001429 \times (6.0221 \times 10^{23})}{15.99491}} = 3{,}775{,}138\ \text{Hz}$$

$$H^1\text{ Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{0.0000899 \times (6.0221 \times 10^{23})}{1.007825037}} = 3{,}773{,}180\ \text{Hz}$$

$$\text{Resonant Temperature (°C)} = \frac{Ln\left(\frac{f(\ 3{,}775{,}138\ )}{f(\ 3{,}773{,}180\ )}\right)}{0.0000291} + 20 = 37.8\ °C$$

Starting Element: Oxygen ($_8O^{16}$)
Natural Abundance: 99.762%
Atomic Mass: 15.99491
Density (grams/cm³): 0.001429
Exp. Coefficient: 0.0000291

Target Element: Hydrogen ($_1H^1$)
Natural Abundance: 99.985%
Atomic Mass: 1.007825037
Density (grams/cm³): 0.0000899
Exp. Coefficient: 0.0000366

The rate of gas absorption (velocity of penetration) into the metal surface interface is enhanced by increased temperature, pressure and electric current. Oxygen gas *adsorbed* onto metal surfaces undergoes molecular dissociation and subsequent *absorption* into the crystal lattice of heavier metal atoms.

The second stage of the transmutation reaction involves the subsequent trapping of absorbed gases into gold atoms by the induced shock of rapid cooling. The sudden contraction of the atomic lattice forces the interstitial absorbed atoms into quantum instability as the strongly repulsive nuclear forces of the adjacent metal atoms close in simultaneously on each gas atom from 6 sides (along the x, y and z axes of the lattice).

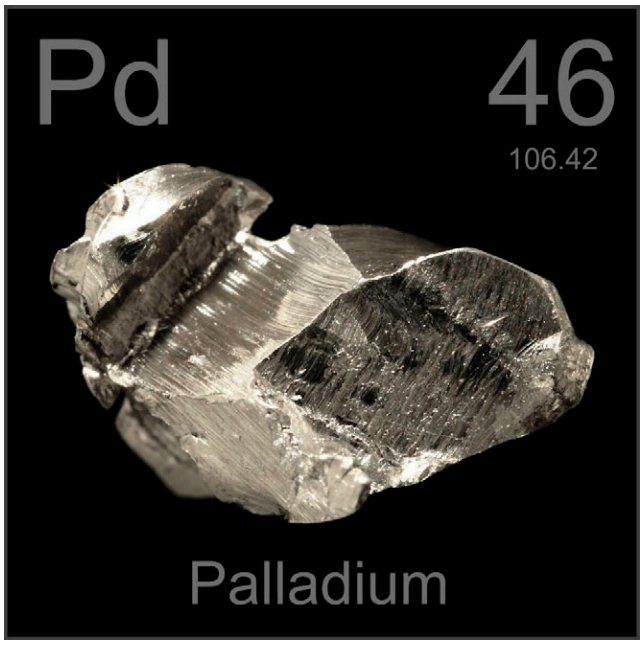
Instead of rapidly contracting, some of the gold atoms are able to maintain the previously established resonant diameter by ejecting protons, neutrons and electrons into available interstitial spaces within the lattice, thereby decreasing the atomic weight of gold atoms to induce the formation of hydrogen and platinum.

Gold ⇒ Platinum

The oxygen-dependent low energy transmutation of gold into hydrogen and platinum occurs *in aqueous reactors,* based on phonon matching of oxygen (O^{16}) at 37.8°C with hydrogen (H^{1}) at rest (20°C), *as in human blood*.

- Gold is heated to 37.8°C with oxygen, releasing hydrogen atoms to form platinum during rapid cooling:

$$_{79}Au^{197} + {}_{8}O^{16} \Rightarrow {}_{1}H^{1} + {}_{78}Pt^{196} + {}_{8}O^{16}$$



Hydrogen provides the exact atomic mass required for the conversion of gold into platinum. Clear atomic mass recombination patterns define fission bi-products ejected from gold nuclei during the quantum trapping event:

Starting Isotope	+	Absorbed Gas Atoms	⇒	Target Isotope	+	Bi-Products	±Variance
$Au^{196.96656}$	+	$O^{15.994914}$	⇒	$H^{1.007825037}$	+	$Pt^{195.96495}$ + $O^{15.994914}$	–0.00622

The Geyser Reactor: Silver ⇒ Palladium Transmutation

The resonant atomic transmutation of silver into palladium is achieved by precision control of atomic resonance in a two-stage reaction that is safe, non-toxic and involves only low energies. Silver becomes instilled with the resonant atomic frequency signature of hydrogen, before being rapidly quenched to trigger bulk conversion into hydrogen and palladium –*according to the established frequency 'memory' of the standing wave field of each atom*.

The first stage of the transmutation reaction maintains the starting element (silver) at the phonon resonance frequency of the target bi-product element (H^1)*, during a 3-hour dwell time exposed to* O_2 *gas nanobubbles.*

Protium, the lightest hydrogen isotope (H^1) provides the resonant target frequency for this reaction, as determined by the following formulae (calculated using the latest atomic data sets for the elements, provided in blue):

$$\text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{d \times Na}{m}}$$

d - density in g/cm³
Na - Avogadro's Constant
m - atomic mass

$$\text{Resonant Temperature (°C)} = \frac{Ln\left(\frac{f(starting)}{f(target)}\right)}{Ec} + St$$

f - frequency in Hz
Ln - natural logarithm
Ec - expansion coefficient
St - standardized temp in °C

The resonant frequency of hydrogen isotope (H^1) in its rest state is 3,773,180 Hz, according to the element's atomic diameter at 20°C. Oxygen isotope (O^{16}) resonates at this same frequency when heated to 37.8°C*:*

$$O^{16}\text{ Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{0.001429 \times (6.0221 \times 10^{23})}{15.99491}} = 3{,}775{,}138\ \text{Hz}$$

$$H^1\text{ Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{0.0000899 \times (6.0221 \times 10^{23})}{1.007825037}} = 3{,}773{,}180\ \text{Hz}$$

$$\text{Resonant Temperature (°C)} = \frac{Ln\left(\frac{f(\ 3{,}775{,}138\ )}{f(\ 3{,}773{,}180\ )}\right)}{0.0000291} + 20 = 37.8\ °C$$

Starting Element: Oxygen ($_8O^{16}$)
Natural Abundance: 99.762%
Atomic Mass: 15.99491
Density (grams/cm³): 0.001429
Exp. Coefficient: 0.0000291

Target Element: Hydrogen ($_1H^1$)
Natural Abundance: 99.985%
Atomic Mass: 1.007825037

Exp. Coefficient: 0.0000366

The rate of gas absorption (velocity of penetration) into the metal surface interface is enhanced by increased temperature, pressure and electric current. Oxygen gas *adsorbed* onto metal surfaces undergoes molecular dissociation and subsequent *absorption* into the crystal lattice of heavier metal atoms.

The second stage of the transmutation reaction involves the subsequent trapping of absorbed gases into silver atoms by the induced shock of rapid cooling. The sudden contraction of the atomic lattice forces the interstitial absorbed atoms into quantum instability as the strongly repulsive nuclear forces of the adjacent metal atoms close in simultaneously on each gas atom from 6 sides (along the x, y and z axes of the lattice).

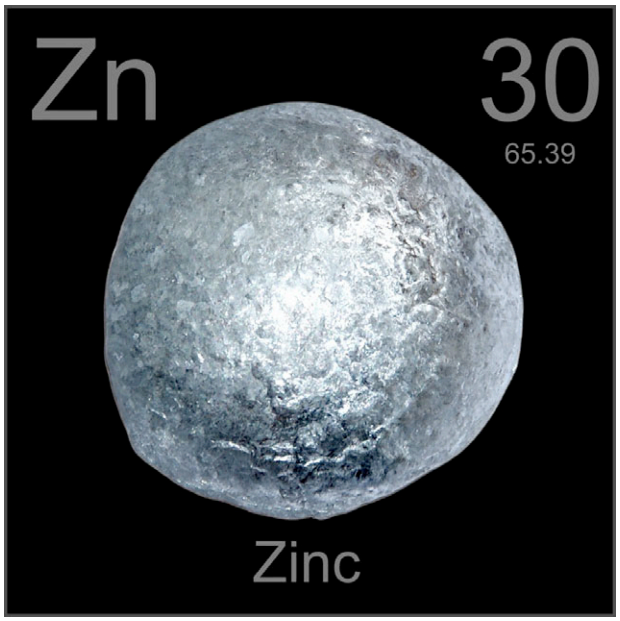
Instead of rapidly contracting, some of the silver atoms are able to maintain the previously established resonant diameter by ejecting protons, neutrons and electrons into available interstitial spaces within the lattice, thereby decreasing the atomic weight of silver atoms to induce the formation of hydrogen and palladium.

The face-centered cubic structure of the metal's atomic lattice allows for a maximum of 6 interstitial gas atoms being adjacent to any one metal atom, providing stable loci for gas atoms ejected by silver atoms during quantum trapping events. Absorption of oxygen atoms through silver surfaces at 37.8°C transmits phonon vibrations throughout the metal lattice at the hydrogen target frequency, enabling bulk conversion of silver into palladium at high rates of efficiency. The subtle bulk weight changes resulting from this resonant nuclear reaction can only be determined after ejected hydrogen atoms have been desorbed from metal surfaces by cooling to the rest state at 20°C.

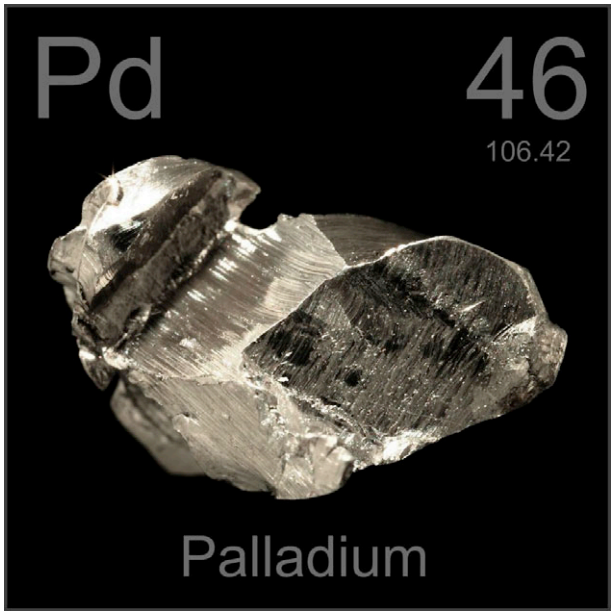
Silver ⇒ Palladium

The oxygen-dependent low energy transmutation of silver into palladium occurs *in aqueous reactors*, based on phonon matching of oxygen (O^{16}) at 37.8°C with hydrogen (H^{1}) at rest (20°C), *as in human blood*.

- Silver is heated to 37.8°C with oxygen, releasing hydrogen atoms to form palladium during rapid cooling:



$$ {}_{47}Ag^{107} + {}_{8}O^{16} \Rightarrow {}_{1}H^{1} + {}_{46}Pd^{106} + {}_{8}O^{16} $$
$$ {}_{47}Ag^{109} + {}_{8}O^{16} \Rightarrow {}_{1}H^{1} + {}_{46}Pd^{108} + {}_{8}O^{16} $$



Hydrogen atoms comprise the exact atomic mass required for the conversion of silver into palladium. Clear atomic mass recombination patterns define fission bi-products ejected from silver nuclei during the quantum trapping event:

Starting Isotope	+	Absorbed Gas Atoms	⇒	Target Isotope	+	Bi-Products	±Variance
$Ag^{106.90509}$	+	$O^{15.994914}$	⇒	$H^{1.007825037}$	+	$Pd^{105.90348}$ + $O^{15.994914}$	–0.00622
$Ag^{108.90475}$	+	$O^{15.994914}$	⇒	$H^{1.007825037}$	+	$Pd^{107.90389}$ + $O^{15.994914}$	–0.00697

The Geyser Reactor: Zinc ⇒ Palladium Transmutation

The resonant atomic transmutation of zinc into palladium is achieved by precision control of atomic resonance in a 2-stage reaction that is safe, non-toxic and involves only low energies. Zinc becomes instilled with the resonant atomic frequency signature of palladium, before being rapidly quenched to trigger bulk conversion into palladium *–according to the established frequency 'memory' of the standing wave field of each atom*.

The first stage of the transmutation reaction maintains the starting element (zinc) at the phonon resonance frequency of the target element (palladium), during a 3-hour dwell time exposed to CO_2 gas nanobubbles.

Palladium isotope Pd^{108} provides the resonant target frequency, as determined by the following formulae (calculated using the latest atomic data sets for the starting element and the target element, provided in blue):

$$\text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{d \times Na}{m}}$$

d - density in g/cm³
Na - Avogadro's Constant
m - atomic mass

$$\text{Resonant Temperature (°C)} = \frac{Ln\left(\frac{f(starting)}{f(target)}\right)}{Ec} + St$$

f - frequency in Hz
Ln - natural logarithm
Ec - expansion coefficient
St - standardized temp in °C

The resonant frequency of palladium isotope Pd^{108} in its rest state is 40,632,335 Hz, according to the element's atomic diameter at 20°C. Zinc isotope Zn^{64} resonates at this same frequency when heated to 48.8°C:

$$Zn^{64}\text{ Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{7.14 \times (6.0221 \times 10^{23})}{63.92914}} = 40{,}667{,}653\text{ Hz}$$

$$Pd^{108}\text{ Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{12.02 \times (6.0221 \times 10^{23})}{107.90389}} = 40{,}632{,}335\text{ Hz}$$

$$\text{Resonant Temperature (°C)} = \frac{Ln\left(\frac{f(40{,}667{,}653)}{f(40{,}632{,}335)}\right)}{0.0000302} + 20 = 48.8°C$$

Starting Element: Zinc ($_{30}Zn^{64}$)
Natural Abundance: 48.27%
Atomic Mass: 63.92914
Density (grams/cm³): 7.14
Exp. Coefficient: 0.0000302

Target Element: Palladium ($_{46}Pd^{108}$)
Natural Abundance: 26.46%
Atomic Mass: 107.90389
Density (grams/cm³): 12.02
Exp. Coefficient: 0.0000118

The rate of gas absorption (velocity of penetration) into the metal surface interface is enhanced by increased temperature, pressure and electric current. Carbon dioxide gas *adsorbed* onto metal surfaces undergo molecular dissociation and subsequent *absorption* into the crystal lattice of heavier metal atoms.

The second stage of the transmutation reaction involves the subsequent trapping of absorbed gases into zinc atoms by the induced shock of rapid cooling. The sudden contraction of the atomic lattice forces the interstitial absorbed atoms into quantum instability as the strongly repulsive nuclear forces of the adjacent metal atoms close in simultaneously on each gas atom from 6 sides (along the x, y and z axes of the lattice).

Instead of rapidly contracting, some of the zinc atoms are able to maintain the previously established resonant diameter by accepting protons, neutrons and electrons from 3 adjacent trapped gas atoms, thereby increasing the atomic weight of zinc atoms to induce the formation of palladium.

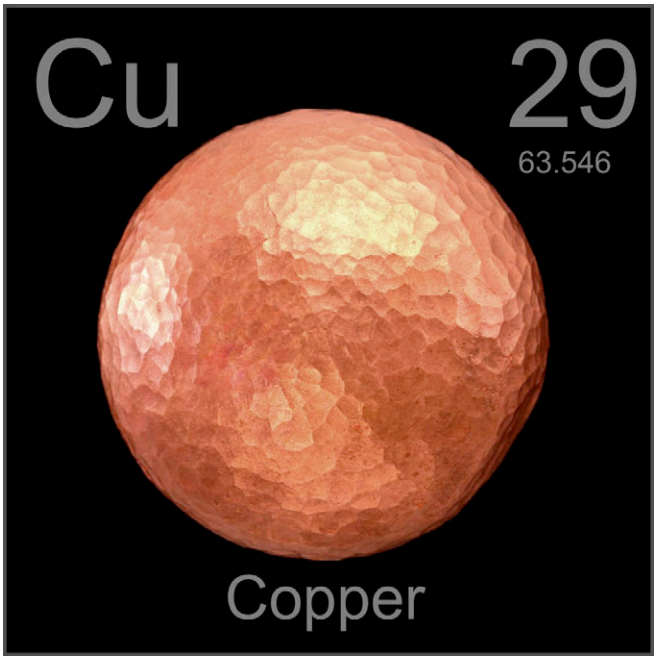
The face-centered cubic structure of the metal's atomic lattice allows for a maximum of 6 interstitial gas atoms being adjacent to any one metal atom, limiting maximum total conversion during the reaction to $^{1}/_{4}$ (~25%) of the total number of metal atoms. In the optimized case of complete saturation of absorbed gases, the transmutation of zinc into palladium can achieve a maximum weight increase to 109.5% of the original mass, leaving 75% of the zinc atoms unaltered and the remaining 25% converted into palladium –*increasing in weight to become 137% of the total original mass*.

Zinc ⇒ Palladium

The carbon dioxide-dependent low energy transmutation of zinc atoms into palladium atoms occurs during exposure to CO_2 gas absorption during precision heating to 48.8°C resonance with palladium (Pd^{108}) isotope.

- Zinc is heated, absorbing carbon and oxygen atoms to form palladium atoms during rapid cooling:

$$
\begin{aligned}
{}_{30}Zn^{64} + ({}_{6}C^{12} + {}_{8}O^{16}) + {}_{8}O^{16} &\Rightarrow {}_{46}Pd^{108} \\
{}_{30}Zn^{66} + ({}_{6}C^{12} + {}_{8}O^{16}) + {}_{8}O^{16} &\Rightarrow {}_{46}Pd^{108} + 2\ {}_{1}H^{1} \\
{}_{30}Zn^{67} + ({}_{6}C^{12} + {}_{8}O^{16}) + {}_{8}O^{16} &\Rightarrow {}_{46}Pd^{108} + 3\ {}_{1}H^{1}
\end{aligned}
$$



Carbon dioxide (CO_2) gas comprises the exact atomic mass required for the conversion of zinc into palladium, dissociating into carbon and oxygen atoms that combine with individual zinc atoms in groups of 3 adjacent interstitial gas atoms as (C + 2 O). Resonant atomic mass recombination patterns between gas and metal atoms are as follows:

Starting Isotope	+	Absorbed Gas Atoms	⇒	Target Isotope	+	Bi-Products	±Variance
$Zn^{63.92915}$	+	$1\ C^{12.00000} + 2\ O^{31.98983}$	⇒	$Pd^{107.90389}$			+0.01509
$Zn^{65.92604}$	+	$1\ C^{12.00000} + 2\ O^{31.98983}$	⇒	$Pd^{107.90389}$	+	$2\ H^{2.015650074}$	–0.00367
$Zn^{66.92713}$	+	$1\ C^{12.00000} + 2\ O^{31.98983}$	⇒	$Pd^{107.90389}$	+	$3\ H^{3.023476111}$	–0.01041

The Geyser Reactor: Zinc ⇒ Copper Transmutation

The resonant atomic transmutation of zinc into copper is achieved by precision control of atomic resonance in a two-stage reaction that is safe, non-toxic and involves only low energies. Zinc becomes instilled with the resonant atomic frequency signature of hydrogen, before being rapidly quenched to trigger bulk conversion into hydrogen and copper –*according to the established frequency 'memory' of the standing wave field of each atom*.

The first stage of the transmutation reaction maintains the starting element (zinc) at the phonon resonance frequency of the target bi-product element (H^1)*, during a 3-hour dwell time exposed to* O_2 *gas nanobubbles.*

Protium, the lightest hydrogen isotope (H^1) provides the resonant target frequency for this reaction, as determined by the following formulae (calculated using the latest atomic data sets for the elements, provided in blue):

$$\text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{d \times Na}{m}}$$

d - density in g/cm³
Na - Avogadro's Constant
m - atomic mass

$$\text{Resonant Temperature (°C)} = \frac{Ln\left(\frac{f(starting)}{f(target)}\right)}{Ec} + St$$

f - frequency in Hz
Ln - natural logarithm
Ec - expansion coefficient
St - standardized temp in °C

The resonant frequency of hydrogen isotope (H^1) in its rest state is 3,773,180 Hz, according to the element's atomic diameter at 20°C. Oxygen isotope (O^{16}) resonates at this same frequency when heated to 37.8°C*:*

$$O^{16}\text{ Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{0.001429 \times (6.0221 \times 10^{23})}{15.99491}} = 3{,}775{,}138\ \text{Hz}$$

$$H^1\text{ Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{0.0000899 \times (6.0221 \times 10^{23})}{1.007825037}} = 3{,}773{,}180\ \text{Hz}$$

$$\text{Resonant Temperature (°C)} = \frac{Ln\left(\frac{f(\ 3{,}775{,}138\ )}{f(\ 3{,}773{,}180\ )}\right)}{0.0000291} + 20 = 37.8\ °\text{C}$$

Starting Element: Oxygen ($_8O^{16}$)
Natural Abundance: 99.762%
Atomic Mass: 15.99491
Density (grams/cm³): 0.001429
Exp. Coefficient: 0.0000291

Target Element: Hydrogen ($_1H^1$)
Natural Abundance: 99.985%
Atomic Mass: 1.007825037
Density (grams/cm³): 0.0000899
Exp. Coefficient: 0.0000366

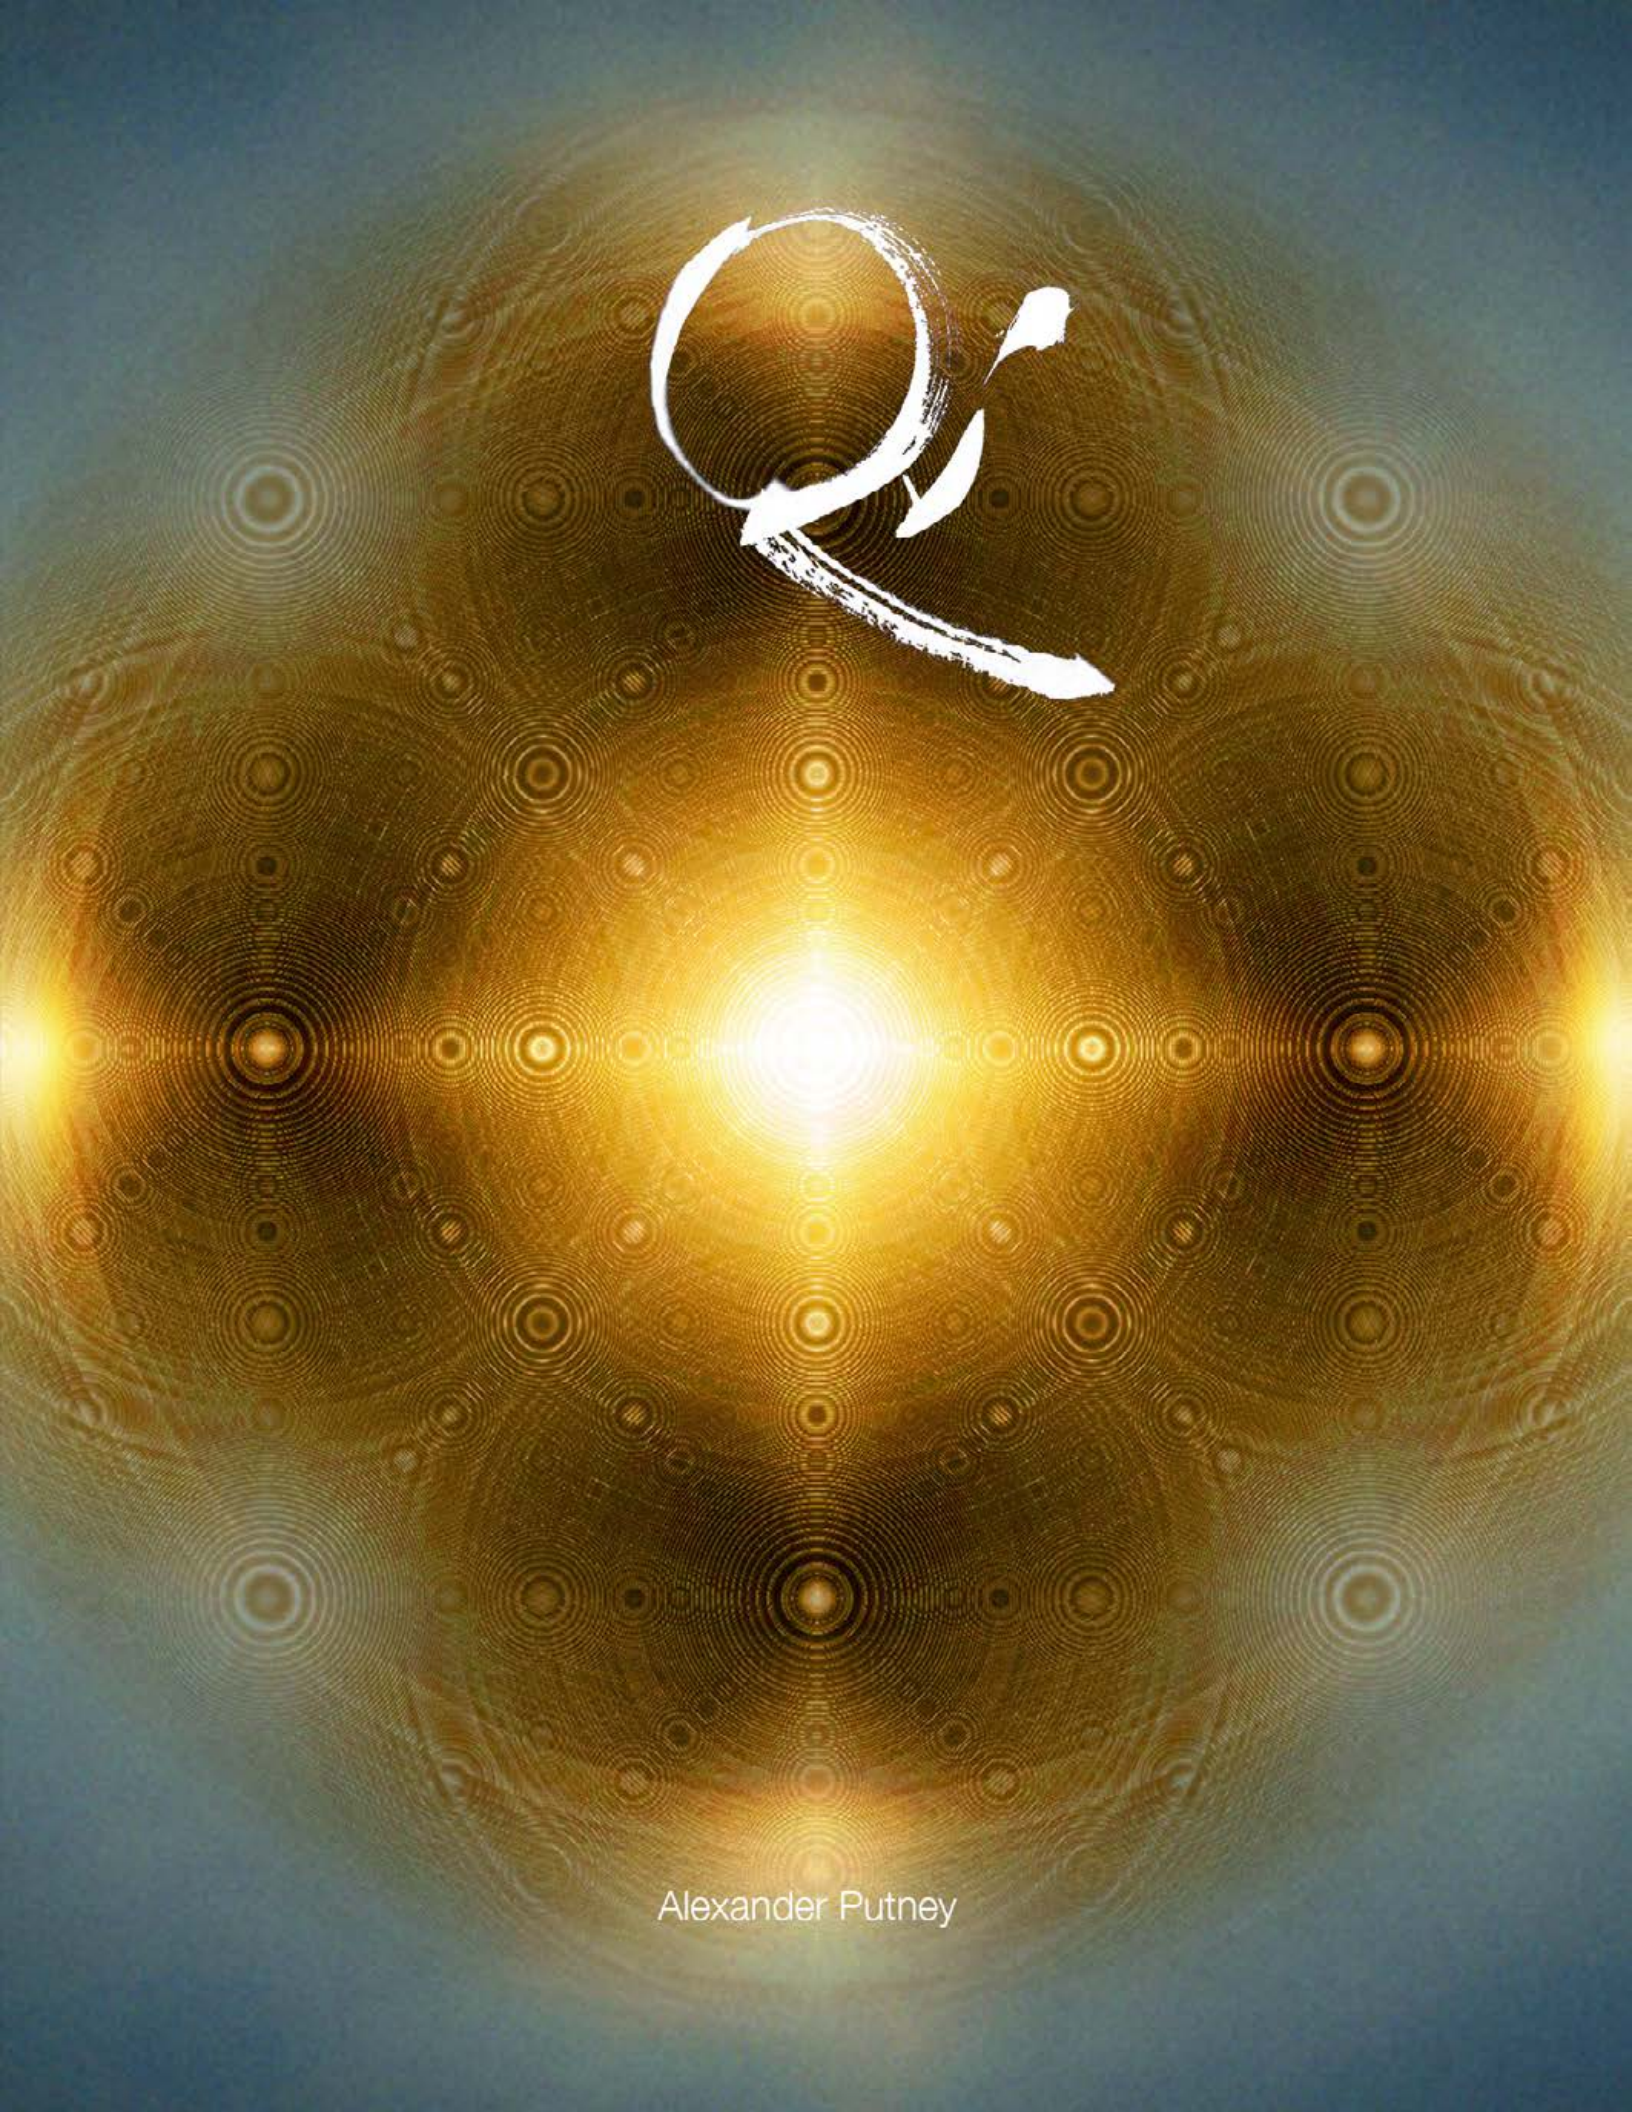
The rate of gas absorption (velocity of penetration) into the metal surface interface is enhanced by increased temperature, pressure and electric current. Oxygen gas *adsorbed* onto metal surfaces undergoes molecular dissociation and subsequent *absorption* into the crystal lattice of heavier metal atoms.

The second stage of the transmutation reaction involves the subsequent trapping of absorbed gases into zinc atoms by the induced shock of rapid cooling. The sudden contraction of the atomic lattice forces the interstitial absorbed atoms into quantum instability as the strongly repulsive nuclear forces of the adjacent metal atoms close in simultaneously on each gas atom from 6 sides (along the x, y and z axes of the lattice).

Instead of rapidly contracting, some of the zinc atoms are able to maintain the previously established resonant diameter by ejecting protons, neutrons and electrons into available interstitial spaces within the lattice, thereby decreasing the atomic weight of zinc atoms to induce the formation of hydrogen and copper.

The face-centered cubic structure of the metal's atomic lattice allows for a maximum of 6 interstitial gas atoms being adjacent to any one metal atom, providing stable loci for gas atoms ejected by zinc atoms during quantum trapping events. Absorption of oxygen atoms through zinc surfaces at 37.8°C transmits phonon vibrations throughout the metal lattice at the hydrogen target frequency, enabling bulk conversion of zinc into copper at high rates of efficiency. The subtle bulk weight changes resulting from this resonant nuclear reaction can only be determined after ejected hydrogen atoms have been desorbed from metal surfaces by cooling to the rest state at 20°C.

Zinc ⇒ Copper



The oxygen-dependent low energy transmutation of zinc into copper occurs *in aqueous reactors*, based on phonon matching of oxygen (O^{16}) at 37.8°C with hydrogen (H^{1}) at rest (20°C), *as in human blood*.

- Zinc is heated to 37.8°C with oxygen, releasing hydrogen atoms to form copper during rapid cooling:

$$_{46}Zn^{64} + {}_{8}O^{16} \Rightarrow {}_{1}H^{1} + {}_{45}Cu^{63} + {}_{8}O^{16}$$
$$_{46}Zn^{66} + {}_{8}O^{16} \Rightarrow {}_{1}H^{1} + {}_{45}Cu^{65} + {}_{8}O^{16}$$

Hydrogen atoms comprise the exact atomic mass required for the conversion of zinc into copper. Clear atomic mass recombination patterns define fission bi-products ejected from zinc nuclei during the quantum trapping event:

Starting Isotope	+	Absorbed Gas Atoms	⇒	Target Isotope	+	Bi-Products	±Variance
$Zn^{63.92915}$	+	$O^{15.994914}$	⇒	$H^{1.007825037}$	+	$Cu^{62.92960}$ + $O^{15.994914}$	–0.00828
$Zn^{65.92713}$	+	$O^{15.994914}$	⇒	$H^{1.007825037}$	+	$Cu^{64.92779}$ + $O^{15.994914}$	–0.00849

Alexander Putney

Human beings ascend in knowledge and wisdom by observation and contemplation of the Oneness of all nature surrounding us, perpetually sustained by invisible streams of life force known to the ancients as *prana* in Sanskrit India; as *ch'i* or *qi* in ancient China; as *k'u* among the Maya. The fine architecture of the isotopes of physical matter presents the fundamental cosmic order that endows the divine luminosity of all living organisms throughout our vast Universe.

Modern physicists have not yet identified the primary source of the photonic and acoustic energies of the *spirit* or *soul* from which arises the clear distinction between living and inanimate matter. Vibratory relationships observed among the atoms comprising our bodies and all matter are herein recognized as the essential key for understanding elemental nuclear transmutations, opening the door to a harmonious technological era of atomic resonance.

The symphony of atoms in a crystal lattice generates the dynamic relationships that facilitate the natural low energy conversion of one element into another, as defined by the phonon resonance formula of geologist W. Lussage, realized in 1965. The precise framework of phonon resonance reveals a new class of resonant atomic recombinations that occur at critical temperature thresholds, revealing the underlying mechanism for precision temperature regulation in warm-blooded animals and exact temperature range requirements exhibited by the innumerable abundance of lifeforms.

Ancient Aztec and Maya wisdom extolls the life-sustaining properties of human blood as being profoundly connected to the notion of cosmic resonance: *"What is the blood that connects stones with soul, men with suns? It is the universal unity, the one creative principle crystallizing into myriad forms, and when liberated by sacrifice it returns to unity."* Barefoot contact with the sacred pyramid stones electrically excites the perpetual nuclear fusion and fission reactions taking place between gases and metals in the bloodstream, releasing soft photons in the visible spectrum that constitute the human *light body* or *rainbow body*.

The complimentary ancient qi energy balancing systems of Asia maintain medical diagrams of the body's qi meridians that biophysicists have recently identified as a fine network of transparent ducts that optically link all of the organs with the central nervous system. Biophotonic studies have photographed the effective light balancing in the meridian system by traditional acupuncture techniques, recording rhythmic fluctuations in human photon field intensity that directly correspond to the sacred Mayan calendar cycles of 14 days, 1 month, 3 months and 9 months –*according to the influence of planetary cycles*.

Integration of the tenets of ancient wisdom with the latest findings of biophysics allows mastery of atomic transmutation and a renewed awareness of the light-storing capacity of DNA as nonlinear standing waves form within nucleotide bases, now recognized as an 'exciplex' laser array located both in the cell nucleus and circulating throughout the qi meridian system.

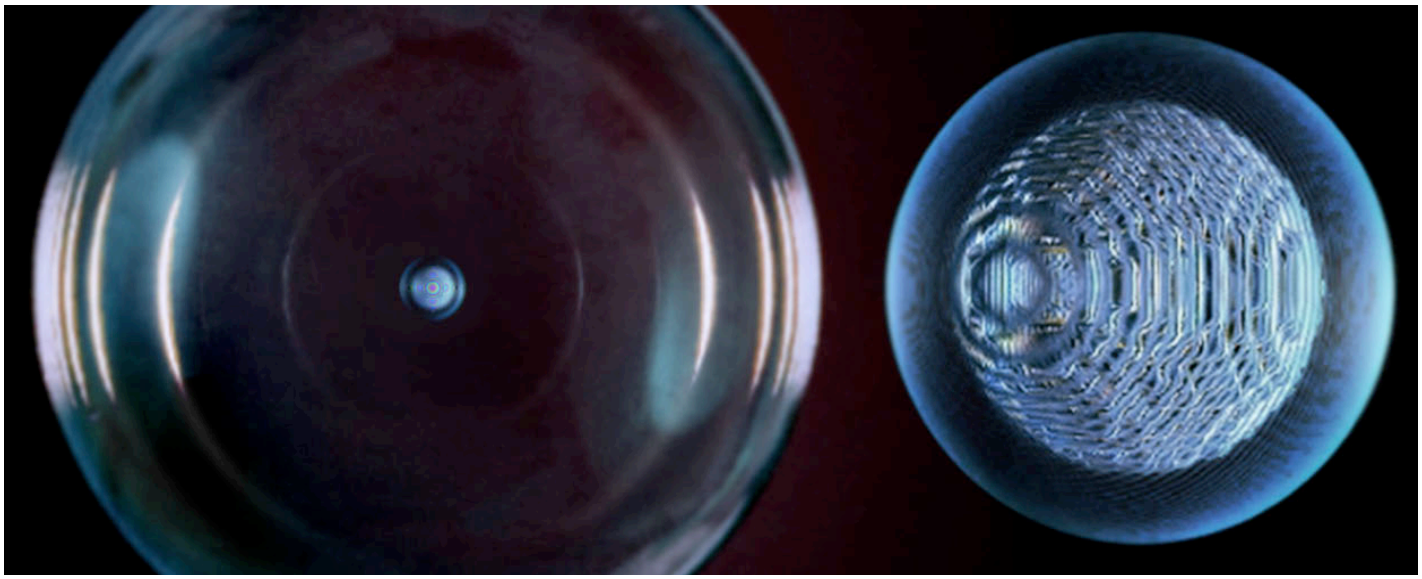
The Quantum Trappings of a Golden Age

The Quantum Trappings of a Golden Age

Intensifying atmospheric ionization has generated spectacular auroral displays in recent months, building toward solar maximum in December. Extreme weather conditions, severe thunderstorms, tornadoes and greater numbers of lightening strikes and auroral displays are being reported all over the world. What exactly takes place in these electron avalanches seen as plasma formations above the Earth that are mirrored by concurrent electrical storms in the atmospheres of all the planets in our solar system?

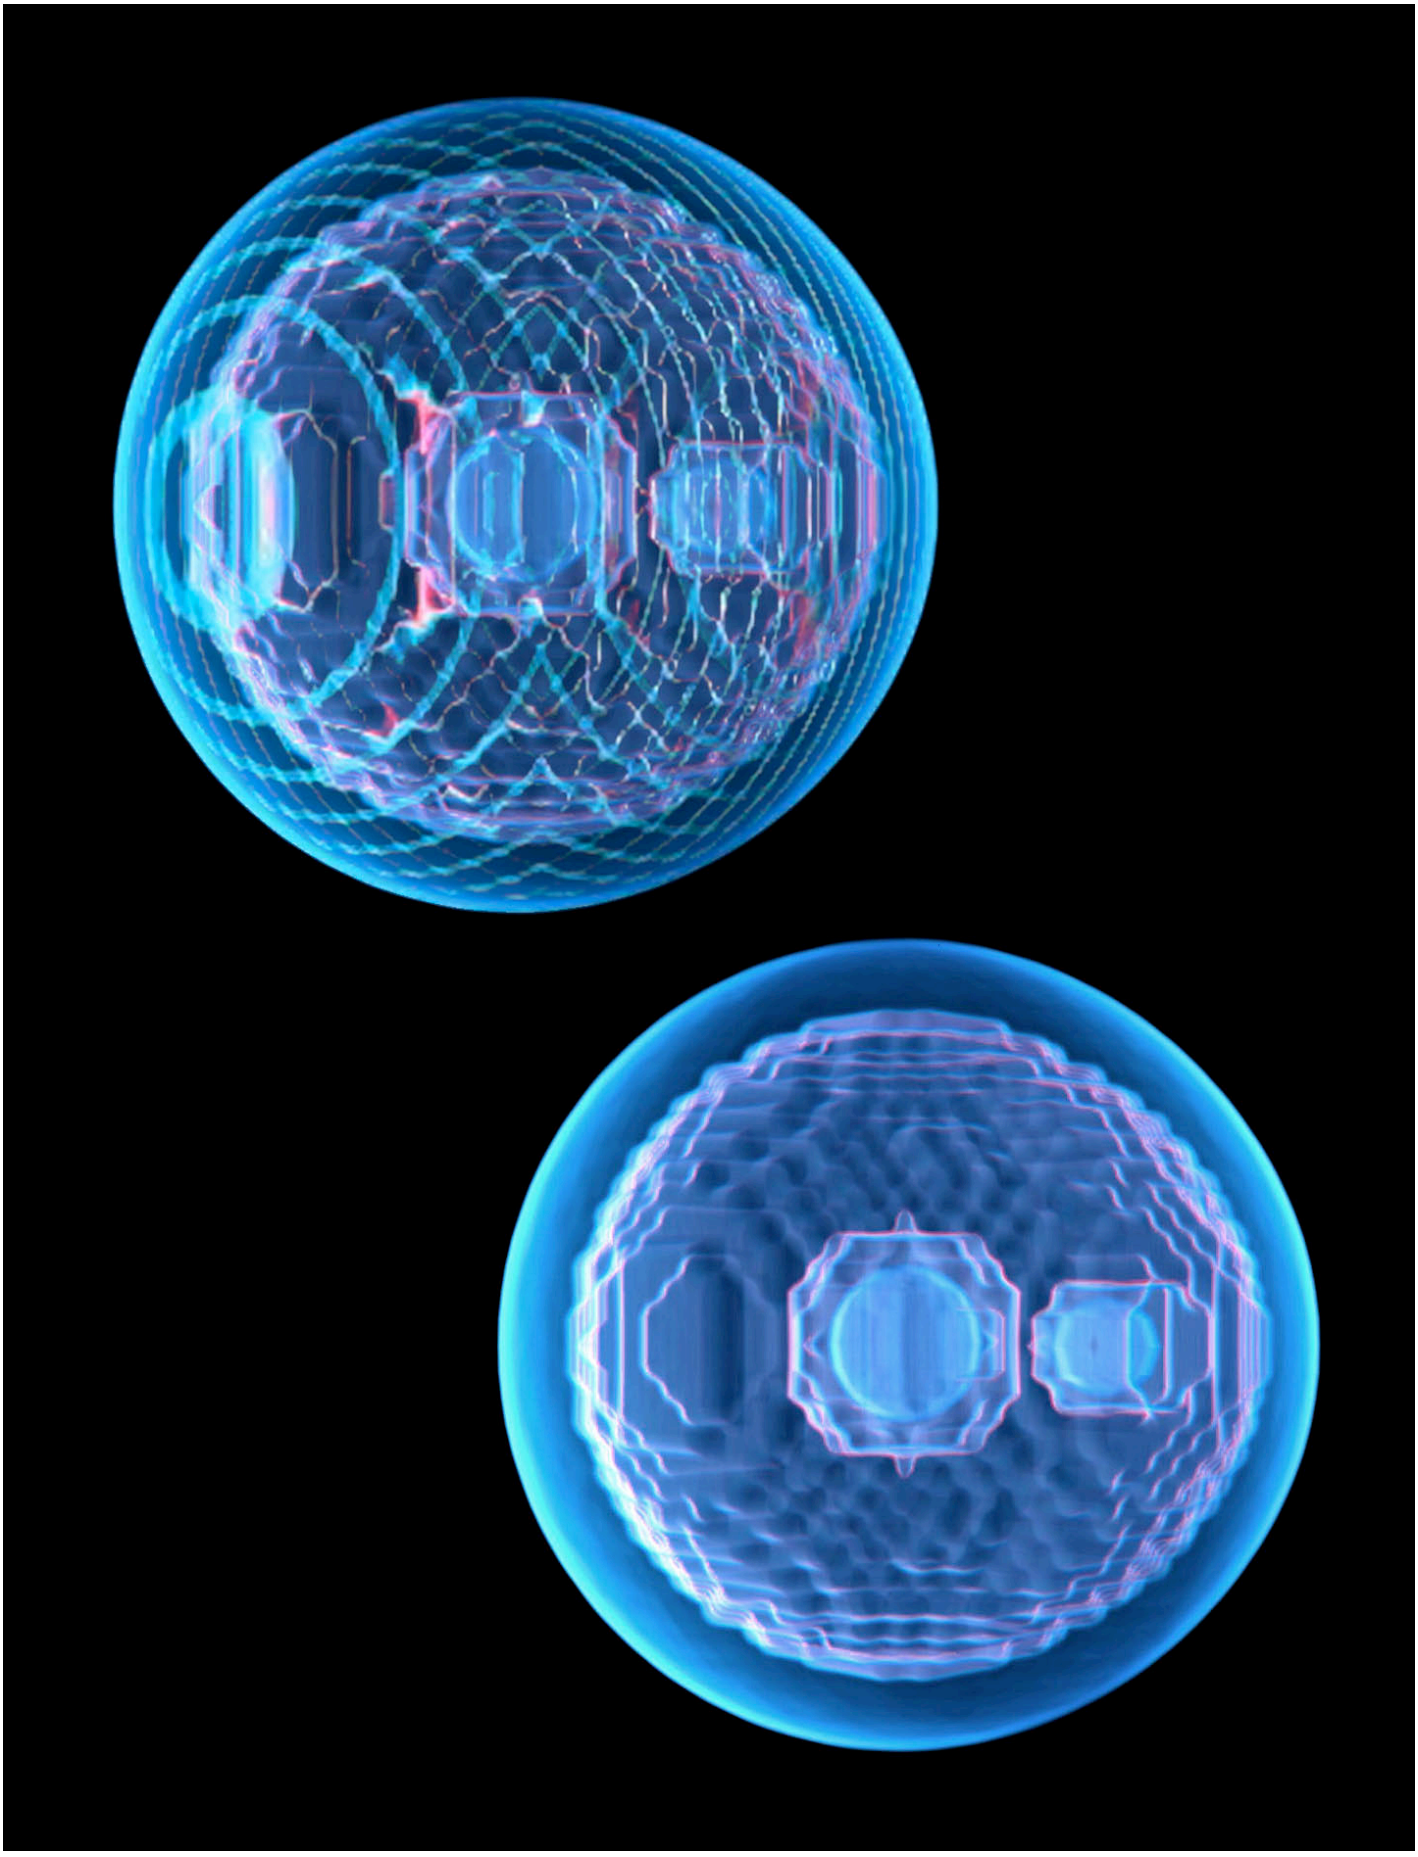


The broader effect of the significant net increase in atmospheric plasma formation is a more efficient cleansing of our polluted skies, through electrical chain reactions known to produce the abundance of nitric oxides and ozone crucial to the natural rebalancing of atmospheric gases. There is yet another, more essential purification of atmospheric hydrogen that takes place in sprites, jets and lightning strikes relating to the elimination of deuterium, a heavy isotope of hydrogen comprising 0.0156% of terrestrial waters. Deuterium content in atmospheric water vapor presents a vertical distribution gradient by gravity[1], with greatest concentrations of heavy water molecules near sea level, decreasing steadily with altitude.

The latest advances of modern atmospheric sciences and atomic physics reiterate the ancient wisdom of the Vedas, as well as the Maya culture of Central America, concerning the sacred purification processes of nature's water cycle. Sanskrit descendant cultures have built hundreds of monumental stone pyramids on every continent and island chain, forming a wireless network resonating at the 1.45 Hz heartbeat frequency and enhancing atmospheric water purity by resonant production of light water and the resonant elimination of heavy hydrogen isotopes from our skies. After centuries of disuse and dormancy, this advanced antediluvian technology of our Atlantean forbearers is now roaring back to life, with each progressive outburst of solar flares driving every atom of our planet into states of greater coherence.[2]

Emulating atmospheric HHO plasma formation in quartz vacuum chambers, chemist/physicist R. Mills has developed HHO plasma reactors (above) that sustain excess energy production by implosion of hydrogen atoms to form *hydrinos*,[3] in a complex process that has been validated by Rowan University researchers. Laboratory findings revealing the unique dynamics of HHO resonant-transfer plasma inform the atomic reactions of lightning. As raindrops and water vapor in the storm cell create an electrical pathway for the ionospheric discharge, water molecules are rapidly ionized, undergoing low energy nuclear fission of deuterium atoms into protium atoms, with the ejected neutrons numbering upto 5,000 per cubic meter:

> Russian scientists... installed three neutron detectors that were sensitive to low energy neutrons: one above ground, one partially shielded in a building, and a third underground... The cosmic rays generate muons that collide with something in or very near the detector, resulting in neutrons that have the high energy of the muon being registered. Neutrons from lightning, on the other hand, can only have the energy given up by a fission event, which is then lost in collisions with molecules in the air as they travel to the detector... In the previous experiments, it had been assumed that each detection event corresponded to a single neutron, [whereas] the new data show that up to 5,000 neutrons per cubic meter are produced every second by lightning strikes...[4]



The plasma formations of lightning and aurora have been replicated for study. At Blacklight Power, Mills has defined the high-energy states of hydrogen as an implosion process that releases vast amounts of energy through emission of infrared and ultraviolet light. During the formation of HHO plasma from water vapor, heavier deuterium isotopes are resonantly converted into protium as neutrons are ejected from the nuclei, represented by the conversion equation [$D^2 \Rightarrow H^1 + n^1$]. *Densely concentrated resonant nuclear transmutations of deuterium into protium remain the only viable explanation for the origin of neutron flux released by atmospheric HHO plasma briefly generated during lightning strokes.*

Precision tuning of this resonant conversion process of deuterium into protium allows bulk purification of drinking water for human consumption, as even slightly deuterium-depleted water has been observed to reduce and kill cancers, as well as significantly reducing rates of cellular aging.[5] Significant extension of the average human lifespan will become measurable as light water becomes publicly available.

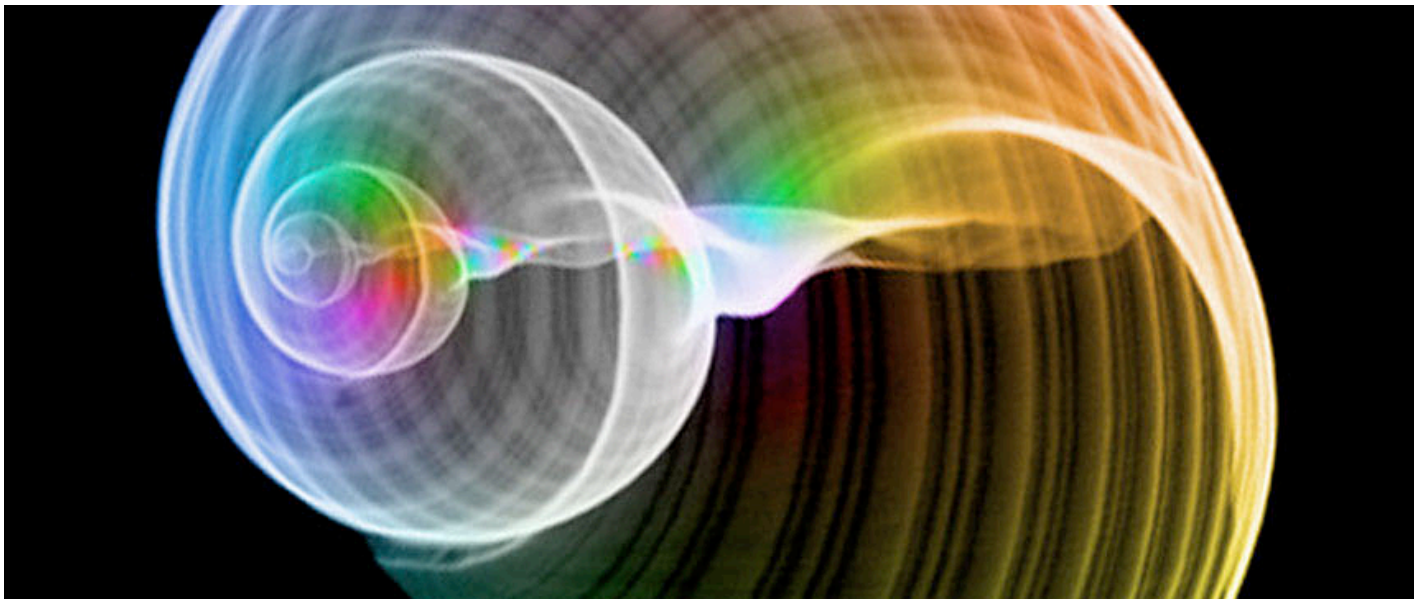
Nuclear fission reactions of deuterium in lightning have not been previously identified, yet deuterium fusion reactions within metal substrates have been widely reported. The low energy fusion of deuterium atoms to form helium within a palladium lattice produces excess heat during electrolysis with heavy water[6], while later experimentation achieved slightly greater efficiency by applying electron polarization.[7] An emerging understanding of the complex nuclear dynamics of resonant conversions of lighter gases into heavier gases promises a full revelation of the atmospheric balancing processes protecting all life.

Mathematical modeling of the nuclear recombinations that occur during low energy atomic reactions has been achieved by applying the nonhomogenous Burgers equation for nonlinear standing waves. Accurate visualization of the deuterium nucleon describes the standing wave fields surrounding the proton and neutron, solved as the 'Two-Body Distribution Probability of a Nucleon' (above, rendered by R. Zirbes).[8]

The standing wave structure of the electron was predicted by this author after research into Sanskrit mandala artifacts from La Maná, Ecuador in 2004-07 that display ultraviolet fluorescent inlays encoding the quantum quadratic function [$z_{n+1} = z_n^2$], being closely related to the Mandelbrot set [$z_{n+1} = z_n^2 + c$], and directly observed for the first time by Swedish researchers in 2008.[9] Ancient Vedic knowledge of nonlinear standing waves underlies all of the holistic consciousness technologies of our deep past and imminent future, *opening the door to resonant processes for converting one element into another.*

The natural abundance of pure metals present in Earth's atmosphere and lithosphere appear as solid deposits and reduced particles of all sizes. Microbial and oxidative processes constantly reduce metal surfaces into nanoparticles, while geological forces liquefy and separate metals by density. Extensive interdisciplinary study has revealed that *both geological* and *biological* processes induce low energy atomic nuclear transmutations at specific resonant temperatures, in the presence of specific gases.

Extensive investigations by French biologist C.L. Kervran (1901-1983) revealed the natural simplicity of biological transmutations occurring in multitudes of vital processes by replicating nuclear conversions as simple electrochemical reactions *in vitro*. Kervran defined resonant nuclear reactions *as reversible, and involving both fusion and fission events between gases, metals, nonmetals and earths.* His simple *in vitro* demonstration of the oxygen-dependent low energy atomic conversion of carbon into iron was reported in 1962, wherein ultrapure carbon rods were used as electrodes in an aqueous discharge system. *Sediment analysis confirmed the fusion of two carbon atoms with two oxygen atoms in the formation of iron*.[10]



Multiple government-funded investigations into recurring cases of fatal carbon monoxide poisoning of steelworkers in France were finally concluded with Kervran's definitive 1964 demonstration under controlled laboratory conditions that *lethal quantities* of carbon monoxide are generated during steel plasma-cutting processes over 400°F by low energy nuclear transmutations of nitrogen gas.[11] The fact that carbon monoxide is not formed below this critical temperature threshold is consistent with advanced atomic resonance calculations derived decades later, *providing a basis for the determination of optimal temperature ranges for all such resonant atomic reactions that occur throughout natural systems.*

Kervran's groundbreaking studies of various other heat-induced atmospheric and lithospheric processes led to his identification of several essential nuclear transmutations –without which such processes cannot be understood– finding that *airborne pairs of nitrogen atoms readily combine to form silicon at the edge of the thermosphere*.[12] A similar fusion event was identified in volcanic reactions where *pairs of carbon atoms merge in the formation of magnesium, while pairs of oxygen atoms merge to form sulfur*.[13] The natural abundance of elements and the specific isotope ratios produced in thermospheric and volcanic processes provide compelling evidence for low energy nuclear reactions as the unified driving force of nature.

Various researchers have obtained significant evidence for biological transmutation as the origin of calcium from nuclear conversions of sodium, magnesium, potassium and silicon in a wide range of organisms that secrete calcium from one side of a membrane to produce protective shells. Experiments showed that avian and reptilian species deprived of dietary calcium were incapable of producing solid eggshells unless provided with a dietary source of silicon that was readily converted into the calcium required for normal eggshell development.[14] Similar experiments with crustacean species deprived of environmental calcium sources revealed their ability to supplant calcium with magnesium to facilitate normal shell development.[15]

Kervran also determined that calcium formation during tooth enamel and bone growth processes in all vertebrate species was mitigated by the same substitutive resonant nuclear reactions of *magnesium and oxygen fusing to form calcium*, as well as another notable reaction: *carbon fusing with fluorine to form phosphorus*.[16] The reversal of the latter process was identified in the bacterial digestion of bone, with *phosphorus undergoing resonant fission into carbon and fluorine daughter isotopes*. The constant emission of fluorine gas during bone decomposition is relied upon in the dating of fossil specimens, yet its genesis as a fission product of bacterial digestion remains the only viable explanation.

Soil productivity is another area that Kervran's biological transmutation research has benefitted, after his unique findings concerning utilization of copper by wheat plants for resonant conversion into manganese. Initial attempts to increase manganese levels in wheat by the addition of manganese to soil proved fatal to test plants, while extensive trials by wheat farmers in Alberta, Canada confirmed Kervran's findings that supplementing soils with bluestone copper rebalances manganese and *doubled soil productivity*.[17]

Kervran further applied his comprehensive findings to resolve many commonly misunderstood biomineral deficiencies in humans involving biological transmutation of all essential elements including magnesium, calcium, manganese, iron, copper and zinc. *In fact, it is known that calcium deficiency and resulting bone-depletion cannot be reversed by calcium intake*. Calcium is now widely supplemented with magnesium, but the underlying mechanism can only be satisfactorily explained by resonant atomic transmutation. Hard evidence for fusion of magnesium and oxygen atoms is found in measurable Ca^{44} depletions in all bone.[18]

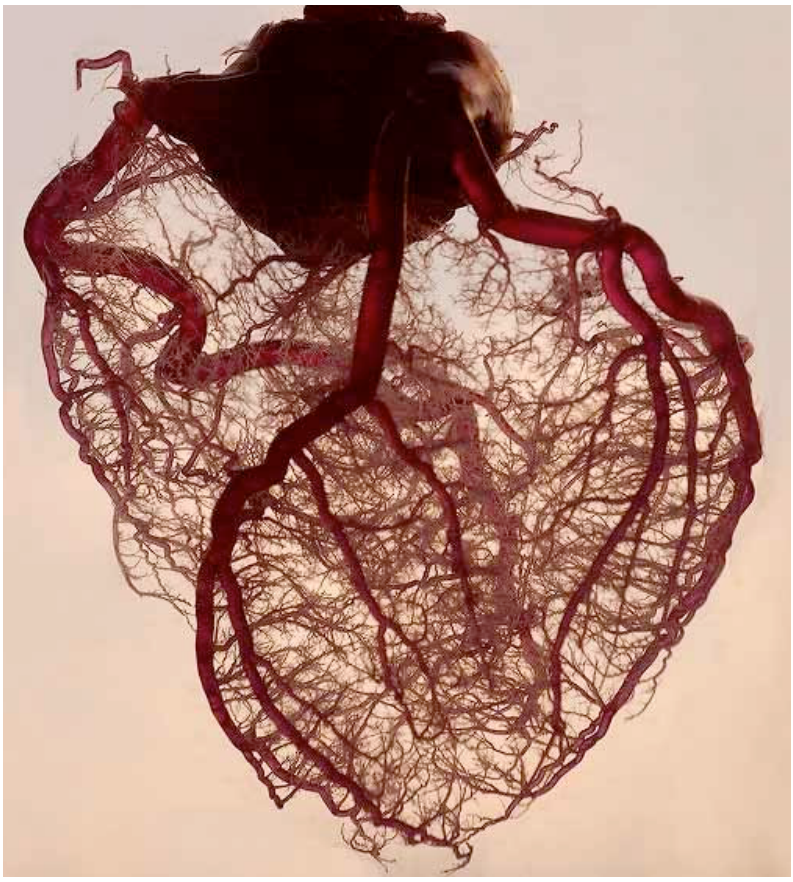
An identical situation exists in dietary supplements manufactured for both iron and copper, *which must be given together to achieve rebalancing of either essential element, as blood metabolism involves the resonant conversion of one element into the other.*[19] Comparative study of the three main varieties of animal blood –*green, blue and red*– reveal distinct sets of nuclear reaction cascades taking place within narrow resonant temperature bands enabled by thermocline migration and thermoregulation strategies.

Cellular respiration processes in all green-blooded organisms, including ascidian, holothurian and sponge species, exhibit an alternate transmutation of iron that closely relates to those used by red- and blue-blooded species (vertebrates, cephalopods, gastropods and crustaceans).[20] *Fission of iron atoms forms titanium and vanadium in green blood while in red blood the fusion of iron and oxygen forms copper and in blue blood the fission of copper atoms forms oxygen, manganese and iron*. When one considers that *constantly cycling cascades of nuclear reactions underlie the essential functions of all biological systems, acting as radiant biological holographic projectors*, all previously inexplicable animal and plant behavior displaying group synchrony and coherent mass communication can be understood as nonlinear biophoton field coupling effects occurring within the range of visible light.

Researchers Widom, Srivastava and Sivasubramanian have redefined the well-established properties of biophotons as products of atomic nuclear reactions, drawing conclusions that parallel those established by Kervran in their 2011 paper, entitled *'Biological Nuclear Transmutations as a Source of Biophotons'*:

> We have shown that soft multi-photon radiation from hard higher energy reactions sources can be employed to describe the three major well-established properties of biophoton radiation. Since the soft photon frequencies span the visible to the ultraviolet frequency range, the hard reaction sources have energies extending into the nuclear transmutation regime. Thus, the biophotons serve as a valuable clue as to which biological systems exhibit a large number of nuclear transmutations.[21]

Kervran's observations of human skin and sweat gland processes inspired laboratory experiments in 1959 that clearly demonstrated the low energy nuclear fusion of sodium and oxygen to form stable potassium,[22] which contributes to the overall biophoton emissions observed of human skin surfaces. This surprising resonant atomic reaction was later replicated by ionizing sodium vapor in the presence of oxygen under spectrographic observation (Torii, Sakurazawa, Odagiri, 1963; Ohsawa, Kushi, 1964).



Recent investigations of the ultra-weak visible luminosity of the human body have applied direct biophoton detection by ultra-sensitive light-amplified CCD cameras that accurately record subtle diurnal fluctuations in the distribution patterns within human biophoton fields over time. The re-emission of absorbed photons observed in living cells is identified as 'delayed luminescence' in the hours after exposure. Multiple sources comprise the perpetual and spontaneous biophoton emissions of all cells. Biophysicist F.A. Popp and his research team have reported remarkable series' of images of the weak human glow *during traditional acupuncture and moxibustion therapies* (at left), clearly revealing the left-right symmetry of the healthy body and biorhythmic cycles of 14 days, 1 month, 3 months and 9 months.[23]

Popp's focus has narrowed to investigations of the nonlinear photon trapping of DNA as a coherent broadband visible light biocommunication system, emitted from within the chromatin in the nucleus of each cell. *DNA base-molecules and surrounding cell walls act as quantum resonators, efficiently storing light by internal reflection of nonlinear standing waves. These findings inform a radical recharacterization of chromatin as an exciplex laser array, with DNA base pairs now recognized as 'excited complexes' that emit photon fields displaying constructive or deconstructive interference modes.*[24] Studies found that DNA conformation and skin conductivity directly correlate with biophoton emission intensity.[25]

Areas of the human body that emit the greatest intensity of photons (seen above in yellow, red and white) correspond closely to the circulatory system. Along with the heart, large superficial veins and arteries present the greatest biophoton emission and highest electrical conductivity in the body. Blood is more saline than other bodily fluids, and full of iron-bearing hemoglobin, contributing to a conductivity that is higher than the rest of the body's systems, acting as an extension of the electromagnetic field of the beating heart *by maintaining an electronically excited state exhibiting coherent oscillations*:

> Monitoring of spontaneous and luminophore-amplified photon emission (PE) from non-diluted human blood under resting conditions and artificially induced immune reaction revealed that blood is a continuous source of biophotons indicating that it persists in electronically excited state. This state is pumped through generation of electron excitation produced in reactive oxygen species (ROS) reactions. Excited state of blood and of neutrophil suspensions (primary sources of ROS in blood) is an oscillatory one suggesting of interaction between individual sources of electron excitation. Excited state of blood is extremely sensitive to the tiniest fluctuations of external photonic fields but resistant to temperature variations as reflected in hysteresis of PE in response to temperature variations. These data suggest that blood is a highly cooperative non-equilibrium and non-linear system, whose components unceasingly interact in time and space. At least in part this property is provided by the ability of blood to store energy of electron excitation that is produced in course of its own normal metabolism.[26]

Oscillatory excitation of the electronic state of blood by ROS reactions coordinates enzymatic activities and enhances the absorption of dissolved gases by metal nanoparticles in the blood, especially lithium, chromium, manganese, iron, nickel, copper, zinc and selenium. Hemoglobin within red cells acts as a reducing agent that synthesizes iron nanoparticles in the 2-5 nm range[27] for optimized binding with oxygen during circulatory transport.

Precision control of the blood pressure differentials of dissolved oxygen levels maintained between red cell membranes and the surrounding blood plasma is accomplished by temperature-dependent transport interactions with sodium and potassium cations.[28] Kervran's elucidation of the electrically-enhanced nuclear fusion of sodium and oxygen to form stable potassium occurs *under the conditions maintained in healthy blood, in conjunction with nuclear fission reactions induced by the phonon resonance of metal-bound oxygen atoms with hydrogen at rest.*

The indispensible role of absorbed oxygen atoms in the resonant nuclear conversions of *sodium ⇒ potassium* and *iron ⇒ manganese* directly implicates these reactions as primary mechanisms for blood's crucial rebalancing of metal concentrations, thus enabling effective utilization of a wider ratio of available metals to fulfill the well-known respiratory functions as well as the newly discovered biophotonic functions of blood medium.

This conclusion is directly supported by isotopic signature studies of trace metals in mammals and plants, which diverge significantly from the great abundance of dietary metal sources and those of all geological deposits. Trace copper isotope ratios in human blood consistently present a Cu^{65} variation of +0.30% as compared with non-biological copper,[29] *being enhanced by the fission of zinc atoms to form copper.*

Isotopic shifts of iron in human blood enable gender determinations of partial skeletal remains,[30] with male blood presents Fe^{56} depletions of –2.5% to –2.9%,[31] suggesting heavier iron isotopes do not concentrate in the blood serum of females due to regular menstrual blood loss and the enhanced iron absorption that compensates for such periodic deficiency. This hypothesis is supported by findings that hemochromatosis, characterized by excess iron levels and heavy iron isotope concentrations, is alleviated by phlebotomy (the removal of blood).[32] Such notable isotopic shifts that perpetually accumulate during blood recirculation *implicate the atomic weight disparity as produced by perpetual resonant nuclear transmutations of iron*.

The surprising conclusions established by Kervran's *in vivo* biological transmutation experiments have not been thoroughly followed-up by biophysicists despite the ever growing body of solid evidence for nuclear conversions occurring in all living organisms. The compelling case of biological transmutations informs the open questions of biophotonics by synthesis with the formulaic framework of phonon resonance developed by W. Lussage in 1965 and confirmed in microbial transmutation studies reported by J. Champion in 2001:

> Dimensional phonon resonance occurs when the space occupied by one isotope is *exactly the same as that of another isotope in its rest state* [i.e. 20°C]. This event can only occur under the following two conditions: the expansion of an isotope by heating, or the contraction of an isotope by cooling. Due to the natural characteristics of elemental properties, this event is extremely rare and one can only force the event under select conditions. To determine the phonon resonance of an isotope, it is necessary to apply the following formula:[33]

$$\text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{d \times Na}{m}}$$

d - density in g/cm³
Na - Avogadro's Constant
m - atomic mass

$$\text{Resonant Temperature (°C)} = \frac{Ln\left(\frac{f(starting)}{f(target)}\right)}{Ec} + St$$

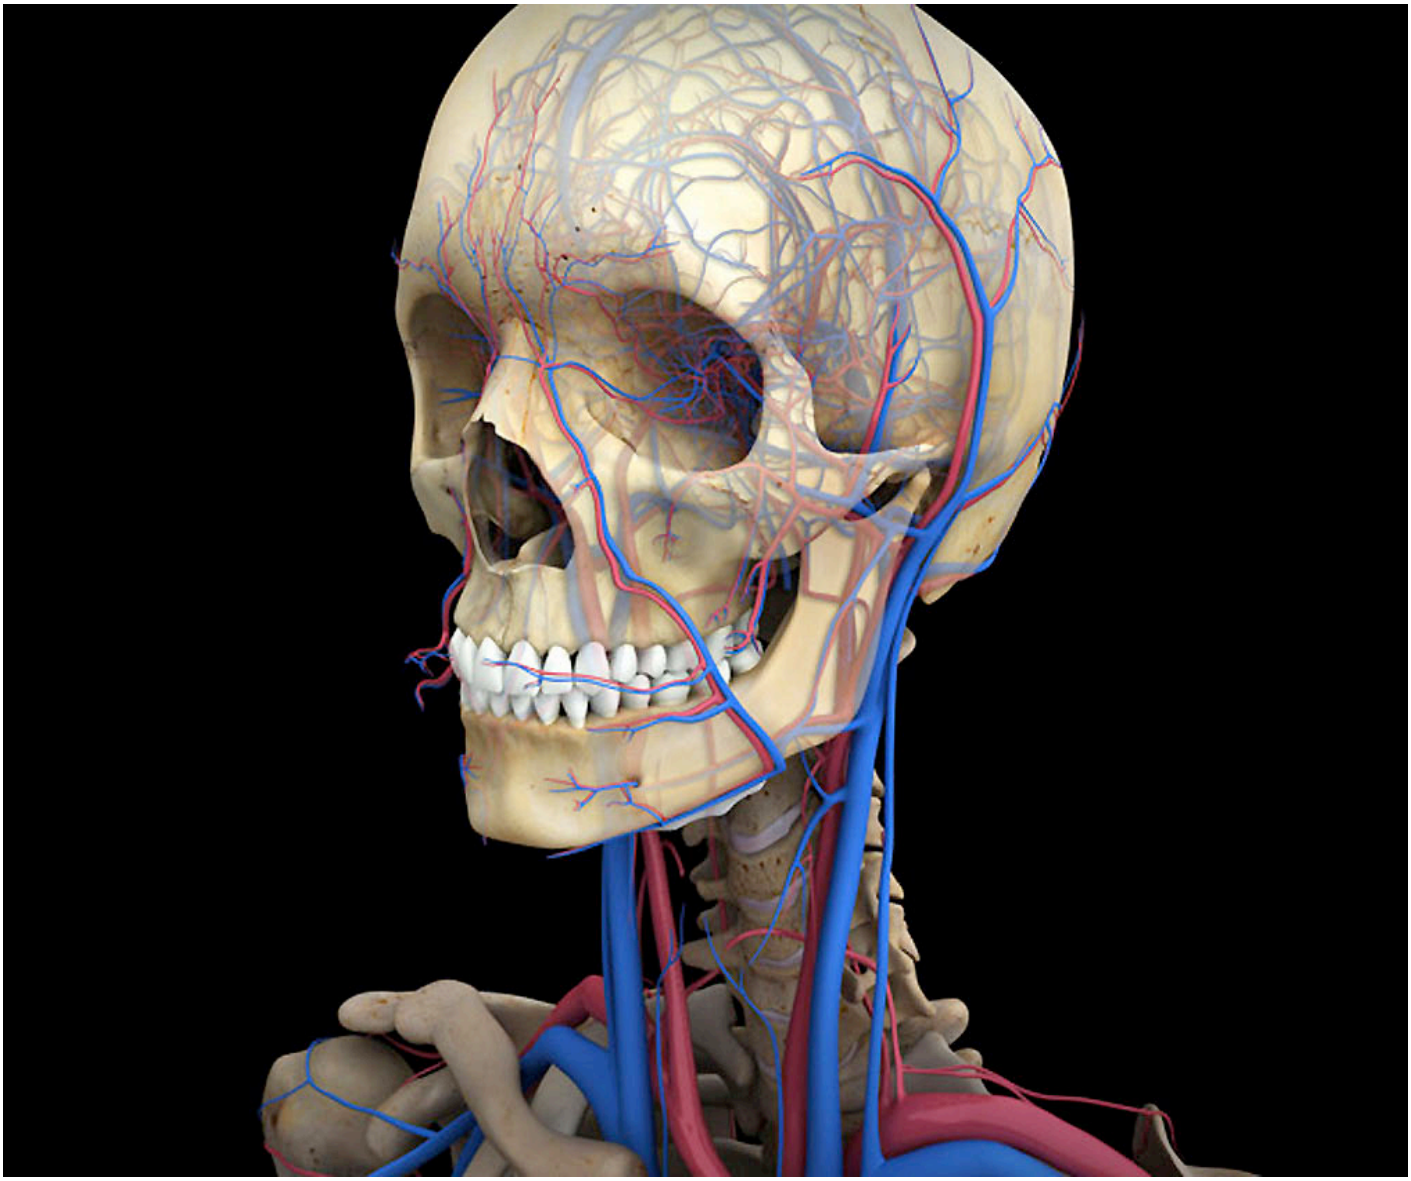
f - frequency in Hz
Ln - natural logarithm
Ec - expansion coefficient
St - standardized temp in °C

Phonon resonance calculations reveal the elusive quantum dynamics of lattice interactions that induce low energy nuclear reactions throughout the bodies of living organisms, as first identified by Kervran decades earlier. Precise calculations of the exact atomic diameters of various isotopes were only recently enabled by the careful determination of exact atomic masses, densities and linear thermal expansion coefficients for all known isotopes –*data that was not available during Kervran's discoveries of biological transmutations, and comprises undeniable evidence for his conclusions.*

Atomic data for each isotope applied in these calculations (in blue) was obtained from various updated sources, while the exact atomic mass figures are consistent with tables produced by the Secondary Ion Mass Spectrometer (SIMS) Laboratory of the GeoForschungsZentrum in Potsdam, Germany.[34]

The evolution of red-blooded mammals has specifically exploited the phonon frequency interactions of gases and metals in the blood for producing excited electron states that have yet to be fully understood. Phonon vibration of individual oxygen atoms bound to iron atoms in hemoglobin enables the resonant atomic recombination process by instilling the target frequency of daughter elements.

Quite surprisingly, the atomic diameters of O and H atoms are relatively similar despite their difference in atomic mass, allowing for frequency matching possibilities near room temperature. As oxygen atoms are driven through repeating heat fluctuations by cyclical movement through the human body, frequency matching with hydrogen atoms occurs in the warmer areas before slowly dropping in the extremities. The resonant frequency of hydrogen (H^1) in its rest state is 3,773,180 Hz, according to the element's atomic diameter at 20°C. Oxygen isotope (O^{16}) resonates at this same frequency when heated to 37.8°C*:*

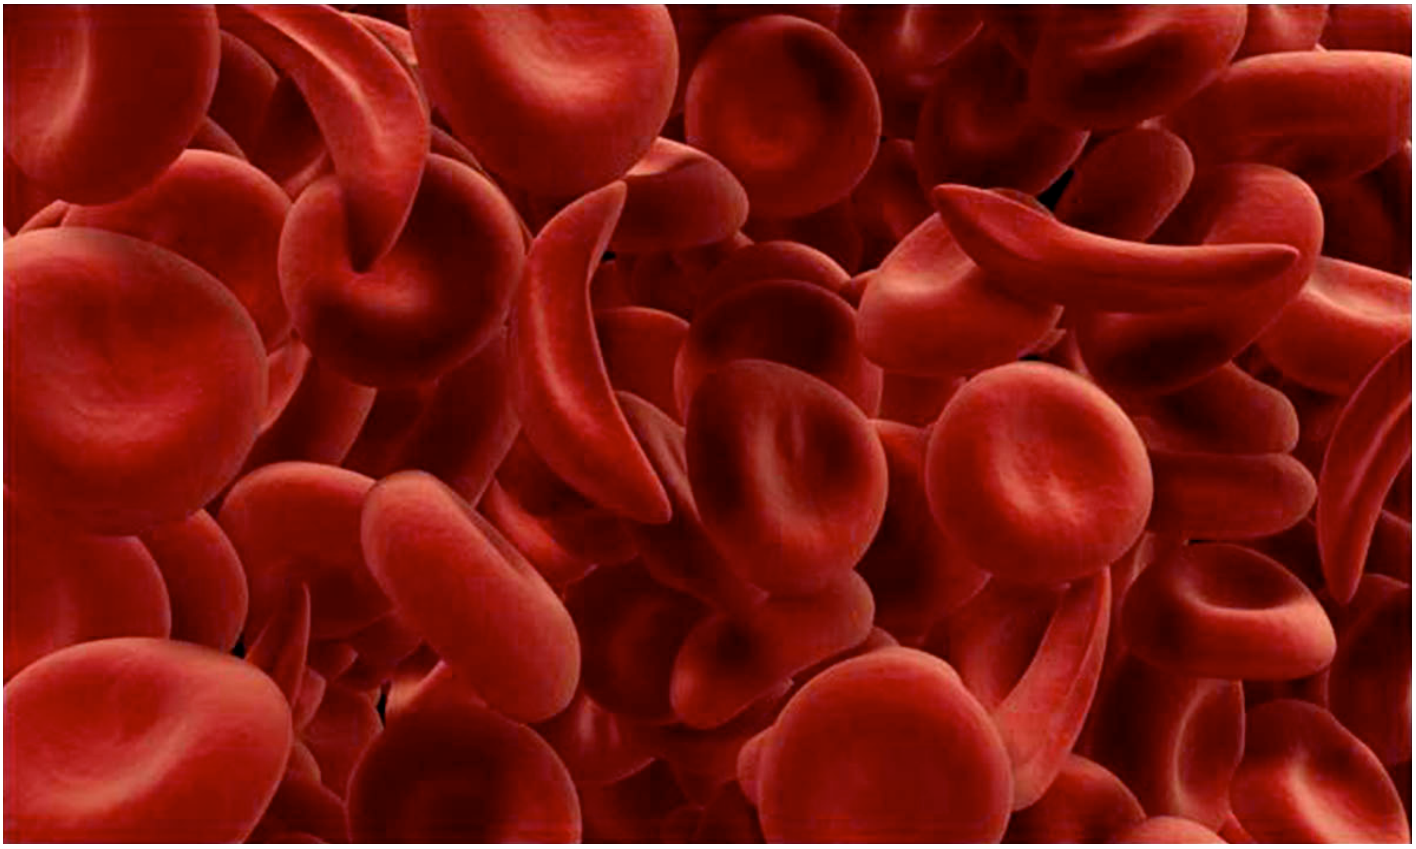


$$O^{16}\text{ Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{0.001429 \times (6.0221 \times 10^{23})}{15.99491}} = 3{,}775{,}138\ \text{Hz}$$

$$H^1\text{ Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{0.0000899 \times (6.0221 \times 10^{23})}{1.007825037}} = 3{,}773{,}180\ \text{Hz}$$

$$\text{Resonant Temperature (°C)} = \frac{Ln\left(\frac{f(\ 3{,}775{,}138\ )}{f(\ 3{,}773{,}180\ )}\right)}{0.0000291} + 20 = 37.8\ °\text{C}$$

Starting Element: Oxygen ($_8O^{16}$)
Natural Abundance: 99.762%
Atomic Mass: 15.99491
Density (grams/cm³): 0.001429
Exp. Coefficient: 0.0000291



Target Element: Hydrogen ($_1H^1$)
Natural Abundance: 99.985%
Atomic Mass: 1.007825037
Density (grams/cm³): 0.0000899
Exp. Coefficient: 0.0000366

Blood circulating within the heart and large arteries maintains temperature near 38.0°C, slightly elevated above average core body temperature near 37.0°C. This significant variance of blood from the mean human body temperature induces rhythmic thermal fluctuations in blood cells according to their cyclical transport from the warm heart to the slightly cooler extremities and skin capillaries. *During circulation, fission of iron atoms releases hydrogen atoms by phonon induction of bound oxygen atoms at 37.8°C:*

$$Fe^{54} + O^{16} \Rightarrow H^{1} + Cr^{53} + O^{16}$$
$$Fe^{56} + O^{16} \Rightarrow H^{1} + Mn^{55} + O^{16}$$
$$Fe^{57} + O^{16} \Rightarrow H^{1} + Fe^{56} + O^{16}$$
$$Fe^{58} + O^{16} \Rightarrow H^{1} + Fe^{57} + O^{16}$$

The narrow temperature requirement of the healthy human body are calibrated to the phonon frequency matching threshold of oxygen atoms with hydrogen atoms within the heme groups of erythrocytes. Recognition of this atomic reaction offers a new view of hemoglobin and myoglobin proteins as nuclear transmutation nanomachines, efficiently reducing iron nanoparticles into individual atoms for binding with oxygen molecules during transport, while electrical currents in the bloodstream dissociate iron-bound O_2 molecules to excite atomic recombinations releasing hydrogen. By this mechanism, nuclear conversion rates are enhanced by natural exposure to electric current through barefoot contact with the Earth.

Further studies of isotope variations in trace elements of the human body will identify specific contributors to exciplex photon cascades observed as biophotons. The wide variety of metals present in healthy human blood and their respective concentrations endow the fluid medium with complex resonant characteristics only now being recognized as phonon resonance dynamics of the metal crystal lattice.

The frequency matching 'architecture' of phonon resonance relationships maintained in healthy blood trigger the release of electrons that, together with ROS processes, excites the blood by a surprisingly rich variety of nuclear reactions that provide the first comprehensive explanation for the diversity of trace metals in blood. Reactions of iron and oxygen conform to a pattern also witnessed in the other elements.

The varied combinations of gases and metals in red blood present an array of potential reactions that may be occurring within the range of temperatures maintained by different portions of the human body, and requires thorough experimental confirmation in every case. Refining the volume expansion coefficients for gases will be an important step toward designing a comprehensive set of experimental procedures for determining the full hierarchy of atomic conversion cascades that vitalize the human body.

Thermoregulation in warm-blooded mammals is apparently calibrated to phonon relationship of oxygen with hydrogen. The pattern of resonant atomic reactions that best explains observed isotopic variations are listed for several other predominant isotope recombinations, following the same basic formula as iron:

$$Zn^{66} + O^{16} \Rightarrow H^{1} + Cu^{65} + O^{16}$$
$$Cu^{65} + O^{16} \Rightarrow H^{1} + Zn^{64} + O^{16}$$
$$Zn^{64} + O^{16} \Rightarrow H^{1} + Cu^{63} + O^{16}$$
$$Cu^{63} + O^{16} \Rightarrow H^{1} + Ni^{62} + O^{16}$$
$$Ni^{60} + O^{16} \Rightarrow H^{1} + Co^{59} + O^{16}$$
$$Ni^{58} + O^{16} \Rightarrow H^{1} + Fe^{57} + O^{16}$$
$$Mn^{55} + O^{16} \Rightarrow H^{1} + Cr^{54} + O^{16}$$
$$Cr^{52} + O^{16} \Rightarrow H^{1} + V^{51} + O^{16}$$

Red Blood Cell Element		Reference Range (μg/g)
Pb	lead	< 0.90
Hg	mercury	< 0.10
Se	selenium	0.19 – 0.38
Mo	molybdenum	0.0005 – 0.0020
As	arsenic	< 0.010
Zn	zinc	8 – 14.5
Cu	copper	0.52 – 0.89
Ni	nickel	0.001 – 0.30
Co	cobalt	< 0.0010
Fe	iron	745 – 1050
Mn	manganese	0.007 – 0.030
Ch	chromium	0.0003 – 0.0060
V	vanadium	0.0001 – 0.0020
P	phosphorus	480 – 745
K	potassium	65 – 95
Ca	calcium	8 – 31
Mg	magnesium	36 – 64

Nominal concentration ranges for trace elements in human red blood cells reveal the presence of several elements in healthy individuals that can accumulate to potentially toxic levels (in red, above).[35] The origin of exotic trace elements such as arsenic and cobalt generally present in the bloodstream may be explained by perpetual phonon-enabled reactions of oxygen bound with nickel and selenium at 37.8°C, where oxygen achieves resonance at the target frequency of hydrogen atoms at rest (20°C):

$$Se^{76} + O^{16} \Rightarrow H^{1} + As^{75} + O^{16}$$
$$Ni^{60} + O^{16} \Rightarrow H^{1} + Co^{59} + O^{16}$$

An interesting case of alternating isotopes of adjacent elements found in red blood cells relates to the relationship of potassium and calcium, which convert from one to the other in a cascade series:

$$Ca^{42} + O^{16} \Rightarrow H^{1} + K^{41} + O^{16}$$
$$K^{41} + O^{16} \Rightarrow H^{1} + Ca^{40} + O^{16}$$
$$Ca^{40} + O^{16} \Rightarrow H^{1} + K^{39} + O^{16}$$

Another similar relationship may be discerned in the case of the essential elements magnesium and sodium, occurring by the phonon induction of oxygen bound with magnesium in red blood at 37.8°C:

$$Mg^{24} + O^{16} \Rightarrow H^{1} + Na^{23} + O^{16}$$

These most abundant isotopes found in human blood are simultaneously converting within the same very narrow temperature band, revealing the essential role of phonon relationships among gas atoms in the bloodstream. Upon confirmation of these findings, one must inevitably conclude that *the innate phonon resonance relationships of stable isotopes in adjacent element groups fulfill the primary purpose of providing all living systems with resonant temperature ranges for generating nuclear reaction cascades.*

Resonant nuclear interactions of matter form the basis of life throughout the vast reaches of the cosmos, and warm-blooded beings similar to mammals on Earth likely inhabit innumerable galaxies by exploiting tuned nuclear reactions releasing photon cascades by multiple resonant metal conversions near 37.8°C.

This unmistakable pattern of phonon resonance conversions demonstrated between the predominant metals within red blood directly reveals the *primary fundamental principle* within the universal isotopic architecture of all matter that enables all living organisms to maintain excited states for coherent electro-photonic field communication. *These remarkable conclusions offer the only comprehensive explanation for the observed natural isotopic order and the precision temperature regulation of living organisms.*

Resonant nuclear reaction cascades excited in healthy red blood cells follow distinct recombination regimes that help promote crucial balances among the blood metals. These regimes are only now being identified by comprehensive calculation sets accounting for the atomic mass recombinations of a wide variety of metal isotopes present in human blood, including zinc, copper, nickel, cobalt, iron, manganese, chromium, vanadium, selenium, arsenic, calcium, potassium, magnesium and sodium (opposite).

On the whole, these nuclear conversion patterns consistently display atomic mass variances near –0.01u, confirming the precisely modular mass relationships of the elements, and the special role of hydrogen in the perpetual dance of resonant transmutation. Biophotonic studies of non-diluted whole blood have revealed clear thermal hysteresis patterns specifically linking photon emission to declining temperatures.[36]

Starting Isotope	+	Absorbed Gas Atoms	⇒	Target Isotope	+	Byproducts	±Variance

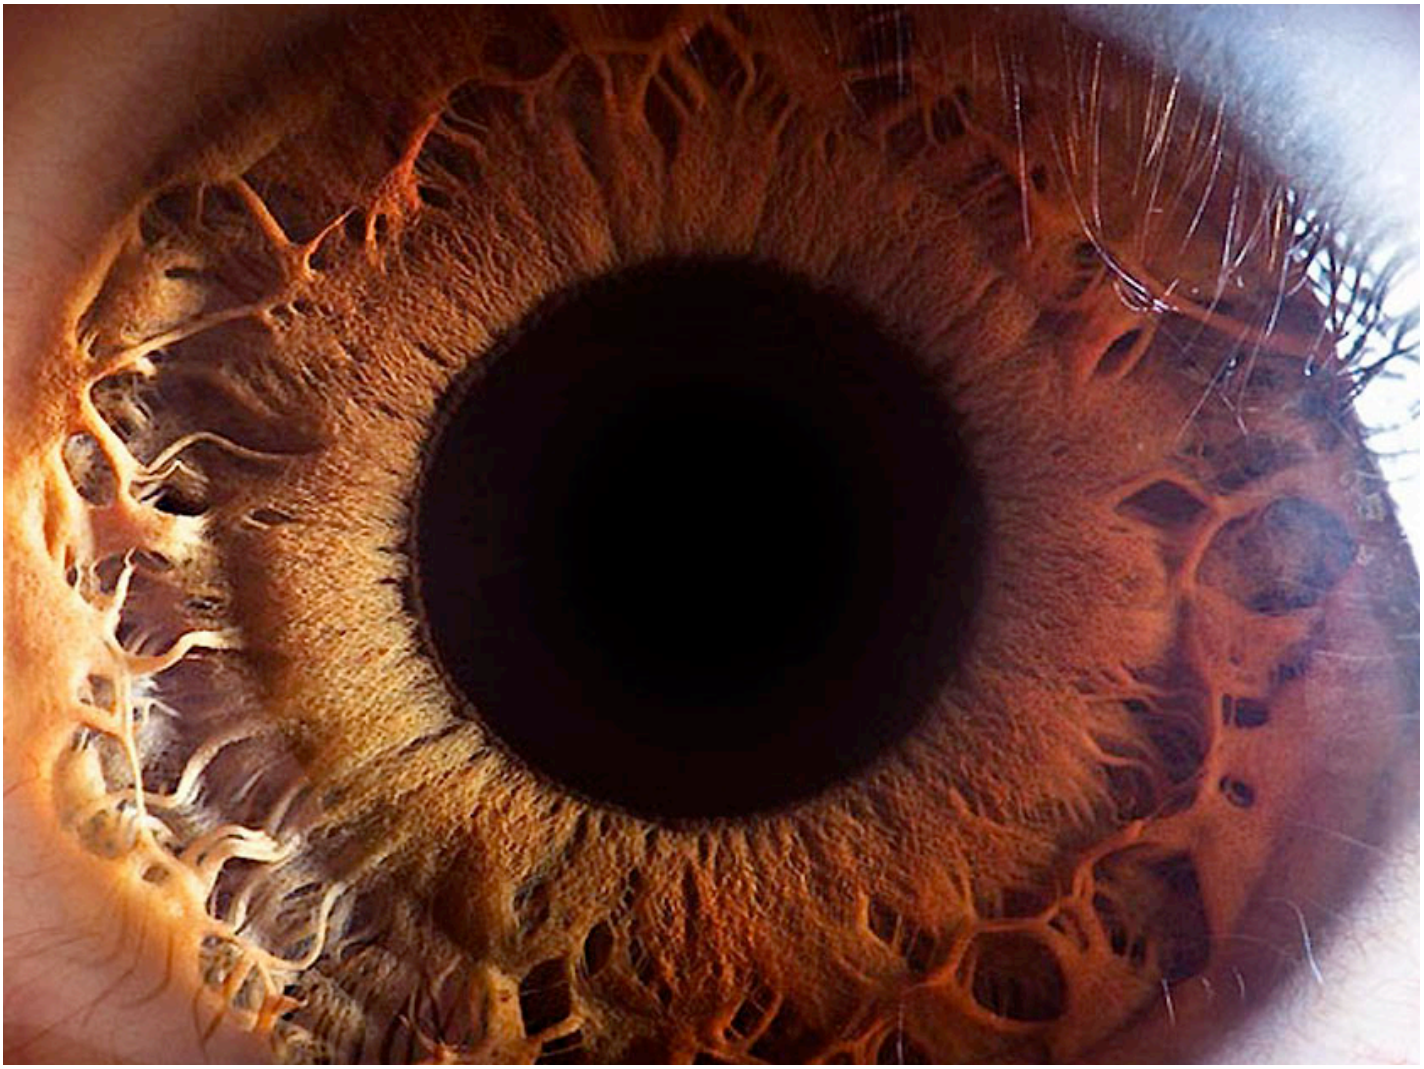
The largest arteries and veins that cycle blood to the arms arch upwards from the heart (above), reflecting the sacred structure of standing waves closely associated with heartbeat sychronization ceremonies throughout indigenous traditions the world over. Broad standing wave patterns cover the chest among traditional Igorot mens' tattoo designs from the Phillipine Islands (opposite), and are also witnessed as the dominant chest pattern among Australian Aboriginal body painting styles from various regions.



The precise tuning of nuclear transmutations resonantly induced by the exact temperature of human blood provides a new biophysical framework for the integration of the ancient energy balancing practices of Asia, in addition to the Vedic *prana* development practice of sungazing known to all monumental stone builders worldwide. Modern sungazers practicing such ancient techniques include Anastasia, Sunyogi Umasankar, Hira Ratan Manek, Acharya Jowel and Dimbeswar Basumatary, *all of whom derive the majority of their energy directly from the sun while largely abstaining from the normal metabolic consumption of food*.[37]

Ancient traditions of the Maya teach the initiate that *solar (photonic) energy of the heart is stored within the (DNA) serpent or 'coatl' for utilization by strict adherence to sacred cultural bioelectrification practices*. Biophysicists have already determined that *all cellular metabolic functions can be fueled directly by exposure to electrical current,*[38] and it is now evident that drinking the celestial golden waters of the Maya in caves and at pyramid sites, *barefoot*, induces electroluminescence in gold and silver nanoparticles that scatter red and blue light within the body's cells.[39]

Intracellular luminosity is the key to enhanced vitality and the extreme longevity ascribed to the Atlantean masters of consciousness, who make the explicit acknowledgement that *'gold is immortality'*, referring to electrum colloids as the elixir *Soma*: "The man who supplies food hath always [his Soma] pressing stones adjusted, a wet Soma filter, well-prepared religious rites… he who hath this knowledge wins the luminous spheres" (Atharva Veda: IX.6). A Sanskrit descendant culture, the Maya preserved the Vedic calendar system (above) observing planetary cycles and resulting biophotonic cycles of 14 days, 1 month, 3 months and 9 months –a human gestation cycle. Maya wisdom explicitly states *human beings attain immortality by regular sungazing meditation at sacred temple sites, thereby engaging the eyes in completion of the solar circuit, absorbing and re-emitting photonic energy directly back to the sun:*

Chalchiuhtlicue, Goddess of Terrestrial Waters, of that which flows, runs, surges, forward and down, arriving always at profounder levels. Chalchiuhtlicue swells the fruits and flowers only so that they may drop. Chalchiuhtlicue fills the gourd of pulque so that man may forget…

Tláloc, God of Celestial Water, god of the vapor that rises, from the earth warmed by the sun after the rains, god of the mist that ascends from the valleys at dawn, god of the water that returns to its source in the clouds that swim over the highest peaks, god of the humid incense from which rise the copal prayers and the prayers of sacrifice.

Tláloc is the return of vapor that strains to rise, is the return of time that strains to remember. Tláloc, God of the Fight Against the Current, with whose aid the hero battles against the torrent toward his own origin and beginning, towards the wings of his soul, the wings that Tláloc hides in the hero's past.

Quetzalcóatl, the Plumed Serpent, moves between gods and men, because Quetzalcóatl is God who permeates man and is the man that achieves God… The Plumed Serpent is born when that which slithers over the Earth grows wings to be elevated to Heaven. Quetzalcóatl is a superior man, the inner circle of humanity, the link between gods and men.

All men are made of earth, air, water, and fire... But in their hearts and in their semen, each man has his own coati, his own serpent, the energy of Tonatiuh, the power of the sun itself. And in this serpent sleeps consciousness, in this serpent is hidden his divinity. From this serpent his wings will grow.

There is an occult energy in the heart that comes from Tonatiuh, the sun, and if man releases it, returning it consciously to the sun, he becomes immortal. But to liberate this energy... man must sacrifice the desires and habits that he adores, sacrifice them in himself, and turn the knife against the enemy that he carries within himself, that keeps his heart a prisoner.[40]

Well-preserved masterworks of painting and sculpture by Aztec and Mayan artists attest to their prolific intellectual life, with Gods representing the transcendent isotopic qualities of water and fire. Tláloc, God of Celestial Waters represents light water (and all that biophysics now attributes to the effects of protium on cellular longevity), standing in opposition to Chalchihutlicue, Goddess of heavy Terrestrial Waters.

Quetzalcóatl presents the spiritual path of superior man who adheres to sacred bioelectrification practices, depicted as the Eagle Warrior with tail plumes forming standing waves (above, right). The *k'ulthanlilni* serpent is depicted rising through the *chacla* (Mayan for 'kundalini' and 'chakras') to form wings as three lines weaving in helices along the spinal column *–representing the three frequency modes of nonlinear standing light waves stored in the DNA spiral. Floral mandalas adorn the wrists of ascending Quetzalcóatl, with tassels that can be clearly recognized as chromosomes, bearing coiled DNA strands* (below, at left).

Biophysical studies have recently reconfirmed ancient sacred knowledge that, indeed, *human eyes emit light*, as first observed in rat eye retinas and reported in 2010 (Wang, et al).[41] Spontaneous biophoton emission measured by the researchers is comprised of soft photon scattering from continual atomic conversions pervading the network of fine blood vessels behind the retina, which forms a loose spiral centered behind each eye. The lens of the eye may not only focus environmental light onto the retina, but also focus ultra-weak biophotons re-emitted from the retina into a beam centered along the line of sight. *Such findings confirm Maya elucidations of the solar circuit completion by ocular photon emissions.*

Barefoot contact with the piezoelectric pyramid stones provides electrical currents that excite atomic reactions within the blood by *increasing the rate of molecular dissociation of gas molecules adsorbed to metal surfaces, effectively increasing the rate of gas absorption into metals.* Just as Qigong and Reiki adepts practice regular meditation in conjunction with barefoot lifestyles at sacred sites, related holistic energy balancing practices such as acupressure, acupuncture, cupping and moxibustion are resonantly amplified by sacred bioelectrification lifestyles that excite the body's nuclear transmutation processes.

The renewed holistic view of all living organisms as biological nuclear reactors *–that resonant nuclear transmutations are safely occurring all around us and within us in every moment of our existence–* shows modern scientific feats of 'atom smashing' to be entirely unnecessary for inducing nuclear transmutation. As exhibited by biological nuclear reactions, precision control of resonantly tuned reactions allows safe nuclear conversion of isotopes with a natural simplicity that has also been achieved in the field of genetic engineering. Crude initial genetic splicing methods have given way to more advanced 'wave genetics' techniques involving *irradiation of living organisms with pulsed laser light or infrasound to induce mass spontaneous genetic enhancements in entire populations by coherent biophoton field stimulation.*

Qi Meridians

Qi Meridians

Recognition of the essential biological transmutations that give rise to cascading nonlinear dynamics in biophoton field fluctuations shows such simple yet commonly misunderstood therapies as the application of infrared light (or moxibustion), as well as 'violet ray' UV-A treatments, efficiently replicate the beneficial effect of sunlight *by stimulating the body's atomic transmutation processes and the resulting biophoton emission cascades,*[1] while avoiding the harmful UV-B and UV-C frequencies of direct solar radiation.

Ancient energy meridian therapies have been validated by ultrasensitive CCD cameras, revealing fine optical communication channels within the human body that *exactly correspond to the qi meridian system precisely mapped in the ancient medical sciences of Asia*.[2] Electrophotonic meridians of the body were rediscovered by B.H. Kim in 1963 (named 'Bonghan ducts'),[3] and confirmed by *in vivo* fluorescence microscopy by K.S. Soh in 2004, *as a transparent, threadlike nodal network of corpuscles connected by bundled ductules that constitute a distinct circulatory system freely suspended within the vascular and lymphatic systems, optically hardwiring all of the internal organs directly to the central nervous system*:

> Bonghan theory… [identifies] channels with DNA granules flowing inside… connecting the acupoints in the skin to the internal organs. As the channels form a network of one-dimensional tubes with light sources, they can be an optical channel… [producing] a coherent photon state… and the regulation mechanism of the body as a whole.[4]

The free vascular suspension of fine electrophotonic ducts, which lack anchor filaments altogether, enables circulatory pumping of DNA crystals by the peristaltic motion of the ducts themselves. Soft photon emissions from the persistent resonant nuclear fusion cascades occurring in the electronically excited bloodstream are stored as nonlinear standing waves within electrophotonic filaments by crystalline DNA granules and chromatin that flow through the ultrafine filaments at a speed of 0.3 ± 0.1 mm/s.[5]

While thorough biophoton imaging of adept Qigong healers has not yet been reported, conscious control of the heart offers definitive evidence of the quantum effects of biological fiber-optic networks, such as pyrokinesis and electricity from hands. Recent findings of the correlation between biophoton emission and skin conductivity have inspired laboratory investigations of electroacupuncture, reporting enhanced photon emission of stimulated electrophotonic corpuscles at acupoints using ultrasensitive cameras.[6]

The optical transmission of infrared light through the meridian system stimulates the flow of light-storing DNA granules to rapidly and effectively rebalance the luminal field of the human body. Moxa treatments provide direct infrared illumination to selected acupressure points, bringing highly localized skin surfaces to temperatures as high as 55°C for just a few seconds, before brief withdrawl of the heat (Li *et al*, 2009).

Skin temperatures during rest periods measured at different points of the body show a normal range of 19–29°C (Benedict, et al., 1919). Relatively recent discoveries in the field of thermography, or the visualization of infrared light, have been widely applied in diagnosing animal or human bodies for fungal infection and cancer diagnosis, also allowing direct imaging of distinct temperature variations observed between the warmer areas of the body where lymph node clusters and glands tend to be located, as opposed to the colder nasal region, the extremities and areas where excess fat is stored below the skin.

When properly applied, intense infrared and ultraviolet-A light elevates skin metabolism into a heightened state that alters the elemental makeup of sweat gland secretions. The fascinating details of this heat-induced mode of enhanced skin metabolism were first quantified by C.L. Kervran in cases of heat stress of workers during oil prospecting activities in the arid conditions of North Africa's Sahara desert in 1959.

To determine necessary dietary enhancements for the continually heat-stressed workers, Kervran created a closed environment to study the unusual relationship between sodium and potassium in human sweat. In total, 808 analyses were conducted to carefully quantify the elemental makeup of all liquids and solids ingested and excreted by the workers, even including sponging off sweat secretion samples. *Test results confirmed that the ratio of potassium to sodium in the excreta of workers increased with temperature.*

A full quarter, or an average of 1.28g per day, of ingested sodium could not be accounted for in their wastes. If this sodium was simply being stored in the body, a six-month accumulation would amount to a kilogram, suggesting that sodium was being converted into another element altogether. Painstaking analyses confirmed that the missing sodium was excreted as excess potassium, that otherwise could not be accounted for. Furthermore, data revealed that seasonal temperature increases over the course of the study from May to September, showed a clear correlation with the changes in the potassium to sodium ratio (K / Na) of workers' perspiration. *This was unmistakable evidence for biological transmutation.*

Kervran's report was published in 1963, presenting carefully drawn conclusions that comprised the identification of resonant nuclear transmutations occurring in the human body. He suggested a crucial role of oxygen in this temperature-dependent reaction by showing that oxygen possesses the exact atomic mass disparity between sodium into potassium. *However, this conversion reaction is far more complex.* Subsequent attempts to replicate this reaction *in vitro* were successful, and progressed to more complex experimental setups in Japanese universities, where the reaction was replicated under spectrographic observation by various other researchers using sodium vapor (Torii, Sakurazawa, Odagiri, 1963; Ohsawa, Kushi, 1964). The spectral emission lines of potassium consistently appeared in the pure sodium vapor.

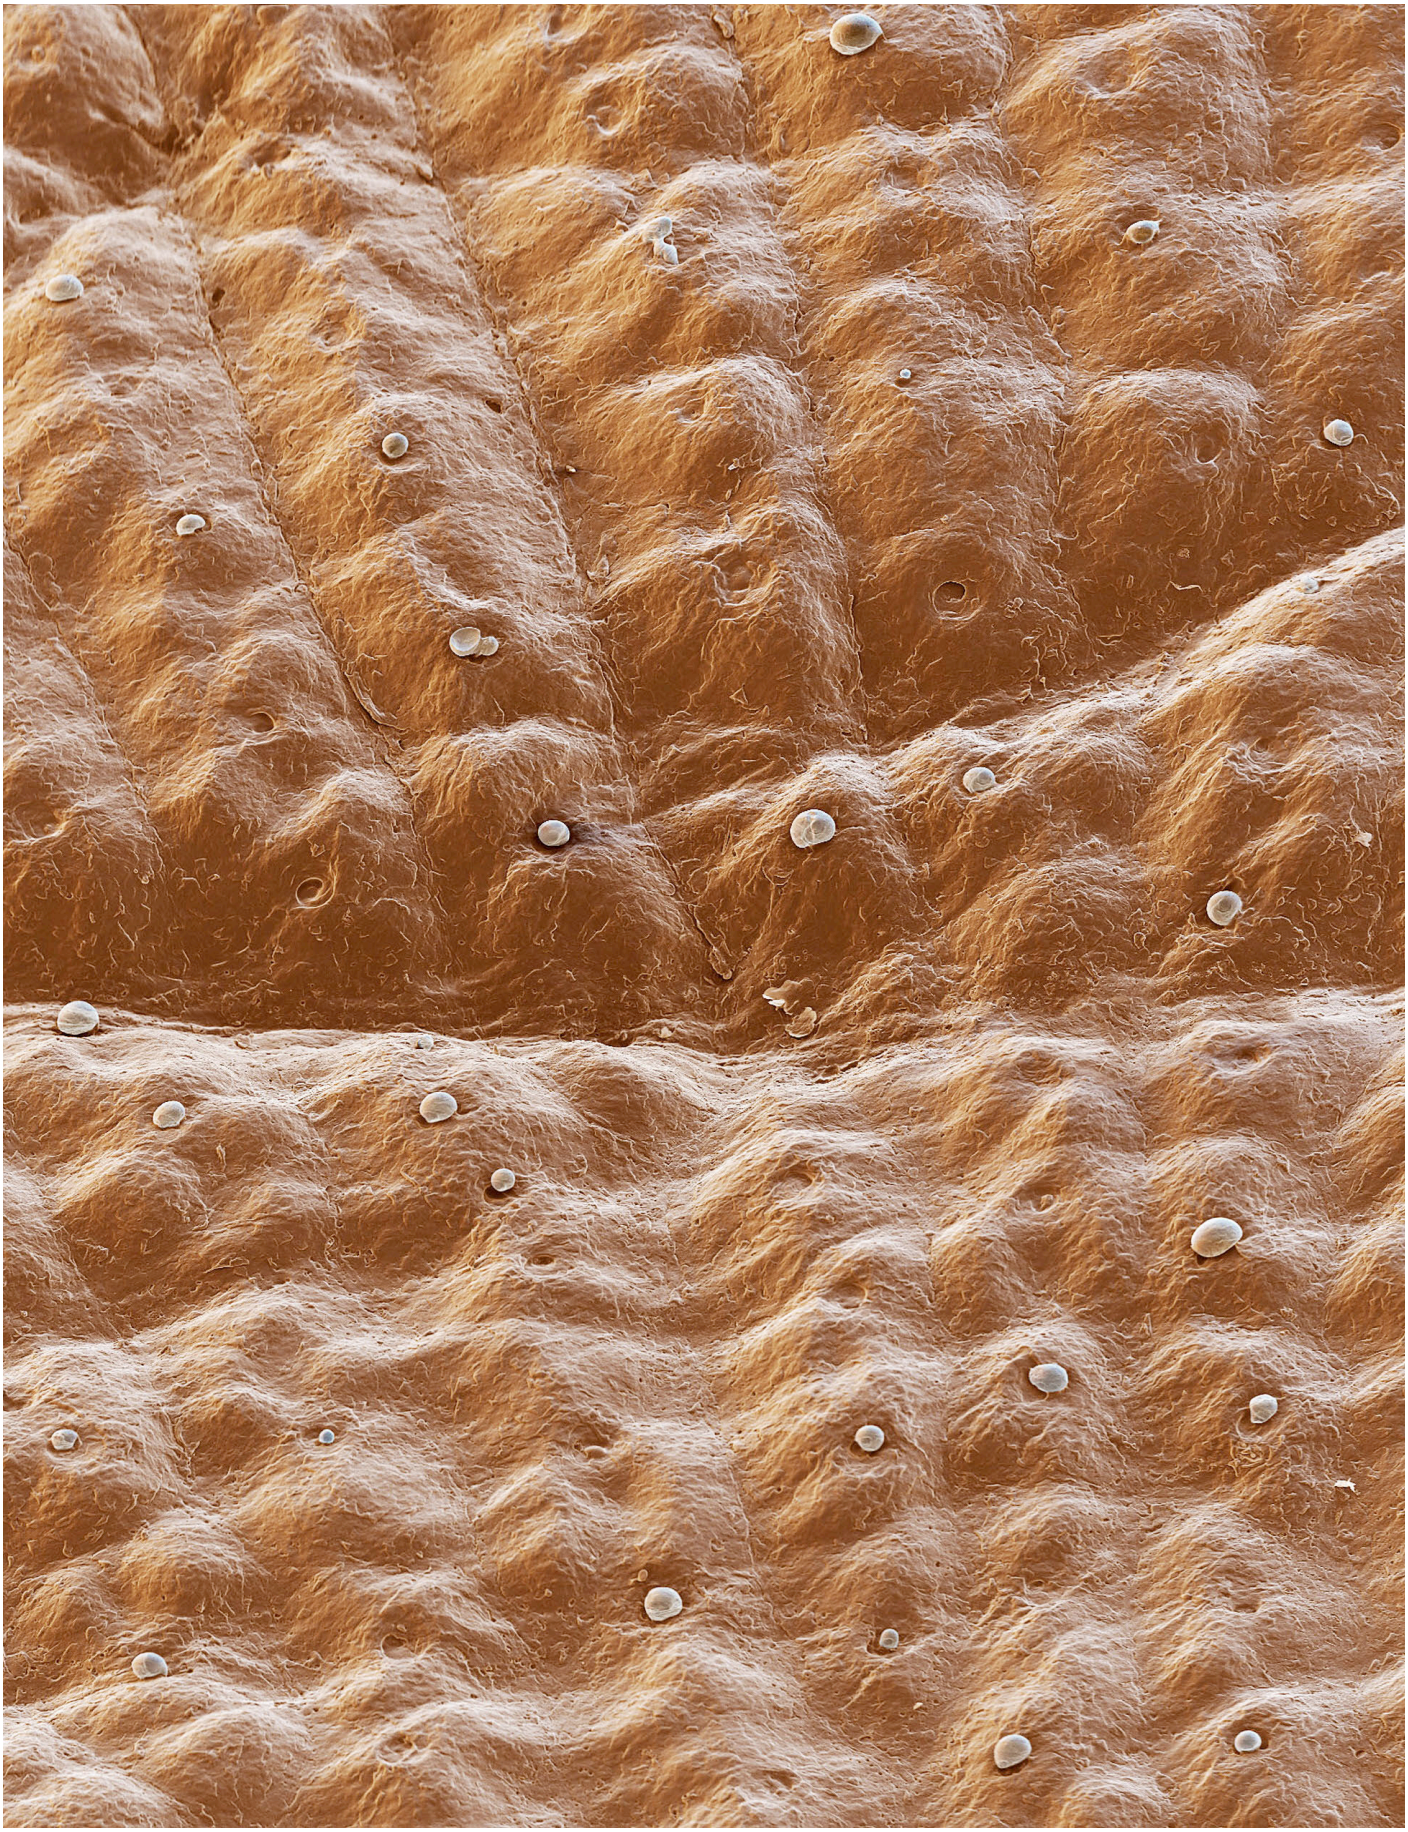
Time and time again, this reliable experiment revealed the same startling result –*sodium vapor heated at low temperatures in the presence of oxygen converted into potassium at a stable rate that increased with electrical input to the system. Neon and argon gases added to the sodium/oxygen reaction were found to increase the potassium output,* for unknown reasons. Phonon resonance calculations determine precise temperature thresholds that induce atomic conversion cascade chains involving neon and argon gases:

$$
\begin{aligned}
Na^{23} + O^{16} &\Rightarrow H^{1} + Ne^{22} + O^{16} \\
Ne^{22} + O^{16} &\Rightarrow H^{1} + Ne^{21} + O^{16} \\
Ne^{21} + O^{16} &\Rightarrow H^{1} + Ne^{20} + O^{16} \\
Ne^{22} + Ne^{20} &\Rightarrow 2\,H^{1} + Ar^{40} \\
Ne^{21} + Ne^{20} &\Rightarrow H^{1} + Ar^{40} \\
2\,Ne^{20} &\Rightarrow Ar^{40} \\
Ar^{40} + O^{16} &\Rightarrow H^{1} + K^{39} + O^{16}
\end{aligned}
$$

Phonon frequency matching of oxygen heated to 37.8°C with hydrogen at rest (20°C) induces conversion of sodium atoms into neon isotopes (Ne^{22}, Ne^{21}, Ne^{20}). Phonon resonance of Ne^{20} atoms at 37.7°C with stable argon isotope (Ar^{40}) induces resonant fusion of two neon gas atoms into a single argon gas atom. O/H resonance at 37.8°C then induces fission of argon atoms, yielding hydrogen and potassium (K^{39}).

$$Ne^{20}\ \text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{0.0009 \times (6.0221 \times 10^{23})}{19.99244}} = 3{,}004{,}057\ \text{Hz}$$

$$Ar^{40}\ \text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{0.001785 \times (6.0221 \times 10^{23})}{39.96238}} = 2{,}996{,}252\ \text{Hz}$$



$$\text{Resonant Temperature (°C)} = \frac{Ln\left(\frac{f(3{,}004{,}057)}{f(2{,}996{,}252)}\right)}{0.0001468} + 20 = 37.7\ °\text{C}$$

Starting Element: Neon ($_{10}Ne^{20}$)
Natural Abundance: 90.48%
Atomic Mass: 19.99244
Density (grams/cm^3): 0.0009
Exp. Coefficient: 0.0001468

Target Element: Argon ($_{18}Ar^{40}$)
Natural Abundance: 99.60%
Atomic Mass: 39.96238
Density (grams/cm^3): 0.001785
Exp. Coefficient: 0.0001231

The ± variance in atomic weight between starting isotope and absorbed gas atom in relation to the target isotope and reaction byproducts differs significantly among these atomic conversions. As typifies resonant nuclear reactions taking place in the bloodstream, oxygen-based reactions in the Na ⇒ K sequence display a negative variance (starting isotopes weigh less than the products) while the 2 Ne ⇒ Ar reactions display a positive variance (starting isotopes outweigh the products). During the $2\,Ne^{20} \Rightarrow Ar^{40}$ fusion reaction, an excess atomic mass of 0.02450 U is ejected as an electron pair, comprising 0.0010971598 U, while *the remaining 0.0234028402 U is emitted as photons; primary contributors to the ultra-weak biophoton radiation of human skin. Fluctuations in emission intensity from skin are caused by variations of planetary infrasound.*

Scanning electron microscopy of the dermal ridges of human hands and fingerprints have captured detailed images of individual pores of the sweat glands and their tiny sweat secretions (opposite). Shown in a heightened relief, the configuration of pores provides a unique fingerprint that leaves its watermark in the world as traces of sweat are perpetually secreted (below). Forensic science has been rapidly advanced using fingerprint, skin, hair and saliva samples for DNA pattern analyses to identify criminal suspects, and the present applications of phonon resonance physics similarly *identifies unique patterns in the fundamental isotopic signatures of the elements that enable all biological metabolic processes.*

Dehydration becomes a serious threat during long periods of intense sweating, yet other temperature-dependent resonant atomic reactions have caused fatalities in the high-temperature work environments of steel manufacturing plants. While toxic welding gases and carbon soot produced by oxygen/acetylene torch processes and the dangers of metal grinding activities are well-known, carbon monoxide poisoning cases were once a serious industry hazard that had to be overcome by rigorous scientific investigation.

A series of fatal CO poisoning cases in France in 1955 presented a great conundrum. The following is an excerpt from C. Louis Kervran's *'Biological Transmutations'* (Crosby Lockwood, 1972), translated from the original French by Crosby Lockwood and revised by Herbert and Elizabeth Rosenauer, pages 18-21:

> In 1935... a case of fatal poisoning of a welder had occurred... [yet] I could find no evidence to show where the carbon monoxide originated... It was only in 1955 that it dawned upon me what had happened. In that year... three welders using blow-pipes had died in a period of several months... from carboxyhaemoglobinaemia (carbon monoxide poisoning)... It was decided... to take blood samples from fellow workers even though the men were apparently in good health. The samples showed that those doing the same work as the victims were seriously afflicted with chronic carboxyhaemoglobinaemia, some to a degree approaching that of the fatal cases.

> In fact the three fatal incidents in 1955 had lead me to a hypothesis which I had to verify. As the blood contains carbon monoxide without any being inhaled, if there is an undetected source of this toxic gas, it would be found in samples taken in the proximity of the respiratory organs, thus carbon monoxide would be produced in the body...
>
> ...[T]he indisputable fact [was,] that carbon monoxide did not enter the breathing passages, but that the workers bent over the metal as they cut it, and the powerful flame jet made a large area of the surface incandescent. Therefore, it was my opinion that the air, having been in contact with the incandescent metal, had become "activated". When the air was breathed in, it provoked a formation of carbon monoxide in the blood at the lungs level.
>
> The control experiment was made with the welders themselves. They were asked to wear a sandblaster's helmet, which has an air tube at the back of the neck... allowed to hang down so that the workers breathed in the air behind them. In a short time the incidences of carbon monoxide poisoning had markedly decreased... As a result, the prevention of such accidents followed. All that was needed was to give the workman an upward current of fresh air to counteract the air rising from the incandescent metal... (Experiments made in 1964 on rabbits and on humans had shown... this endogenous reaction only takes place when the metal is heated to more than 400°C.)...

After contact with incandescent metals, nitrogen atoms heated to ~400°C in open air readily bind with oxygen atoms, forming nitric oxides that undergo resonant nuclear fission upon contact with lung tissue:

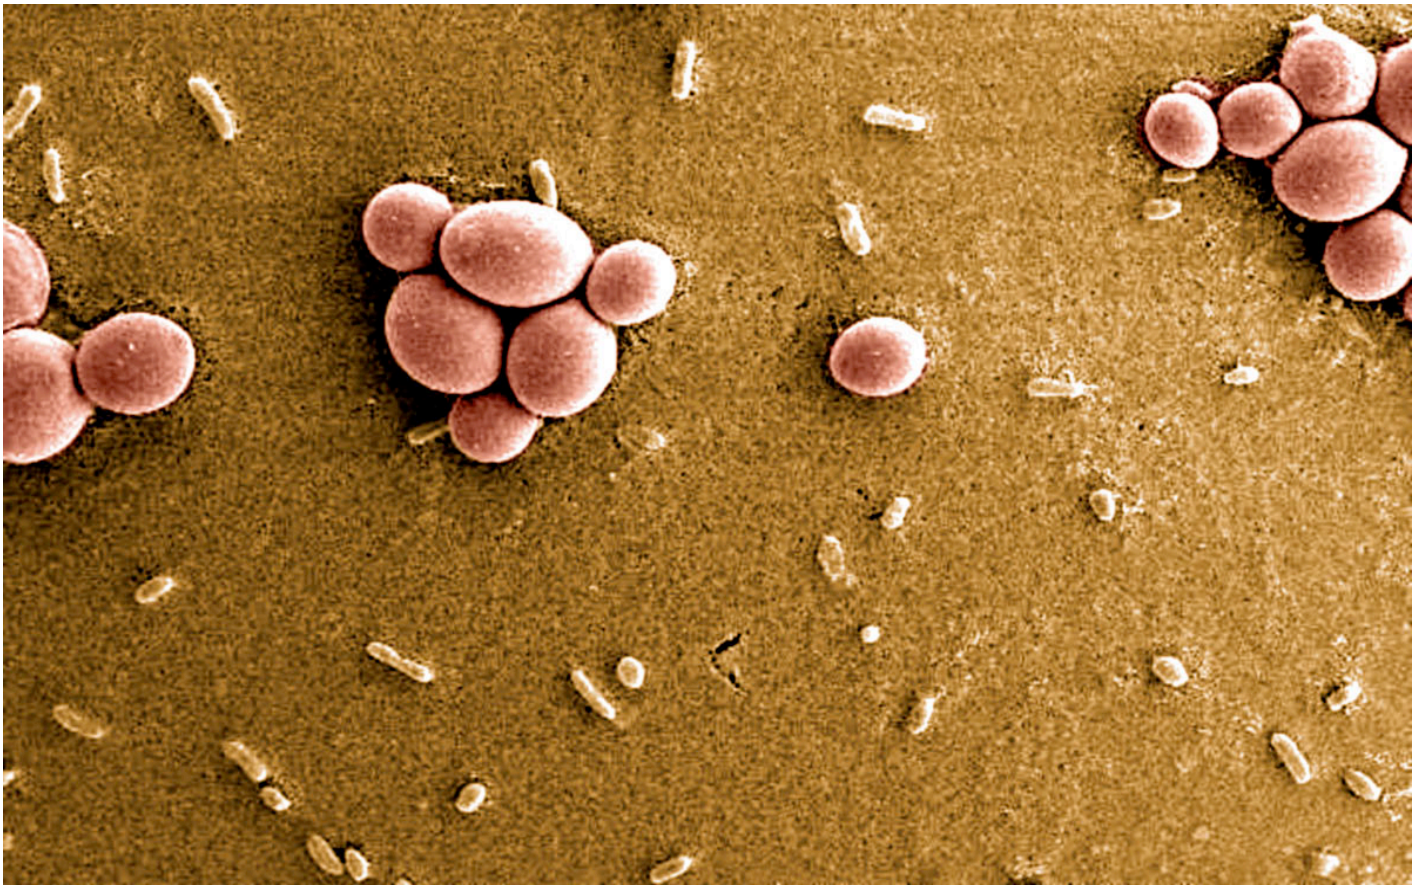
$$N^{14} + O^{16} \Rightarrow H^{1} + C^{13} + O^{16}$$

This tendency for atomic rearrangement that Kervran's experimentation had identified as occurring only above ~400°C is now known to be induced by dimensional phonon resonance frequency matching of bound oxygen atoms with hydrogen atoms. When heated above ~400°C, nitrogen and oxygen atoms form nitric oxides that cool to the resonant frequency of hydrogen (H^{1}) atoms at rest (20°C). Upon contact with cool lung tissues, nitrogen atoms are forced into rapid contraction, yet maintain their resonant atomic diameter by ejecting single hydrogen atoms (H^{1}) to form the rare, heavy isotope of carbon (C^{13}).

The resonant frequency of hydrogen (H^1) in its rest state is 3,773,180 Hz, according to the element's atomic diameter at 20°C. Oxygen isotope (O^{16}) resonates at this same frequency when heated to 37.8°C:

$$O^{16}\ \text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{0.001429 \times (6.0221 \times 10^{23})}{15.99491}} = 3{,}775{,}138\ \text{Hz}$$

$$H^1\ \text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{0.0000899 \times (6.0221 \times 10^{23})}{1.007825037}} = 3{,}773{,}180\ \text{Hz}$$



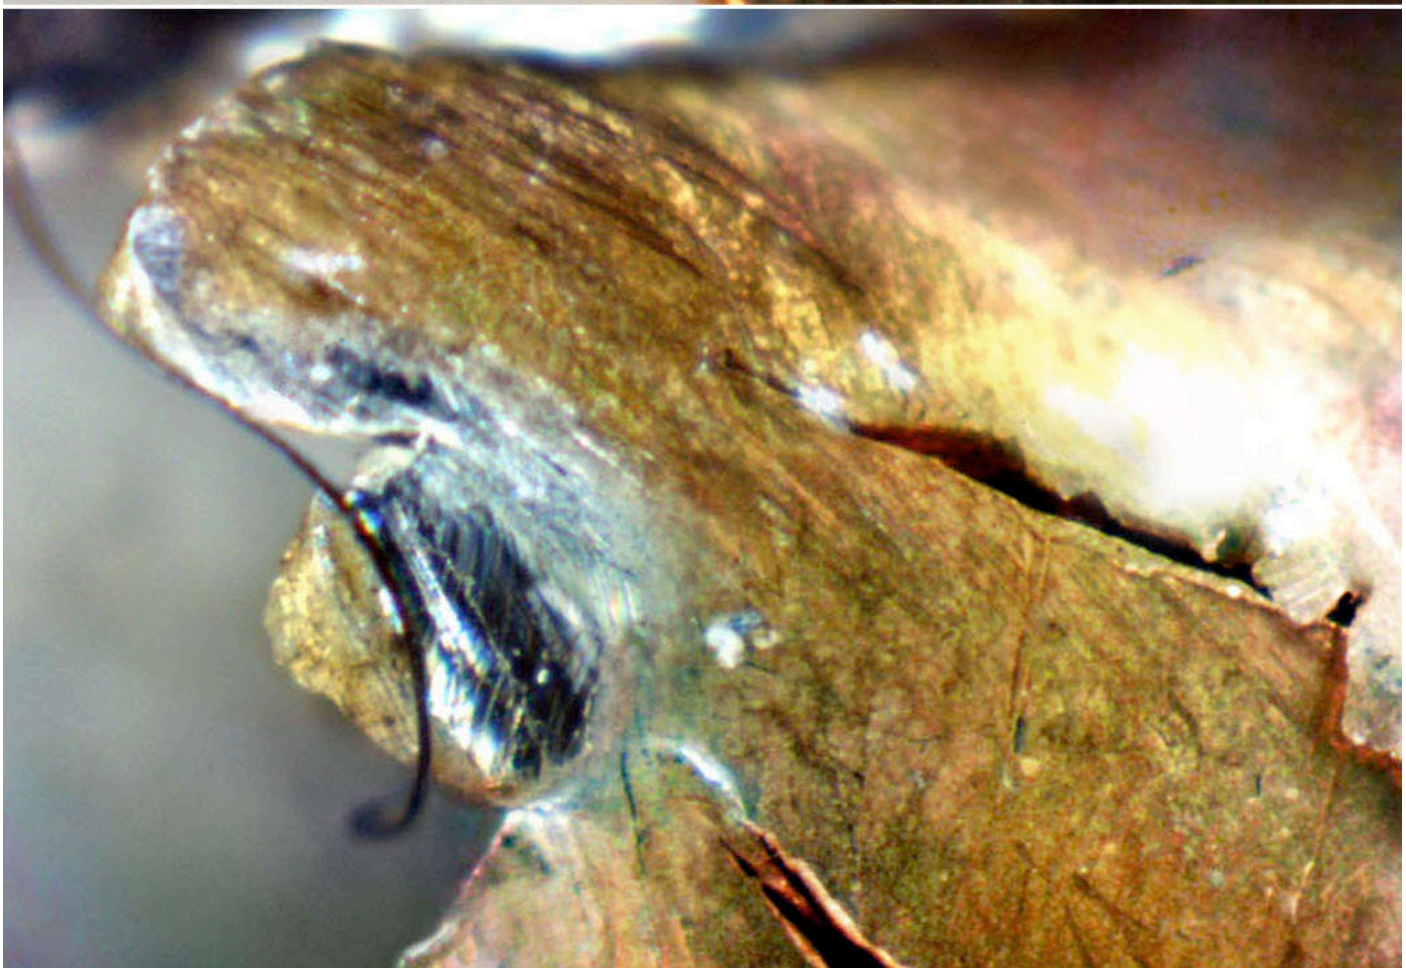
$$\text{Resonant Temperature (°C)} = \frac{Ln\left(\frac{f(\,3{,}775{,}138\,)}{f(\,3{,}773{,}180\,)}\right)}{0.0000291} + 20 = 37.8\ °C$$

Starting Element: Oxygen ($_8O^{16}$)
Natural Abundance: 99.762%
Atomic Mass: 15.99491
Density (grams/cm^3): 0.001429
Exp. Coefficient: 0.0000291

Target Element: Hydrogen ($_1H^1$)
Natural Abundance: 99.985%
Atomic Mass: 1.007825037
Density (grams/cm^3): 0.0000899
Exp. Coefficient: 0.0000366

As Kervran had surmised and experimentally confirmed decades ago, potentially fatal carbon monoxide poisoning occurs as the *'atomic memory'* of nitric oxides drops below 37.8°C inducing conversion of nitrogen atoms into carbon and hydrogen atoms. The low energy transmutation reaction is triggered upon contact with cooler lung tissue, without breaking the molecular bond with oxygen during the event.

Phonon resonance determinations based on the conversion formulae of W. Lussage comprehensively elucidate the mnemonic capacity and temperature-induced conversion patterns among the isotopes of the physical elements, bringing human consciousness toward a complete understanding of the fundamental atomic processes that drive the recycling of elements through the incessant electrically-enhanced interaction of metals and gases being alternately heated and cooled as the planets spin.

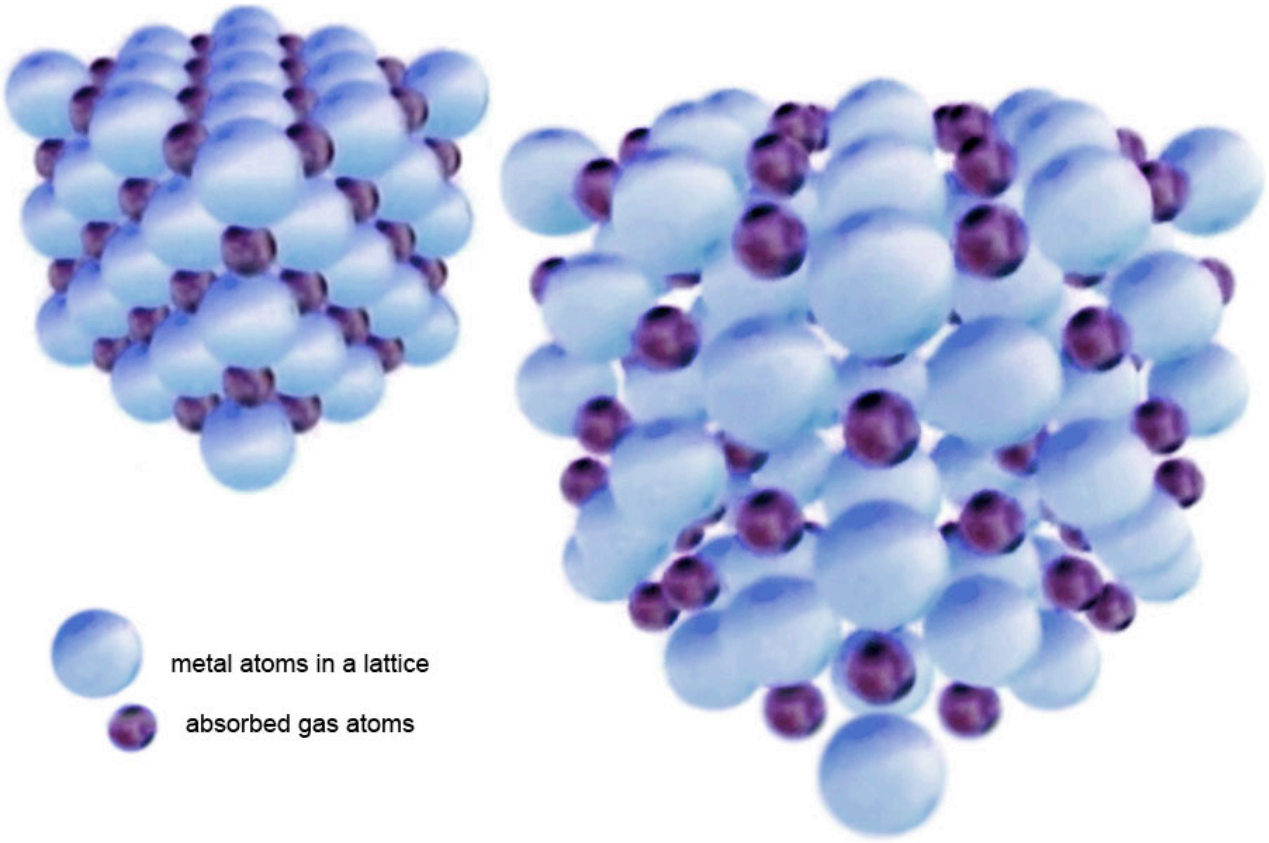


Studies of the artificial excitation of the electromagnetic fields of objects and organisms undertaken by K. Korotkov have inspired the development of advanced techniques of Kirlian photography, now publicly available as the Gas Discharge Visualization (GDV) system.[7] Future electrophotonic devices will soon enable rapid healing and rejuvenation in vacuum chambers where HHO gas containing colloidal electrum light water (pure protium, without heavy hydrogen isotopes) becomes rapidly ionized to form HHO plasma.

HHO plasma will not heat water, due to the reaction of HHO gas recombining to form H_2O. As used today in dental hygiene, helium/ oxygen cold plasma torches apply nanopulsed currents to turn plasma 'on' and 'off' at a rapid rate, allowing the flame to maintain such low temperatures that it can be directly applied to skin surfaces, oral tissues and tooth enamel. Electro-stimulation of cellular metabolism by low-intensity nanopulsed electrophotonic fields can be further applied to entire plasma chambers wherein wireless data devices can electronically couple to biophoton fields for digital communication and data storage.[8]

The astounding atomic reactions taking place in these newly recognized bioelectric excitation processes have also been observed in bacteria. Electrokinetic motility of microbes[9] provides insight into the nuclear reactions that occur on metal surfaces, whereby bacterially generated electrical currents enable electro-dissociation and digestion of a wide variety of available metals, including steel[10] and even radioactive isotopes of uranium.[11] Bacterial transmutation of nuclear waste is enabled by special abilities like those of Deinococcus *radiodurans* to repair DNA damage constantly incurred by gamma radiation,[12] which informs the resilience of whitish scum growing in spent fuel pools at the Savannah River Nuclear Site.[13]

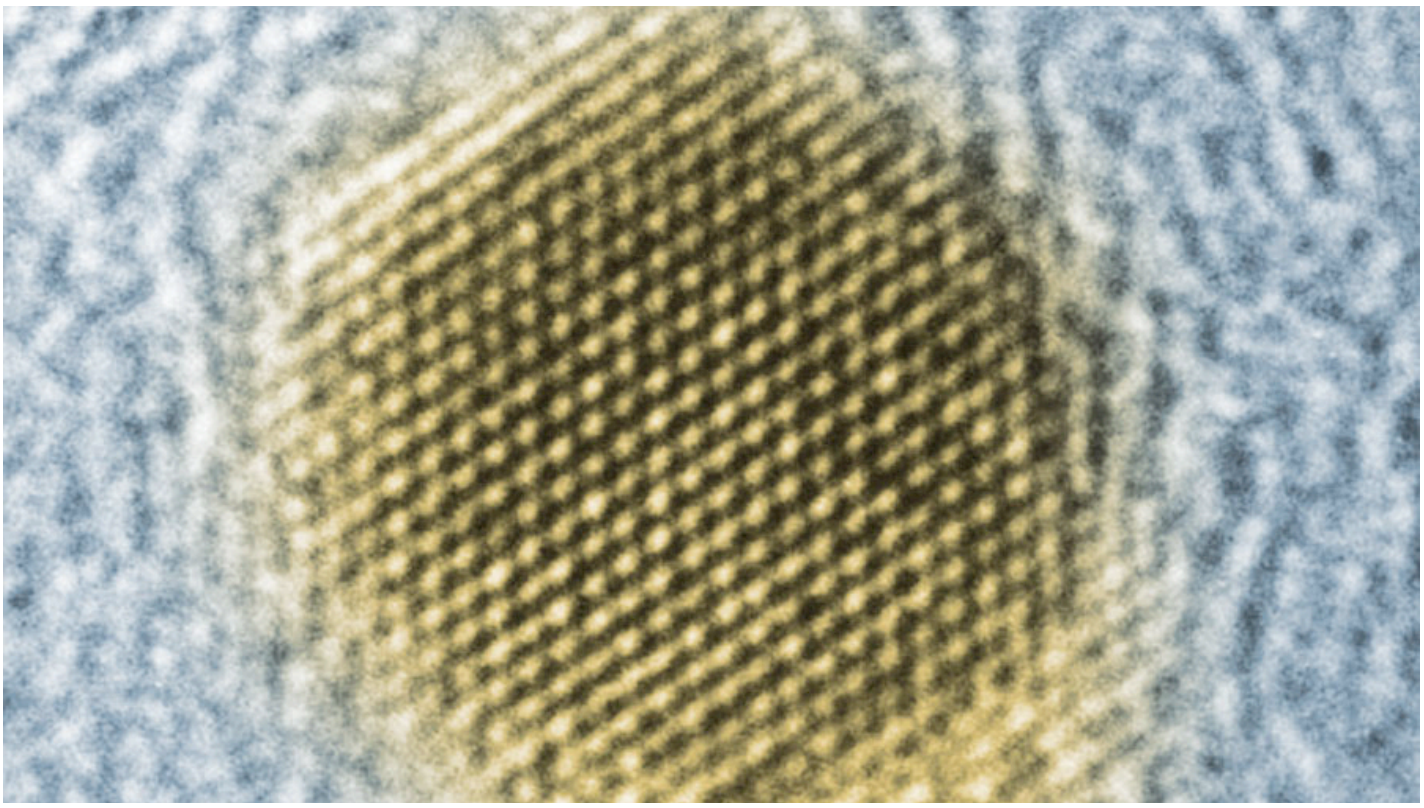
Nuclear transmutations of metals were identified in multiple budding yeast species (Champion, 2008) and disclosed in US Patent Application US2008/0081359: *'Methods for Producing Mutant Microbes Useful for Precious Metal and Bioenergy Production'.*[14] Intriguing metabolic processes of Saccharomyces *cerevisiae* convert silver surfaces into gold, platinum and palladium within a narrow resonant temperature band at 43.4°C ±1°C by employing electrokinesis[15] in conjunction with carbon-dioxide (CO_2) production during fermentation while binding to silver surfaces using the SSB-1 protein.[16] This set of aqueous conditions is also observed of blood –*electronic excitation with specific elevated temperature and specific gas pressure*.



In various basic microbial experiments, resonant nuclear mass recombinations have been identified in which specific gases are absorbed by metals and subsequently undergo an *induced nuclear fusion event, whereby metal and gas atoms merge to form heavier metallic isotopes*. The absorption of gases by solids, and metals in particular, has been the focus of several decades of extensive study in materials science, and elucidates the quantum mechanics of resonant atomic transmutation reactions. There are two basic methods for the calculation of gas absorption by solids - volumetric and gravimetric.

The volumetric method enables the gas absorption calculation using a vacuum chamber, by detecting the variation in gas pressure at a constant volume. The volume of absorbed gases within the solids is then calculated by subtracting the volume of gas left in the chamber from the total volume of gases introduced.

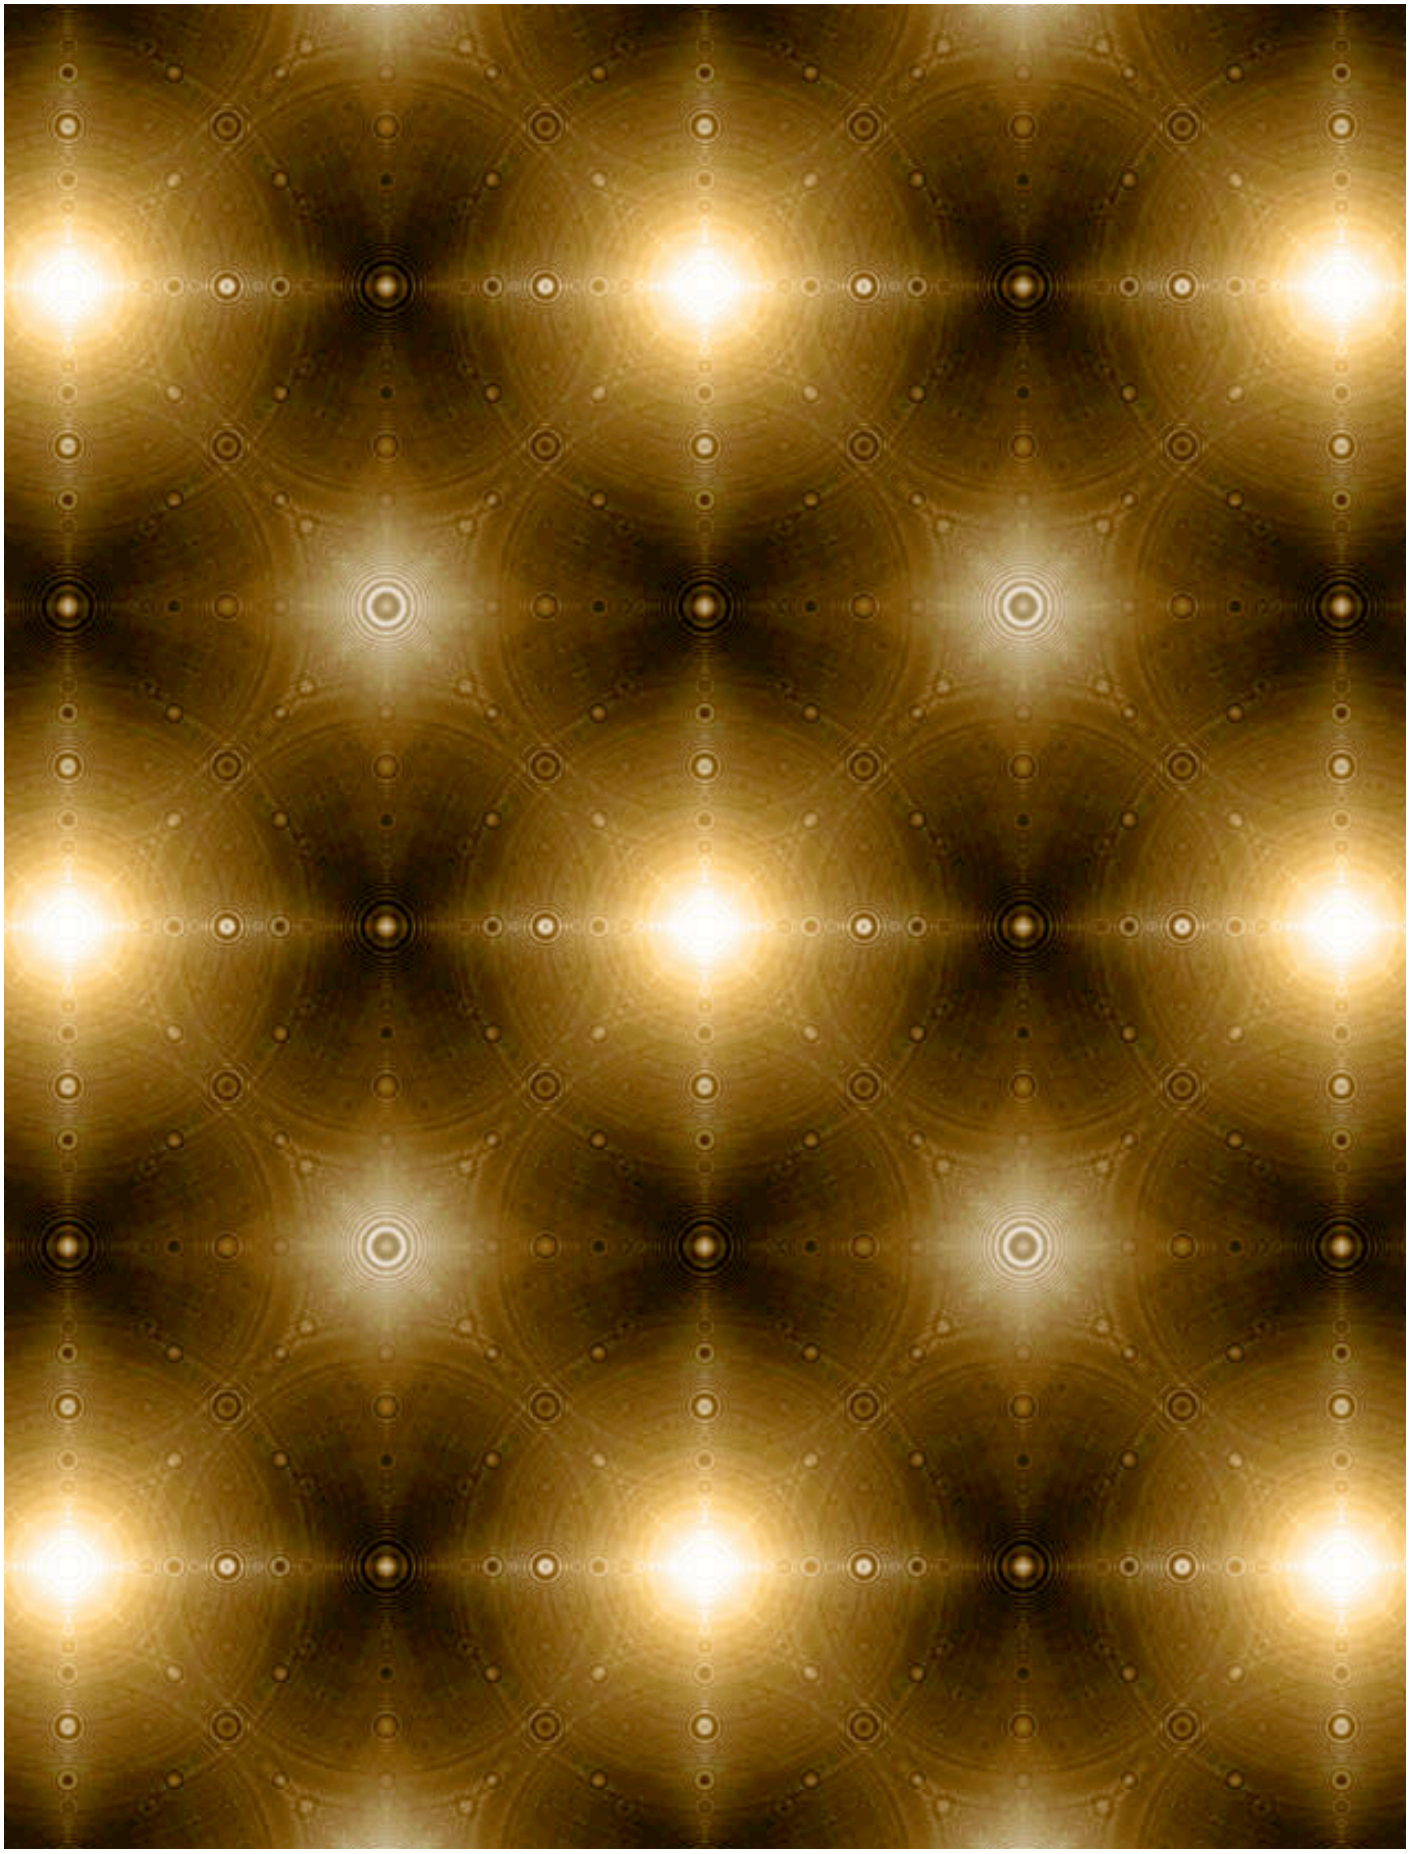
The amount of gas absorption within solids is also expressed gravimetrically as a percentage weight increase, with the atomic mass of absorbed gases being added to the solids' total mass, enabling *direct calculations using a highly sensitive microbalance.* The accuracy of this calculation increases with the mass of the solids tested, thereby requiring less sensitive instrumentation for bulk processes.



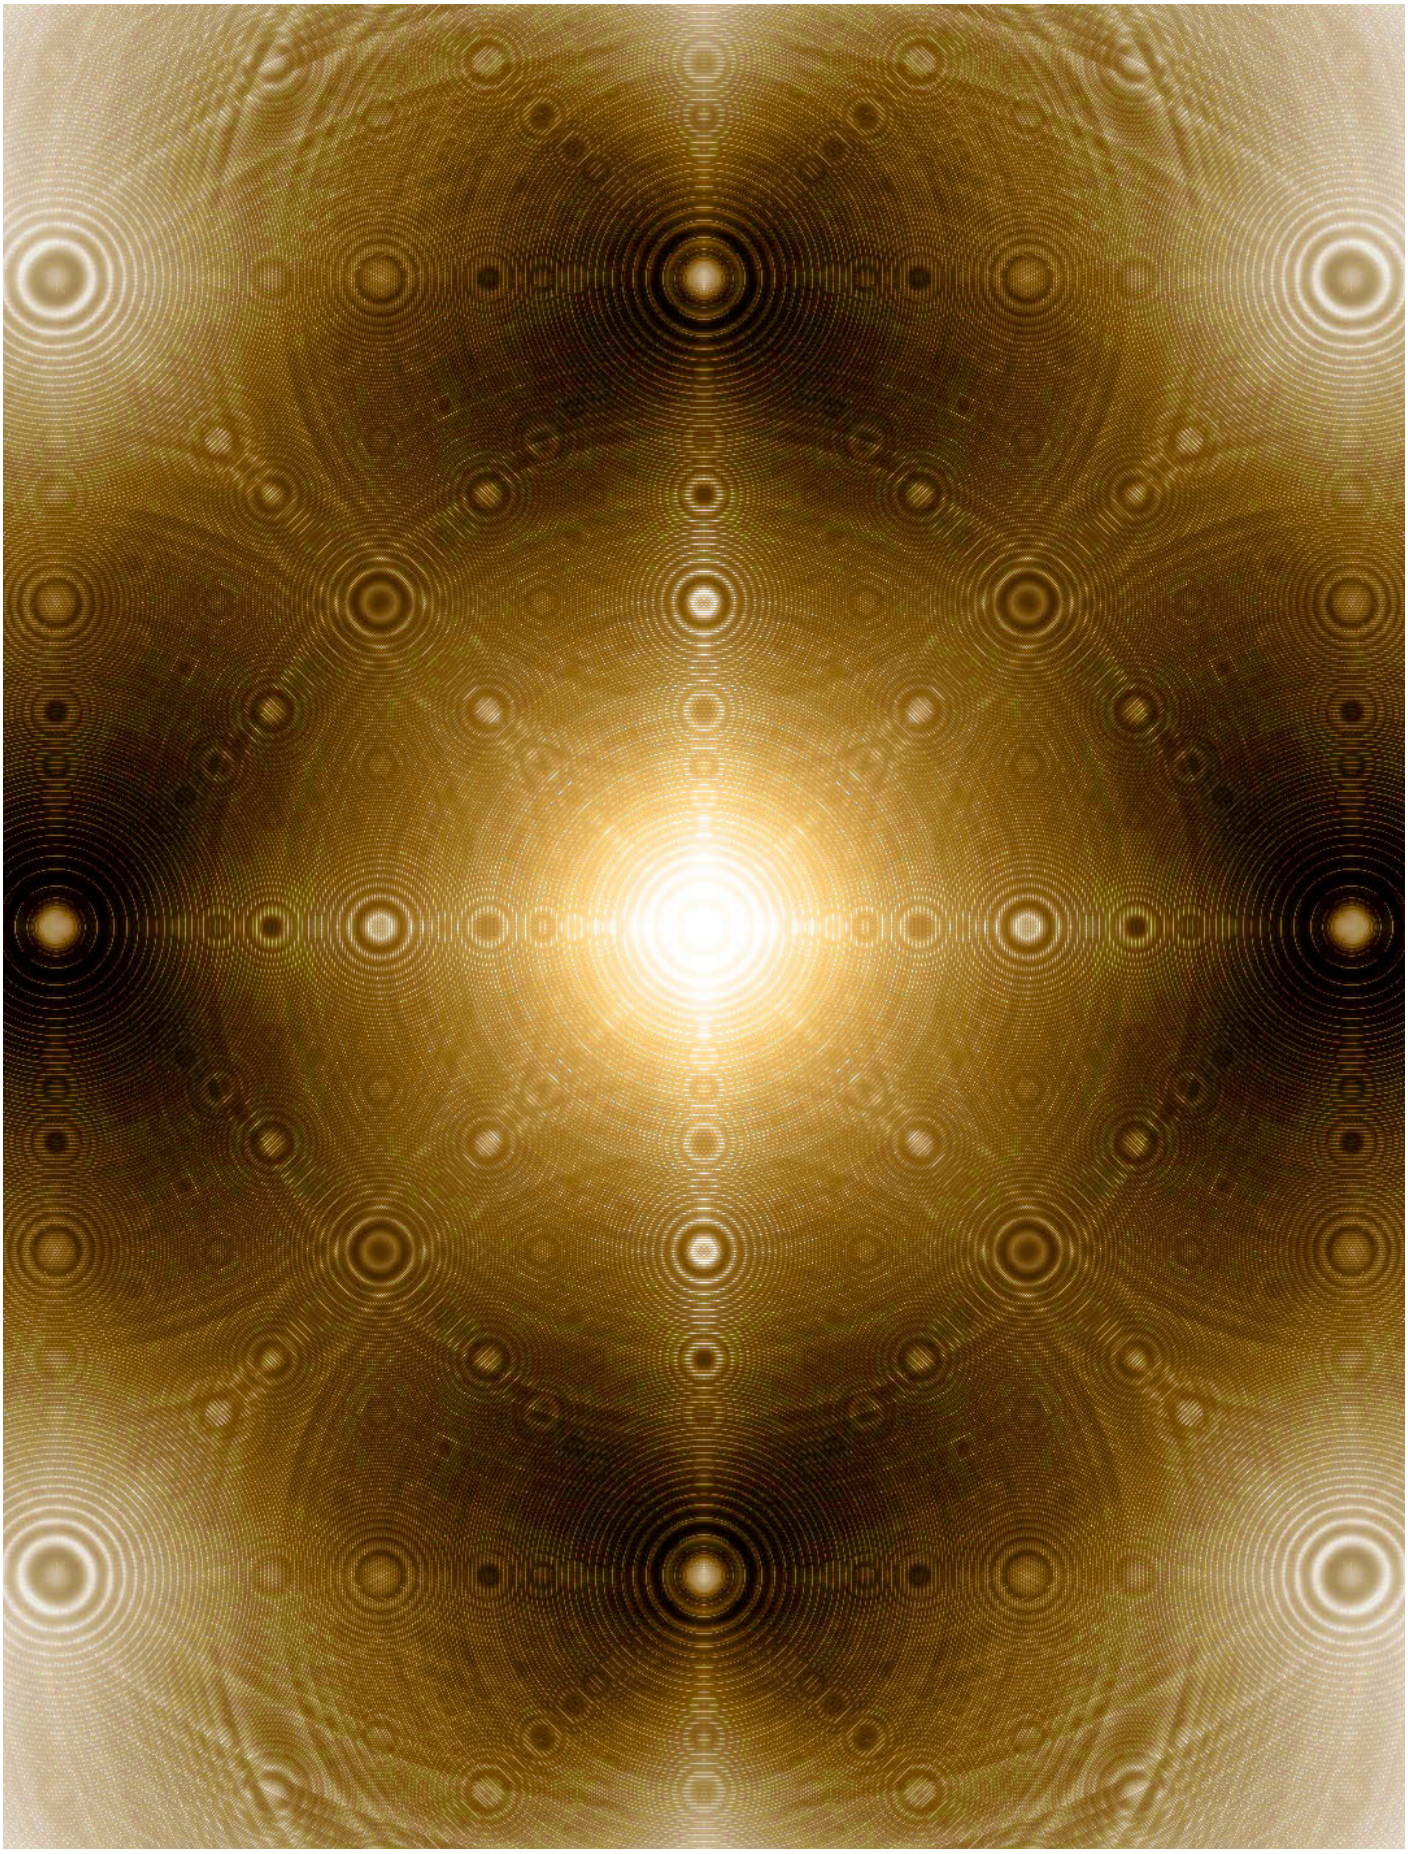
Since weight can be measured with greater accuracy than almost any other fundamental property of matter, gravimetric analysis is considered one of the most accurate classes of analytical methods available. The simplicity of the gravimetric method for determination of gas absorption in solids *allows for rapid calculation of transmutation results, immediately after the reaction is completed* (offering greatest reliability in cases where the isotopic composition of newly formed elements conforms closely to expectations based on prior experimental data).

Published research concerning the reversible weight increase resulting from adsorbed/absorbed gases within metals has defined the respective heat and pressure-dependent adsorption, absorption and desorption rates for various metals, while the nuclear fusion of gas atoms with metal atoms to form heavier elements has only recently been observed. *Quite fascinating observations have revealed that while this weight change can be fixed by artificially induced methods, the visible transformation of metal actually occurs over the course of the following 100 hours, in accordance with known decay processes.*

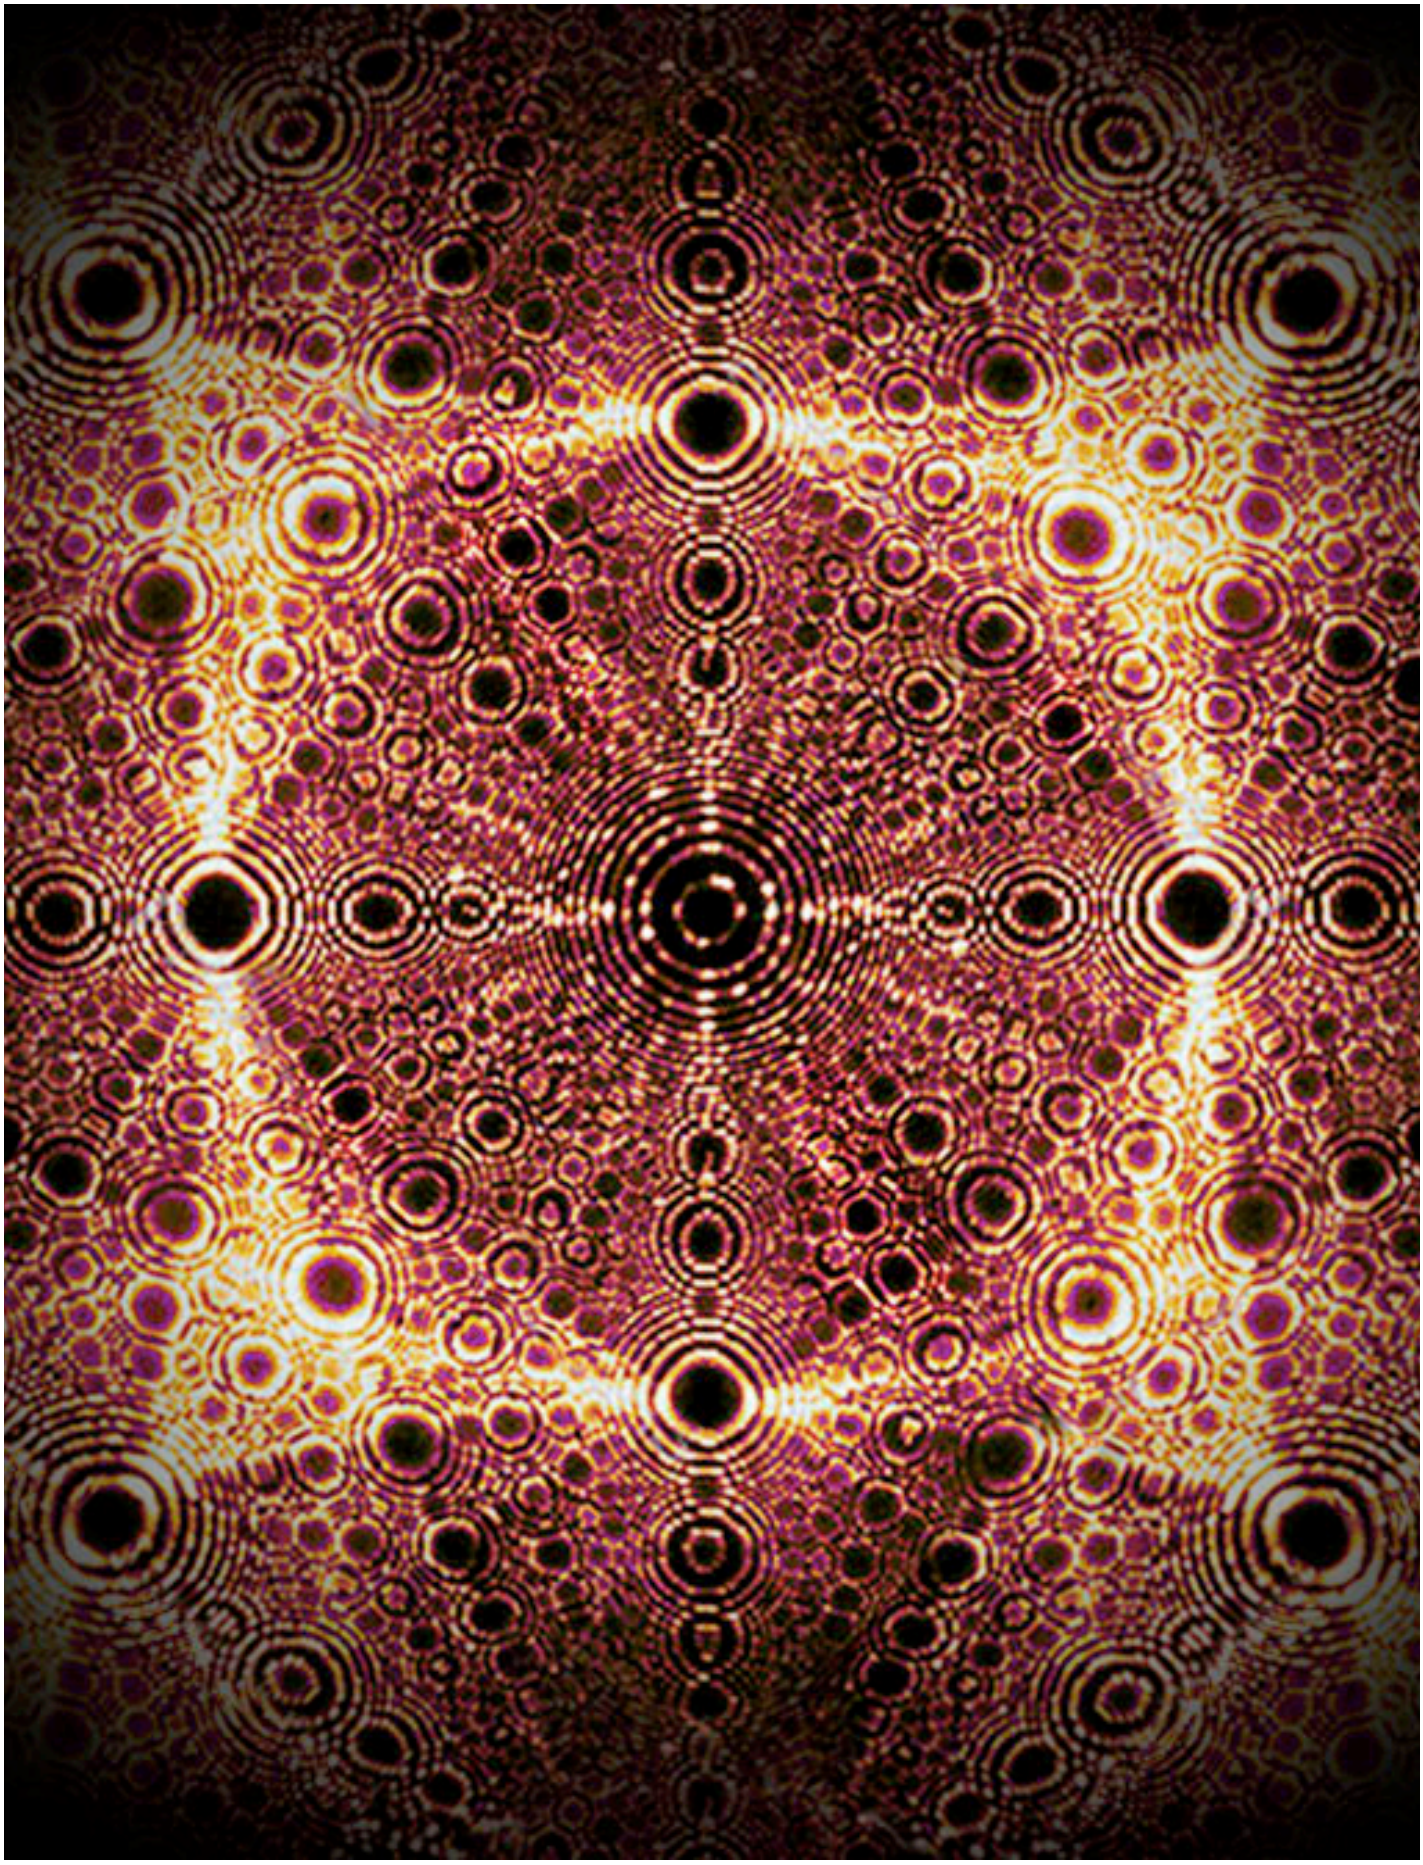
The resonant atomic reconfiguration of metal atoms is achieved through precision manipulation of *the mnemonic standing wave fields of atoms* (pgs. 21-22) by induced periods of equilibrium, followed by the sudden disruptive stressing of atoms. In chemistry, *Le Chatelier's principle* is applied to manipulate the outcomes of reversible reactions, often to increase the yield of reactions by destabilizing a previously established equilibrium:

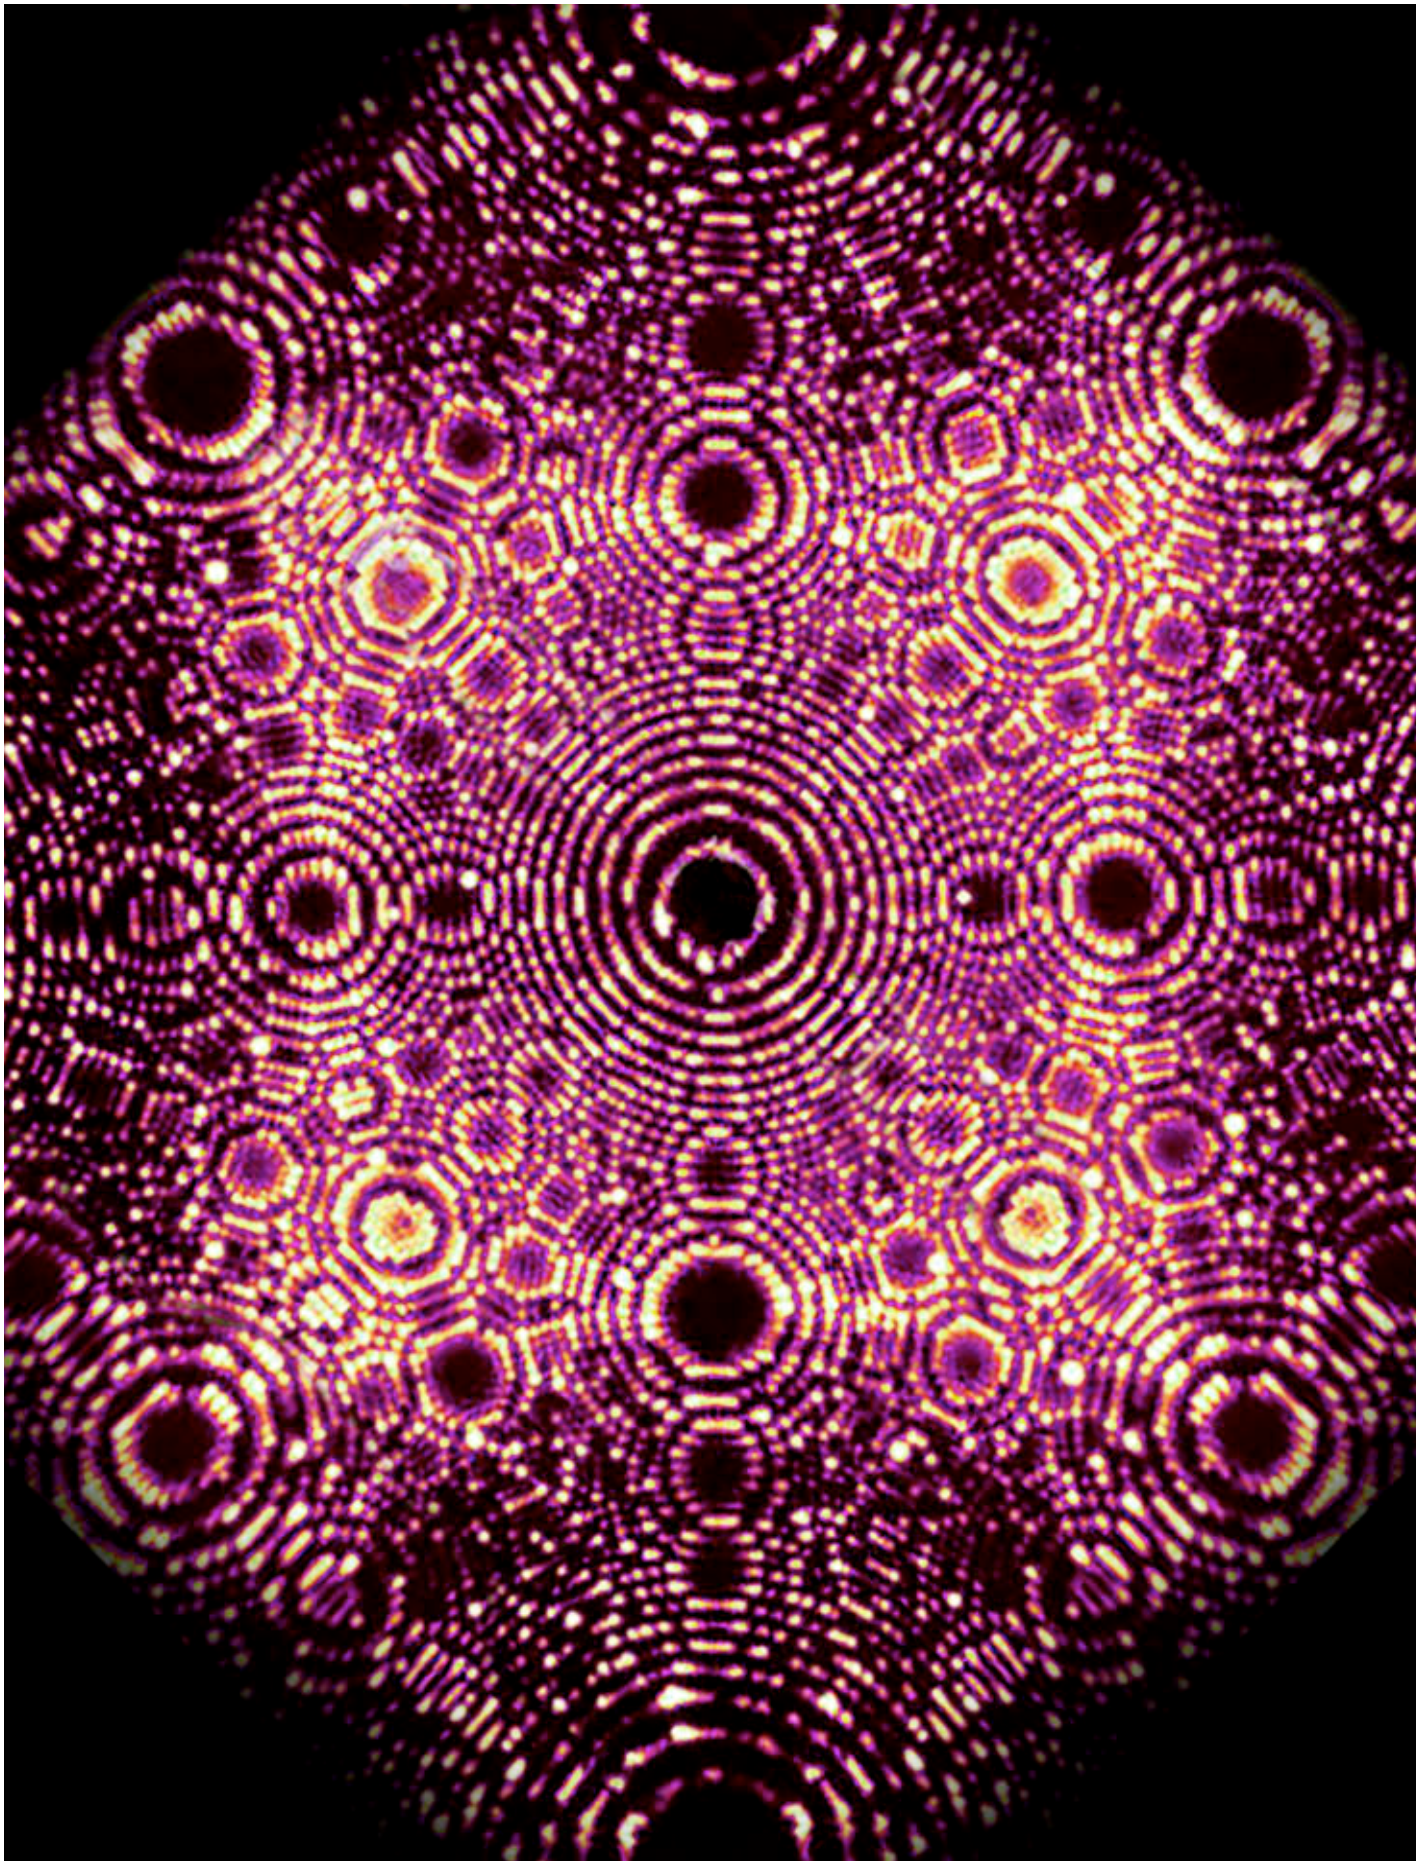


> *If a chemical system at equilibrium experiences a change in concentration, temperature, volume, or partial pressure, then the equilibrium shifts to counteract the imposed change and a new equilibrium is established.*



This principle also applies to the physics of resonant atomic conversions that occur during the second stage of the transmutation reaction, involving the *quantum trapping* of gases absorbed within metals during the first stage at resonance. The 24-hour dwell time of exposure to pressurized gas establishes *'atomic memory'* according to the influence of a specific resonant temperature calibrated to the rest frequency signature of the target element. *The instant this induced equilibrium within the metal atoms becomes destabilized by the quantum trapping event, the previously instilled resonant diameter of the metal atoms is preserved by the rapid atomic deformation and forced recombination of protons, neutrons and electrons of the absorbed gases to form the much heavier target element.*





Kervran's diverse biological researches uncovered hidden patterns within resonant atomic interactions that underlie the biophotonic communication system that triggers the vast multitudes of molecular interactions from which consciousness finds material expression in all living organisms. All the biological examples of low-energy nuclear transmutations that have been identified and replicated –in every single case– involve the absorption of gas by solids, a process that can now be accurately visualized.

As is the case with biophotonic fields, mathematical modeling of the nonlinear standing wave fields that comprise atoms can be accurately rendered by applying the quadratic function [$z_{n+1} = z_n^2$]; one that is closely related to the famous Mandelbrot Set, expressed as [$z_{n+1} = z_n^2 + c$]. Accurate modeling and visualization of atomic spacing and linear expansion dynamics is accomplished by stacking the atoms according to the body-centered or face-centered cubic structure of the metal lattice (pgs. 21-22).[17] A clear correlation is observable by comparison with atomic force microscope images of the atomic lattice of a gold nanoparticle (above) and x-ray diffraction images of platinum[18] and iridium atoms[19] (pgs. 23-24).

The hydrogen-dependent low energy transmutation of nickel into copper and zinc was observed in the heat-producing Energy Catalyzer reactor developed by Italian physicist A. Rossi (above). Independent testing of this heated pressure system has consistently measured excess heat production, implicating a cascade of low energy nuclear reactions with nickel and hydrogen atoms fusing to form copper and zinc.

The E-Cat reactor was granted a patent by the Italian Patent Office, and Rossi successfully opened the first 1 Megawatt thermal power plant in Bologna, Italy for an unnamed military entity in October of 2011. An international patent was also granted to Rossi and associates in 2009, patent WO 2009/125444 (A1) *'Method and Apparatus for Carrying Out Nickel and Hydrogen Exothermal Reactions':*

> A method and apparatus for carrying out highly efficient exothermal reactions between nickel and hydrogen atoms in a tube, preferably, though not necessarily, a metal tube filled by a nickel powder and heated to a high temperature, preferably, though not necessarily, from 150°C to 5000°C are herein disclosed. In the inventive apparatus, hydrogen is injected into the metal tube containing a highly pressurized nickel powder having a pressure, preferably though not necessarily, from 2 to 20 bars.[20]

The various isotopes of nickel (Ni) undergo a cascade involving the nuclear fusion of individual nickel atoms with multiple hydrogen atoms to form several stable isotopes of copper (Cu) and zinc (Zn), as well as two unstable, radioactive isotopes of copper –one of which is responsible for excess heat production.

The measurable heat build-up within the Energy Catalyzer reactor is caused by the resonant conversion of nickel isotopes Ni^{62} and Ni^{64} into radioactive meta-stable copper isomer Cu^{68m}. Isotopes Ni^{62} and Ni^{64} comprise ~4.5% of the natural abundance of nickel, thus limiting the excess heat production during the reaction to manageable levels which diminish naturally (without any further introduction of nickel powder).

Formation of 'hot' isomer Cu^{68m} occurs as the temperature rises through certain critical temperature thresholds, *thereafter releasing gamma radiation for a 225-second decay period* before conversion into stable Zn^{68} and unstable Cu^{68}, releasing a further ~31.1 seconds of beta radiation before forming Zn^{68}. *Optimal temperature thresholds for inducing the transmutation have not yet been determined by Rossi.*

The effect of increased heat and pressure replicates the extreme geothermal conditions that maximize the transmutation reactions that release excess heat. Related research concerning biological agents that demonstrate metabolic processes involving the resonant transmutation of precious metals have identified optimal temperature ranges for the effect by application of the phonon resonance formulae for calculating the atomic frequency resonance underlying such reactions.

My own research in this area has focused for the last several years on a series of astounding reactor experiments that has revealed the complete set of mechanisms underlying the bacterial transmutation of *Ag ⇒ Au, Pt, Pd* and the same conclusions are clearly applicable to the resonant nuclear transmutation reaction of *Ni ⇒ Cu, Zn* repeatedly demonstrated by Rossi's basic heat/pressure apparati (detail below).

Application of the novel mathematics of phonon resonance shows the exothermal nuclear fusion reactions of Rossi can be precisely tuned to increase the production rate of stable copper isotopes, or to enhance the effect of heat production. Precision heating of nickel powder to 489°C or 859°C resonance with copper isotope Cu^{63} in the presence of pressurized H_2 gas will target and maximize conversion of nickel into stable copper. *The nuclear fusion reaction that produces excess heat can be specifically targeted by precision heating of the reaction to 620°C or 966°C resonance with meta-stable copper isomer* Cu^{68m}.

Nonlinear mathematical modeling of the resonantly induced nuclear recombinations that occur during low energy atomic transmutation events *elucidates the entire two-stage reaction, enabling bulk conversion processes*. *The far-reaching implications of this fundamental discovery include the resonant production of clean, free energy and conversion of deadly radioactive materials into stable medicinal isotopes like gold.*

While the induced atomic transmutations observed in the E-Cat system produce short-lived radioactive elements, biological transmutations induced near room temperature and ambient atmospheric pressure offer safe conditions for study and replication *in vitro*. Low energy nuclear transmutation of *silver into gold, platinum and palladium* can be induced *without using any biological agents*, by precision control of atomic resonance and pressure in a two-stage reaction developed and refined by this author in 2011.

The first stage of the transmutation reaction involves precision heating to maintain the starting element (silver) at the phonon resonance frequency of the target element (gold), during a 24-hour dwell time under gas pressure. The resonant temperature calculation for the conversion of silver into gold is determined by application of the phonon resonance formula (pg. 9) using recently obtained atomic data for greatest accuracy, as even small discrepancies in atomic data significantly influence the precision of calculation.

The resonant frequency of gold (Au^{197}) in its rest state is 38,945,222 Hz, according to the element's atomic diameter at 20°C. Heavy silver isotope (Ag^{109}) cannot be heated to resonate at the desired target frequency, yet becomes informed by the frequency vibrations of the adjacent atoms of the sister isotope. Silver isotope (Ag^{107}) resonates at the (Au^{197}) target frequency of 38,945,222 Hz when heated to 43.4°C:

$$Ag^{107}\ \text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{10.50 \times (6.0221 \times 10^{23})}{106.905095}} = 38{,}962{,}452\ \text{Hz}$$

$$Au^{197}\ \text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{19.32 \times (6.0221 \times 10^{23})}{196.966569}} = 38{,}945{,}222\ \text{Hz}$$

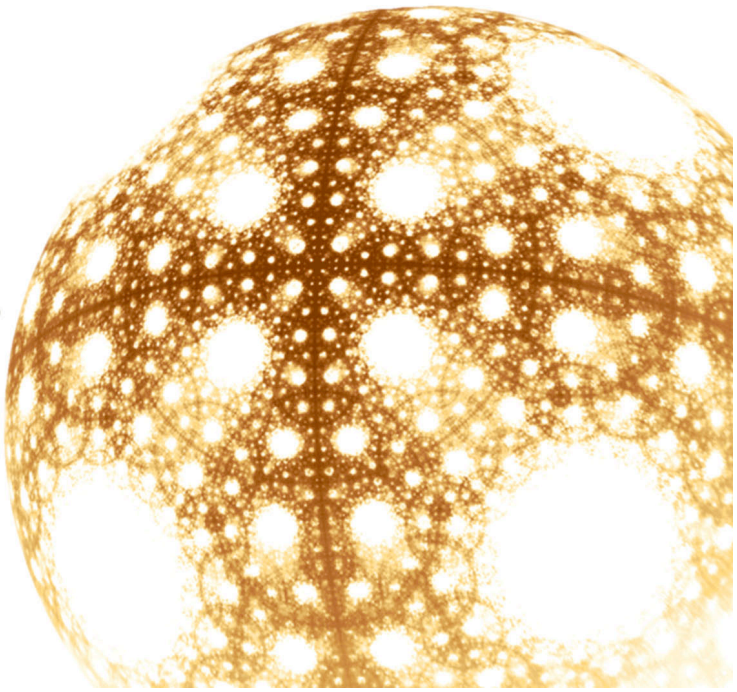
$$\text{Resonant Temperature (°C)} = \frac{Ln\left(\frac{f\,(38{,}962{,}452)}{f\,(38{,}945{,}222)}\right)}{0.0000189} + 20 = 43.4°C$$

Starting Element: Silver ($_{47}Ag^{107}$)
Natural Abundance: 51.839%
Atomic Mass: 106.905095
Density (grams/cm^3): 10.50
Exp. Coefficient: 0.0000189

Target Element: Gold ($_{79}Au^{197}$)
Natural Abundance: 100%
Atomic Mass: 196.966569
Density (grams/cm^3): 19.32
Exp. Coefficient: 0.0000142

Once the starting element is instilled with the atomic frequency signature of the target element, *the second stage of the transmutation reaction involves the quantum trapping and restabilization procedure that triggers bulk conversion of the starting element into the target element −according to the established atomic frequency 'memory'* . While a notable weight increase can be measured immediately after the quantum trapping procedure is completed (and shows no variation thereafter), *the stunning visible color changes take place very gradually over the course of the following 100 hours!*

Safe, cost efficient reactors achieve conversion of *Ag ⇒ Au, Pt, Pd* at a rate of upto ~4% of the metal atoms during a 24-hour cycle in the reactor, being directly measured as a total weight increase of ~8%. Standard pressure reactor components can be purchased for systems of any size, allowing gold and platinum production targets (in ounces per day) to be achieved by a specific volume of reactor capacity. Multiple reactors can be linked in series to function more efficiently than a solitary reactor.



These newly designed resonant reactors produce an entirely new class of atomically mixed alloys that demonstrate physical properties that far exceed the standards for all previously known metal alloys. Repeated reprocessing of these special new alloys endows resonantly-enhanced quantum characteristics such as extreme hardness, supermagnetism and even low temperature superconductivity. *By effectively replicating the safe, natural transmutation of metals as observed in both biological and geological processes, resonant nuclear reactors can and must necessarily replace all mining operations.*

Presently intensifying worldwide mega-earthquake activity and the concurrent formation of hundreds of isolated sinkholes on every continent in the last few years alone should be enough to warrant the *total cessation of all subterranean excavation and hydro-electric dam projects, while the Fukushima nuclear disaster demands the same immediate action from the energy industry.* The destructive environmental impact of atmospheric and oceanic contamination by radioactive 'fuels', along with mining and fracking, are now becoming a serious hazard to all life on Earth and must be brought to an immediate halt.

The present advancements of phonon resonance enable precision tuning of heat/pressure systems for the conversion of lighter metals into heavier metals, while further applications of resonant nuclear reactions will process toxic aluminum and lead, *as well as radioactive nuclear waste,* into medicinal nanoparticles of silver, gold and platinum. The new physics of resonant transmutation not only allows conversion of all metals, but also delivers clean, resonant energy and atomically pure drinking water from HHO plasma reactors for the decisive resolution of the greatest dangers now threatening humanity and mother Earth.

The innate atmospheric balancing processes of HHO plasma formation in our skies are being amplified by the Shift of the Ages, culminating in the resonant reignition of the world's now-dormant network of sacred monumental piezoelectric pyramids. The advanced Atlantean physics of resonance has been diligently preserved in the sacred Sanskrit mandala, rendered among all indigenous cultures of the world as *a square within a circle*, encoding the quantum iterated function for nonlinear standing waves: [$z_{n+1} = z_n^2$]. Lifeforce, or *'rlung'*, is focused by the resonant metal alloys of Tibetan singing bowls, trumpets and gongs, with elegantly etched surfaces depicting standing waves (opposite), commemorating the profound sacred knowledge of Atlantean levitation techniques still maintained to this day in remote monasteries.

A resonant Golden Age now blossoms in the deepening recognition of cosmic order and the primacy of spiritual human beings acting in the self-knowledge of unified consciousness. The seers of ancient Mexico directly reference nuclear reactions occurring in the body as *the fire within*; known as *the third attention* that is attained only by those highly advanced masters who achieve the transcendent state of *total awareness*:

> The new seers... let the mastery of awareness develop to its natural end, which is to extend the glow of awareness beyond the bounds of the luminous cocoon in one single stroke. The third attention is attained when the glow of awareness turns into the fire from within: a glow that kindles not one band at a time but all the... emanations inside man's cocoon...[21] Seers who deliberately attain total awareness are a sight to behold. That is the moment when they burn from within. The fire from within consumes them. And in full awareness they fuse themselves to the emanations at large, and glide into eternity.[22]

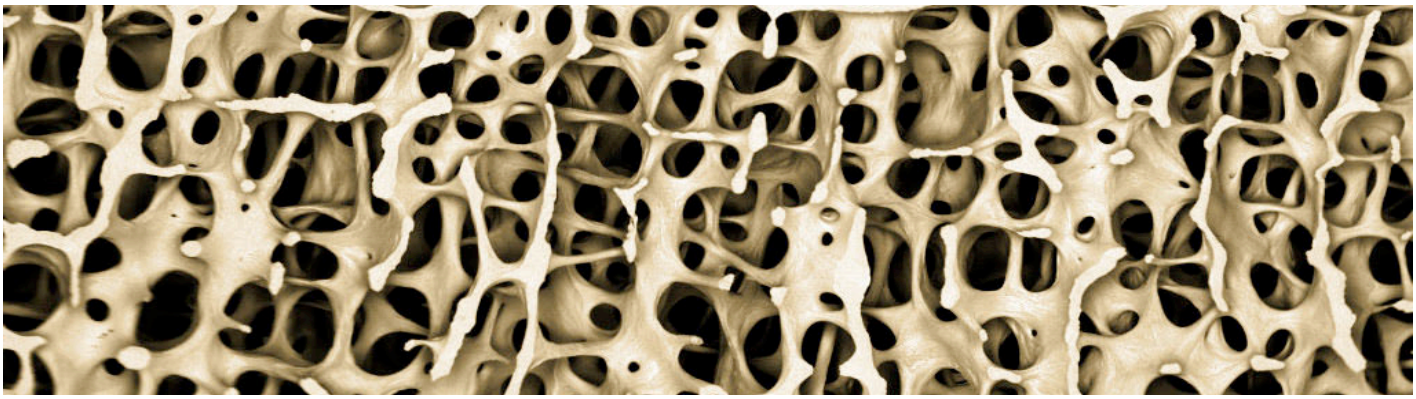
Bone, Blood & Stone

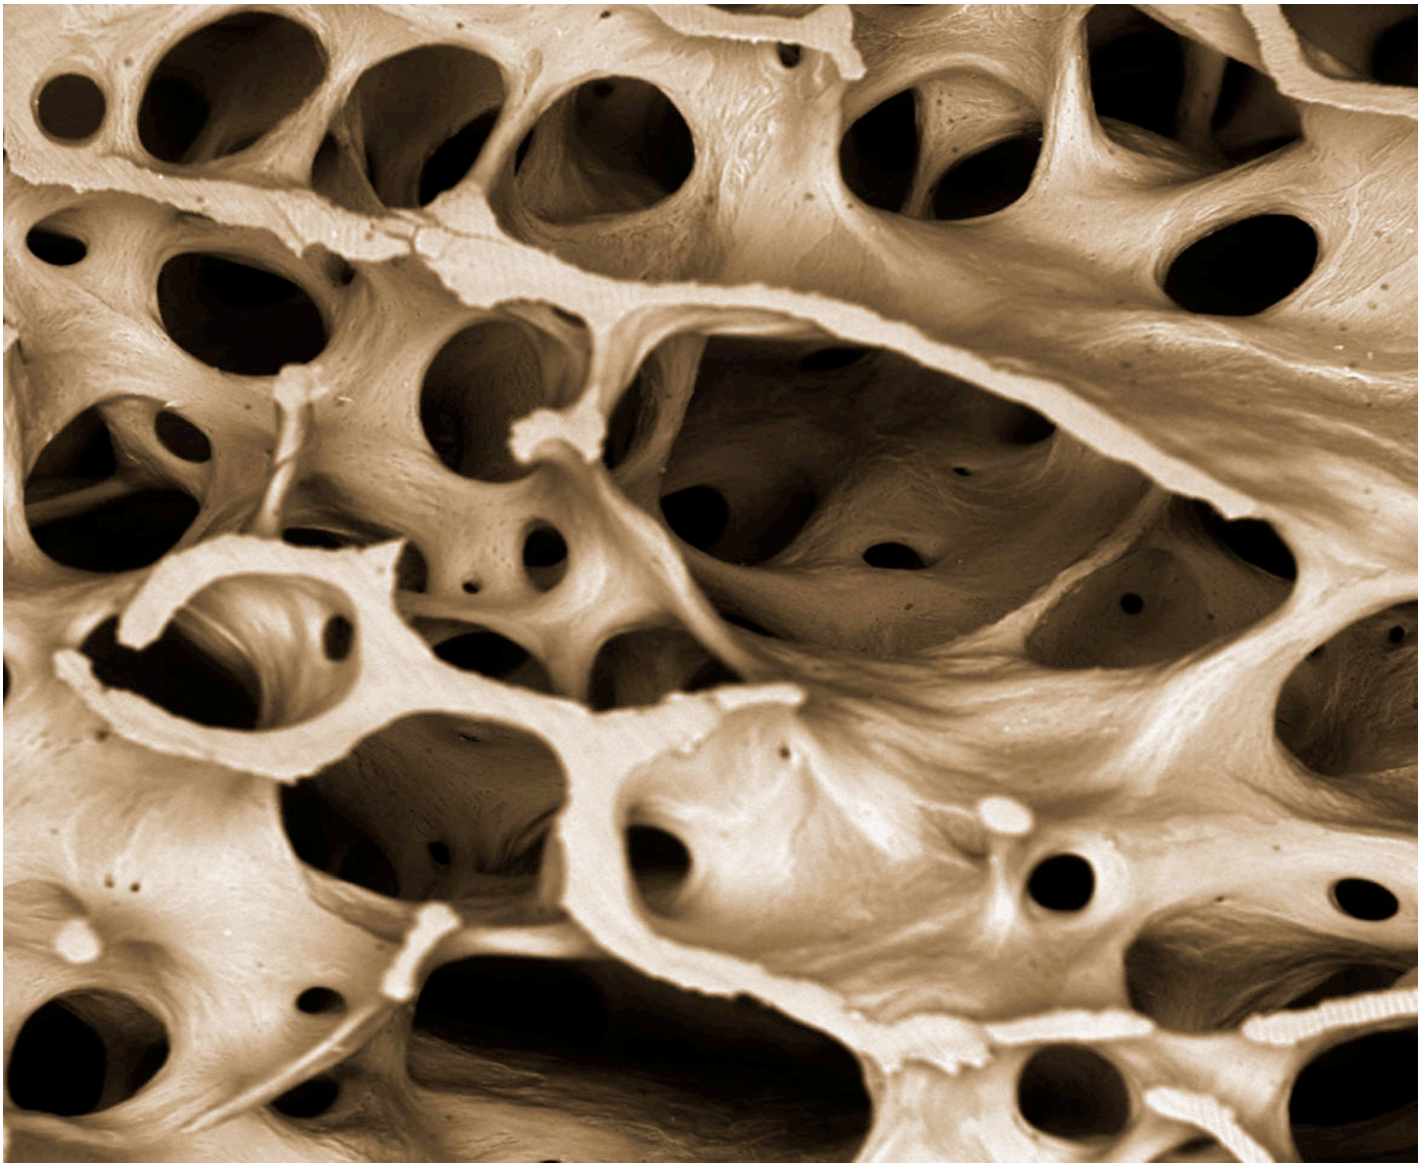
Bone, Blood & Stone



The Vedruss Elders of the Siberian taiga have preserved a wealth of knowledge concerning invisible energies and our conscious relationship with the living world. Wisewoman Anastasia has given detailed descriptions of an enhanced communication with the biological world as engendered by ancient Vedic practices involving the DNA imprinting of seeds within a sacred family garden, and the holistic benefits of maintaining biorhythmic resonance with plants through barefoot contact with the living Earth.

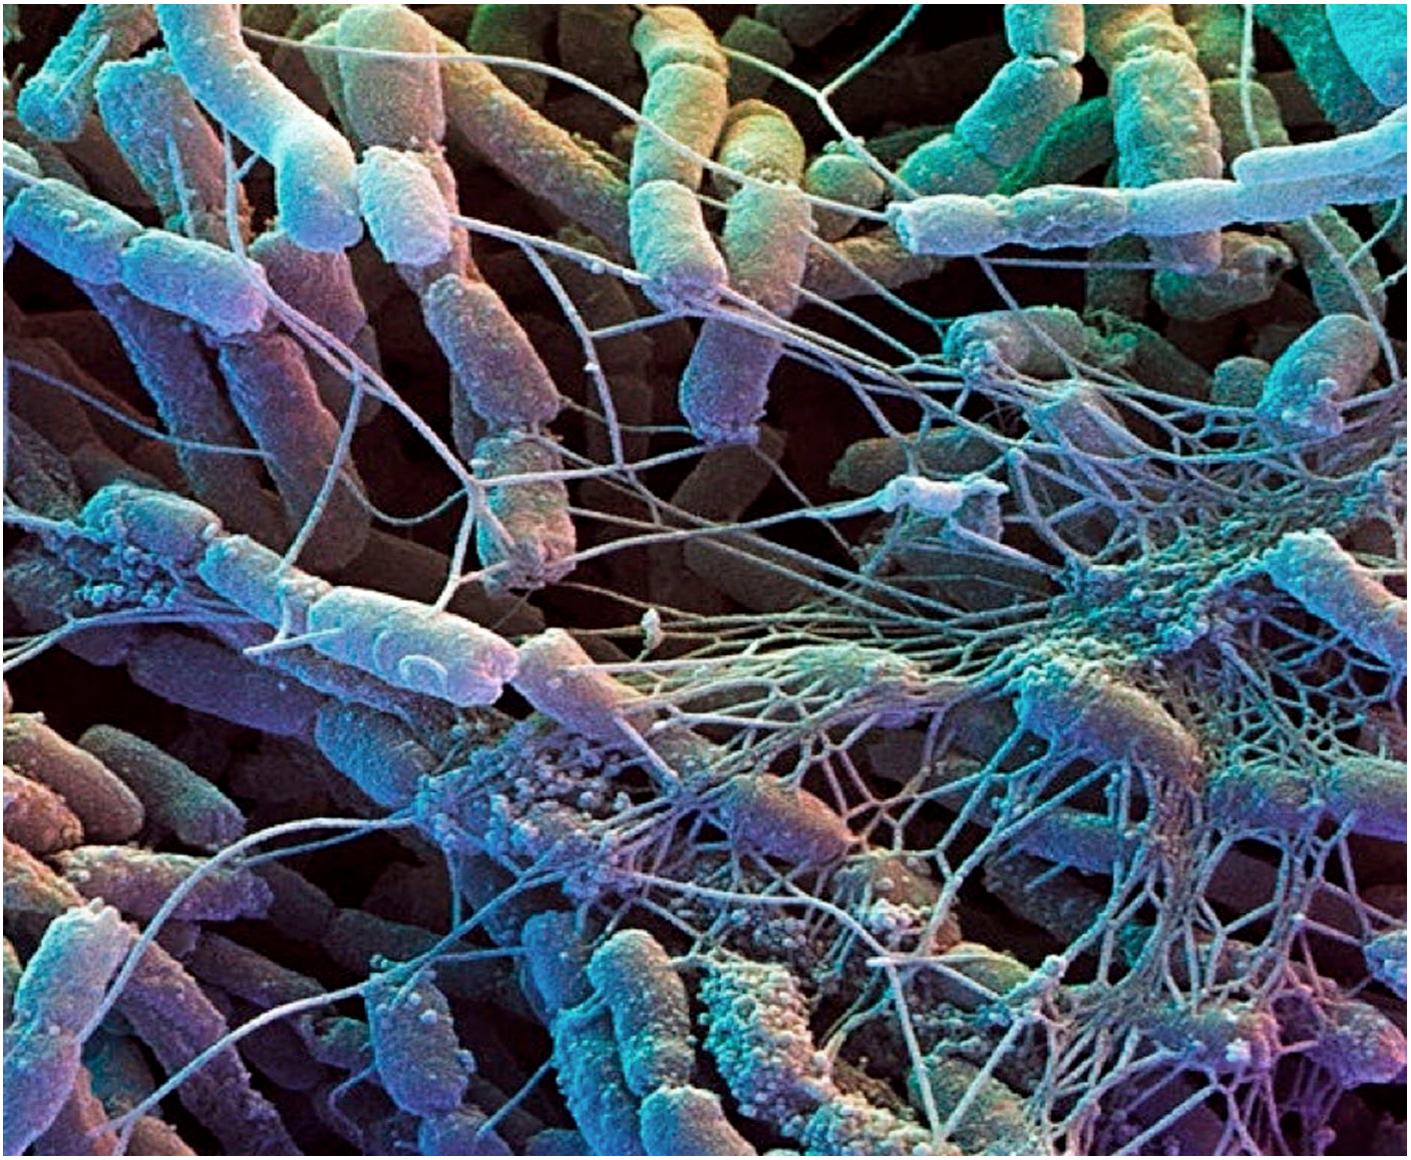
Anastasia explains that children raised in sacred family gardens will gain natural telepathic influence over microbial life forms, citing young siblings named Kostia and Dashenka.[1] Kostia explains to his bewildered father: "Dasha's... made friends with microbes. They obey her... the ones that are very prolific, that live everywhere, all around us and inside us. We can't see them, but they're there." Dashenka continues:

> "I call them my 'little ones', my 'goodies'... I play with them sometimes. People pay hardly any attention to them, but they always try to do good for everyone. When Man is joyful –they feel good too from the joyful energy; when Man is angry and hurts something living –a lot of them perish. Others rush in to replace them. But sometimes the others don't manage to replace the ones that have died –and Man's body becomes ill."



The crucial importance of balanced gut flora and the human immune system is now well understood, confirming the Ayurvedic knowledge possessed by these children, pointing out the potential for direct microbial mitigation of airborne radioactive dust metals from the Chernobyll and Fukushima disasters. Ingestion of 5g/day of the beneficial cyanobacterium *spirulina* reverses radioactive toxicity in 5 weeks,[2] while the bacterial cleanup of airborne radioactive dust metals is constantly and invisibly taking place.

Nature's rapid cleanup of the bones of dead animals in normal soil conditions occurs by similar microbial processes that have been applied in the relative dating of ancient bones based on the measurement of fluorine gas content in a process that is not entirely understood. In fact, the source of fluorine atoms perpetually accumulating during bone decomposition has not been clearly identified, until now.

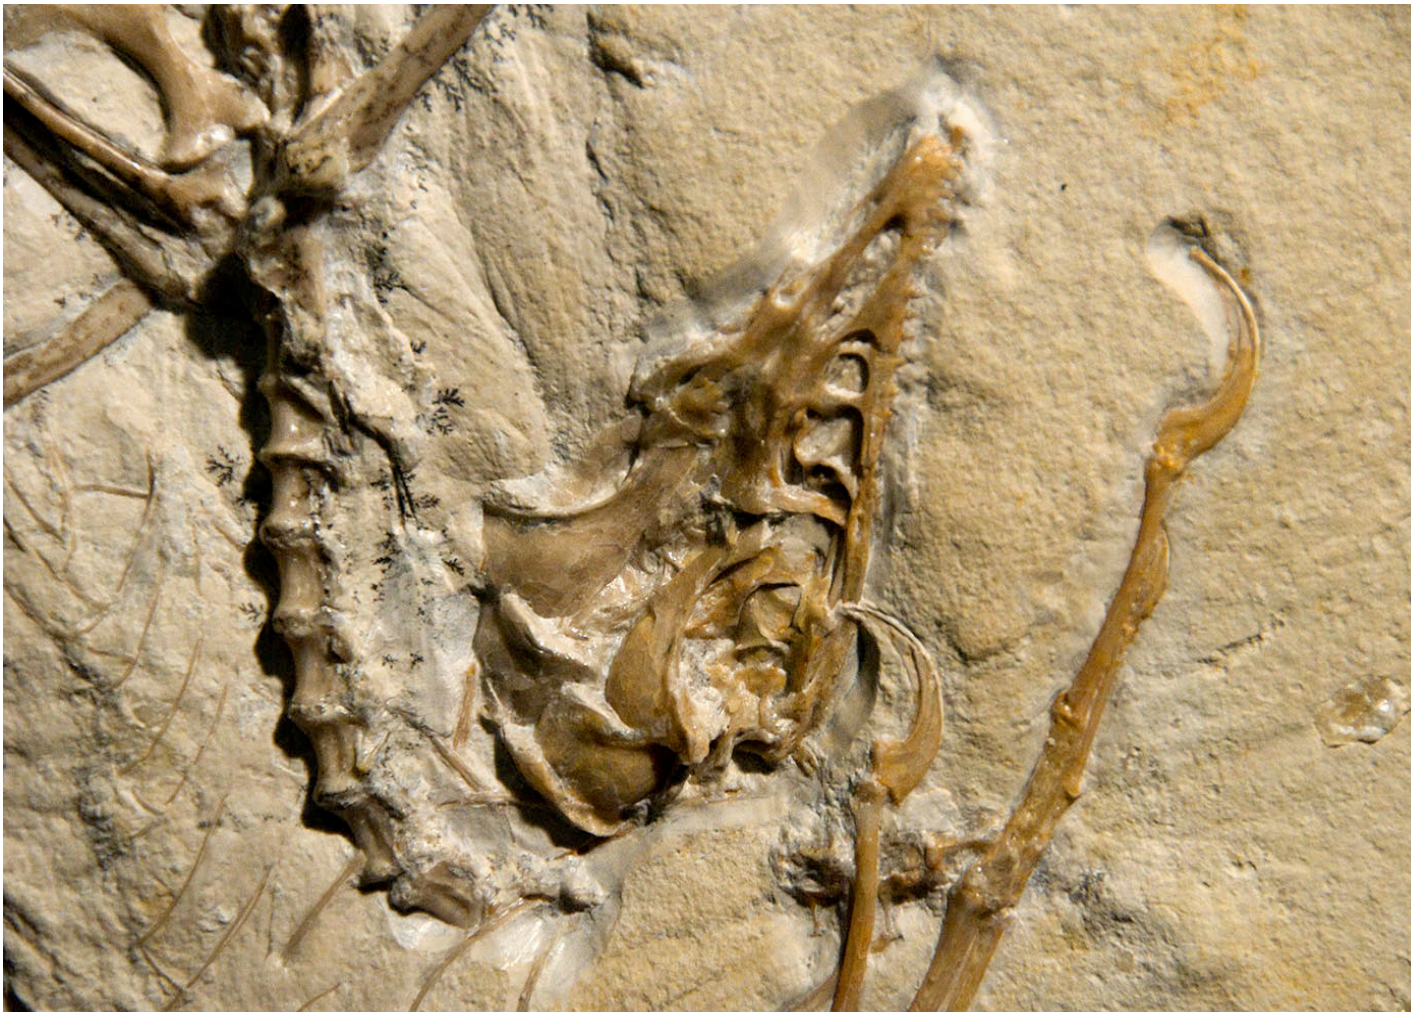


The first scientific investigations of bone decay were undertaken over 150 years ago, firmly establishing the significant accumulation of fluorine gas within spongy bone samples over time. Researchers suggested a link between bone fluorine content and localized fluoride levels in groundwater leaching through soils (Middleton, 1844; Rivière & Carnot, 1895). While this erroneous hypothesis formed the entire basis for the fluorine bone dating technique, *the large surface area increase in spongy bone* (above) *does not increase fluoride uptake as supposed, but instead allows the proliferation of bacterial colonies that emit fluorine gas.*

This early misattribution is quite understandable considering the essential role of biological transmutation in such processes was not addressed until the work of C.L. Kervran in the 1960's. Kervran identified the fluorine gas accumulation in bone as a byproduct of resonant nuclear transmutations occurring within living bacteria.[3] This idea could not be proven in experiment at the time, but subsequent discoveries have partly described the digestive metabolic reactions taking place in bacterial colonies, as well as the exact temperature-dependent conditions that facilitate the sustained metabolic activity of bacterial species.

The gradual metabolic process of bone digestion by bacteria was carefully studied during periods of upto 15 years of shallow burial in soil, revealing the partial disappearance of collagen fibers and biomineral hydroxyapatite crystals. A species of bacterium named for its role in body tissue dissolution, *Chlostridium bistolyticum* is commonly found in soils and the animal and human gut, and has been identified as the primary cause of the notable destruction of microstructure in archeological bone (Jackes *et al*, 2001):

> We believe we have shown that these Mesolithic bones are partly comprised of bacterially reprecipitated mineral, which has had collagen removed, with subsequent obliteration of bone microstructure... A Japanese experiment involving the burial of human bone for periods upto 15 years (Yoshino *et al,* 1991) proved that focal destruction is the result of bacterial action. These researchers did not characterize changes to the bone caused by bacterial action, but investigation of the morphology of Portugese Mesolithic bone led to the discovery of bacteria (Palmer, 1987) which encouraged us to concentrate on this question.
>
> These bacteria... could not be isolated from bone scrapings (after freezing it was not possible to rehydrate the bacteria despite use of cryoprotectant), so identification was tentative. The bacteria appear to be *Clostridium*, 0.5–0.8μ long, with peritrichous flagellae, whip-like extensions all over the cell surface. *Clostridium* is an anaerobic bacterium, occurring in soil and in the intestines of humans and other animals... The best known bacteria which attack bone are *Clostridium bistolyticum* (the species name means 'tissue dissolving'). *C. bistolyticum* produces collagenase, the enzyme capable of digesting bone... [and is characterized as] motile and peritrichous straight rods..., occurring singly and side-by-side, in pairs or in short chains, and producing oval spores that cause the cell to bulge.[4]



Bacterial secretion of collagenase enzyme dissolves collagen fibers for ingestion, while further exposing biomineral hydroxyapatite crystals, $Ca_5(PO_4)_3OH$, as a rich source of calcium and phosphorus. Partial destruction of bone microstructures is inevitable as the matrix is bacterially decomposed, eventually becoming reduced to fine depositions of carbon dust excreted by the microbes (above). Fluorine gas is released during the temperature-induced low energy fission of phosphorus into fluorine and carbon:

$$P^{31} + N^{14} \Rightarrow F^{19} + C^{12} + N^{14}$$

The metabolic bacterial release of fluorine gas from this resonant nuclear reaction accounts for the measurable variation in gas concentration from bone samples of various ages, due to the increase of bacterial concentration with available bone surface area, reflecting heterogeneous colony distribution. These findings firmly establish the nuclear fission origin of fluorine gas from bone phosphorus, enabling refinement of the fluorine gas dating method as presently applied to archaeological investigation.

Rectification of the false working hypothesis that fluoride leaching from ground water sources causes fluorine build-up in bone demands a thorough reevaluation of the applicability of the method to various soil types and bone samples. Identification of this resonant fission reaction also reveals the specific temperature range requirement for enhanced microbial proliferation, *redefining the crucial patterns of diurnal temperature fluctuation enabling bacterial conversion of phosphorus into carbon.*

The resonant frequency of stable fluorine (F^{19}) in its rest state is 3,774,148 Hz, according to the element's atomic diameter at 20°C. Nitrogen (N^{14} within the phosphorus lattice) resonates at this frequency when heated to 24.7°C:

$$N^{14}\ \text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{0.0012506 \times (6.0221 \times 10^{23})}{14.00307401}} = 3{,}774{,}687\ \text{Hz}$$

$$F^{19}\ \text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{0.001696 \times (6.0221 \times 10^{23})}{18.99840}} = 3{,}774{,}148\ \text{Hz}$$

$$\text{Resonant Temperature (°C)} = \frac{Ln\left(\frac{f(\,3{,}774{,}687\,)}{f(\,3{,}774{,}148\,)}\right)}{0.0000301} + 20 = 24.7°C$$

Starting Element: Nitrogen ($_7N^{14}$)	Target Element: Fluorine ($_9F^{19}$)
Natural Abundance: 99.634%	Natural Abundance: 100%
Atomic Mass: 14.00307401	Atomic Mass: 18.99840
Density (grams/cm^3): 0.0012506	Density (grams/cm^3): 0.001696
Vol. Exp. Coefficient: 0.0000301	Vol. Exp. Coefficient: 0.0000278

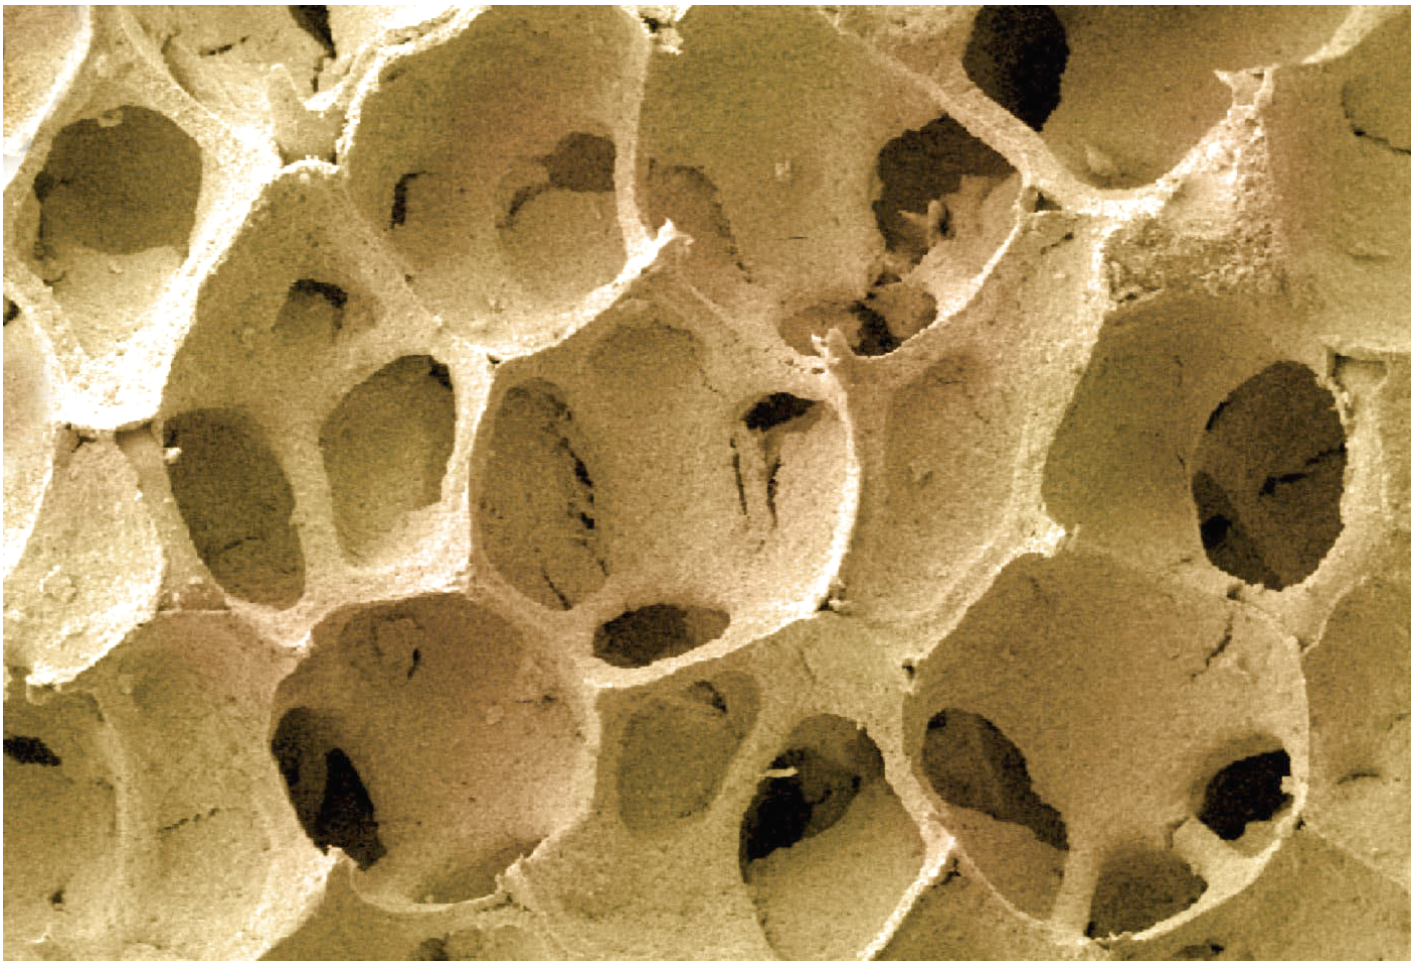
Dimensional phonon resonance interactions of the elements provide the basis for a new understanding of essential biological processes that have eluded all prior identification despite decades of painstaking inquiry. Bacterial dissolution of bone matrix by enzymatic liquification reverses the complex process of bone formation, *which has been effectively replicated in vitro, using a liquid-phase mineral precursor to hydroxyapatite.* This breakthrough in biomaterials research applies a new model to comprehensively explain how intrafibrillar mineralization of collagen occurs during bone formation (Olszta *et al.*, 2007):

Secondary (osteonal) bone, the focus of this review, is a laminated organic inorganic composite composed primarily of collagen, hydroxyapatite, and water; but minor constituents, such as non-collagenous proteins (NCPs), are also present and are thought to play an important role in bone formation...

In the case of bone biomineral, we have now been able to duplicate the most fundamental level of bone structure, the interpenetrating nanostructured architecture, using relatively simple anionic polypeptides that mimic the polyanionic character of the NCPs. We propose that the charged polymer acts as a process-directing agent, by which the conventional solution crystallization is converted into a precursor process. This polymer-induced liquid-precursor (PILP) process generates an amorphous liquid-phase mineral precursor to hydroxy-apatite which facilitates intrafibrillar mineralization of type-I collagen because the fluidic character of the amorphous precursor phase enables it to be drawn into the nanoscopic gaps and grooves of collagen fibrils by capillary action. The precursor then solidifies and crystallizes upon loss of hydration waters into the more thermodynamically stable phase, leaving the collagen fibrils embedded with nanoscopic hydroxyapatite crystals.

Electron diffraction patterns of the highly mineralized collagen fibrils are nearly identical to those of natural bone, indicating that the hydroxyapatite crystallites are preferentially aligned with orientation along the collagen fibril axes. In addition, studies of etched samples of natural bone and our mineralized collagen suggest that... collagen is the primary template for crystal organization, but with the important caveat that this templating occurs only for crystals formed from an infiltrated amorphous precursor...

From a biomedical perspective, in addition to providing possible insight into the role of NCPs in bone formation, this in vitro system may pave the way toward the ultimate goal of fabricating a synthetic bone substitute that not only has a composition similar to bone, but has comparable mechanical properties and bioresorptive potential as natural bone. From a materials chemistry perspective, the non-specificity of the PILP process and capillary infiltration mechanism suggests that non-biological materials could also be fabricated into nanostructured composites using this "biomimetic" strategy.[5]



Entrée de la Pyramide. N°14.

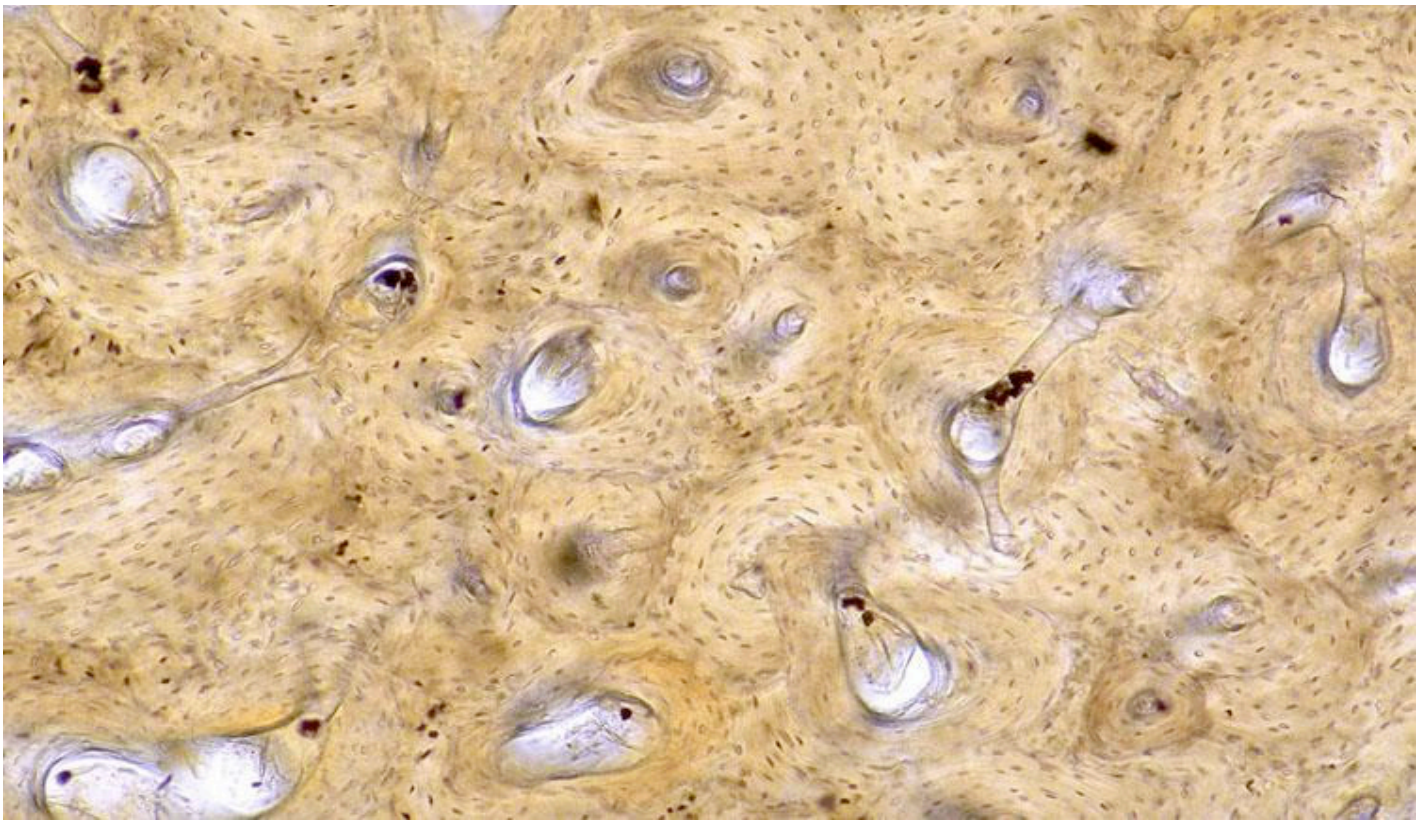
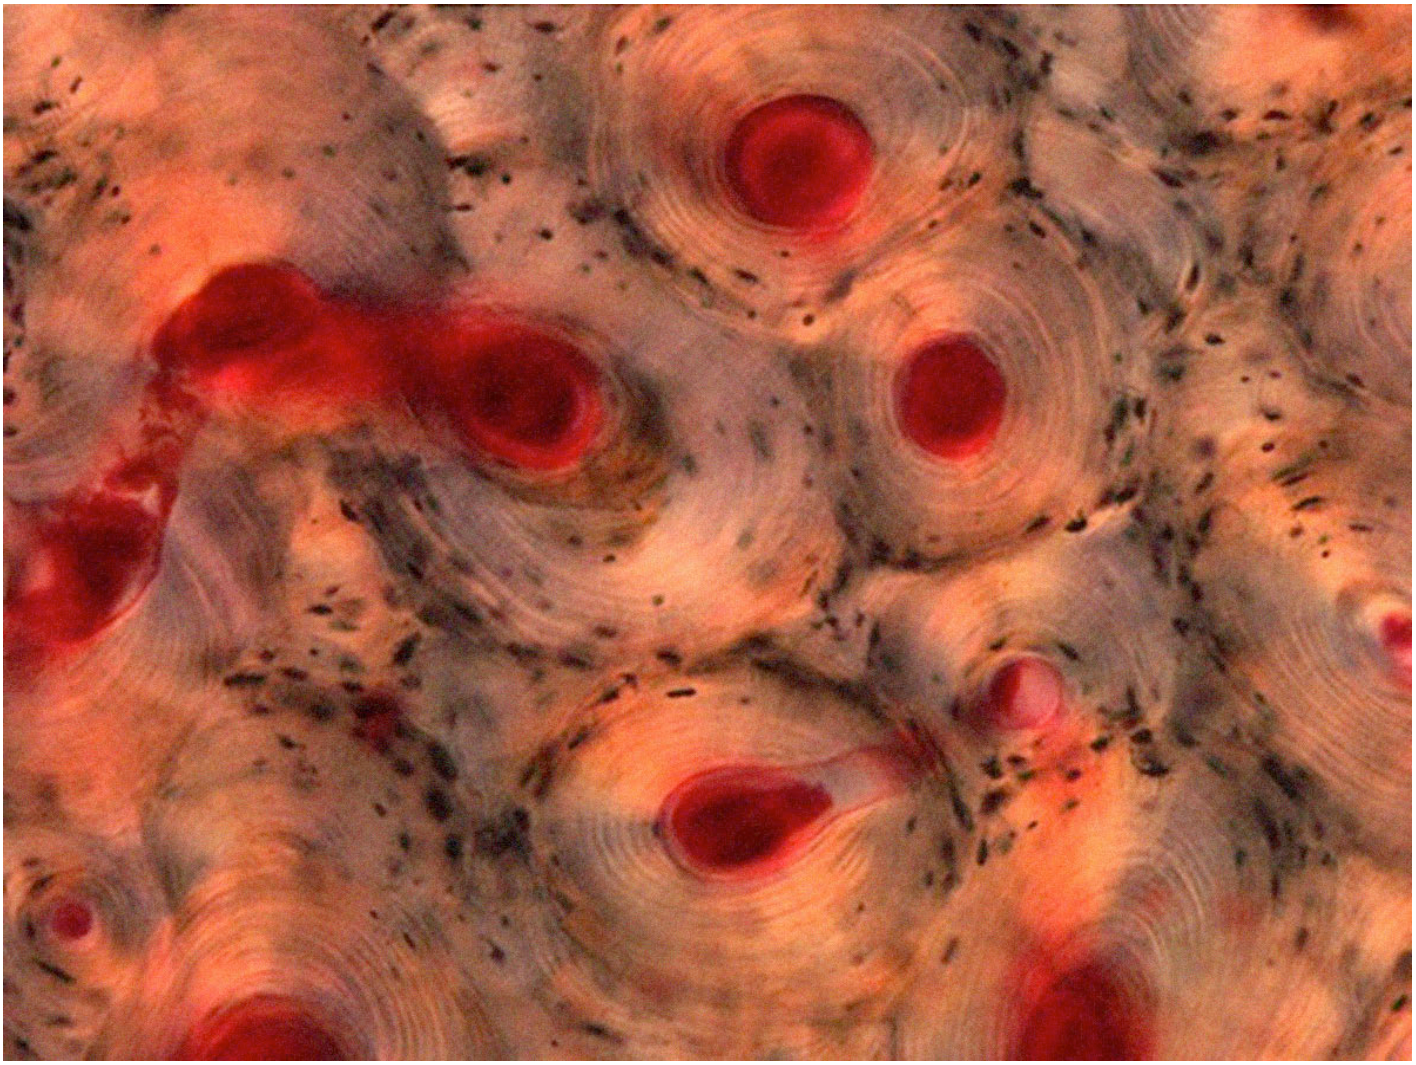
In vitro replication of the biomineral crystallization process of bone formation closely reproduces the fine crystallographic structures observed of biological bone samples, suggesting that non-collagenous proteins dictate the alignment of seed nanocrystals. Images of the morphology of artificial porous hydroxyapatite ceramic samples were obtained by scanning electron microscopy (Rusnah, 2011)[6], presenting foam-like structures left by gas bubble clusters present within the liquid during crystallization (below).

Artificial hydroxyapatite produced in modern laboratory experiments has lead to the application of novel calcium-phosphate bone cements (Combes *et al.*, 2007)[7] and also confirms the extraordinary findings of geopolymer experts regarding the artificial origin of the stones of Egypt's Orion pyramids. The high content of calcite, opal CT and hydroxyapatite crystals constituting the Great Pyramid's artificial limestones (Davidovits, 1984)[8] attests to *an ancient global Vedic biotechnology of psychoacoustic architecture, constructed in high-resonance biomimetic geopolymer stone* (opposite).

The octahedral form of each of the pyramids references the calcite biomineralizations of the human pineal gland, known as the *ajna* or *'third-eye' chakra* in ancient Sanskrit tradition, while the complex composition of the pyramids' cement blocks mimic the resonant characteristics of human bone. The presence of gas bubbles within artificial limestones *–having been poured as liquid cement–* significantly lowers the density of these ancient geopolymer products. Hydroxyapatite crystals within the stones may substitute calcium with various bivalent metal ions, as observed in natural bone (Gutowska *et al.*, 2005).[9]



The resonant properties of the crystalline formations of human bone have been incorporated into every stone of ancient Vedic temples to enhance acoustic energy storing within the buildings. Similarly, sacred Ayurvedic waters contain trace amounts of electroluminescent gold and silver nanoparticles to enhance the resonant capacity of the human body, generating red and blue light by surface plasmon resonance during barefoot exposure to piezoelectric temples, linking bone with stone for bioelectrical healing.

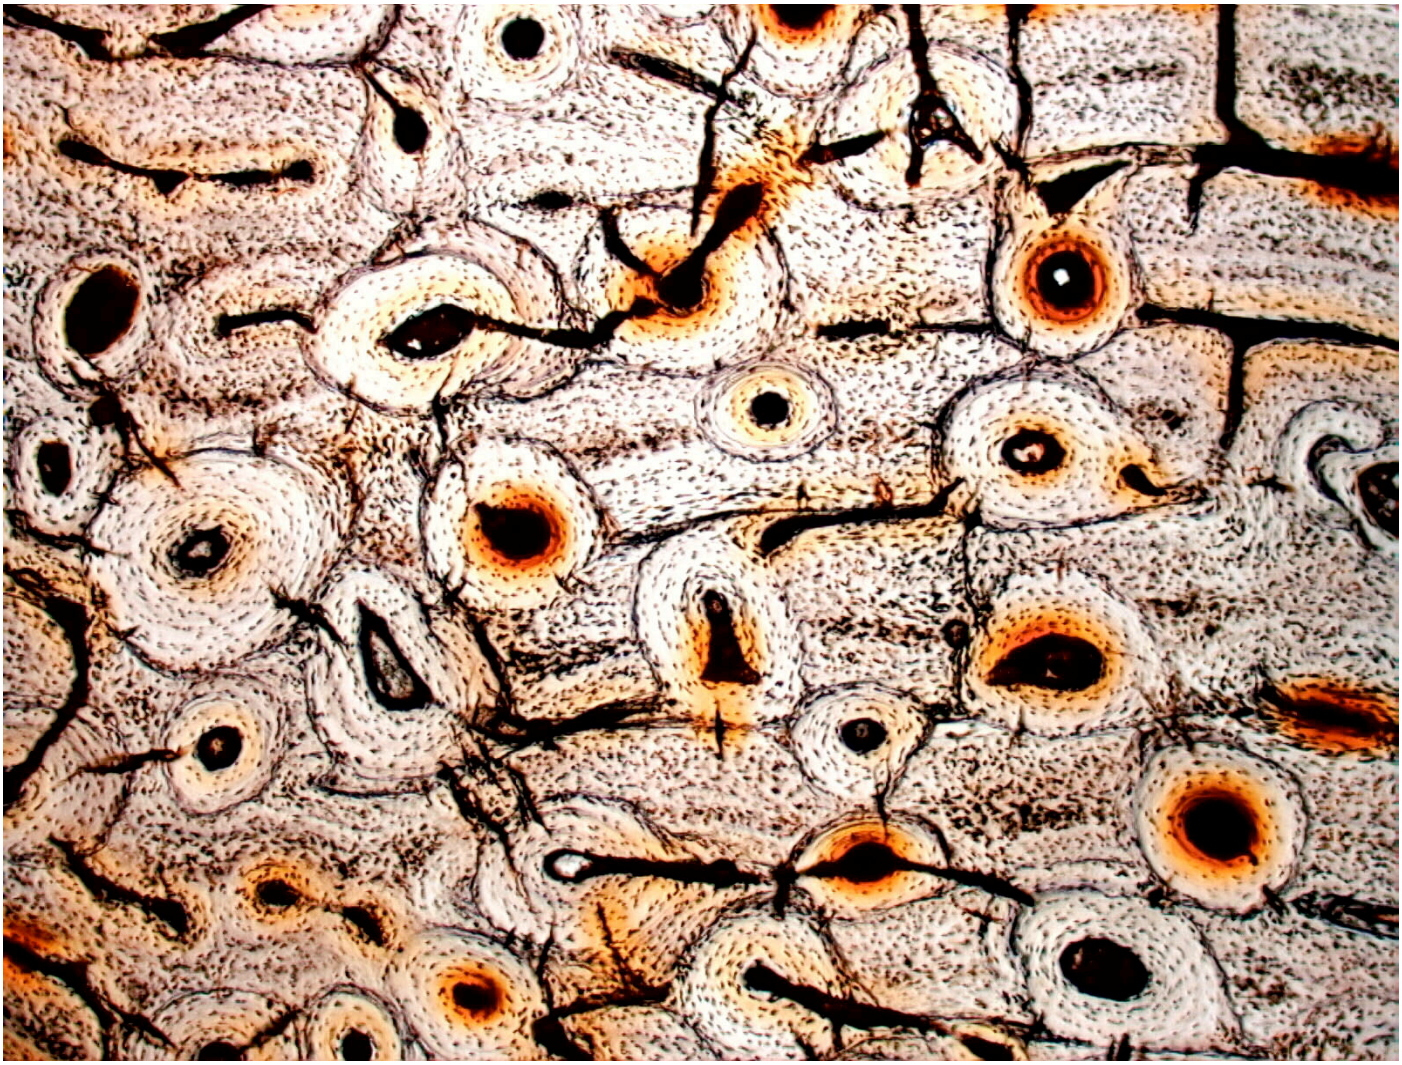


The primary function of blood in the formation of bone has been extensively studied, yet remains an area of vertebrate physiology that is not fully understood. Bone health has been closely linked with diet, as calcium depletion has become a major problem for westerners due to decades of regular consumption of processed milk, *which has been conclusively shown to deplete calcium levels within the body rather than rebalance them as falsely advertised by the dairy industry and government agencies.*[10]

Preliminary research by C.L. Kervran provided the first coherent evidence for this counter-intuitive biological mechanism being the result of low energy nuclear transmutations taking place within the body itself, suggesting that supplementing levels of other crucial elements may achieve rebalancing of bone calcium during depletion. To this end, simple dietary trials were conducted that revealed horsetail tea effectively increases calcium levels in the body by supplying potassium for conversion into calcium.[11]

Magnesium is another essential element implicated in the dietary rebalancing of calcium levels, but the resonant atomic conversion of one element into another could not be replicated in experiment to verify Kervran's strong hypothesis. Recent studies of isotopic variation in bone calcium versus tissue calcium reconfirms that bone biomineralization requires low energy transmutation (Skulan & DePaolo, 1999):

> Calcium from bone and shell is isotopically lighter than calcium of soft tissue from the same organism and isotopically lighter than source (dietary) calcium. When measured as the $^{44}Ca/^{40}Ca$ isotopic ratio, the total range of variation observed is 5.5‰, and as much as 4‰ variation is found in a single organism. The observed intraorganismal calcium isotopic variations and the isotopic differences between tissues and diet indicate that isotopic fractionation occurs mainly as a result of mineralization...
>
> Bone is typically depleted in heavy calcium relative to soft tissue and dietary calcium by about 1.3–1.5‰ in terms of the $^{44}Ca/^{40}Ca$ ratio. This fractionation produces differences in the isotopic composition between soft tissue, bone, and dietary calcium that under many conditions can be detected with current analytical techniques. According to our model, the difference in isotopic composition between soft tissue and dietary calcium should reflect the net bone mineral loss or gain. Soft tissue is generally similar or higher in $\delta^{44}Ca$ relative to dietary calcium when bone formation is dominant and lower in $\delta^{44}Ca$ relative to dietary calcium when bone mineral loss is dominant. It should therefore be possible to use measurements of soft tissue and dietary $\delta^{44}Ca$ as a qualitative indicator of the calcium balance in living organisms.[12]



Digitally-controlled phonon resonance reactors now enable replication of low energy nuclear reactions perpetually taking place during bone formation. Red blood cells supply the starting element used by the body to accomplish low energy transmutation of potassium into calcium that accounts for the significant isotopic variation of mineralized bone calcium from dietary calcium and tissues.

During blood circulation through the fine network of Haversian canals that course through compact bone (above), potassium atoms within eruthrocytes maintain rhythmic temperature fluctuations between 37–38°C that trigger the resonant conversion reaction. Each oxygen-bound atom of potassium isotope (K^{41}) releases a single hydrogen atom during the formation of stable atoms of calcium isotope (Ca^{40}):

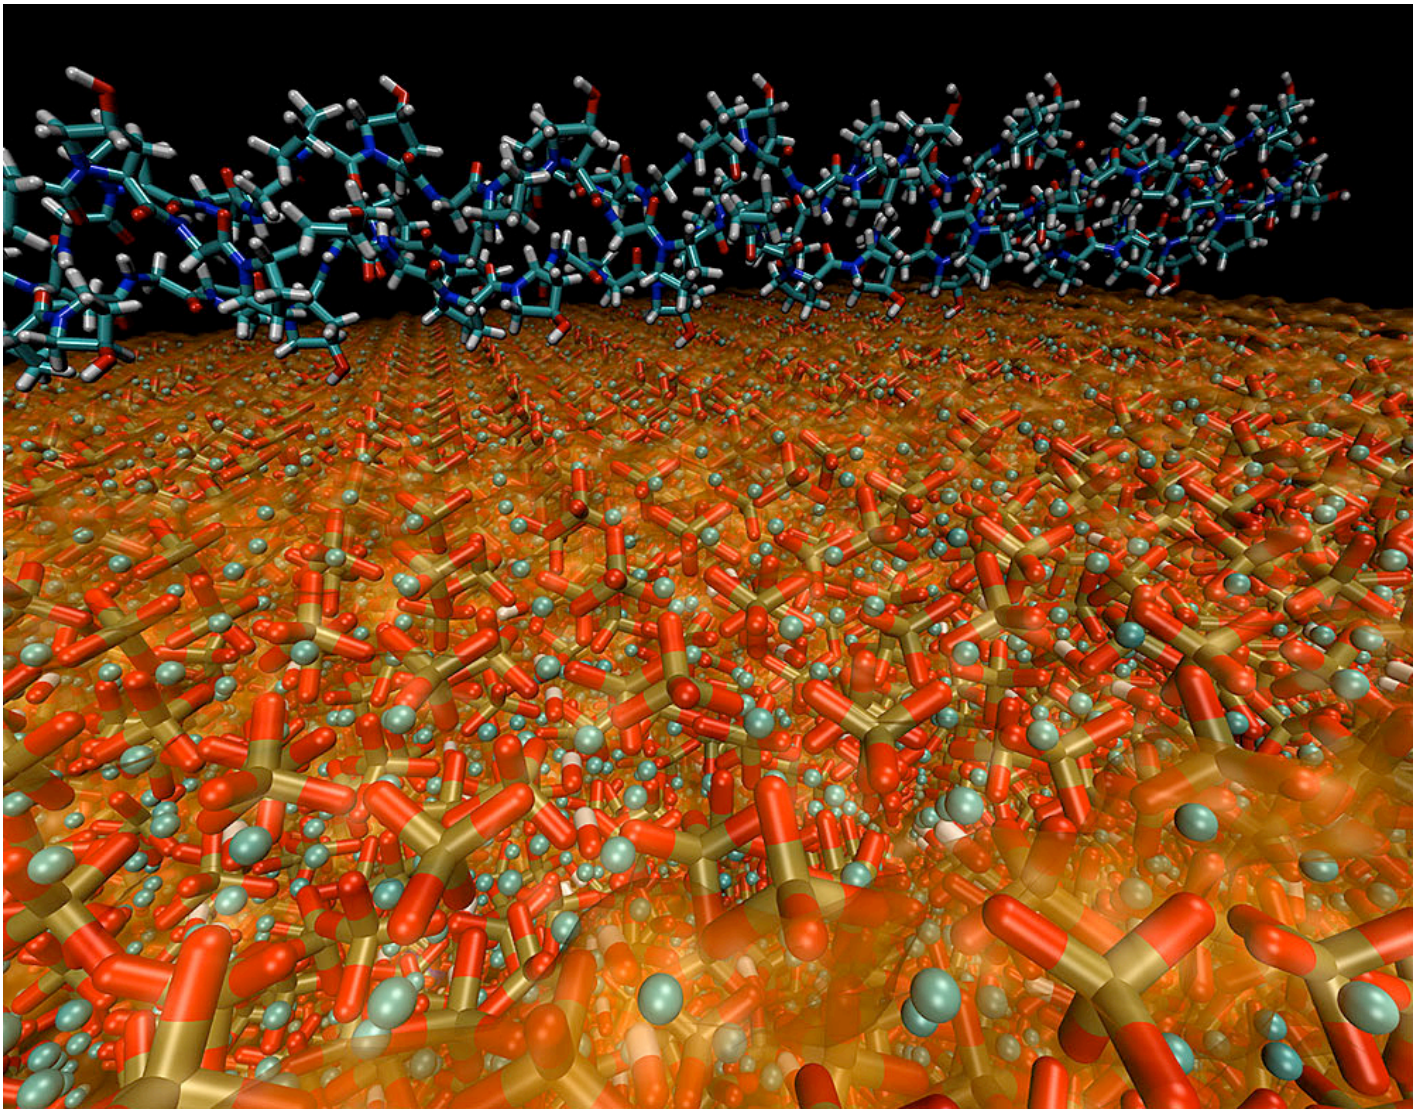
$$K^{41} + O^{16} \Rightarrow H^{1} + Ca^{40} + O^{16}$$

This reaction occurs simultaneously with closely related atomic conversion cascades that also include *Zn* ⇒ *Cu*, *Cu* ⇒ *Ni*, *Ni* ⇒ *Co*, *Fe* ⇒ *Mn*, *Mn* ⇒ *Cr* and *Cr* ⇒ *V*. This extensive series of reactions is facilitated within red blood cells by phonon frequency matching at the median temperature that is closely maintained within the core of the body, where the heart is located. The bones of the body are also well insulated from heat loss by muscle, fat and skin layers, comprising the core of each extremity.

Transmutation of potassium into calcium in vertebrate bone is enabled by phonon frequency matching of potassium-bound oxygen atoms with hydrogen atoms at rest state. The resonant frequency of hydrogen isotope (H^{1}) in its rest state is 3,773,180 Hz, according to the element's atomic diameter at 20°C. Oxygen isotope (O^{16}) resonates at this same frequency when heated to 37.8°C*:*

$$O^{16}\ \text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{0.001429 \times (6.0221 \times 10^{23})}{15.99491}} = 3{,}775{,}138\ \text{Hz}$$

$$H^{1}\ \text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{0.0000899 \times (6.0221 \times 10^{23})}{1.007825037}} = 3{,}773{,}180\ \text{Hz}$$



$$\text{Resonant Temperature (°C)} = \frac{Ln\left(\frac{f(\ 3{,}775{,}138\ )}{f(\ 3{,}773{,}180\ )}\right)}{0.0000291} + 20 = 37.8\ °C$$

Starting Element: Oxygen ($_8O^{16}$)

Natural Abundance: 99.985%
Atomic Mass: 1.007825037
Density (grams/cm^3): 0.0000899
Exp. Coefficient: 0.0000366

These phonon resonance determinations suggest that potassium deficiency, in particular, negatively influences the body's ability to rebalance calcium production levels, leading to gradual bone mineral loss. A balanced diet including potassium-rich foods is therefore recommended, especially white beans, dark leafy greens, baked potatoes and acorn squash, avocados, dried apricots, mushrooms and bananas, as well as herbal beverages such as horsetail tea.

For these previously unrecognized reasons, maintaining balanced, potassium-rich dietary choices effectively protects against osteoporosis by providing the elements used by the body for biomineral deposition of calcium, as specifically required for the growth and maintenance of healthy bones.

The microstructural properties of bone have been characterized in recent studies as a nanocomposite of collagen and hydroxyapatite that far exceeds the performance capabilities of both components (above, with collagen fiber atop a hydroxyapatite crystal). The complete molecular structure of bone was finally decoded by a team of MIT research scientists led by M. Buehler,[13] after tests confirmed their calculations:

> Buehler explains that even a few years ago, the modeling required to deduce the internal structure of bone would have taken years of computer time on the most powerful computers. But newer supercomputers can carry out much more detailed computations in a few months. Still, it took several iterations, after studying the previous results and probing the material's response to increasing pressure, to derive an answer, which the team was then able to confirm through comparisons with laboratory tests.
>
> One key, they found, is that the hydroxyapatite grains are tiny, thin platelets just a few nanometers (billionths of a meter) across, and are deeply embedded in the collagen matrix. The two constituents are bound together by electrostatic interactions, which allows them to slip somewhat against each other without breaking.

This breathrough in the modeling of the molecular structures of naturally formed bone will enable development of more advanced artficial bone composite materials that will merge with natural bone without disturbing its natural piezoelectric capacity that is essential to its resonant function as a tranducer of localized infrasound. Application of supercomputer analyses to biological phonon resonance transmutation processes involved in bone formation will reveal the complete architecture of temperature-induced nuclear reactions that drive the eternal transformative rematerialization of Creation, ceaselessly turning the atomic wheelworks of Nature.

Qi Flashes

Qi Flashes

Ancient healing traditions from various parts of the world have been passed on from master to pupil in hidden temples, kept secret from destructive outer influences for thousands of years. Only a few of these lineages of sacred knowledge have survived to the present day. Adept practitioners of highly complex bioenergetic healing techniques that require a comprehensive knowledge of the qi meridians of the body have been forced into secrecy over the generations of politically motivated persecution.

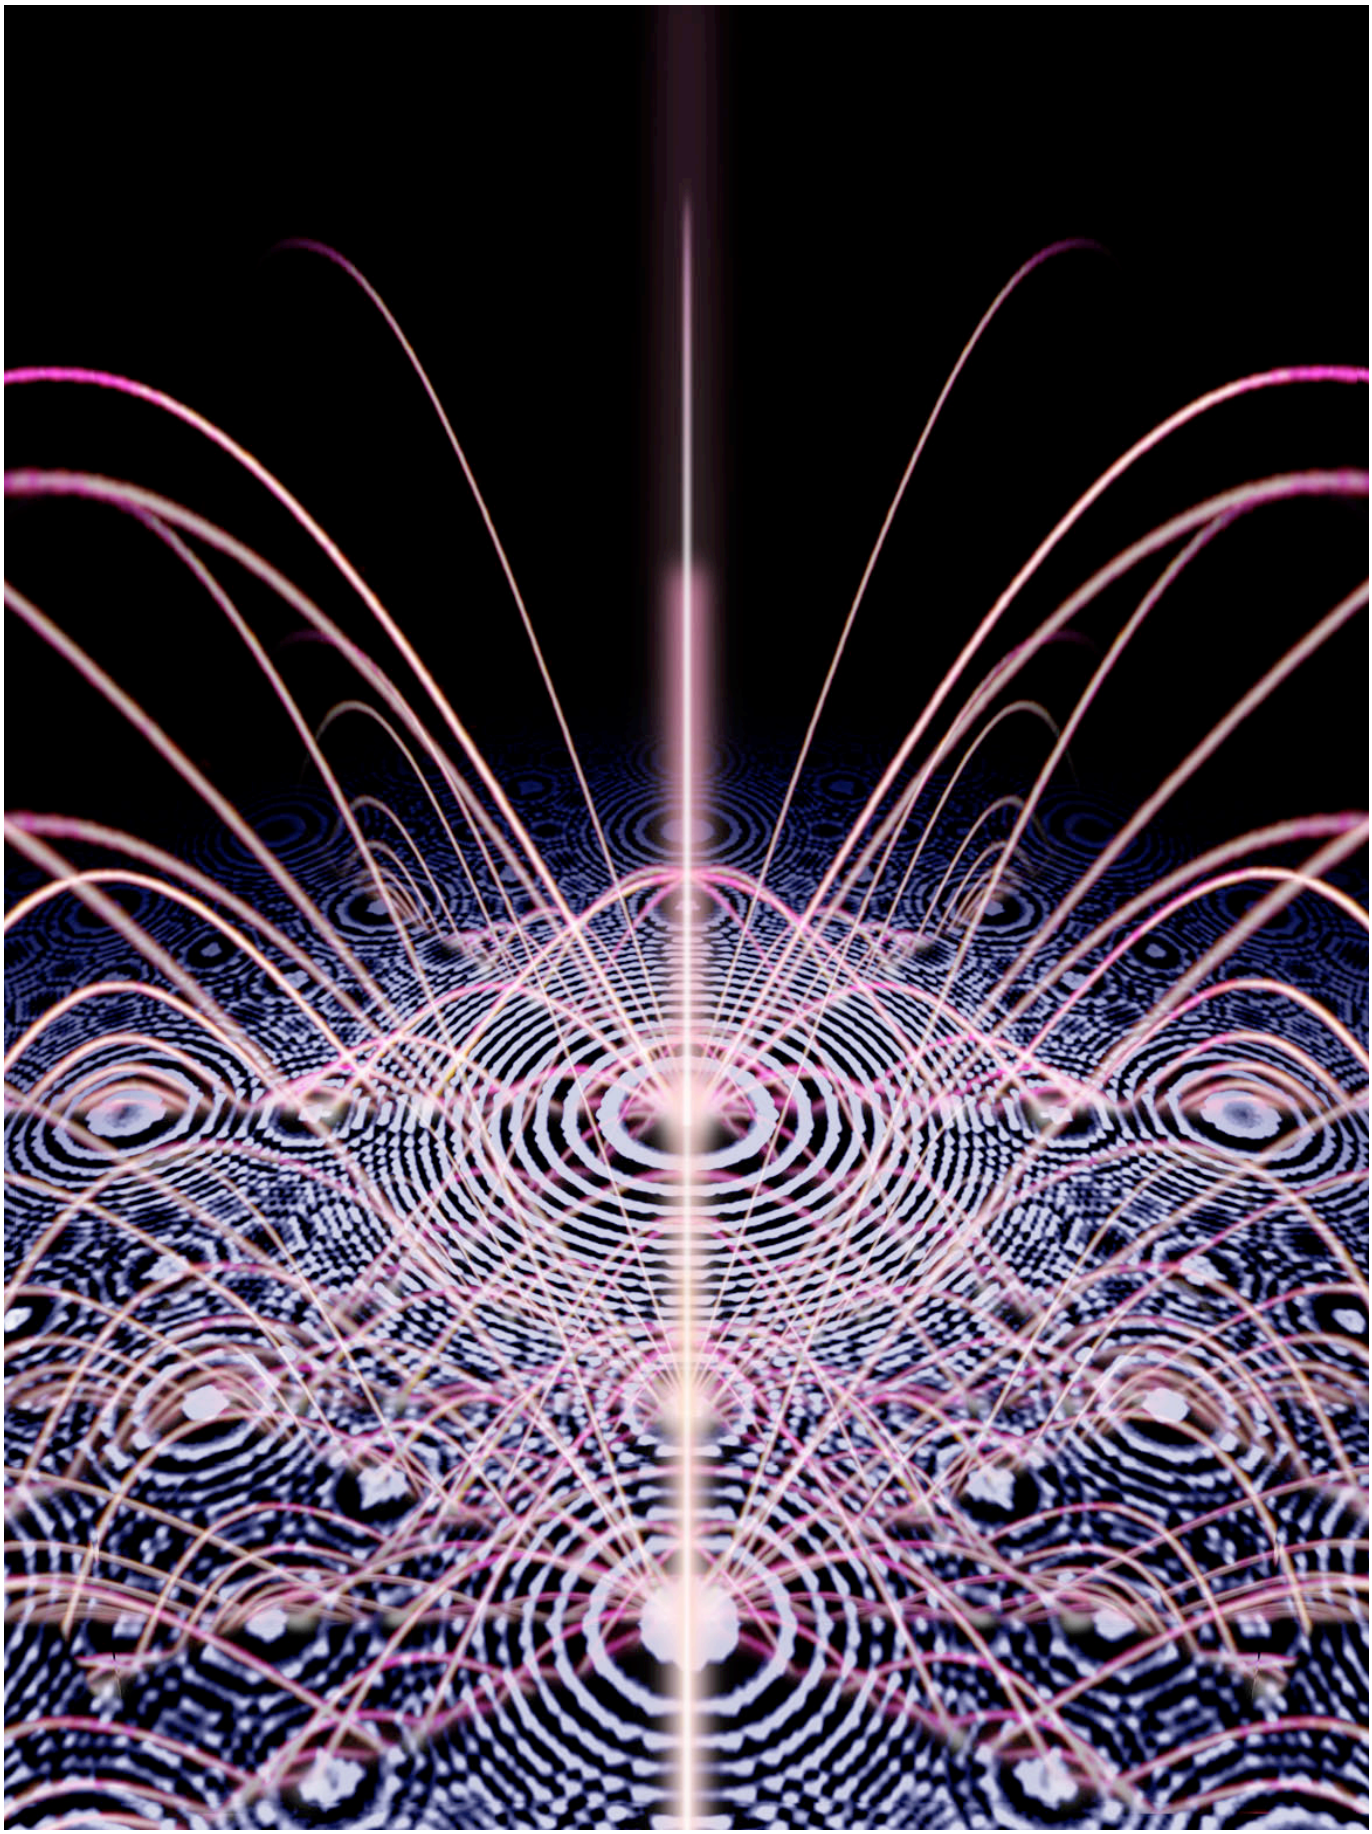
Bonghan Kim's 1963 identification of a fine network of translucent ducts lining all of the body's organs revealed a tertiary circulatory system that links the previously known vascular and lymphatic systems.[1] *Integration of the breakthroughs of biophotonics with the suppressed findings of Bonghan Kim provide the electrophysiological basis for laboratory study of qi meridians and moxibustion therapies.*[2]

The BBC television documentary episode *'Ring of Fire: East of Krakatoa'* (1987) captures rapid HHO plasma flashes around the body of Javanese Mo Pai Master John Chang (opposite).[3] These rapid flashes, lasting 2-5 frames, are identified here for the first time as closely linked with resonant atomic transmutation processes that are perpetually induced in the bloodstream.[4]

After Chang completes the *qi* electro-acupuncture treatment for filmmaker Lorne Blair, he gestures to his *navel* and *perineum* explaining "Yin-Yang, positive-negative... when [I flex, they] meet together... this can [generate] electricity". At the moment that Chang begins to bring his hands together, the flash of an electrical discharge can be seen atop his head, in stark contrast with his black hair (above). Flashes also appear on the Mo Pai healer's hair and arms during focused projection of qi.

Blood circulation is controlled by the heart, and it is the mastery of the pulmonary and vascular systems that enables qi focusing, requiring years of meditation to achieve an essential emotional balance. While he casually smokes on the patio, a bright flash streaks from Chang's heart (above) just as he explains: "God has given us all the Yin-Yang polarity, but it takes discipline and meditation to awaken and control it." Mo Pai techniques enable EM induction of atomic reaction cascades in the blood near 37.8°C:

$$Zn^{66} + O^{16} \Rightarrow H^{1} + Cu^{65} + O^{16}$$
$$Cu^{65} + O^{16} \Rightarrow H^{1} + Zn^{64} + O^{16}$$
$$Zn^{64} + O^{16} \Rightarrow H^{1} + Cu^{63} + O^{16}$$
$$Cu^{63} + O^{16} \Rightarrow H^{1} + Ni^{62} + O^{16}$$
$$Ni^{60} + O^{16} \Rightarrow H^{1} + Co^{59} + O^{16}$$
$$Ni^{58} + O^{16} \Rightarrow H^{1} + Fe^{57} + O^{16}$$
$$Fe^{58} + O^{16} \Rightarrow H^{1} + Fe^{57} + O^{16}$$
$$Fe^{57} + O^{16} \Rightarrow H^{1} + Fe^{56} + O^{16}$$
$$Fe^{56} + O^{16} \Rightarrow H^{1} + Mn^{55} + O^{16}$$
$$Mn^{55} + O^{16} \Rightarrow H^{1} + Cr^{54} + O^{16}$$
$$Fe^{54} + O^{16} \Rightarrow H^{1} + Cr^{53} + O^{16}$$



Of the over 80 distinct plasma flashes recorded in the 1987 Blair documentary, the great majority appear close to the healer's skin or clothing in areas of the body where large arteries convey blood below skin surfaces. The largest plasma discharges are seen near the healer's head and heart, the carotid artery in the neck, and along the exterior arteries of the arms and legs.

Chang's attainments are the culmination of 18 years of intensive training involving prolonged meditation and isometric muscular excercises practiced in underground chambers, following the strict protocols of his Master Lao, a Chinese emigrant to Java. Documentary video clearly captures HHO plasma orbs and streaks flashing in the air during electro-acupuncture healing and pyrokinesis demos (composite, above). Auto-induced EM fields and semi-levitation (90% weight loss) have also been recorded.[5] My own experiences with rapid plasma flashes have been previously discussed in comparison with the accounts of Nikola Tesla regarding luminous sparks and flashes during life-threatening situations:

> [I]mpulse-driven behavior is a kind of automation of human consciousness, while self-motivated scientific investigation results in a 'brilliant idea' or spiritual cognition that becomes energetically expressed as flashes of light around one's body, precisely following the moment of insight. Tesla acknowledged as much in his breakthrough experiences:
>
> > I never had any control over the flashes of light… [that] were, perhaps, my strangest experience and inexplicable. They usually occurred when I found myself in a dangerous or distressing situation or when I was greatly exhilarated. In some instances I have seen all the air around me filled with tongues of living flame. Their intensity, instead of diminishing, increased with time and seemingly attained a maximum when I was about twenty-five years old… these luminous phenomena still manifest themselves from time to time, as when a new idea opening up possibilities strikes me…[6]
>
> Interestingly, despite all of Tesla's close work with electrical standing waves, he did not draw the conclusion that I have arrived at: that these flashes of light are actually airborne plasma discharges moving along the invisible standing waves. This hypothesis is borne out by dozens of luminous flashes that have been captured on video downlink from NASA space missions, later discovered in single frames by video editor Martyn Stubbs.[7]

Longview, Texas 11:50pm, 9/9/9 ~ 6:10am 9/10/9

One particularly interesting frame (below) captures a red/pink plasma discharge streaking across the Earth's thin horizon, amplifying the crescent Earth's reflected light where it is crossed by the discharge. This detail is consistent with the properties of plasma. The multicolor flashes were also observed inside the shuttle and commented on by awestruck astronauts Mark Lee and Steven Smith on live audio/video downlink to mission control, during the 1997 Hubble Repair Mission STS-82:

> Mark: What was that flash?… I saw a light flash past me just here. Did you see it?
>
> Steven: … [Laughs] I just thought it was my imagination.
>
> Mark: Yeah, I saw it too… so it's not. There were two of them. There's another one. What are they?
>
> Steven: I thought I saw the lights flickering in here.
>
> Mark: Who'd be taking pictures? What is this?
>
> Steven: It's just gone past in front of us.

Martyn Stubbs presents dozens of NASA downlink video frames that clearly capture streaking luminous flashes that appear for mere nanoseconds. Most people who see such flashes dismiss them due to the extreme brevity of the experience, but when the flashes occur in series, as recorded on the STS-82 shuttle mission, witnesses are able to reconfirm their observations. The highly charged electrical environment of the space shuttle while in orbit of Earth presents a perfect opportunity to witness and capture the phenomena, while on Earth it occurs more rarely.[8]

The qi electromagnetic healing and pyrokinesis demonstrations of Master John Chang represent the first definitive video documentation of ancient advanced Vedic techniques associated with the root of acupuncture and acupressure therapies. Drinking of sacred waters[9] in conjunction with daily meditation practices in piezoelectric stone temples according to ancient wisdom endows the human body with the crystalline properties of an efficient electrical capacitor that can be discharged during qi projection.

As witnessed in Longview, Texas on 9/9/9 (overleaf),[10] intensifying ground-level HHO plasma discharges are presently activating the monumental stone temples of our ancestors, calling our hearts into sacred alignment. Within stone temple chambers, electro-stimulation of the qi meridians of the body[11] ignites the nuclear fire of resonant atomic transmutation cascades that vitalize all living beings.

Subtle physiological processes that revitalize the human body are greatly magnified by the conscious activity of a Buddha. The awakened mind of Buddhahood has fully recognized that the human body can generate all the elements required for life and vitality *within itself*, thus requiring no food or water.

The great simplicity of this elightened understanding has confounded western scientists for many decades, *for it has been repeatedly demonstrated by adepts of meditation from eastern traditions.* A new model of the phonon resonance dynamics of atomic transmutation now offers a concise explanation for how *a Buddha is able to generate hydrogen atoms in bulk, forming water molecules within the body itself.*

As fully demonstrated under scientific scrutiny by a young Nepalese adept now named Maha Sambodhi Dharma Sangha (below; born Ram Bomjan), *a Buddha lives barefoot, meditating below giant trees and below ground in sheltered caves.* Giant stone temples were constructed by ancient cultures in all parts of the world for this practical purpose: to enhance the natural reionization processes of the human body.

Bioelectrical stimulation of phonon resonance transmutations within the human body is achieved through direct skin contact with giant trees and ground currents. Sap coursing through the arteries of trees acts in similar fashion to acids in a battery, while the fractal architecture of tree branches act as efficient antennae for accummulating electrical charge from standing waves in the air above.

The Sleeping Prophet Edgar Cayce (1877-1945) identified these exact concepts as the source of all vitality that can be significantly enhanced by drinking high-purity colloidal gold and silver waters for increasing cellular conductivity, referred to by all ancient Vedic scholars as the elixir of life –*'Soma'*:

> Concerning life forces themselves; that certain elements are a part of the physical manifestation of the spiritual and mental forces, from a chemical reaction – [involving] silver and gold. (Reading 2873-1)

Spoken through Cayce, the Akashic Source made specific reference to a physiological effect involving the activity of nuclear fusion and the atomic transmutation of metals that becomes enhanced under direct electrical current, having been employed by the builders of the pyramids during the Atlantean era:

> [T]he direct current passing through the activity of the fusing of metals and the transmutation that forms from same... itself becomes the source of an alternating current to which there is added then a stepped-up activity… [sustaining] this fusing of the metals or ores.

> All of these activities then became a part of the use of electrical forces for metals and their activity … as magnetic forces for the applications to portions of the body for transmuting or… re-generating the bodily forces themselves. For as the very forces of the bodily functionings are electrical in their activity, the very action of assimilation and distribution of assimilated forces is in the physical body an active force of the very low [frequency] yet very high [energy] vibratory forces themselves… (Reading 470-22)

This lengthy explanation given by Cayce relates ancient Sanskrit wisdom regarding the use of precious metals for enhancing bioelectrification and electroluminescence of the human body. Ancient Ayurvedic knowledge of essential oils, such as neem, clove and ginger, prescribed their application as reducing agents to efficiently synthesize nanoparticles of precious metals for consumption in the 'Bread of Life' and 'Water of Life'. Sacred electrum waters were elevated by Sanskrit tradition as Soma, the 'Elixir of Life', containing electroluminescent gold and silver nanoparticles. Recent identification of the Ayurvedic Soma press recovered by maintenance workers at an ancient cemetery in Jerusalem, Israel (below), provides direct evidence that resonant atomic transmutation processes were known to Vedic adepts.[12]

Ayurvedic Soma press
Jerusalem, Israel

Resonant transmutation reactions that occur by this newly rediscovered atomic frequency-based process release hydrogen atoms. Enhanced bioelectrification conditions increase the rate at which such reactions occur, effectively shifting the conversion rate of elements in the body into the vital range that sustains human bodies without the need for nourishment from external sources of water or nutrition.

Solitary hydrogen atoms released by phonon resonance transmutations throughout the body quickly bind with other hydrogen atoms to form H_2, and oxygen atoms to form H_2O. Deep breathing techniques practiced by a Buddha also enhance the resonant atomic reaction rates by increasing oxygen content in the blood, thereby simulating what must naturally occur on high-resonance planets with higher atmospheric oxygen content than that of our own Earth (presently measured at 20.95%).

Water formed in this sacred manner –*through bioelectrification of the body for enhancing H-releasing resonant nuclear reaction rates*– always releases the lightest isotope of hydrogen: protium (heavy isotopes such as deuterium are not produced). For this reason, trace deuterium content of the body of the meditating Buddha gradually lowers with his continued abstinence from food and drink, as a greater percentage of body water is formed by protium released from resonant reactions than is taken in through skin absorption. *This hypothesis can be verified by testing trace deuterium levels in adepts of meditation such as the present-day living Buddha, Maha Sambodhi Dharma Sangha* (sweating, overleaf).

A rapid atomic transmutation cascade series accomplished in experimental *in vitro* work at Japanese universities (Torii *et al.*, 1963; Ohsawa *et al.*, 1964) replicated natural processes perpetually occurring in the blood circulation and skin excretion cycles generated by human activity that generate other vital elements such as neon, argon and potassium. The following sequence of transmutations form rapid atomic chain reactions elapsing in mere milliseconds, being entirely unobservable to scientists monitoring progress of the reaction sequence through spectrography:

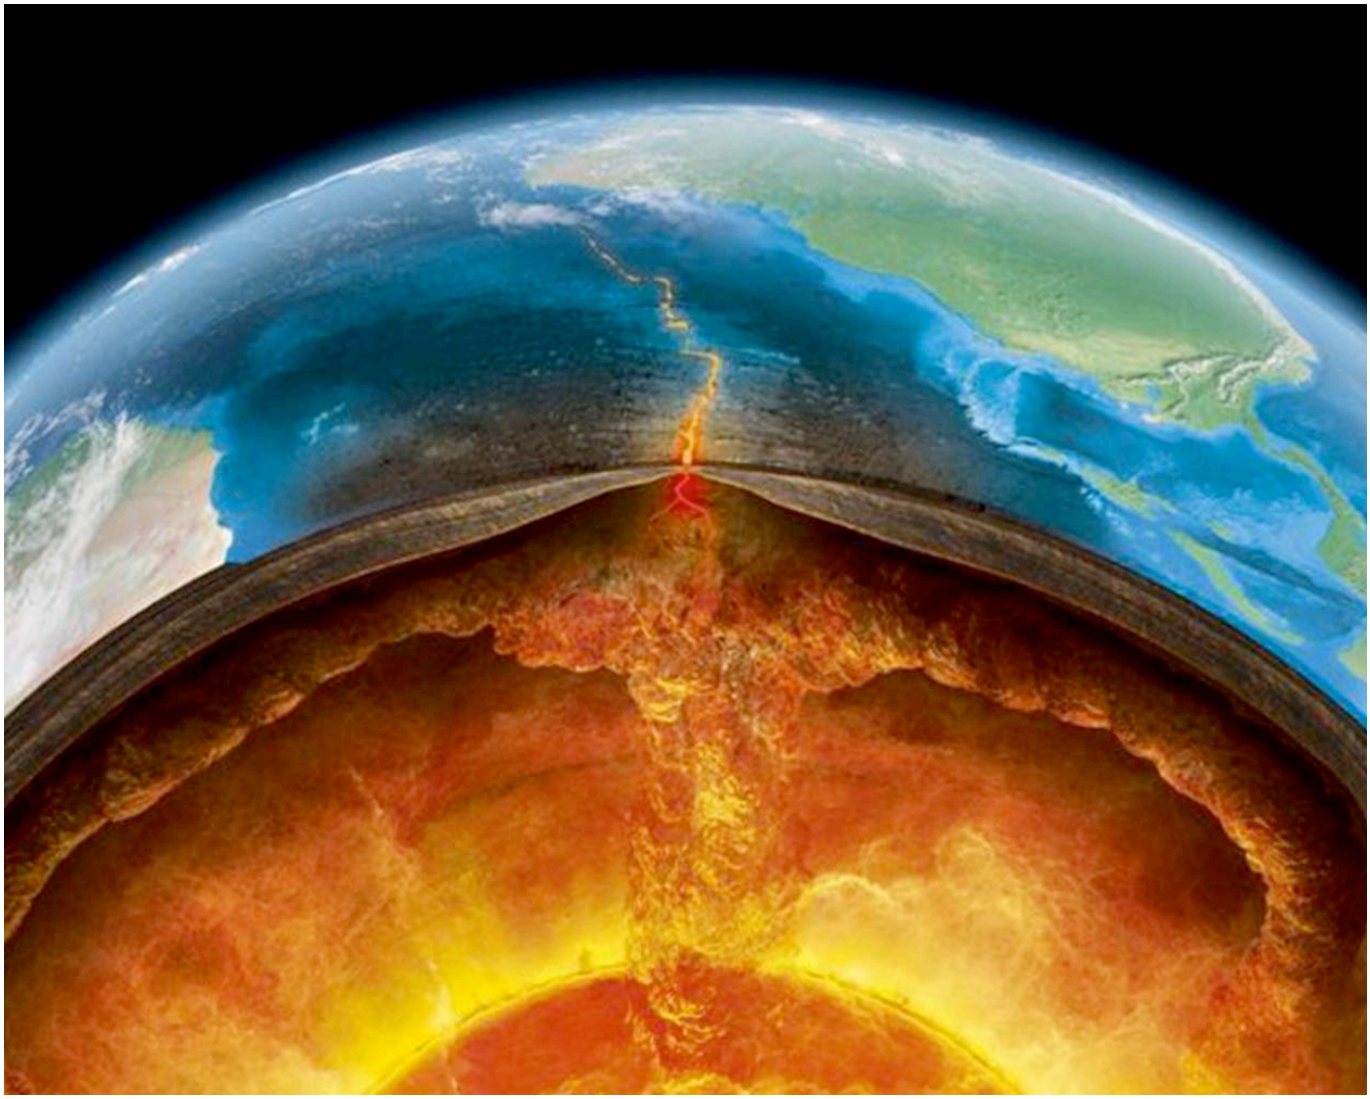
$$Na^{23} + O^{16} \Rightarrow H^{1} + Ne^{22} + O^{16}$$
$$Ne^{22} + O^{16} \Rightarrow H^{1} + Ne^{21} + O^{16}$$
$$Ne^{21} + O^{16} \Rightarrow H^{1} + Ne^{20} + O^{16}$$
$$Ne^{22} + Ne^{20} \Rightarrow 2\,H^{1} + Ar^{40}$$
$$Ne^{21} + Ne^{20} \Rightarrow H^{1} + Ar^{40}$$
$$2\,Ne^{20} \Rightarrow Ar^{40}$$
$$Ar^{40} + O^{16} \Rightarrow H^{1} + K^{39} + O^{16}$$

This sequence of resonant atomic transmutations is enabled by the parallel phonon resonance matching dynamics of oxygen isotope (O^{16}) at 37.8°C with hydrogen isotope (H^{1}) at rest (20°C) observed between neon isotope (Ne^{20}) at 37.7°C with argon isotope (Ar^{40}) at rest. *These special resonant relationships shown between gas element pairs of vastly differing atomic weights appear woven into the atomic fabric of the Universe for vitalizing life by a great perpetuation of invisible, secretive nuclear events.*

Bioelectrically stimulated nuclear reactions taking place within the resonant body of the Buddha in deep meditation generate every compound required for survival through a great abundance of transmutation cascades. Salt or sodium chloride (NaCl), comprised of elements sodium (Na) and chlorine (Cl), is a good example of a compound that is crucial for human metabolism and is perpetually being produced in the body of a Buddha practicing severe meditation techniques.

Sodium (Na^{23}) is produced when blood flows through capillaries in the surface layers of the skin, as bound magnesium and oxygen atoms cool below 37.8°C. The subtle temperature drop that results from the cooling action of sweat evaporating from skin surfaces induces the resonant nuclear fission of magnesium atoms into sodium and hydrogen atoms as follows:

$$Mg^{24} + O^{16} \Rightarrow H^{1} + Na^{23} + O^{16}$$



Chlorine atoms are also produced from available sulfur and argon atoms previously produced by the same resonant atomic transmutation mechanism, according to the following conversion formulae:

$$S^{36} + O^{16} \Rightarrow H^{1} + Cl^{35} + O^{16}$$
$$Ar^{38} + O^{16} \Rightarrow H^{1} + Cl^{37} + O^{16}$$

These subtle resonant transmutation reactions taking place in the human body, only recently recognized and verified in repeatable laboratory experiments, confirm that both the water and the salt content of the excretions of human skin are comprised of by-products of natural nuclear conversions.

Nepalese Maha Sambodhi Dharma Sangha and Javanese Mo Pai Master John Chang represent *shining exemplars* of ancient Atlantean meditation and qi healing modalities, whose sacred practices moisturize and illuminate their bodies from within, generating bright HHO plasma flashes in the air around the humble figures of those Enlightened Masters.

Like the Buddha in deep meditation under the Bodhi Tree, the Earth itself is also perpetually transmuting elements deep within the mantle that release a great abundance of hydrogen atoms. Along with many other gases formed as byproducts of resonant transmutation events, hydrogen gas (H_2) drives massive upwellings of the mantle as magma is cooled, and rises away from the crystalline iron core of the planet.

Target isotopes produced by all resonant transmutation reactions first appear at rest state (20°C), which causes a slight cooling of the masses of magma as billions upon billions of atomic conversions begin to take place in waves of rapid chain reactions. By this surprising and previously unknown phonon resonance reaction mechanism, convection of the mantle is fundamentally propelled by gas byproducts of resonant atomic reaction chains that occur only during the cooling phase of upwelling.

This newly described resonant atomic transmutation process driving the immense convection belts of Earth's mantle provides a comprehensive explanation for the astonishing abundance of water recently discovered permeating through the deep lithosphere. *Without explaining how hydrogen forms in the mantle*, researchers announced: 'Planet Earth makes its own water from scratch deep in the mantle'.[13]

Recently, researchers investigating extreme conditions present in the lithosphere documented the formation of SiH_4 and H_2O by dissolution of quartz in H_2 fluid under high pressure and high temperature (Shinozaki *et al.,* 2014).[14] While available oxygen atoms trapped within quartz lattice structures bond with H_2 at high pressures and high temperatures to form the abundance of deep lithospheric waters (Futera *et al.,* 2016)[15], the fundamental process of resonant atomic transmutation that release hydrogen byproducts within rising convection currents of Earth's mantle has not been considered.

The phonon frequency dynamics of these newly discovered Universal atomic laws provide profound insight into the resonant nuclear conversions taking place throughout the astounding diversity of geological, biological and atmospheric processes that drive the formation and growth of planet Earth.

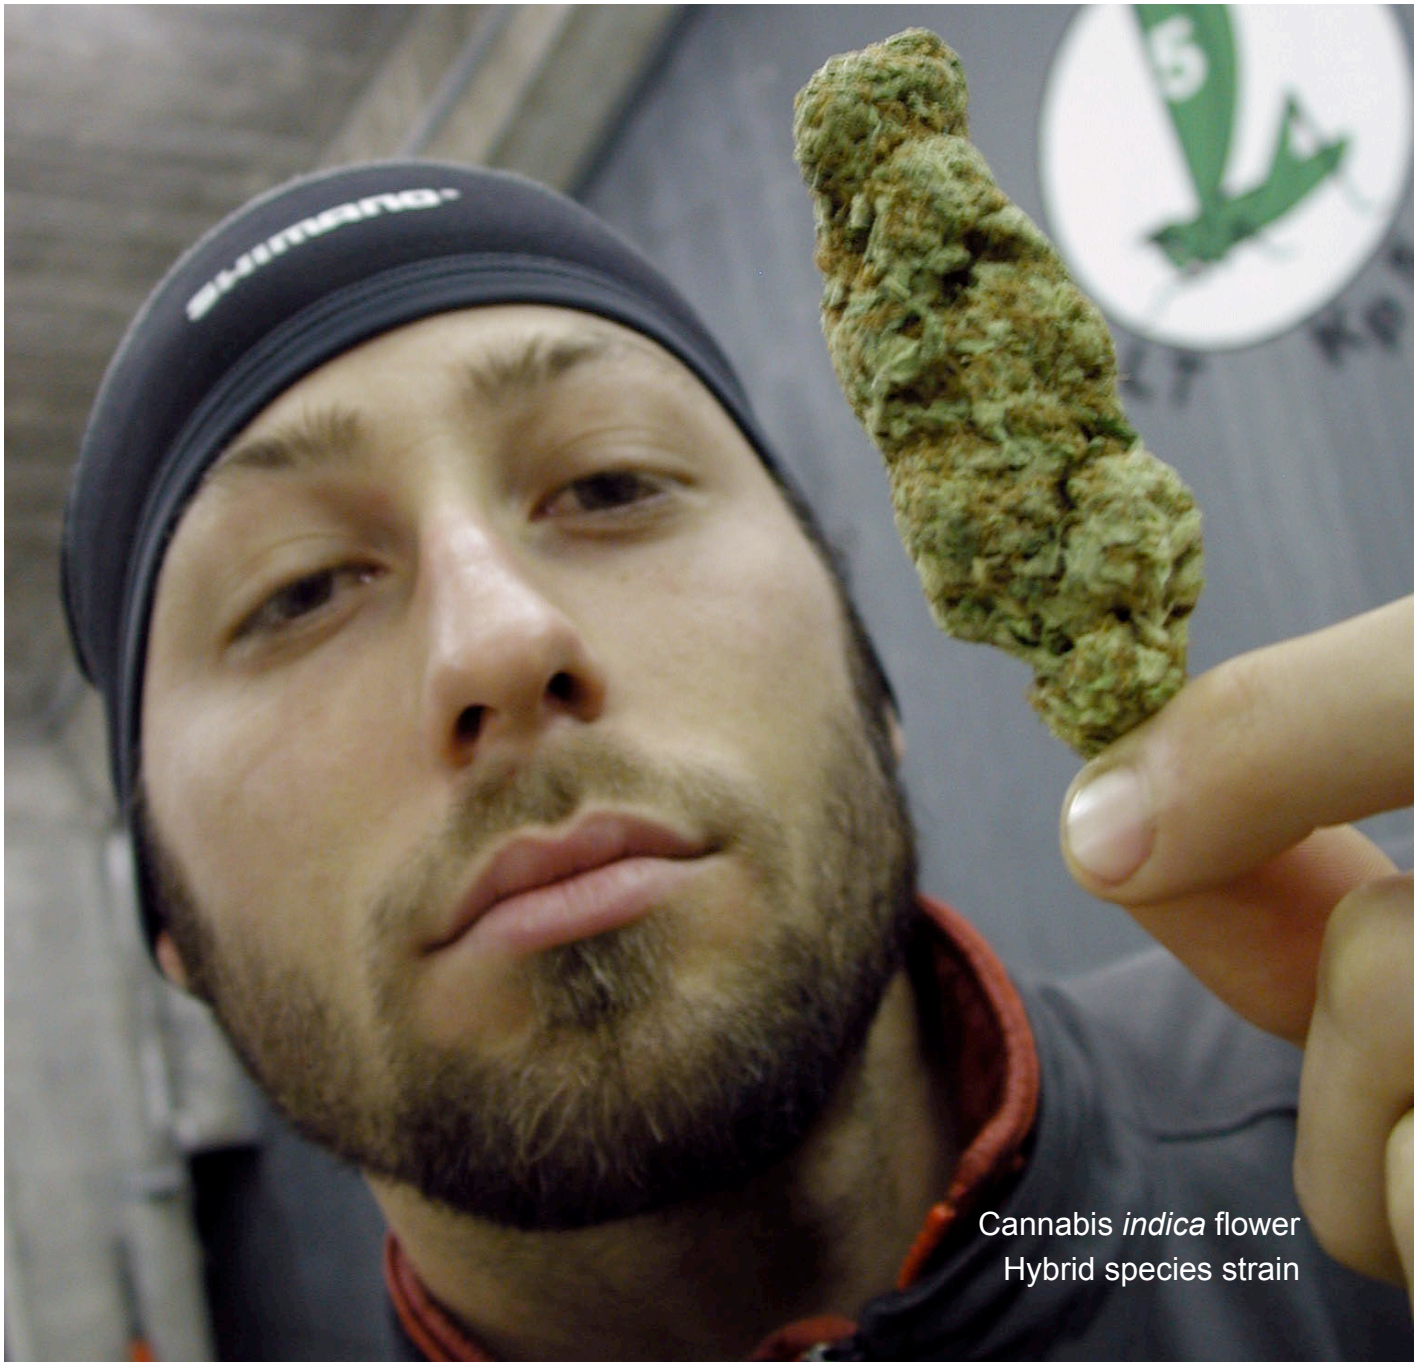
Cannabis Smoke
&
Psychoacoustics

Cannabis Smoke & Psychoacoustics

Cannabis is a sacred plant that has been widely used among indigenous wisdom traditions in communities throughout the world for at least tens of thousands of years. The name 'cannabis' is of Greek origin, while the Sankrit name is *'ganjika'* –revealing the origin of the modern name 'ganja'. Ancient mummies have been excavated with cannabis remains in Altai, Siberia; Xi'an and Turpan, China; Luxor, Egypt; Berel, Kazakhstan; Gurbanesti, Romania; and at the Kunar River, Pakistan.



Sadhu smoking ganjika
River Ganga, India

However, modern medical research concerning the many health benefits and physiological effects of smoking cannabis (marijuana, hashish, or cannabinoids) has been widely suppressed despite its widespread medical recognition and rapidly growing use in developing countries.

The anti-depressant and anti-anxiety effects of cannabis smoking, in addition to oral consumption of 'ganga foods' containing cannabis extracts, are common knowledge. However, the most significant physiological effects of cannabis smoke inhalation remain almost entirely unknown, even among regular users of this ancient sacred herbal remedy.

Laboratory investigations undertaken in the last two decades have revealed that cannabis smoking effectively remediates pain, nausea, vomiting, epilepsy, ischemic stroke, cerebral trauma, multiple sclerosis, cancer tumors and other disorders in humans and animals.

Tetrahydrocannabinol (THC) and cannabidiol (CBD) are most prevalent among at least 113 active cannabinoids identified in cannabis that activate two types of cannabinoid receptors, designated CB1 and CB2. These cannabinoid receptors are distributed mainly in the brain and nervous system of all mammals, including humans, as well as various other vertebrate and invertebrate species:

Cannabis *indica* flower
Hybrid species strain

> Several decades of irrational prejudice may have hampered clinical research on cannabis as a medicine, but work on the pharmacology of its active ingredients has been making steady progress. Just as the body has a natural counterpart to the opiate drugs, so too it makes its own endogenous cannabinoids. These act through receptors, of which two variants—CB1 and CB2—have been definitely identified and at least one other is suspected. The CB1 receptors are located only in the brain; their CB2 counterparts are found peripherally, and especially on the cells of the immune system. Cannabinoid receptors are present not just in vertebrates but also in mollusks, leeches, and other invertebrate groups that have been evolutionarily separate for 500 million years. The fact that natural selection has for so long conserved these receptors is an indication of their physiological importance.[1]

The incontravertible conclusion that has been drawn from the abundant presence of cannabinoid receptors in such a wide variety of species is that natural generation of endogenous cannabinoids (endocannabinoids) occurs within the bodies of all such species –*proliferating in diverse habitats where contact with cannabis plants has never occurred*– when specific natural conditions are present. So, exactly what environmental conditions could possibly induce endocannabinoid production in squid, octopi, or even mollusks?

The answer to this question has evaded modern researchers for several decades, and is revealed here for the first time. Hemispheric synchronization of the brain and nervous system is induced in all of these species and habitats when two slightly offset frequencies of sound together induce an effect called binaural beating, whereby a third interference frequency becomes distinctly audible. This effect of tri-frequency resonance can potentially occur in any biome; in the air, on land, below ground or in aquatic habitats.

It is precisely this environmentally-induced effect of psychoacoustic resonance that triggers the natural production of endocannabinoids, which engage cannabinoid receptors in the brain and nervous system, causing the growth of new neurons in the hippocampus, or *hippocampal neurogenesis*. Clinical studies of this neurogenesis process show its effectiveness in both embryonic and adult cannabis users, *yet have not been conducted using psychoacoustic induction*. Ancient psychoacoustic whistles of the Ohum civilization discovered at the pyramids of La Maná, Ecuador[2] induce this effect in users, as demonstrated by Suzanne Benoit and this author in 2013 (above).[3]

As witnessed in the video, playing these psychoacoustic whistles for even a short period of time generates binaural beating effects that induce hemispheric synchronization of the brain, as well as stimulating vagus nerve activity that upregulates potassium channels (Shen *et al.*, 2013)[4] and promotes restoration of conciousness of patients in vegetative states (Corazzol *et al.*, 2017).[5] As most apparent at the end of the video, intense vibratory effects felt in the face and chakras of the body accompany the release of endocannabinoids within the brain of the whistle-player, resulting in hippocampal neurogenesis. *Laughter and joyous sensations that arise in the players of these instruments are very similar to euphoric 'highs' enjoyed by cannabis smokers.*

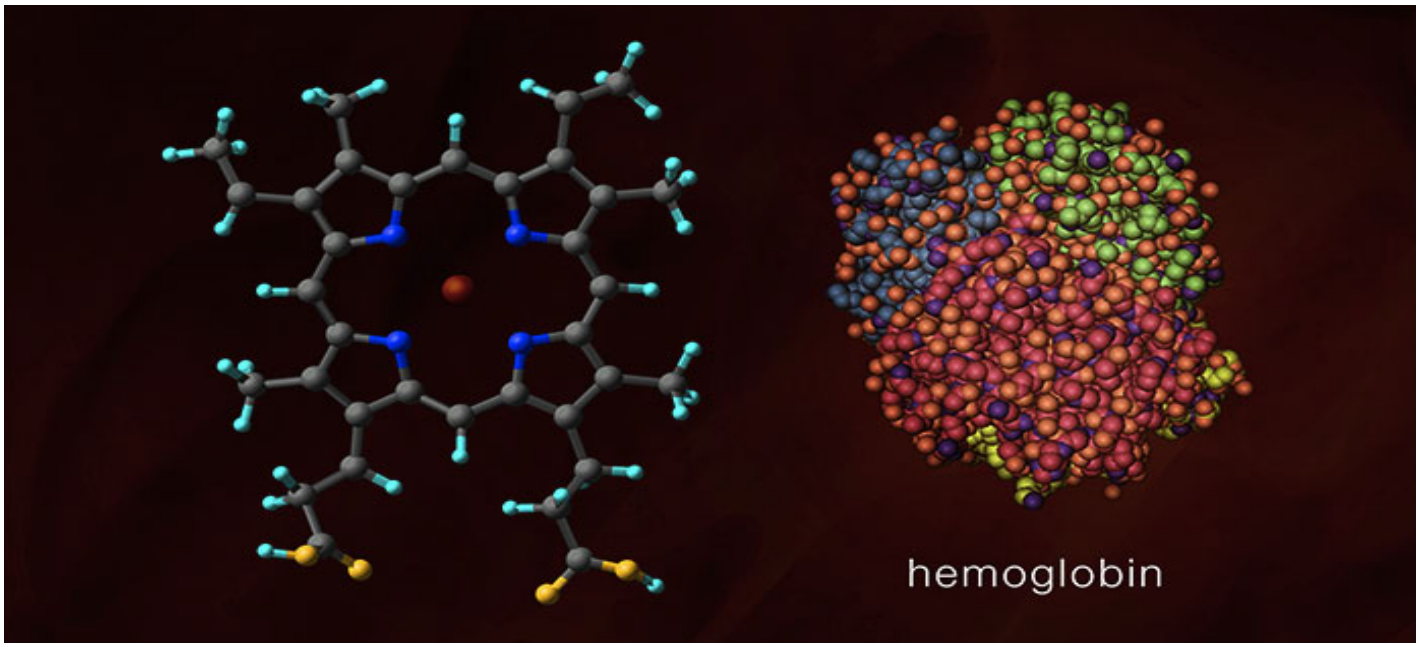
Consumption of cannabis extracts is the only method for induction of hippocampal neurogenesis that has been studied in clinical trials, although the role of hemispheric synchronization has not been identified by researchers as the crucial effect that in turn causes neurogenesis. In 2005, laboratory investigators of neuronal growth phenomena reported 'Cannabinoids Promote Embryonic and Adult Hippocampal Neurogenesis and Produce Anxiolytic- and Antidepressant-Like Effects' (Jiang *et al.*, 2005)[6], following an earlier study on CB1 (Jin *et al.*, 2004),[7] while the great majority of psychoactive substances yet studied actually suppress the neurogenesis process, many of which actually destroy neurons in the brain (ie. alcohol, heroin, cocaine, ketamine, methamphetamine, etc…).

Notable exceptions to this fact include natural hallucinogens such as psilocybin ('magic mushrooms'), peyote and ayahuasca, which enhance neuroplasticity and effectively promote neurogenesis at moderate dosages.

Interestingly, low to moderate cannabis dose administration also produces the greatest beneficial effects, whereas administration of high doses cause a long-lasting inhibition of acetylcholine release in the brain, as detailed in 'Biphasic Effects of Cannabinoids on Acetyl-choline Release in the Hippocampus: Site and Mechanism of Action' (Tzvara *et al.*, 2003):

> Cannabinoids have been shown to critically modulate cholinergic neurotransmission in the hippocampus,... [producing] a biphasic, dose-dependent, effect on hippocampal acetylcholine: a low (0.5 mg) and a high (5 mg) dose... induces a transient stimulation and a prolonged inhibition of hippocampal acetylcholine efflux, respectively.[8]

Another beneficial effect of cannabis use involves its inhibition of monaminergic neuro-transmission (Tzvara *et al.*, 2003).[9] Monoamine oxidases are enzymes in the body responsible for degrading biogenic amine neurotransmitters such as noradrenaline (norepinephrine), serotonin and dopamine. As a monoamine oxidase inhibitor, cannabis acts as a natural antidepressant.



Cannabis smoking upregulation of the prime anti-oxidant glutathione in the lungs and liver has also been reported, greatly enhancing cellular protection throughout the body by maintaining other key anti-oxidants in their reduced (active) form to maximize antioxidant activity. Increased concentrations of glutathione in the lungs offer greater protection against foreign material and pathogenic agents within the respiratory system.

In addition, cannabis smoking influences upregulation of catalayze and superoxide dismutase in the blood and saliva to about twice the normal levels, significantly enhancing the cleansing activity of the body's immune and detoxification pathways. These primary antioxidants offer crucial protection against oxidative/peroxidative cellular damage and are closely tied to longevity.

The potent anti-cancer effects of cannabinoids were reported in 2016, through their ability to actively prevent cancer cells from multiplying. According to US Patent Application 20160015683: "cannabinoids, including THC and Cannabidiol, promote the re-emergence of apoptosis so that tumors will stop dividing and die" (McCarty, 2016).[10] Rather than causing lung cancer, as erroneously promulgated by worldwide governmental anti-smoking propaganda, *cannabis smoking effectively prevents the growth of cancer cells throughout the entire body. In fact, skin application of cannabis oil is less effective than smoking for delivering cannabinoids to prevent growth of cancerous lesions.*

Most recently, the potent neuroprotective activity of phytocannabinoids such as tetrahydrocannabinolic acid (THCA) has been reported (Nadal *et al.*, 2017).[11] Six distinct phytocannabinoids are now known to bind with, and thereby activate, peroxisome proliferator-activated receptor-γ (PPARγ), increasing mitochondrial mass in neuroblastoma cells, and preventing cytotoxicity. This process also improves motor deficits, prevents striatal degeneration, attenuating microgliosis, astrogliosis and inflammation.

Cannabis smoke inhalation introduces low levels of carbon monoxide (CO) into the lungs, which is then absorbed by lung tissues and becomes transported into the bloodstream forming carboxy-hemoglobin (COhb). Molecular bonding of CO with heme (below, left) is 200 times the bond strength of oxygen (O_2) with heme,[12] thereby more efficiently conferring the phonon resonance vibrations of oxygen to hemoglobin molecules. By this molecular bonding mechanism, phonon resonance transmutations perpetually occurring in healthy blood circulating throughout the body are greatly enhanced, as triggered by atomic contraction during successive cooling phases.

Tighter binding of CO with sodium (Na) atoms present in blood likewise enhances reaction rates of the sodium to potassium (Na Þ K) phonon resonance transmutation cascade sequence:

$$
\begin{aligned}
Na^{23} + C^{12}O^{16} &\Rightarrow H^{1} + Ne^{22} + C^{12}O^{16} \\
Ne^{22} + C^{12}O^{16} &\Rightarrow H^{1} + Ne^{21} + C^{12}O^{16} \\
Ne^{21} + C^{12}O^{16} &\Rightarrow H^{1} + Ne^{20} + C^{12}O^{16} \\
Ne^{22} + Ne^{20} &\Rightarrow 2\,H^{1} + Ar^{40} \\
Ne^{21} + Ne^{20} &\Rightarrow H^{1} + Ar^{40} \\
2\,Ne^{20} &\Rightarrow Ar^{40} \\
Ar^{40} + C^{12}O^{16} &\Rightarrow H^{1} + K^{39} + C^{12}O^{16}
\end{aligned}
$$

Another coincident fact relates to Javanese Mo Pai Master John Chang –*a modern adept of ancient Atlantean qi healing techniques.* Chang is a habitual tobacco smoker, which likewise introduces low levels of CO into the bloodstream from smoke absorption in the lungs, thereby enhancing electrophotonic emission of his blood and skin through these same atomic nuclear reaction cascades.

Thermal hysteresis studies of photon emission (PE) from non-diluted blood confirm that biophotons are predominantly released from atomic reactions when blood temperture declines (Voeikov *et al.*, 2003),[13] directly implicating phonon resonance matching dynamics identified between O^{16} and H^{1} at precisely 37.8°C, as well as Ne^{20} and Ar^{40} at precisely 37.7°C:

> It can be seen that blood reacts to changes in the gradient of temperature decrease... by elevation of photon emission intensity... [Conversely,] when temperature reaches 39.5°C PE intensity drops abruptly... as soon as temperature after reaching its maximum begins to decline PE from blood starts to elevate... Paradoxical changes in PE -- elevation of its intensity when temperature continued to decline though at different rate than before, or abrupt drop in PE intensity when it continued to raise –indicate that blood has some peculiar mechanism sensing temporal variations of temperature. The nature of this mechanism is currently obscure...

> The hypothesis that reactive oxygen species generation by white blood cells is enhanced due to an increase in oxygen availability, ensuing the enhancement of photon emission from "normal" blood, is supported by the results of our studies of the effect of carbon monoxide upon whole blood and isolated neutrophils. We found that... CO sharply intensified photon emission in non-diluted blood... [offering] a strong indication of highly co-operative processes proceeding in blood...
>
> Thus, blood displays many features of an active physical medium, constituents of which are permanently present in an electronically excited state. Electronic excitation of blood constituents is provided by the reactions of ROS generation permanently proceeding in it and providing energy for pumping internal “biophotonic” field of blood. Efficient migration and storage of energy in blood is provided by its peculiar [liquid crystalline] structure.

Both electronic and photonic excitation of blood can be easily achieved under the proper conditions. According to ancient Shinto traditional wisdom of Japan, beneficial effects of *'misogi'* –alternating hot/cold baths– are undertaken for bodily purification by induced temperature fluctuations of the entire body that enhance phonon resonance reactions throughout the bloodstream and skin.

Psychoacoustic whistles of the ancient Ohum civilization of the South American Andes region (above) likewise enhance the rate of phonon resonance transmutation reactions occurring in the blood and skin of the human body by inducing hyperventilation in the same manner as deep breathing prana practices employed by Vedic traditions of the yogis of India, Nepal and Tibet.

Beyond synchronizing cerebral rhythms, hyperventilation of lung tissues drastically enhances oxygen absorption rates in the lungs, thereby greatly increasing available oxygen in the bloodstream for rhythmically-induced phonon resonance transmutation cascades throughout the body. The essential concepts of the ancient Vedic practice of Kriya Yoga were explicitly tied to *the intake of extra oxygen for transmutation into life currents*, as expressed in the clear scientific language of adept practitioner Paramahansa Yogananda, in his *'Autobiography of a Yogi'* (1946):

> *Kriya Yoga* is a simple, psychophysiological method by which the human blood is decarbonized and recharged with oxygen. The atoms of this extra oxygen are transmuted into life current to rejuvenate the brain and spinal centers. By stopping the accumulation of venous blood, the yogi is able to lessen or prevent decay of tissues; the advanced yogi transmutes his cells into pure energy. Elijah, Jesus, Kabir and other prophets were past masters in the use of *Kriya* or a similar technique, by which they caused their bodies to dematerialize at will.
>
> *Kriya* is an ancient science. Lahiri Mahasaya received it from his guru, Babaji, who rediscovered and clarified the technique after it had been lost in the Dark Ages. "The *Kriya Yoga* which I am giving to the world through you in this nineteenth century," Babaji told Lahiri Mahasaya, "is a revival of the same science which Krishna gave, millenniums ago, to Arjuna, and which was later known to Patanjali, and to Christ, St. John, St. Paul, and other disciples."

Kriya Yoga is referred to by Krishna, India's greatest prophet, in a stanza of the *Bhagavad Gita:* "Offering inhaling breath into the outgoing breath, and offering the outgoing breath into the inhaling breath, the yogi neutralizes both these breaths; he thus releases the life force from the heart and brings it under his control." The interpretation is: "The yogi arrests decay in the body by an addition of life force, and arrests the mutations of growth in the body by *apan* (eliminating current). Thus neutralizing decay and growth, by quieting the heart, the yogi learns life control."

Krishna also relates that it was he, in a former incarnation, who communicated the indestructible yoga to an ancient illuminato, Vivasvat, who gave it to Manu, the great legislator. He, in turn, instructed Ikshwaku, the father of India's solar warrior dynasty. Passing thus from one to another, the royal yoga was guarded by the rishis until the coming of the materialistic ages. Then, due to priestly secrecy and man's indifference, the sacred knowledge gradually became inaccessible.

Kriya Yoga is mentioned twice by the ancient sage Patanjali, foremost exponent of yoga, who wrote: "*Kriya Yoga* consists of body discipline, mental control, and meditating on *Aum.*" Patanjali speaks of God as the actual Cosmic Sound of *Aum* heard in meditation. *Aum* is the Creative Word, the sound of the Vibratory Motor. Even the yoga-beginner soon inwardly hears the wondrous sound of *Aum.* Receiving this blissful spiritual encouragement, the devotee becomes assured that he is in... touch with divine realms.[14]

Piezoelectric temple sites throughout the world are precisely aligned with focal nodes of infrasound standing waves,[15] generally referred to as Schumann Resonance, where the cosmic Aum is most clearly perceived. Yogananda recounted how Master Sri Yukteshwar gave him an experience of the samadhi state of cosmic consciousness by striking a vital marma point on the upper sternum:

Sri Yukteswar... struck me gently on my chest above the heart. My body became immovably rooted; breath was drawn out of my lungs as if by some huge magnet. Soul and mind instantly lost their physical bondage, and streamed out like a fluid piercing light from my every pore. The flesh was as though dead, yet in my intense awareness I knew that never before had I been fully alive. My sense of identity was no longer narrowly confined to a body, but embraced the circumambient atoms. People on distant streets seemed to be moving gently over my own remote periphery. The roots of plants and trees appeared through a dim transparency of the soil; I discerned the inward flow of their sap.

The whole vicinity lay bare before me. My ordinary frontal vision was now changed to a vast spherical sight, simultaneously all-perceptive. Through the back of my head I saw men strolling far down Rai Ghat Road, and noticed also a white cow who was leisurely approaching. When she reached the space in front of the open ashram gate, I observed her with my two physical eyes. As she passed by, behind the brick wall, I saw her clearly still. All objects within my panoramic gaze trembled and vibrated like quick motion pictures. My body, Master's, the pillared courtyard, the furniture and floor, the trees and sunshine, occasionally became violently agitated, until all melted into a luminescent sea; even as sugar crystals, thrown into a glass of water, dissolve after being shaken. The unifying light alternated with materializations of form, the metamorphoses revealing the law of cause and effect in creation.

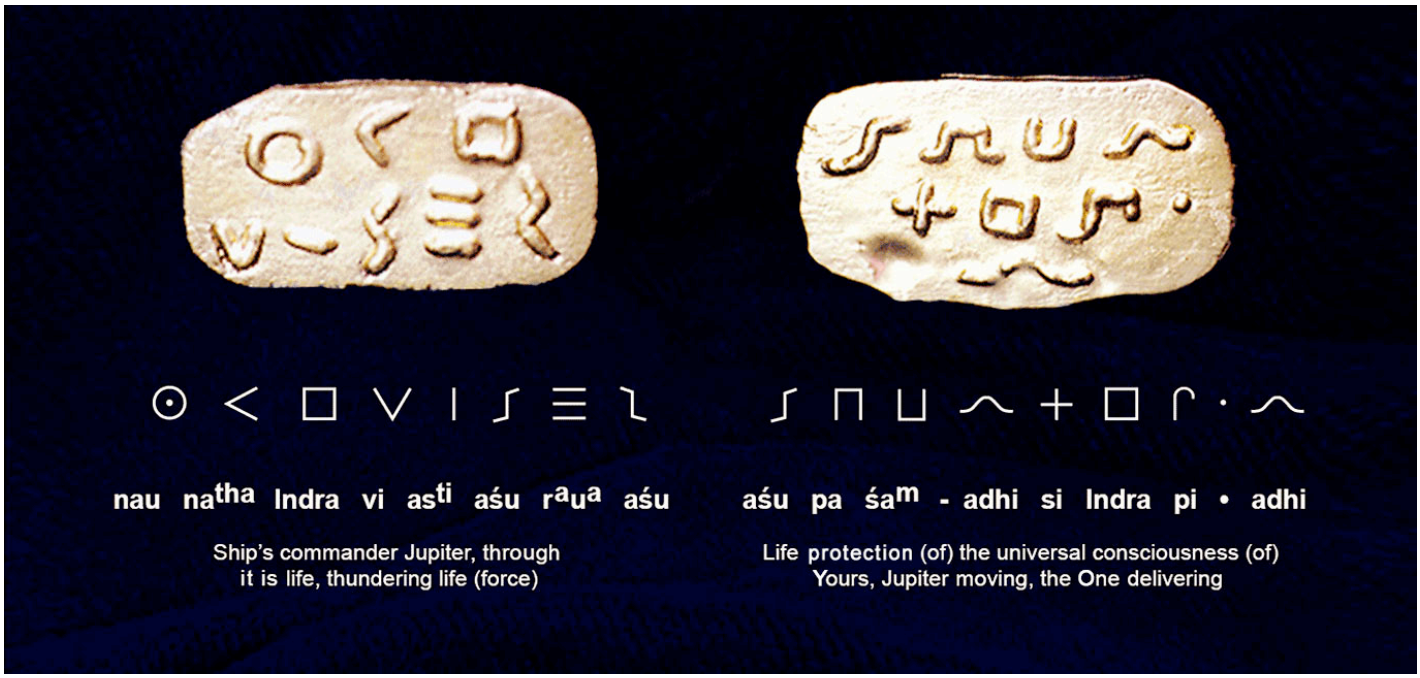
An oceanic joy broke upon calm endless shores of my soul. The Spirit of God, I realized, is exhaustless Bliss; His body is countless tissues of light. A swelling glory within me began to envelop towns, continents, the earth, solar and stellar systems, tenuous nebulae, and floating universes. The entire cosmos, gently luminous, like a city seen afar at night, glimmered within the infinitude of my being. The sharply etched global outlines faded somewhat at the farthest edges; there I could see a mellow radiance, ever-undiminished. It was indescribably subtle; the planetary pictures were formed of a grosser light.

The divine dispersion of rays poured from an Eternal Source, blazing into galaxies, transfigured with ineffable auras. Again and again I saw the creative beams condense into constellations, then resolve into sheets of transparent flame. By rhythmic reversion, sextillion worlds passed into diaphanous luster; fire became firmament. I cognized the center of the empyrean as a point of intuitive perception in my heart. Irradiating splendor issued from my nucleus to every part of the universal structure. Blissful *amrita,* the nectar of immortality, pulsed through me with a quicksilverlike fluidity. The creative voice of God I heard resounding as *Aum,* the vibration of the Cosmic Motor.

Suddenly the breath returned to my lungs. With a disappointment almost unbearable, I realized that my infinite immensity was lost. Once more I was limited to the humiliating cage of a body, not easily accommodative to the Spirit. Like a prodigal child, I had run away from my macrocosmic home and imprisoned myself in a narrow microcosm.[16]

Yogananda's sudden and intense experience of the samadhi state of universal conciousness was illicited by Master Sri Yukteshwar through his adept application of acupressure point stimulation, releasing adequate bioelectrical qi charge accumulation within Yogananda's body. While such astounding demonstrations of ancient Vedic knowledge appear unattainable to western practitioners of meditation and *'anuki'* (meaning "energy retention"), *proper temple facilities are key requirements.*

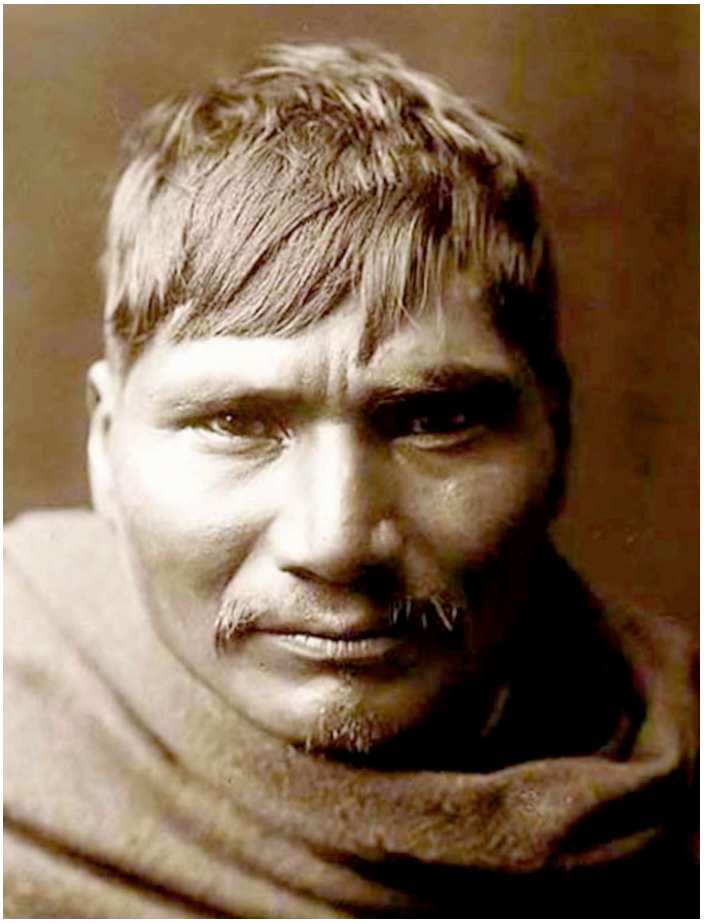
Many remarkable Paleo-Sanskrit relics, produced during the extended time period from ~30,000 to 13,000 years ago, reveal profoundly advanced Atlantean applications of resonant electrophotonic induction technologies for enhancing nuclear reactions in the human body under electromagnetic conditions amplified by aligned pyramid chambers composed of pyromagnetic geopolymer stones.



A large cache consisting of numerous ancient Atlantean statues and artifacts, discovered by Russell Burrows in the mid-1980s in a hidden resonant cave site near the present-day town of Iuka, Illinois, were exquisitiely engraved with Paleo-Sanskrit hieroglyphs.[17]

Among these cast metal, cast geoplymer limestone and shale-hewn masterpieces was a small tablet depicting a face, framed by a square temple entryway with a Paleo-Sanskrit subtext, reading: raua kar ra upama • ma mi-is • plava vi-sa ya las , which translates as "Roaring works, granting (of) the highest One, being synchrony (of) the One inundating... Now enter, begin shining!" (above). *This is an unmistakable reference to the electrophotonic activation process of phonon resonance reaction cascades induced upon entering piezoelectric temples of the sophisticated Altantean civilization.*

Present-day quantum biology research has made adequate progress to succinctly explain these complex Atlantean hieroglyphic tablet texts in accurate scientific terms. The most effective method for identifying acupuncture meridians, using trypan blue as a meridian-specific dye,[18] was first employed for this purpose by Bonghan Kim in his original breakthrough 1964 discovery. More recent studies have successfully reapplied Kim's methodology, confirming the 'Bonghan Duct[s] and Acupuncture Meridian[s] as Optical Channel[s] of Biophoton[s]' (Soh, 2004).[19]



Further contemporary advances have revealed 'UV-A Induced Activation of Bonghan Granules in Motion' (Sung *et al.*, 2005),[20] and under enhanced magnetic field conditions (Lee *et al.*, 2013)[21] such as those generated by HHO plasma glowing within Atlantean pyramid chambers. Physiological tissue and organ regeneration is now recognized in the 'Bonghan System as Mesenchymal Stem Cell Niches and Pathways of Macrophages in Adipose Tissues' (Lee *et al.*, 2009).[22]

The efficacy of ancient Atlantean healing practices have also been revealed by 'Bioluminescence Imaging of Heme Oxygenase-1 Upregulation in the Gua Sha Procedure' (Kwon *et al.*, 2009),[23] as well as thermal 'Images in the Effect of Gua Sha Treatment on the Microcirculation of Surface Tissue'.[24] While modern electrical healing and analysis equipment require power generation from fossil fuel sources, the ancient Atlantean pyramid network operated on resonant induction principles that focused abundantly available planetary energy sources –*the rumbling infrasound of Jupiter:*

A small gold plate from the Illinois cave archive was cast with hieroglyphic relief texts extolling the resonance-based pyramid rejuvenation technologies, reading: nau natha Indra vi asti asu raua asu , meaning "Ship's commander Jupiter, through it is life, thundering life (force)" (above, left). Another small gold plate explicitly praises the protective vitality of the samadhi state of universal consciousness, reading: asu pa sam-adhi si Indra pi • adhi , meaning "Life protection (of) the universal consciousness (of) Yours, Jupiter moving, the One delivering" (above, right).

As comprehensively elucidated herein, *'enlightenment'* is directly conferred by the highly advanced psychoacoustic and biophotonic induction effects of Atlantean and Ohum pyramids and whistling vessels, and duplicated (to a lesser extent) by cannabis smoking in our dissonant modern era for lack of knowledge and access to functional ancient pyramid technologies. Psychoacoustic focusing of global infrasound waves or enhancement of human conciousness was expertly explained to apprentice Carlos Castaneda in painstaking detail by indigenous Yaqui Elder Don Juan, in the vast desolation of the Sonora Desert of Northern Mexico:

"Seers say that there are three types of attention... they are rather three levels of attainment. They are the first, second, and third attention, each of them an independent domain, complete in itself." He explained that the first attention in man is the animal awareness... everything that one can think about is part of the first attention...

Don Juan explained that in order for our first attention to bring into focus the world that we perceive, it has to emphasize certain emanations selected from the narrow band of emanations where man's awareness is located. The discarded emanations are still within our reach but remain dormant, unknown to us for the duration of our lives.

The new seers call the emphasized emanations the right side, normal awareness, the tonal, this world, the known, the first attention. The average man calls it reality, rationality, common sense.

The emphasized emanations compose a large portion of man's band of awareness, but a very small piece of the total spectrum of emanations present inside the cocoon of man. The disregarded emanations within man's band are thought of as a sort of preamble to the unknown, the unknown proper consisting of the bulk of emanations which are not part of the human band and which are never emphasized. Seers call them the left-side awareness, the nagual, the other world, the unknown, the second attention...

"[To be able]… to utilize those unused emanations, one needs uncommon, elaborate tactics that require supreme discipline and concentration... the art of *dreaming*... the concentration needed to be aware that one is having a dream is the forerunner of the second attention. That concentration is a form of consciousness that is not in the same category as the consciousness needed to deal with the daily world."

"The new seers... let the mastery of awareness develop to its natural end, which is to extend the glow of awareness beyond the bounds of the luminous cocoon in one single stroke. The third attention is attained when the glow of awareness turns into the fire from within: a glow that kindles not one band at a time but all the... emanations inside man's cocoon."

Don Juan expressed his awe for the new seers' deliberate effort to attain the third attention while they are alive and conscious of their individuality... "The supreme accomplishment of human beings," he said, "is to attain that level of attention while retaining the life-force, without becoming a disembodied awareness moving like a flicker of light..."

[He then explained that]...the glow produced by a state of total awareness... is *seen* as a burst of incandescence in the entire luminous egg. It is an explosion of light of such a magnitude that the boundaries of the shell are diffused and the inside emanations extend themselves beyond anything imaginable.

"Are those special cases, don Juan?"

"Certainly. They happen only to seers. No other living men or any other living creatures brighten up like that. Seers who deliberately attain total awareness are a sight to behold. That is the moment when they burn from within. The fire from within consumes them. And in full awareness they fuse themselves to the emanations at large, and glide into eternity."

"[As seers] our case is a bit different, because we are at the end of our trail. We are not seeking anything... we go from day to day doing nothing. We are waiting. I will not tire of repeating this: we know that we are waiting and we know what we are waiting for. We are waiting for freedom!"[25]

Nano-Iodine
vs.
Leishmania Protozoa

Nano-Iodine vs. Leishmania Protozoa

The rapid succession of technological innovations now unfolding among diverse scientific fields of inquiry has offered a dazzling array of remote sensing technologies that have unveiled the great antiquity of advanced human civilizations stretching far into the Paleolithic Era, and even beyond.

Pyramid constructions have been identified by side-scanning sonar and bathymetric techniques on the seafloor in various parts of the world, including the Caribbean Sea and multiple sites in the Atlantic and Pacific Oceans.[1,2] Giant megalithic temple constructions have even been identified by satellite-based radar techniques below the ice sheets of Antarctica, yet have been highly classified by world governments and only recently disclosed publicly as unusual natural mountain formations.

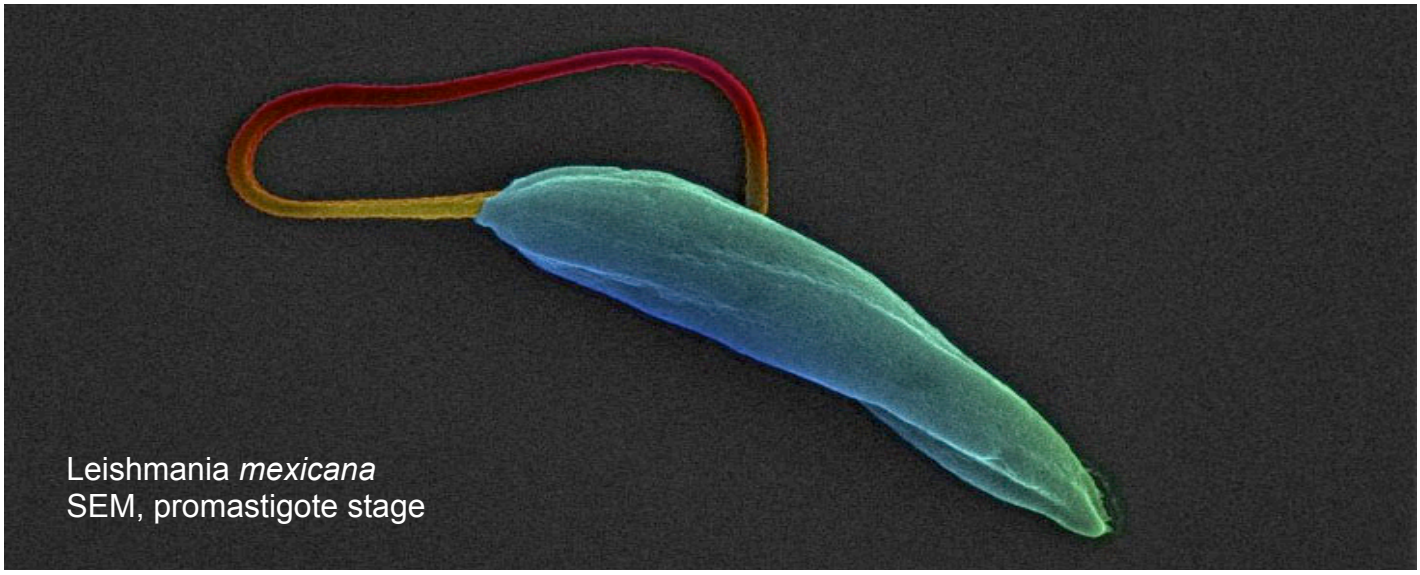
Airborne LiDAR surveys of rainforest-covered regions of the planet have been able to strip away the dense vegetation to visualize the geometric topography of many man-made monumental temples in the Yucatan Peninsula. More recently, another pyramid complex was imaged by LiDAR scanning in the rainforests of the Mosquitia region of Honduras (above)[3], yet no comprehensive archeological evidence has been presented by the most recent, well-funded 2016 expedition, which was entirely abandoned without any significant findings having been reported publicly. Why?

Expeditions undertaken in the 1939 by Theodore Morde to this Honduran pyramid complex were also abandoned after megalithic limestone statues of “monkey gods” were described, and the site named the White City. Seeking funding for further expeditions, Morde was later murdered in 1954. The White City (14.4024°N, 85.7322°W) is situated 7,248 miles from the Orion Pyramids of Giza, Egypt, a resonant distance corresponding to 29.1% of Earth's mean circumference of 24,892 miles.

The mystery surrounding the Honduran pyramid complex endures, yet quite similar prosimian-type statues have since been uncovered at San Augustin, Colombia[4], suggesting a shared origin for the White City of Honduras. Abandonment of the 2016 White City expedition was announced in a short news article on February 4, 2017. Rather than presenting partial findings or any significant photographic evidence obtained by researchers at the site, the bulk of the article went into propaganda books on the site and cleverly explained why no further research would be conducted. This article appears to have been crafted to specifically deter all future investigations:

Q: While you were there, you and several other researchers were infected with Leishmaniasis, a disease caused by protozoan parasites.

A: Mucosal leishmaniasis struck down two-thirds of the expedition — Hondurans, Americans and Brits alike. It is a very persistent disease, a flesh-eating parasite that attacks the face and eventually causes your lips and nose to slough off, leaving a weeping sore where your face used to be. (I would not recommend Googling pictures of the disease!) It has returned in a number of people. But we are getting the best medical care in the world from doctors at the National Institutes of Health, who are studying us and our disease, which appears to be a unique form. It makes for a fascinating medical mystery.[5]



Phlebotomus *perniciosus*
Tropical sand fly

Seemingly, despite all of the medical advances of our present day, archeological investigations of the White City have been prohibited due to the presence of Phlebotomus *perniciosus* tropical sand flies (above) carrying infectious Leishmania protozoa (below). These intracellular parasites quickly infected researchers with cutaneous leishmaniasis, which can eventually progress into the mucosal form of the flesh-eating disease. Mucosal leishmaniasis is a more rapidly spreading variety of infection that, if untreated by proper medication, can destroy the tissues of the sinuses, mouth, nose and eyes, and can in turn lead to intestinal leishmaniasis.

One would assume from this news article that proper medication is simply not available, yet this is certainly not the case. The same situation encountered by American archeologists in Honduras has hindered archeological investigations by this author, and partner Suzanne Benoit, of a large ancient pyramid city complex in La Maná and La Envidia, Ecuador,[6] where similar rainforest conditions exists and associated leishmaniasis-infecting sand flies are abundant.

Leishmania *mexicana*
SEM, promastigote stage

Contrary to the false assertions promulgated by the Honduras pyramids expedition leaders, effective medical treatments for all forms of leishmaniasis have been known for many decades. However, the availability of these most effective remedies has been blocked by governmental restrictions in all Central and South American countries, In fact, even in the United States, access to these leishmaniasis medications is not offered by doctors, as all sources of information regarding these medications and their active compounds has been restricted to both scientists and the general public alike. *Why?*

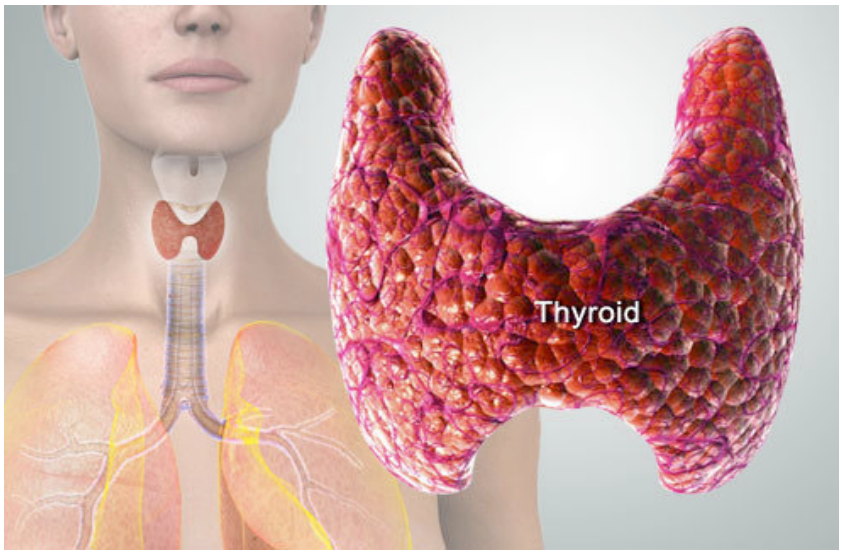
Years of focused research by this author have yielded a clear answer to this question: *the Leishmania protozoa has been weaponized by governmental restrictions on information and access to effective medication for the specific purpose of preventing archeological investigations of these jungle-shrouded pyramid complexes.*

Eupatorium *perfoliatum*

The faces of many of the residents of these areas, both young and old, bear the scars of surgical removal of skin lesions to prevent the spread of cutaneous leishmaniasis, which had undoubtedly killed thousands of Spanish conquistadors during their decades-long genocidal eradications of the Inka peoples native to the Andean region, who protected themselves by applying a natural herbal remedy to cure such infections.

This sacred healing plant is endemic to the coastal rainforests west of the highlands of the Andes mountain range, yet has recently become an endangered species due to the destruction of wetland habitats in many areas where the estuary variety of this plant once grew.

Likewise, the ancient indigenous cultures of eastern North America applied a different species of this sacred healing plant, commonly referred to today as boneset, feverwort, thoroughwort and Indian sage (above), among other names. For centuries before the widespread use of antibiotics, this remedy was traditionally used for treating fevers, colds, coughs, headaches and rheumatism (Howell, 2006). A tea was also used for consumption and as a laxative (Krochmal *et al.,* 1969).



Given the species designation Eupatorium *perfoliatum*, the leaves and flowers of this plant are now known to contain a variety of bioactive compounds, most notably sesquiterpene lactones such as guaianolides and the germacrolanolides (Herz, Kalyanaraman, & Ramakrishnan, 1977). Four recently discovered guaianolides (Maas *et al.*, 2011) showed antiprotozoal activity against the malaria vector Plasmodium *falciparum* and other protozoa (Maas *et al.*, 2011).[7]

However, a thorough review of available data on the medical uses of this natural remedy *does not include any information on its effectiveness against Leishmania protozoa, nor any information on what effective compounds may be related to such an application.* The only fact that implicates Eupatorium *perfoliatum* as an effective remedy for leishmaniasis infection is one of the plant's common names used during 1800s: *"vegetable antimony"*.

Despite brief mention of this antiquated common name, pharmacological data given by sources for Eupatorium *perfoliatum* excludes any mention of antimony among known bioactive agents contributing to its many medical applications. *Now, why would that be the case?*

Medical clinics in all countries where leishmaniasis is prevalent offer only one medication for its treatment, called Glucantime or Meglumine antimoniate, which consists of a *glucose solution with suspended particles of pentavalent antimony*. Rather than offering the easily obtainable herbal extract of Eupatorium *perfoliatum* (containing antimony particles without any glucose, a sugar), this antimony-containing product has been rendered only partly effective *–as the added glucose feeds the infectious Leishmania protozoa, thereby greatly reducing its efficacy.* Once again… why?

Government weaponization of this flesh-eating disease is the answer. If this conclusion seems too extreme or erroneous, consider another effective medication for treatment of leishmaniasis and the identical circumstances surrounding its availability in these same countries where the Leishmania protozoa is prevalent: *aqueous iodine/iodide solutions.*

.

Iodine has a long history of medical use worldwide, having been well known throughout the last century for killing pathogenic microbes of all kinds, and typically used in topical skin applications, as well as for rapid sterilization of surgical instruments and water sources. Protection of the thyroid gland (above, right) from uptake of radioactive cesium particles has also been widely promoted as a primary use for iodine. One might assume that it has been well tested for treatment of leishmaniasis infections, yet this data is not available among any research papers in medical journals.

In a government-contrived scenario identical to that of sugar-loaded antimony medications (ie. Glucantime), all iodine/iodide solutions made widely available in Ecuador for farm and veterinarian use contain molasses, such as Yodotópic[8] and Yodotónico[9], which *(unlike all commonly sold junk food items) do not list the sugar content under the ingredients on the label, instead hiding it under the misleading terms 'c.s.p vehicle' or 'c.s.p excipient'.* One of only two pure aqueous iodine/iodide products available in Ecuador is Lugols Colorant[10], which is even more deceptively labeled. It reads: "For laboratory microscopy use only. Toxic – Do not ingest. Contains resublimated iodine <0.5%" *–when it actually contains 2.5% aqueous iodine/iodide solution that cures leishmaniasis infection.*

Lugol's iodine is a pure aqueous iodine/iodide solution that can only be found at one store in Ecuador, located in the city of Cuenca. Cleverly named 'Nectar', this store enjoys a monopoly on Lugol's iodine and extorts their clients by selling it at 7% an 3% concentrations, in tiny bottles at a *~1000% markup* (to ensure few clients can afford the high doses required to cure leishmaniasis). The only available information sources detailing the efficacy of iodine formulations for eliminating Leishmania protozoa are found in patents for medical treatments published decades ago. Granted in 1993, US Patent WO 1993004731 A1 discloses an 'Iodine-Iodide Treatment of Red Blood Cells':

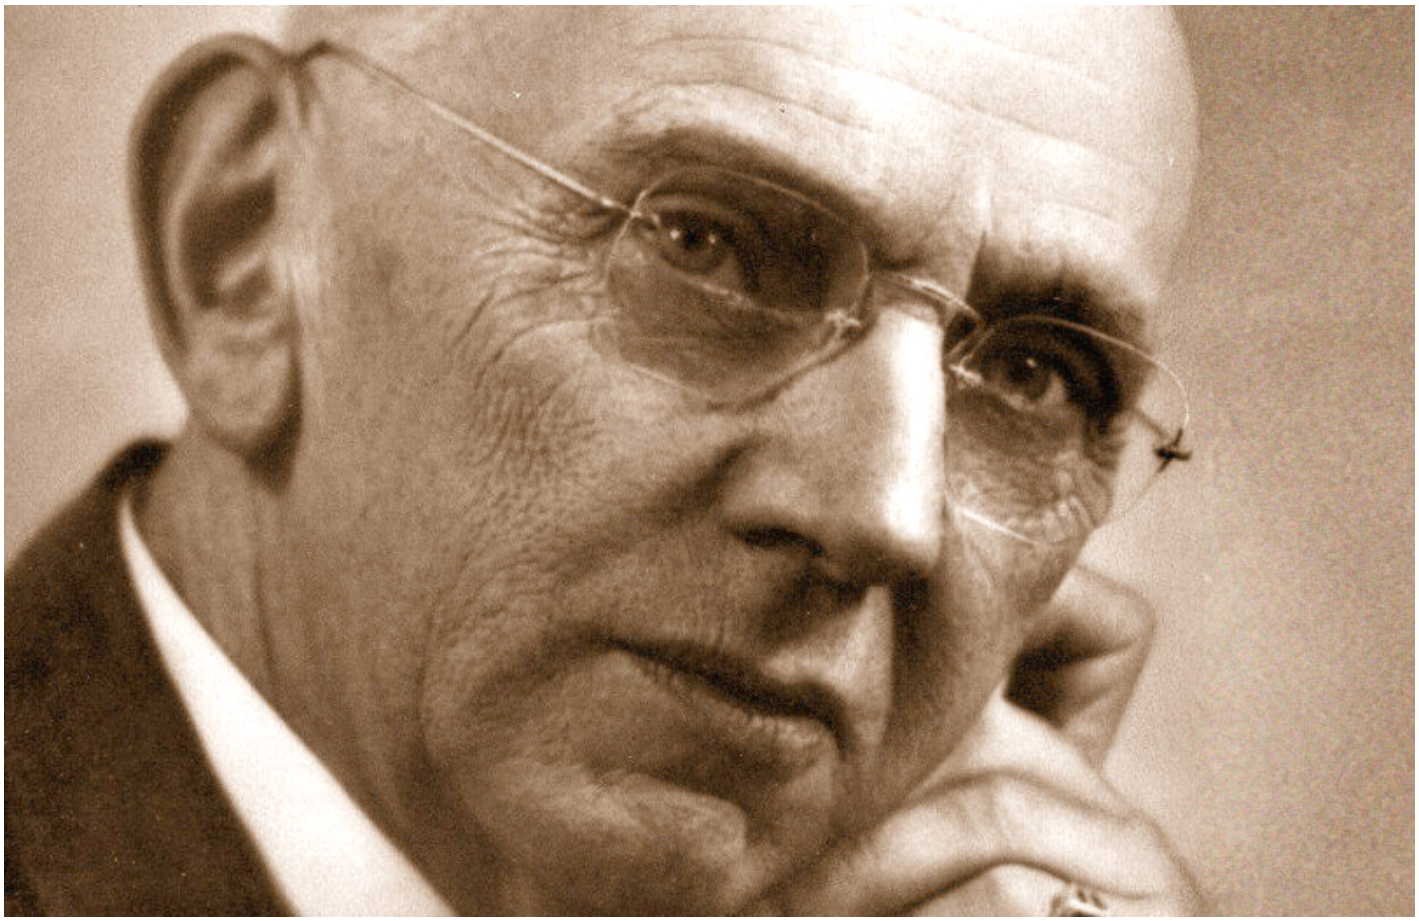
> Iodide is used to describe a compound which disassociates in aqueous solution to produce iodide ions. Potassium iodide and sodium iodide are considered to be the optimum iodides suitable for use in this invention. It has been discovered that the antimicrobial effect iodine in red blood cell containing preparations is greatly enhanced by pre-treating the red blood cells with iodide or treating the red blood cells with iodide and iodine contemporaneously...
>
> Protozoa give rise to many diseases, some of great medical and economic importance. Examples of such protozoa are the genus Plasmodium, e.g. P. *falcipamm*, P. *malariae*, P. *ovale* and P. *vivax*, which causes malaria, Trypanosoma, which causes Chagas' disease, and Leishmania, which cause a variety of leishmaniasis. The method of this invention is effective in eliminating these causative organisms in blood and blood products... The mechanism by which iodide enhances the antimicrobial activity of iodine not known.[11]

US Patent WO 2000074691 A1, published in 2000, discloses the 'Treatment of Cutaneous Leishmaniasis and Other Dermatological Diseases... by Idogenos Sanhory':

> A method of substantially treating of cutaneous leishmaniasis and other dermatological diseases by idoeugenol Sanhory compound (leishmanol). Dosage formulation being from about 15 to 17.5 gm Eugenic acid, 2.5 gm iodine, 2.5 gm potassium iodide, 50 ml ethanol and purified water (USP), required to treat and control cutaneous leishmaniasis [in] approximately 100% of patients... The antimonials, amphotercin and pentamidinde, are complicated to use and are not suitable for extensive use in chronic cases of cutaneous leishmaniasis... [as they] are highly toxic and are recommended for use only in cases that fail to respond to pentavalent antimonials or are suffering from diffuse cutaneous leishmaniasis.[12]

Clearly, aqueous iodine/iodide solutions can effectively eliminate Leishmania protozoa, despite the paucity of published data concerning relevant clinical studies. The best source of information regarding the most effective form of iodine emerged in the 1920s through the readings of trance medium Edgar Cayce, whose holistic healthcare gained worldwide attention over 100 years ago. Cayce's specifications for the manufacture of an electrified iodine formulation containing iodine nanoparticles in distilled water were executed in 1928 by a medical associate Dr. Sunker A. Bisley, and marketed widely under the product name 'Atomidine' (Reading 757-1):

> Atomidine is manufactured by Schieffelin & Co., New York. I do not know whether you will be able to obtain this locally or not, but it has been on the market for several years. This is iodine with the poison removed, yet giving the iodine the effect in the system, as indicated from the very name of the product itself. The company will be able to furnish you with a great many reports of what it has done in hospitals, as well as in local practice.[13]



Cayce also advised lowering Atomidine dosages when receiving natural bioelectrification through barefoot contact with beach sands, composed of piezoelectric quartz crystals which effectively transduce ambient electrical currents generated by the activity of ocean waves (Reading 308-8**)**:

Q: What causes the ends of my hair to split and prescribe treatment necessary to correct this condition?

A: Lack of the proper activity of the thyroid gland. This is to be changed by not burning the hair, not taking too much of the oil out of the body, but by taking occasionally a little Atomidine; not too much, if the body is close to or upon the seashore regularly, but three days in succession during one week out of the month, take one drop in half a glass of water before the morning meal. Don't take it the rest of the time.[14]

After Cayce's stroke-induced death on January 3, 1945, under the guise of World War II economic controls, the Atomidine product was entirely suppressed by US government regulations. Likewise, many other advanced medical devices developed by Cayce's associates were banned, including Violet Ray (ultraviolet-A) and Infrared Ray healing instruments, as well as electrotherapy appliances such as the Radial Appliance and Wet Cell Battery, among so many others.

The suspicious death of Edgar Cayce *–and that of his wife Gertrude from liver cancer less than three months later on April 1, 1945–* directly followed the political assassinations of Nikola Tesla in 1943 and Georges Lakhovsky in 1942, which altogether implicate the controlling Nazi/CIA forces within the US government in a comprehensive medical conspiracy against all of humanity.

The resurgence of information concerning the medical application of ingested iodine/iodide particles in aqueous solutions[15] only occurred many decades later through the research of Dr. Guy Abraham starting in 1998 and later replicated and published in a book by Dr. David Brownstein, entitled *"Iodine: Why You Need It, and Why You Can't Live Without It"* (2009).[16]

However, the research conducted by both Abraham and Brownstein has not gone as far as to state that iodine formulations are capable of eliminating all pathogens from the body. This comprehensive conclusion has only been offered through channeled communications by the psychic medium Laura Knight-Jadczyk, given in a group ouija board session conducted on November 21, 2015:

Q: (L) So, on that point, let me ask about this iodine therapy. I just read this iodine book by a David Brownstein: "Iodine: Why You Need It, Why You Can't Live Without It". This [author] talks about how iodine can kill fungi, bacteria, viruses, detox heavy metals from the body, even the ones that other detox methods don't get... He says that 96% of all people on the planet are iodine deficient. When people come to him, he generally starts them off at pretty high doses, like 50 to 100mg a day, and sometimes twice a day. This is supposed to not only replenish the body's iodine, but also to detox bromines, fluorines, metals, etc... So, some people have started slow and as soon as they have a few drops, they start having symptoms. What are these symptoms from? Is it detox or what?

A: Activation of microbes drawing on the enhanced energy.

Q: (L) We sort of wondered if that was the case. Several of us, as soon as we had been taking iodine a few days, old issues started coming up, like cold sores and such. Several of us started having pains and tiredness and activation of some kind of viral condition, stiff neck, and a bunch of other things. It was similar to the herx reactions we had with the anti-biotic protocol. On the other hand, it seemed more like the viruses got energized by the iodine… So, Instead of backing off like this other book says you should do, she just went full bore... Is that advisable?

A: Indeed. The battle is difficult to win if you keep supplying the "critters" with food and energy.

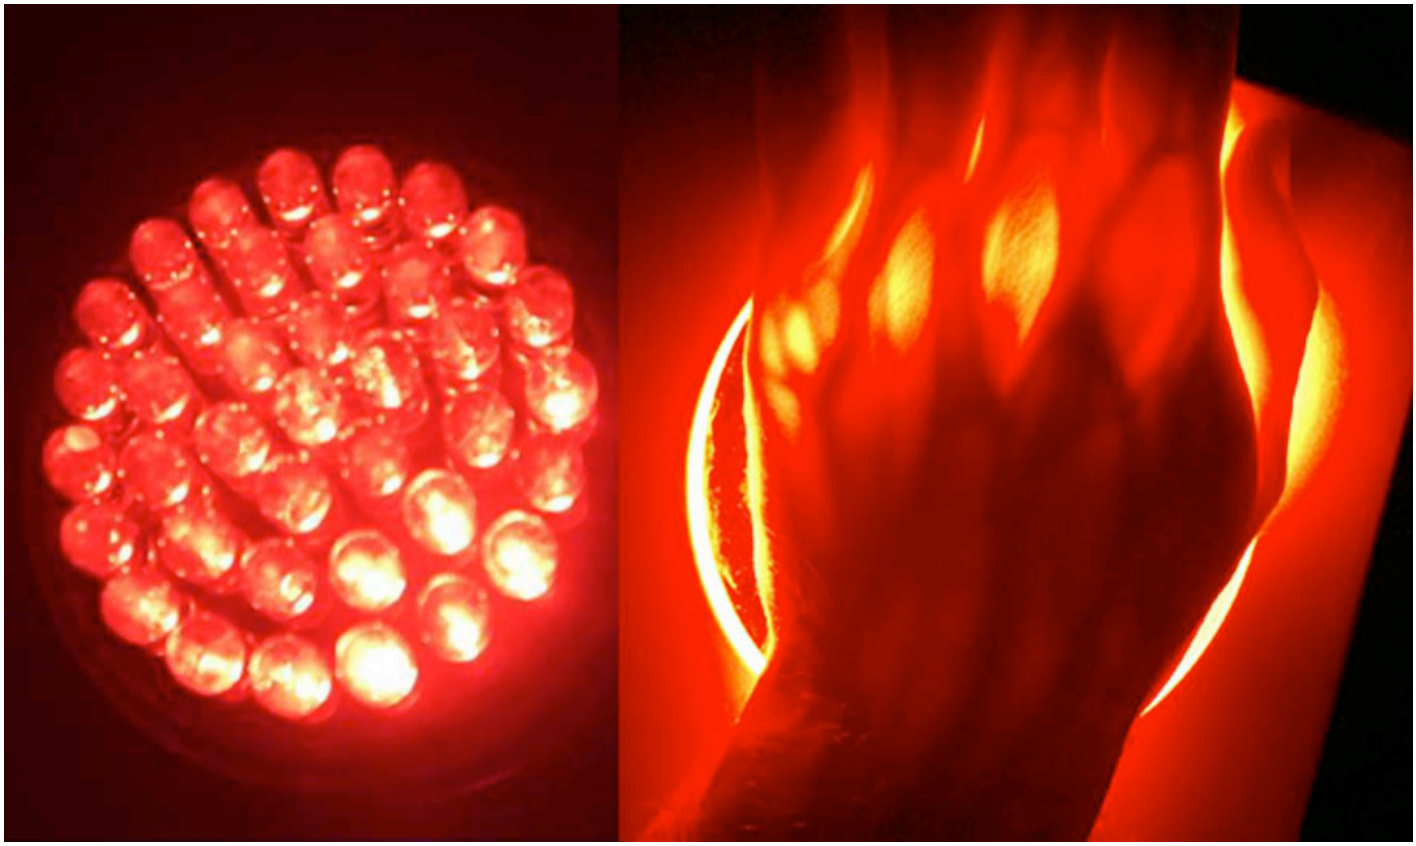
Q: (L) You're just taking enough to energize yourself, which then feeds them because you're not taking a microbicidal dose... So, let me ask you: Could iodine combat AIDS? A: Yes.

Q: (L) Ebola? A: Yes… As you have learned it is good to start the day with a glass of warm salted water. Then you can take more a couple of hours after your iodine.[17]

The exact mechanism by which iodine effectively kills all known pathogens has not been fully elucidated in any medical research journals, and is extrapolated here from concepts clearly related in the Cassiopaea information in relatively non-scientific terms.

Iodine/iodide formulations taken by ingestion, such as Lugol's iodine, are typically composed of potassium iodide/iodine particles suspended in distilled water at ratios of 75% iodide - 25% iodine or 65% iodide - 35% iodine. Upon binding to cell surfaces, potassium iodide and iodine particles become ionized by bioelectrical currents, undergoing gradual dissociation and effectively transporting nano-iodine (iodine ions) through cell membrane barriers via aquaporins.

Potassium iodide is employed in Lugol's iodine formulations for facilitating the solubility of iodine particles in distilled water (pure particulate iodine will not maintain suspension on its own), as well as reducing the deleterious effects of over-alkalization of cells when binding to cell walls that occurs at high concentration.



The necessity of potassium iodide for generating nano-iodine is negated when iodine nanoparticle solutions are ingested, as iodine nanoparticles easily penetrate cell membrane barriers and also maintain suspension in aqueous colloidal solutions when kept in proper storage conditions (protected from sun in tinted glass).

Due to their ultrafine size-range of <10nm, iodine nanoparticles bypass cell membranes through aquaporins that block the transport of all larger particles into cells, thereby significantly limiting the efficacy of conventional iodine formulations used topically for disinfecting skin surfaces, surgical equipment, water sources, etc…

Electrical stimulation of this process through application of a low-level alternating current, whether by natural barefoot contact with beach sands, river stones, waterfalls or by using bioelectrification devices, induces electroporation of cell aquaporins for intracellular transport of nano-iodine.

Medical restrictions on the manufacture and sale of nano-iodine have not been overcome since Cayce's time, and are still not available at present. Despite significant governmental restrictions and limited information such as that offered by Dr. Brownstein, more comprehensive data obtained through the Cassiopaea transmissions informs us that *all diseases can be successfully treated by aqueous solutions of both nano-iodine and particulate iodine/iodide formulations.*

Fortunately, recent laboratory findings have also demonstrated the efficacy of chromotherapy against Leishmaniasis. Easily manageable photonic methods for healing of Leishmaniasis infections were first reported by Azeemi *et al.* in 2011. Despite the inexpensive and easy application of these new healing modalities, such findings have been largely ignored by media and subsequent scientific journal publications on the same subject.

Quoted here at length, these outstanding results were reported as 'Effects of Different Colours in the Visible Region on Leishmania *tropica*' (Azeemi *et al.*, 2011):

> Abstract
>
> The aim of this study was to investigate the wavelength-dependency of chromotherapy effects on cutaneous Leishmaniasis parasite growth. Chromotherapy uses visible range radiations to improve healing; however, its effects on parasite are not well understood. Leishmania tropica was irradiated using seven (7) different wavelengths of visible region. Optical density was observed, which showed that red colour (644 nm) wavelength inhibited the growth of parasite while other colour wavelengths also affected the growth of parasite. It is, therefore, suggested that as red colour inhibits the growth of parasite so patients suffering from L. *tropica* can be treated with the application of red colour.
>
> Results
>
> After initial incubation [of Leishmania *tropica*] for production, out of six samples two were found positive and other four were contaminated with bacteria and fungus. Yellow (590 nm) and purple light (464 nm) increased the size of the parasite (Figures 1 and 2). Red (644 nm), blue (483.5 nm) and violet (400 nm) decreased growth considerably; the size as well as the number of counts of the parasite, with red the most effective (Figures 3-5). Orange colour (610 nm) increased growth incredibly while in green colour (538 nm) the promastigotes appeared to change their size and shape and somewhat converted into rounded form (Figures 5 and 6). In the sample irradiated with red colour wavelength, the parasites were observed as lethargic... as well as least number of counts was observed...

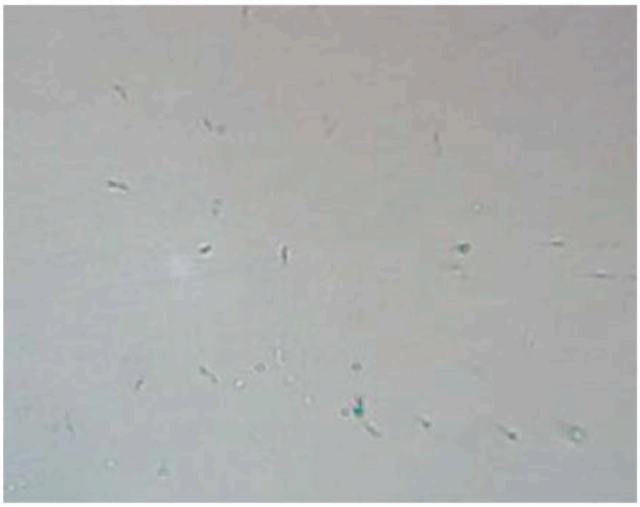


Figure 1. Yellow—parasites irradiated with 590 nm wavelength monochromatic light.

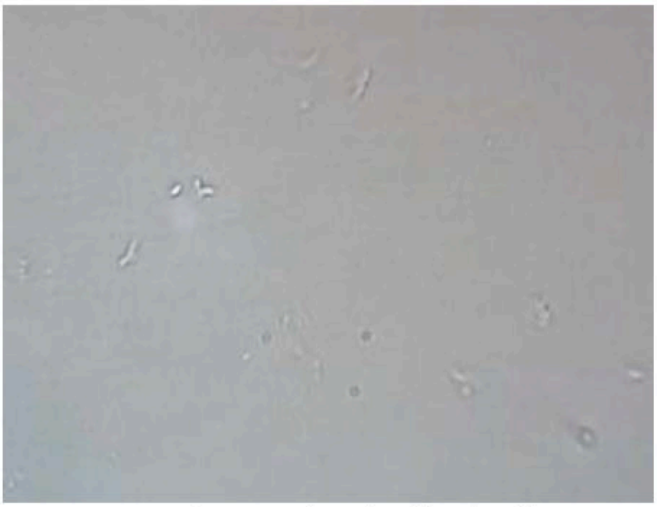

Figure 2. Purple—parasites irradiated with 464 nm wavelength monochromatic light.

Figure 3. Red—parasites irradiated with 644 nm wavelength monochromatic light.

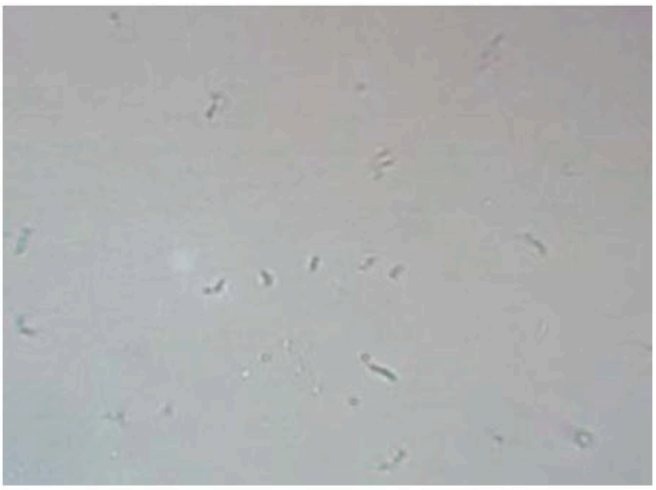

Figure 4. Blue—parasites irradiated with 453.5 nm wavelength monochromatic light.

Figure 5. Violet—parasites irradiated with 400 nm wavelength monochromatic light.

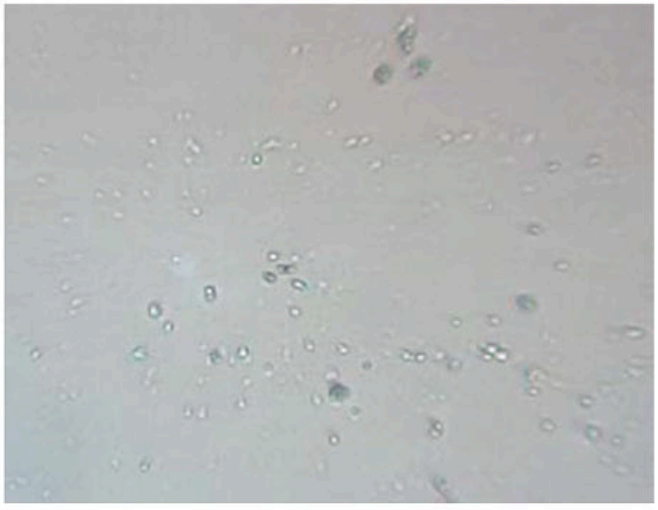

Figure 6. Orange—parasites irradiated with 610 nm wavelength monochromatic light.

Discussion

It was discovered that Monochromatic Single-Wavelength Light Beams had an excellent therapeutic effect on afflicted cell tissue. This occurs through a process called "Photo-Stimulation." The low intensity (non-coagulative) visible laser radiation has been successfully used in some areas of medicine (photodynamic therapy of tumors, therapy of infant hyperbilirubinemia, some dermatological diseases, etc.) [Pratesi *et al.*, 1980].

Also the therapy with red (632.8 nm) laser light (stimulation of tissue regeneration) used for irradiation of the patients with trophic and indolent wounds has gained acceptance in the clinical practice [Karu *et al.*, 1984]. The biomodulatory effect can have a positive effect on the repair of cutaneous wounds [Mendez *et al.*, 2004]. Various studies have been carried out that show the effect of monochromatic light on cells, but the research lacks empirical data regarding effects on parasites...

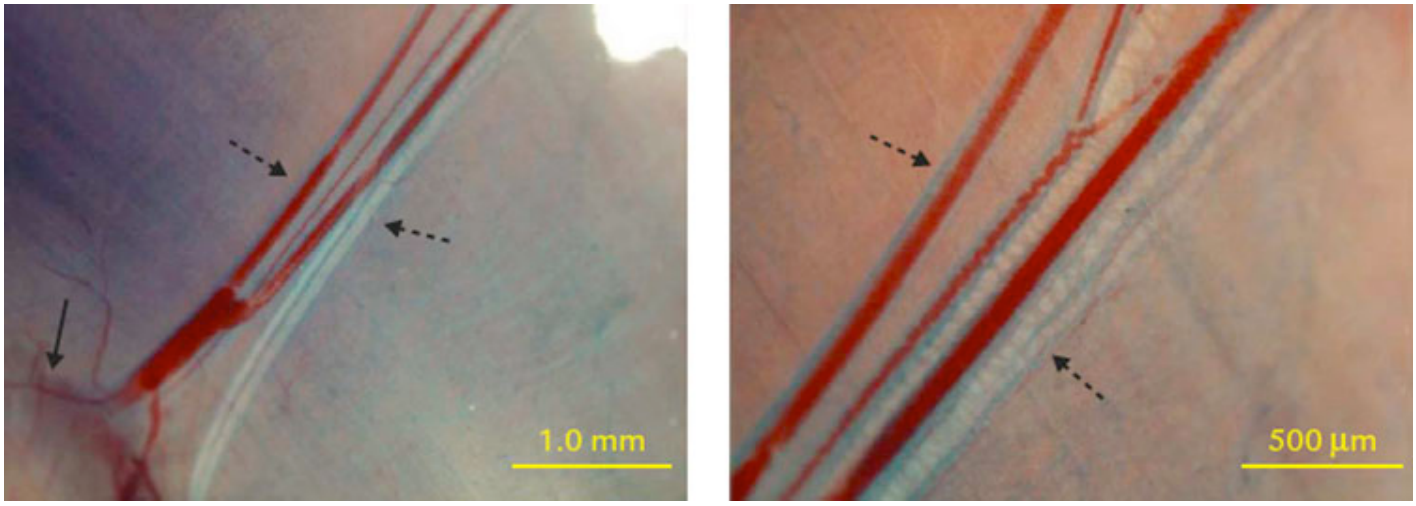
Figures 1-8 are self explanatory to reflect the image of optical density of Leishmaniasis. L. tropica when exposed to red light (644 nm), the decay in this case followed the Gaussian tail and finally to a ramp function. This is an indication that the cutaneous Leishmaniasis, after decay, just disappears because the parasites die...

Although Low Level Laser Therapy (LLLT) has been used previously in most studies, coherence is not important when photo-biological effects are expected because both coherent and non-coherent light have been shown to be effective [Karu *et al.*, 1987].

In our study it is observed that red light showed a great change to inhibit the growth of Leishmania tropica organisms. From this study it is evident that cutaneous Leishmaniasis can be eliminated with higher wavelength, i.e., at 644 nm and with least energy (filtered light beams).

Conclusion

[In vitro testing demonstrates that red light] (644 nm) inhibits the growth and becomes responsible for the decay of leishmania parasite while orange color (610 nm) increases the growth of parasite. Undoubtedly this makes the procedure of chromotherapy for treatment of leishmaniasis cost effective and easy approachable. The response of Leshmania parasite to each color is unique and this confirms Chromotherapy (with 644 nm wavelength), to be very easily manageable by the patient with no problems during treatment.[18]

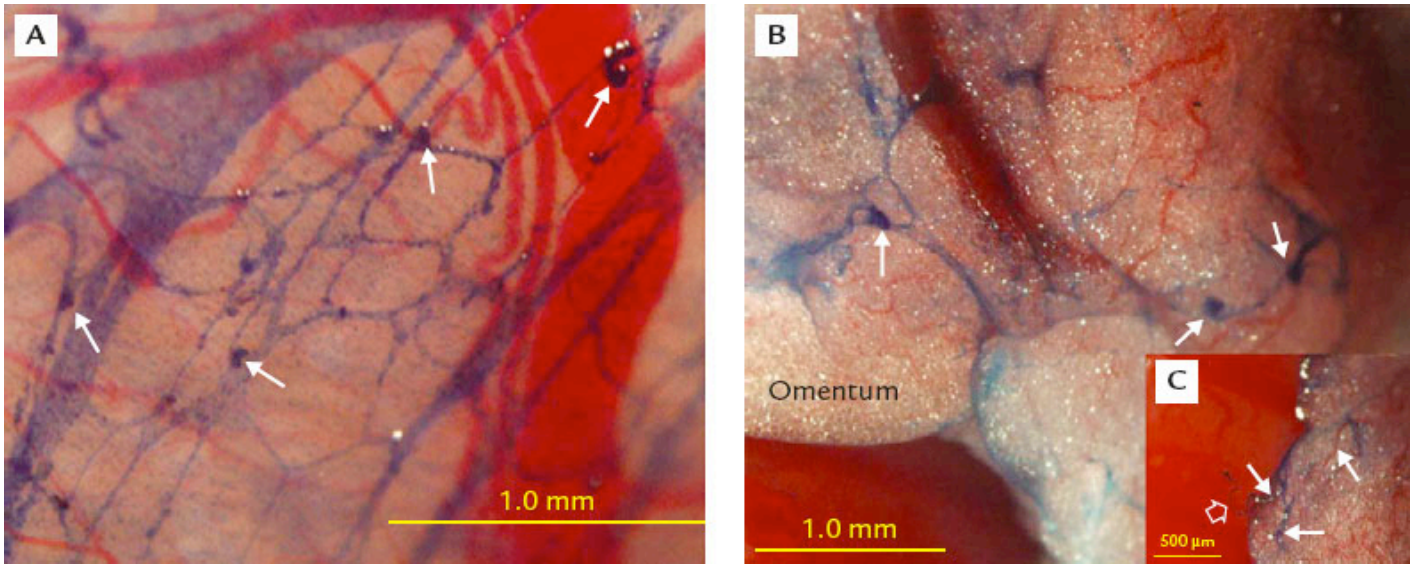


While these breakthrough findings conform to a rapidly expanding class of non-invasive biophotonic treatments that are cheaper, simpler and far more effective than conventional chemical-based medications, the exact physiological mechanisms behind their greater efficacy have not been clearly identified.

The authors of this straight-forward chromotherapy study characterized their findings as effects of 'photo-stimulation' that engages cellular regeneration processes in the body for enhanced wound healing. In the years following this study, investigations of the qi meridian system of the human body have successfully identified the production of stem cells in the qi meridians that dramatically enhances cellular regeneration.

First conducted by Korean biophysicist Bonghan Kim and reported in 1965, Kim's findings have since been confirmed and expanded upon by dozens of other research teams. The structure of the qi meridian system is composed of Bonghan ducts (transparent channels), Bonghan corpuscles (duct junctures) with Bonghan granules, also called microcells or sanals, containing DNA fragments that trap ambient light as they flow through the channels.

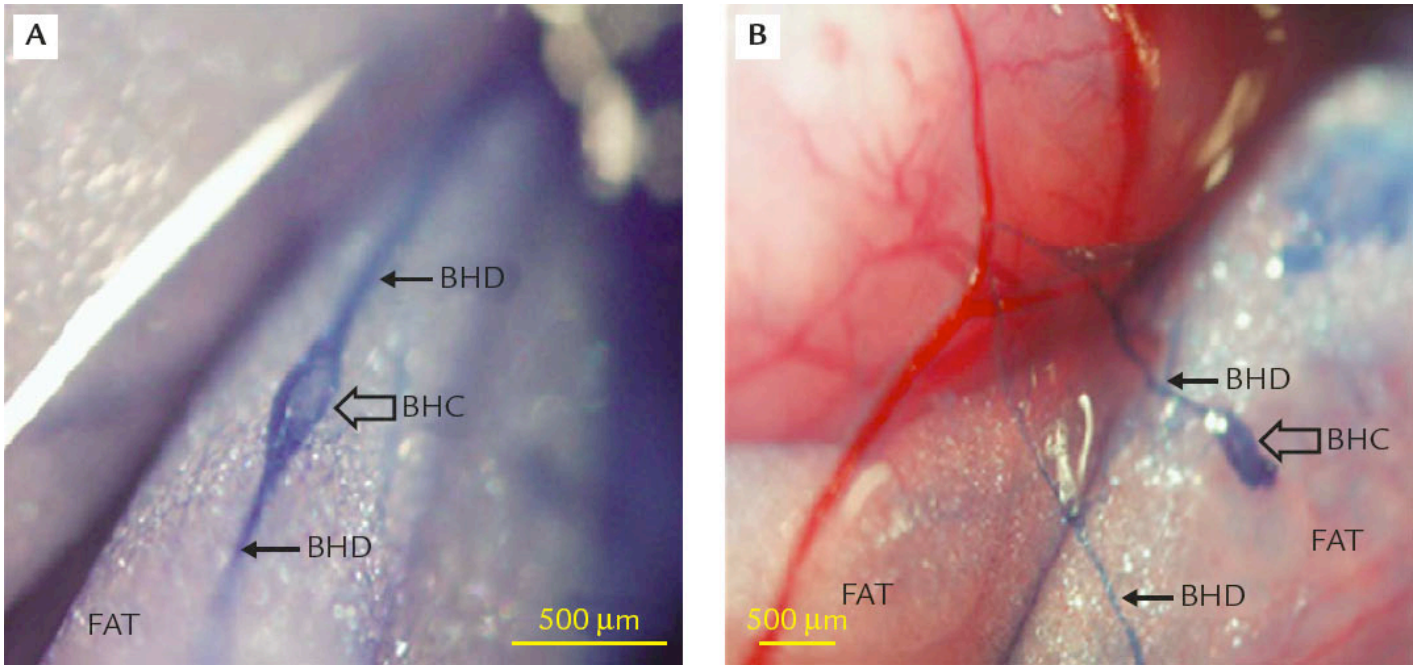
The flow speed of DNA-containing granules within qi meridians on the surfaces of mammalian organs has been reported (Sung *et al.*, 2008), while exposure to ultraviolet A (360 nm) light was shown to increase the flow rate of granules within the meridians in a report titled: 'UV-A Induced Activation of Bonghan Granules in Motion' (Sung *et al.*, 2005). A subsequent paper identified the 'Bonghan System as Mesenchymal Stem Cell Niches and Pathways of Macrophages in Adipose Tissues' comprising the mechanism behind *adipogenesis*: the cellular differentiation process generating adipocytes (Lee *et al.*, 2009).



A concise summary of diverse findings related to the light-enhanced regenerative effects of stem cell production by the qi meridian system was presented in a contemporary paper entitled 'Bonghan Circulatory System as an Extension of Acupuncture Meridians' (Soh, 2009):

Trypan blue technique revealed Bonghan ducts (dotted arrows) along bundle of blood vessels and nerves; right panel, magnified view clearly showing duct along blood vessel; bundle of blood vessels and nerves connect tumor tissue (arrow) at lower left corner to outside skin (Yoo *et al.*, 2009).

The Bonghan system is a newly-discovered circulatory system, which corresponds to classical acupuncture meridians and was discovered in the early 1960s by Bonghan Kim. Despite its potential importance in biology and medicine, it has been ignored or forgotten for a long time. Only recently have most of its significant parts, such as the Bonghan system inside blood or lymph vessels, on the surfaces of internal organs, and in brain ventricles, been confirmed...



A direct test to demonstrate liquid flow, performed by injecting fluorescent nanoparticles into an organ-surface Bonghan corpuscle, revealed a oneway flow, as expected for a circulation system (Lee *et al.*, 2005). The average flow speed, recently measured by injecting Alcian blue into a Bonghan corpuscle on the surface of a rabbit liver (Sung *et al.*, 2008), was 0.3 ± 0.1 mm/s, in agreement with Bonghan Kim's data (Kim, 1965). Liquid flow through a Bonghan duct from the skin toward the internal organs was observed by injecting chrome-hematoxylin and fluorescent nanoparticles in the skin near a rat testis...

Weblike network of Bonghan ducts revealed by using trypan blue. (A) Web of Bonghan ducts on visceral peritoneum around stomach near rat sleen; several small Bonghan corpuscles at crossing points (arrows); blood capillaries not stained. (B) Network of Bongan ducts on omentum below stomach and over small intestine; threee small corpuscles at crossing points of Bonghan ducts (arrows). (C) Inset: another part of same omentum as (A); floating Bonghan duct (open arrow) connected to Bonghan ducts (arrows) in omentum, showing Bonghan ducts on omentum as part of larger network of freely movable Bonghan ducts on internal organ surfaces (Lee *et al.*, 2007).

Improved immune function and beneficial effects on inflammation are often described after acupuncture treatment (Son *et al.*, 2002) and an abundance of mast cells is reported at acupuncture points (Hwang, 1992). We observed that the organ-surface Bonghan corpuscle and Bonghan duct contained a significant number of monocytes, eosinophils, mast cells, and macrophages (Lee *et al.*, 2007; Yoo *et al.*, 2007; Ogay *et al.*, 2009). The abundance of such immune cells in the Bonghan duct supported evidence for the related therapeutic effects of acupuncture treatment and for Bonghan Kim's claim that the organ-surface Bonghan duct is an extension of the classical acupuncture meridian system.

Blood cells are known to be generated in the bone marrow but Bonghan Kim claimed that the intravascular Bonghan duct is another hematopoietic organ (Kim, 1965). Indeed, we observed here that the Bonghan duct became thicker and thus easier to detect when anemia was induced by the injection of phenylhydrazine. Many red blood cells in early stages of maturation were observed in organ-surface Bonghan corpuscles when anemia was induced.

Trypan blue staining of Bonghan duct and Bonghan corpuscle inside adipose tissues. (A) Bonghan corpuscle and connected Bonghan duct inside adipose tissue around rat small intestine. (B) Bonghan corpuscle and two Bonghan ducts near same rat small intestine; blood vessels and adopise tissues not stained (Lee *et al.*, 2009).

Regeneration of damaged liver cells was reported in Bonghan Kim's fourth article (Kim, 1965). Considering this claim, we hypothesized that there might be adult stem cells in Bonghan corpuscles and to verify this hypothesis, we stained sliced Bonghan corpuscles and Bonghan ducts with stem cell marker antibodies. We observed that mesenchymal stem cell markers were strongly expressed in a manner similar to bone marrow...

[Specific] protein profiles suggested that Bonghan Ducts located on organ surfaces have roles as temporary depots and points of differentiation of stem cells for tissue regeneration. Damaged liver tissues are regenerated by the gathering of sanals that had migrated through the Bonghan ducts (Kim, 1965). This process has not been specifically investigated here, but some basic studies have been performed on Bonghan microcells, revealing that their motion appeared to be Brownian, but that they also showed some peculiar light interactions. Their average speed was not affected by visible light, but was significantly increased by UV-A (360 nm) (Sung *et al.*, 2005). The presence of DNA inside a sanal was identified using various types of DNA-specific staining,... and the state of the DNA shown to be fragmented... (Ogay *et al.*, 2006).[19]

These remarkable findings concerning the structural features and flow dynamics of the qi meridian system reveal the complete mechanism by which tissue regeneration is stimulated by exposure to red light (644 nm), and more significantly enhanced by exposure to ultraviolet A light (360 nm), whereby mesenchymal stem cells are produced, distributed and assembled at wound sites requiring regeneration.

This extremely well supported conclusion informs a paradigm-shifting reinterpretation of chromotherapy as an effective method for achieving stem cell regeneration treatments that cost thousands of times less than present-day stem cell injection methods, by directly stimulating the qi meridian system itself.

Irradiation of specific acupressure nodes along the qi meridians by traditional Chinese medicine moxa (infrared) treatment has been extensively studied through biophotonic imaging processes, revealing electro-stimulation of nodal points significantly enhances known acupressure and acupuncture modalities.

Through the use of ancient Atlantean healing techniques, still practiced in secret in various parts of the world to this day, Qigong and Mo Pai practitioners such as John Chang of Java, Indonesia *are able to apply electrical currents to acupressure needles by consciously focusing qi energy stores in their own bodies, for emission through their bare hands. Chang can even ignite paper with his palms* (above).[20]

Synthesis of ancient healing modalities with modern medical breakthroughs offers not only the alleviation of disease factors in the body, but furthermore significantly enhances the human lifespan by cellular regeneration through the process of autophagy, whereby damaged organelles within cells are repaired and the aging process is reversed. Through these ancient means, newly rediscovered, the mystical pursuit of enhanced longevity finds its fulfillment.

Increasing numbers of atmospheric explosions are closely related to the periapsis of our Sol with its binary twin, an unseen brown dwarf companion star. On its regular 36,666.66-year cyclical passage around the sun, the brown dwarf disturbs the Oort Cloud, leaving a meteoric debris field in its wake. This accounts for the rapidly growing number of meteors being reported throughout the world.

Multiple meteorite explosion events in rapid succession occurred in the Ural mountains of Russia, above the city of Chelyabinsk on February 15, 2013, generating a massive primary shockwave followed by several subsequent shockwaves of lesser magnitude that blew out glass windows and damaged buildings for several miles around the bolide explosion. No deaths were reported, yet the multiple concussive events injured over 1,400 people in total. Sizable fragments of the meteor were recovered from Lake Chebarkul after the subsequent discovery of a 20' (6m) wide hole in the frozen ice.[1]

Video footage of the event reveals the controlled destruction of the meteor by green plasma beams emitted from a disc-shaped plasma craft that appears only briefly.[2] This event, along with many other such well-documented UFO incidents involving destruction of meteor threats, reveal an extraterrestrial defense network of underground installations in the Siberian region that actively protect the Earth from major impact threats, as concluded by Russian government investigation of the 1908 Tunguska event.[3]

More recently, in the evening hours of September 26, 2016 a major meteor impact event took place in the Coral Sea off the Queensland coast of Australia, near Boyne Island.[4] The meteor impact shockwave was felt by coastal residents as a jolting tremor, while an actual magnitude 3.8 earthquake did strike the area just hours after the meteor event. While there is no direct evidence for an impact at sea, local firefighters were actively searching the coastline for airplane debris after reports from many eyewitnesses suggested the possibility of a plane crash at sea.

The Coral Sea, Australia and Chelyabinsk, Russia meteor explosions represent strong indicators of the dramatically increasing rate of meteor entry into Earth's atmosphere resulting from the swarm of Kuiper Belt objects and Oort comets dislodged from their distant orbits by the current pass of the brown dwarf twin of our sun. These binary system dynamics dictate dormant periods of global glaciation and active periods of global warming that significantly impact the development of all life on Earth.

Typical elemental composition of chondritic meteorites includes siderophilic and chalcophilic metals such as iron, copper, zinc, aluminum, magnesium, arsenic, tin, indium and antimony.[5] Recurring cycles of slight warming and refreezing according to perpetually shifting ambient space weather conditions during the millennial journeys of meteoritic debris gradually influences the resonant transmutation of aluminum atoms into an unusual isotope of magnesium. How does this nuclear conversion occur?

Low energy conversion of aluminum into magnesium takes place in aluminum rich meteorite samples. Resonant nuclear fission of aluminum into magnesium was first noted as *an excess of rare magnesium isotope (Mg^{26}) in the Allende meteorite* (above), and has been mistakenly attributed as a residue of nucleosynthesis events from the formative phase of our Solar System (Gray & Compston, 1974):

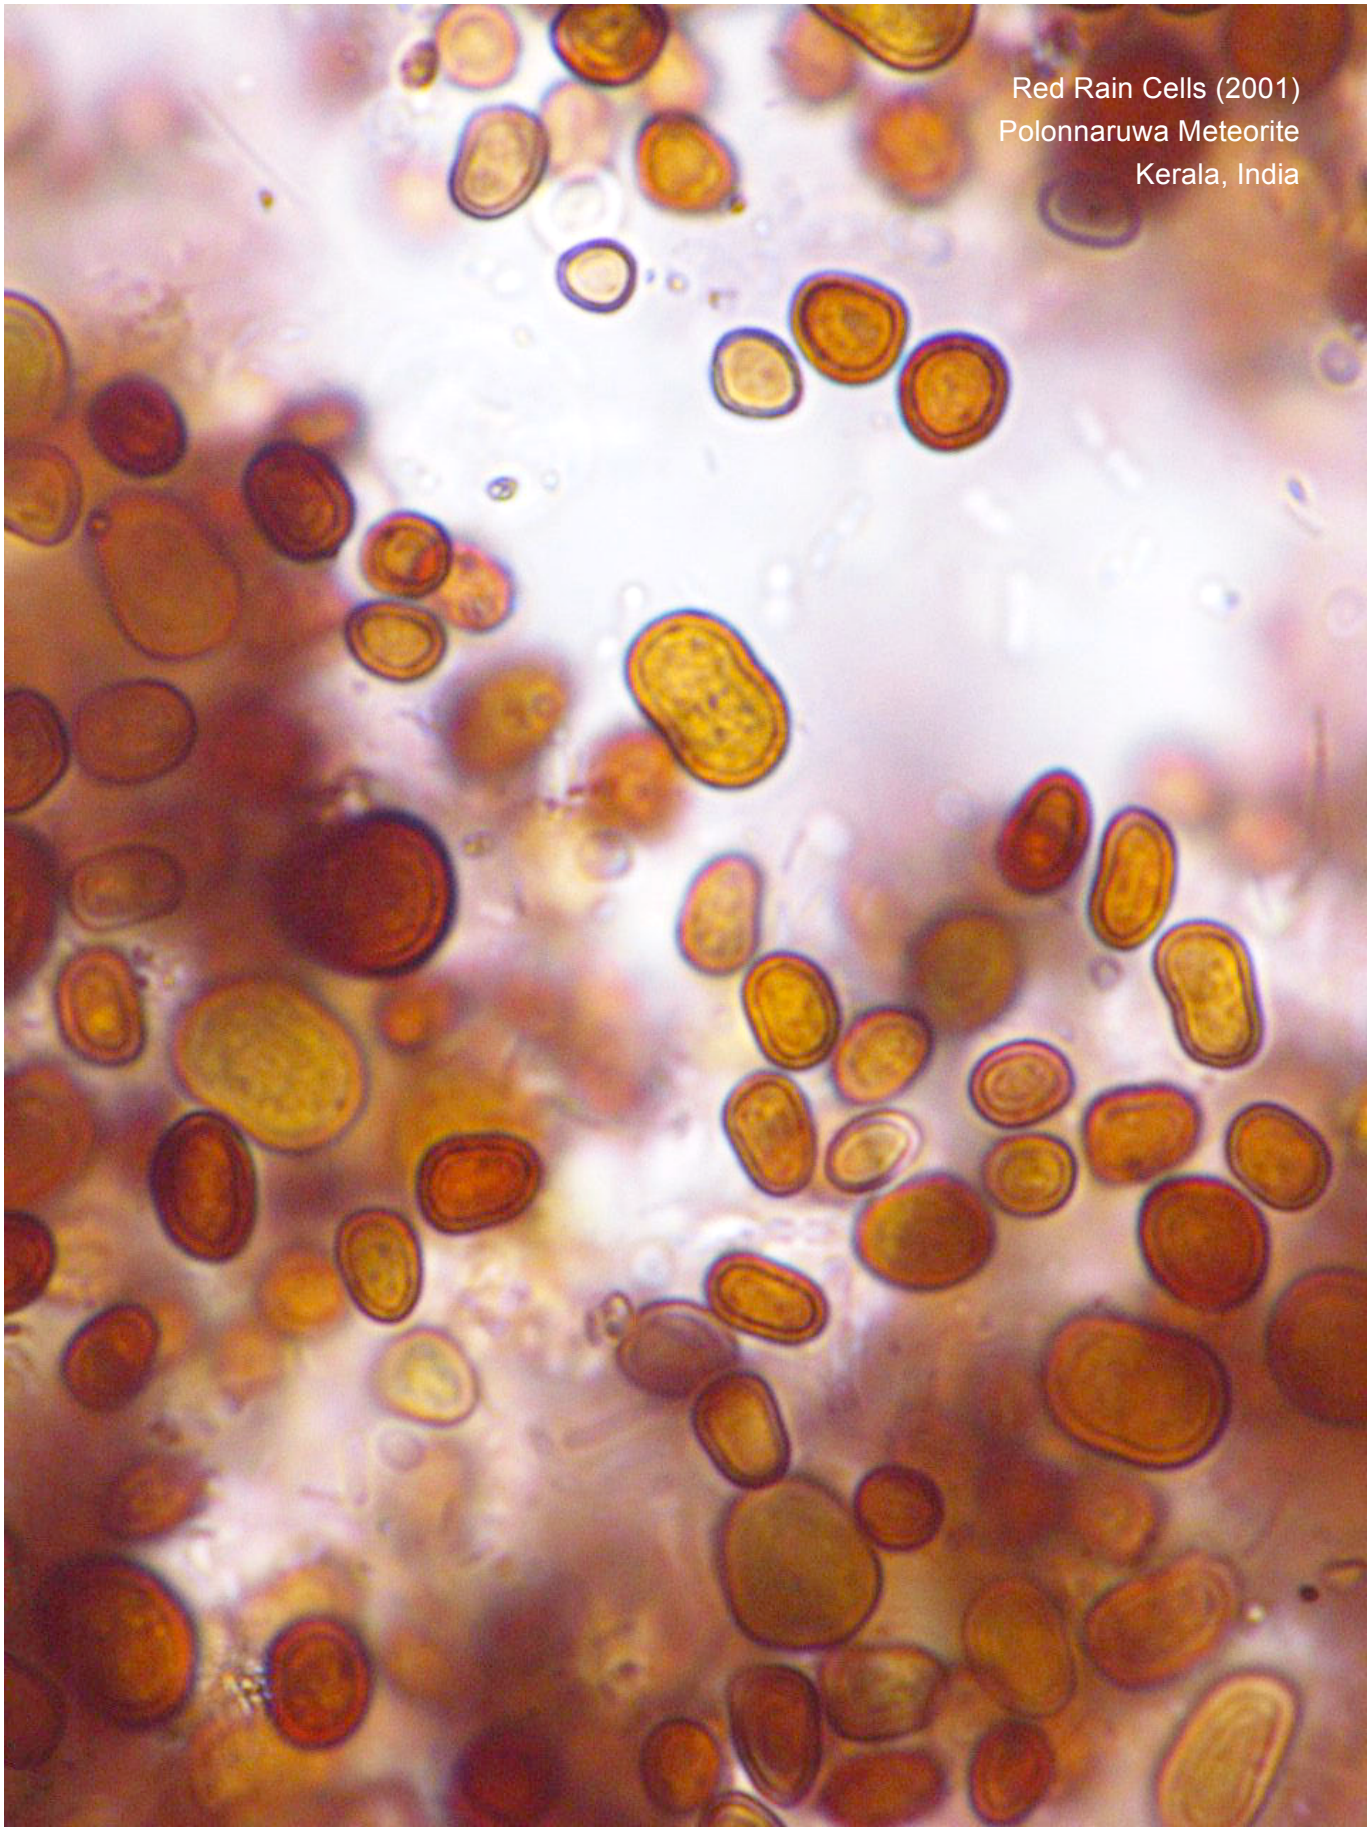
> Variations in the isotopic abundance of magnesium (78.6% ^{24}Mg, 10.1% ^{25}Mg, 11.3% ^{26}Mg) have been sought in meteorites because of the possible addition of radiogenic ^{26}Mg by the decay of ^{26}Al. This short-lived nuclide... is formed by proton bombardment... during the early history of the Solar System. [6]

Phonon resonance determinations reveal frequency matching of stable aluminum isotope (Al^{27}) at -215.4°C with meta-stable aluminum isotope (Al^{26m}) at rest (20°C). Meta-stable Al^{26m} atoms present a half-life of ~717,000 years, releasing electrons during $ß^{+}$ decay into stable magnesium (Mg^{26}) atoms:

$$Al^{27} \Rightarrow H^{1} + Al^{26m} \Rightarrow Mg^{26}$$

Resonant atomic conversion of aluminum into magnesium is enabled at low energies within the temperature conditions of space that fluctuate near -220°C by phonon resonance with an unstable *'extraterrestrial'* isomer of aluminum that is nominally absent in all natural Earthly materials.

By contrast with many previously identified resonant atomic conversions that take place near ambient temperatures in Earth's atmosphere, lithosphere and oceans, low-energy transmutations are even perpetuated in deep space far below the freezing point of water. The resonant frequency of meta-stable aluminum isomer (Al^{26m}) in its rest state is 39,699,570 Hz, according to the element's atomic diameter at 20°C. Stable aluminum (Al^{27}) atoms achieve a matching phonon frequency when cooled to -215.4°C:



$$Al^{27}\ \text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{2.70 \times (6.0221 \times 10^{23})}{26.98154}} = 39{,}205{,}620\ \text{Hz}$$

$$Al^{26}\ \text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{2.70 \times (6.0221 \times 10^{23})}{25.98689}} = 39{,}699{,}570\ \text{Hz}$$

$$\text{Resonant Temperature (°C)} = \frac{Ln\left(\frac{f(39{,}205{,}620)}{f(39{,}699{,}570)}\right)}{0.0000231} + 20 = -215.4°C$$

Starting Element: Aluminum ($_{13}Al^{27}$)	Target Element: Aluminum ($_{13}Al^{26m}$)
Natural Abundance: 100%	Natural Abundance: 0%
Atomic Mass: 26.98154	Atomic Mass: 25.98689
Density (grams/cm^3): 2.70	Density (grams/cm^3): 2.70
Exp. Coefficient: 0.0000231	Exp. Coefficient: 0.0000231

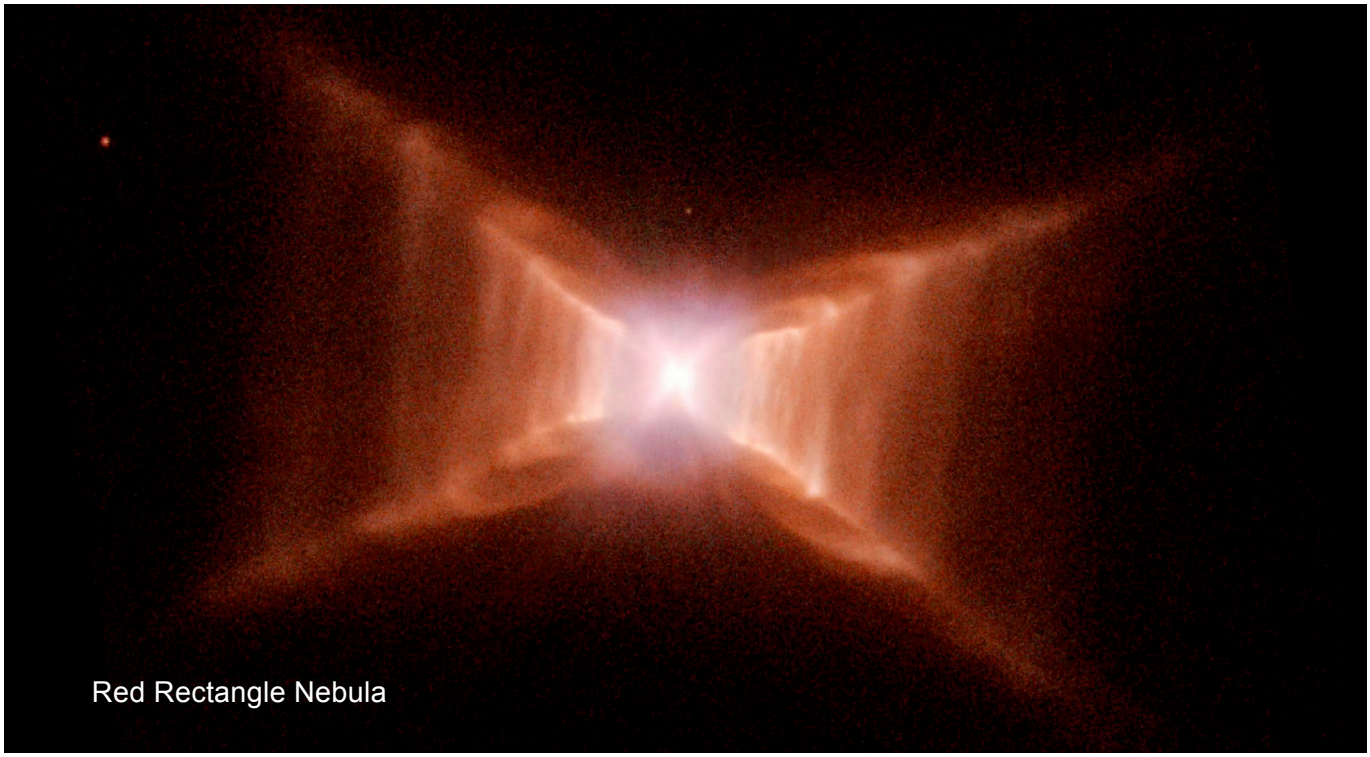
Identification of this very subtle natural atomic conversion process taking place within interstellar chondritic debris allows the possibility of estimating the relative ages for various meteoritic materials by measuring and comparing the relative quantities of this rare magnesium isotope (Mg^{26}).

Red Rain Cells (2001)
Polonnaruwa Meteorite
Kerala, India

Surprising resonant atomic transmutations occurring at deep freeze temperatures in the vacuous depths of space have not been previously recognized by the scientific community, yet coherently account for isotopic shifts in elemental abundance that have baffled scientists for many decades.

Related meteorological findings concerning the Polonnaruwa, Sri Lanka chondritic meteorite and the associated red rain phenomena of 2001, in Kerala, India (below), were followed by similar events in 2012 and 2014. *Microscopic analyses of the red rain, conducted by Dr. S. Kumar, led to the dramatic discovery of red rain cells that likely represent an unknown extraterrestrial species. Furthermore, microscopy of fragments from the Polonnaruwa meteorite by Dr. G. Louis revealed fossilized diatoms.*

The primary task of sequencing the potentially extraterrestrial DNA of the red rain cells was initially thwarted by the unusual character of the protective membrane containing blood-red pigmentation. Finally managing to stain the nuclear structures of red rain cells in 2013, researchers employed DMSO for penetration of the red-colored protective outer membrane to positively identify the presence of nuclear DNA, as detailed in 'DNA Unmasked in the Red Cells of Kerala' (Gangappa & Hogg, 2013):



> We have investigated the fluorescence properties of red rain cells, and the solubility of the red pigment in a variety of solvents. Extraction of the pigment with DMSO allowed successful demonstration of DNA using DAPI staining. Cellular impermeability to staining reagents due to the red pigment is the likely explanation for the failure of previous efforts to demonstrate DNA in red rain cells.[7]

Extraction of the protective red pigment with DMSO enabled another (yet to be published) study, which reports on the 'Temperature Stability of the Red Pigment of Red Rain Cells' (Kumar & Louis, 2016):

> Recent evidences of the features of the red cells which caused the coloration to the red rain of Kerala are very interesting. UV-Vis-NIR absorption studies were conducted in the pigment, of the red cells, extracted using DMSO. Absorption spectra of extracted pigment showed 4 peaks in the visible region and several unexplainable fine structures in the NIR region. The temperature stability of the extracted red pigment was also studied by recording the absorption in the visible region after incubating the pigment at different temperatures which shows that it was very stable up to 190°C. The present results were compared with the temperature stability of known natural pigment, carotenoid.[8]

Dormant red cells reactivate under elevated temperature conditions experienced during atmospheric re-entry, as revealed in 'Growth and Replication of Red Rain Cells at 121°C and Their Red Fluorescence':

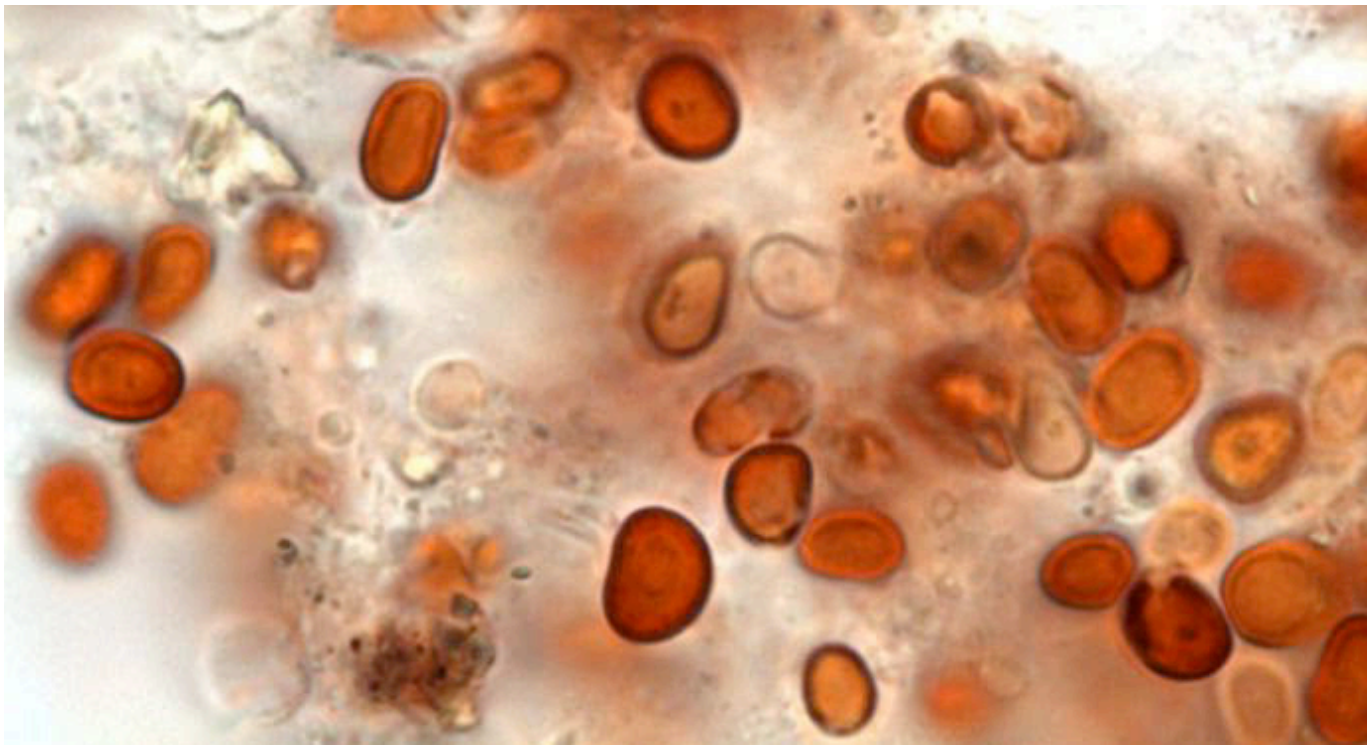
> We have shown that the red cells found in the Red Rain (which fell on Kerala, India, in 2001) survive and grow after incubation for periods of up to two hours at 121°C. Under these conditions daughter cells appear within the original mother cells and the number of cells in the samples increases with length of exposure to 121°C. No such increase in cells occurs at room temperature, suggesting that the increase in daughter cells is brought about by exposure of the Red Rain cells to high temperatures. This is an independent confirmation of results reported earlier by two of the present authors, claiming that the cells can replicate under high pressure at temperatures up to 300°C. The fluorescence behaviour of the red cells is shown to be in remarkable correspondence with the extended red emission observed in the Red Rectangle planetary nebula and other galactic and extragalactic dust clouds, suggesting, though not proving, an extraterrestrial origin.[9]

Red Rectangle Nebula

Further implications of these groundbreaking discoveries concerning the role of Red Rain cells in the cosmos emerged in a study (unpublished) of the 'Unusual Autofluorescence of the Red Rain Cells and the Possible Reason for the Extended Red Emission in the Interstellar Medium' (Kumar & Louis, 2016).

A more detailed analysis of interstellar absorption bands is presented in a subsequent paper (yet to be published), 'On the Possible Role of Red Rain Cells of Kerala as Carriers of the Diffuse Interstellar Bands and the UV Extinction Bump' (Kumar, Wickramasinghe & Louis, 2016):

> The identification of the carriers responsible for the diffuse interstellar absorption bands (DIBs) from 450 to 1000 A° has remained elusive for more than seven decades. The origin of the 217.5 nm absorption feature appearing in the interstellar extinction curve is also an unresolved problem in astrophysics... The absorption studies of the red rain cells of Kerala, in the UV region have consistently showed very broad absorption features at 216.5 nm... The results of the absorption spectra of red cells can be correlated with the DIBs and the UV extinction bump of the interstellar medium, thus showing that the red cell may be a possible candidate for the carriers of these diffuse interstellar bands (DIBs) and the extinction bump at 217.5nm.



With the Polonnaruwa meteorite findings, researchers have firmly established that red rain cells constitute an extant extraterrestrial lifeform that employs a presently-unknown shielding mechanism for protecting DNA in space –*and can withstand prolonged dormant phases during the well below-freezing temperature extremes, intense cosmic radiation and high vacuum conditions of deep space.*

After eons of transit through the emptiness of space, the red rain cells will only become metabolically reactivated at the high temperatures generated by intense friction with gases upon re-entry. In the protective outer layer of the red cells, researchers discovered a *uranium pigment* (Miyake *et al.*, 2013):

> Light microscope examination of the Sri Lankan red rain indicates that the defining red rain cells exist in the presence of other microorganisms including diatoms... TEM study of the red rain cells... shows them to have outer cell walls unusually rich in uranium, and a nuclear region with a strong deficit or absence of phosphorus.[10]

Stable indium isotope (In^{113}) is commonly found in chondritic meteorites, possesses almost half the atomic weight of uranium isotope (U^{238}), and is utilized by red cells for transmutation into uranium:

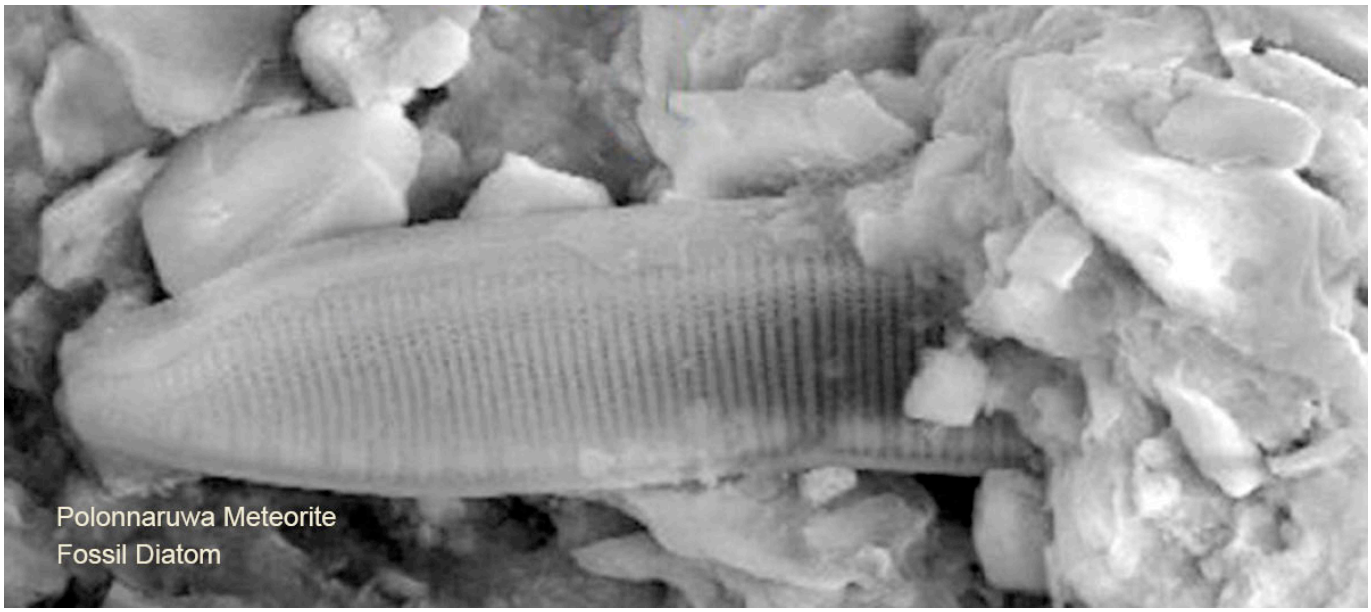
$$2\ In^{113} + C^{12} \Rightarrow Pa^{238} \Rightarrow U^{238}$$

Resonant atomic conversion of indium into uranium occurs in red rains cells within meteorites during atmospheric re-entry at up to 1,650°C by phonon resonance with protactinium. The resonant frequency of unstable protactinium isotope (Pa^{238}) in its rest state is 33,877,796 Hz, according to the element's atomic diameter at 20°C. Indium isotope (In^{113}) resonates at this frequency when heated to 57.5°C:

$$In^{113}\ \text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{7.310 \times (6.0221 \times 10^{23})}{112.90406}} = 33{,}909{,}282\ \text{Hz}$$

$$Pa^{238}\ \text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{15.37 \times (6.0221 \times 10^{23})}{238.05450}} = 33{,}877{,}796\ \text{Hz}$$

$$\text{Resonant Temperature (°C)} = \frac{Ln\left(\frac{f(33{,}909{,}282)}{f(33{,}877{,}796)}\right)}{0.0000248} + 20 = 57.5\ °\text{C}$$



Starting Element: Indium ($_{49}In^{113}$)
Natural Abundance: 4.29%
Atomic Mass: 112.90406
Density (grams/cm^3): 7.310
Exp. Coefficient: 0.0000248

Target Element: Protactinium ($_{91}Pa^{238}$)
Natural Abundance: 0%
Atomic Mass: 238.05450
Density (grams/cm^3): 15.37
Exp. Coefficient: 0.0000099

As with red rain cells, fossil diatoms locked within chondritic meteorites employ the same genetic coding mechanism shared by all terrestrial, aquatic and atmospheric lifeforms of Earth; passing on specific genes using deoxyribonucleic acid, commonly known as DNA. This profoundly reassuring discovery of fossil diatoms in meteorites –*the widely strewn remnants of other oceanic planets in our vast spiral galaxy*– confirms that DNA-bearing organisms proliferate throughout the great depths of the Universe. This clear and inescapable conclusion has been denied by mainstream microbiology.

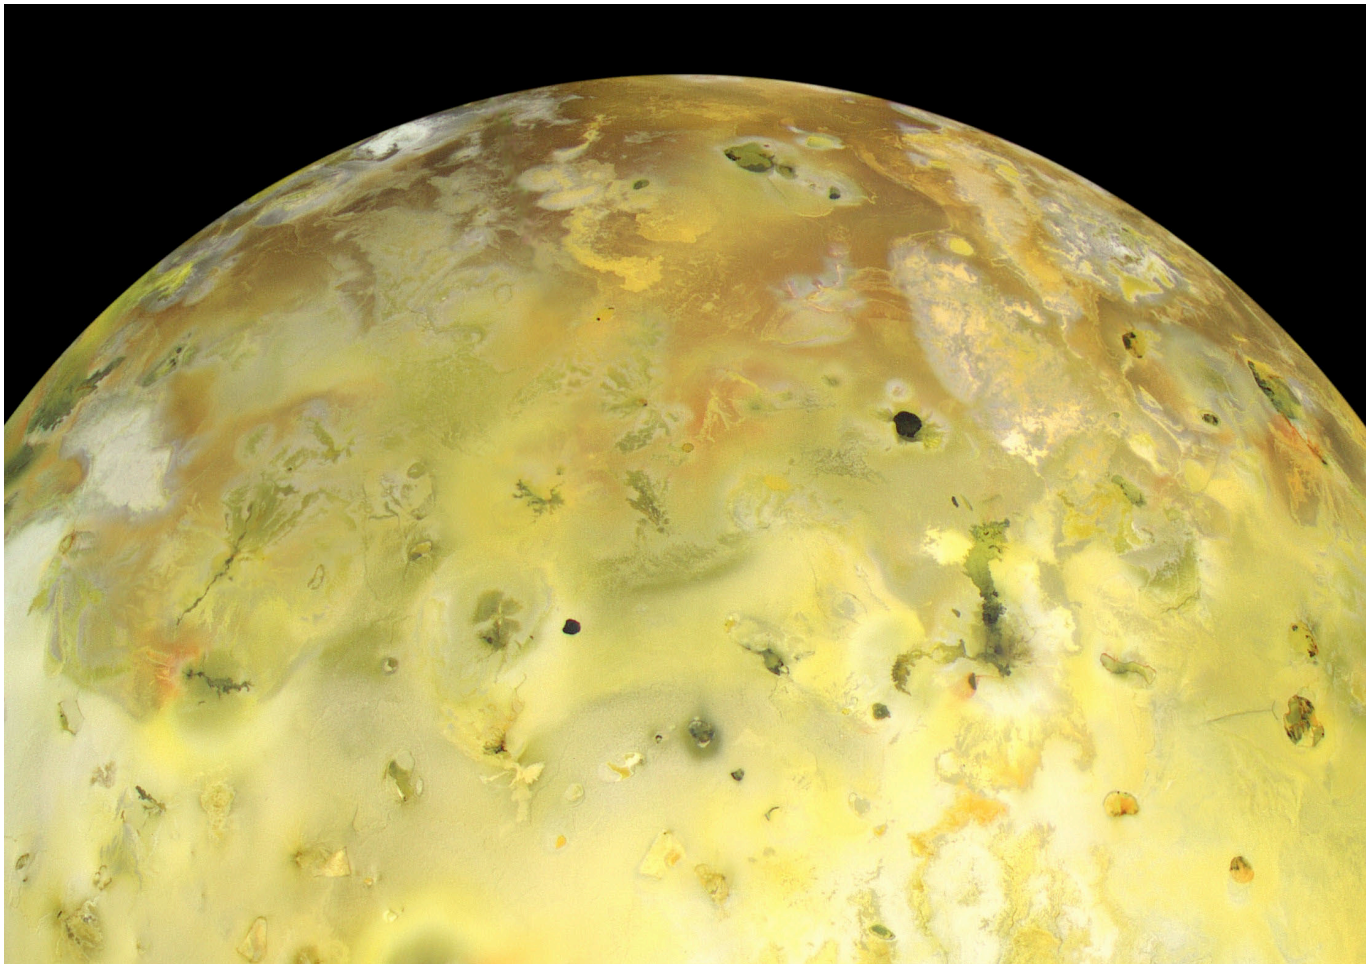
These paradigm-shifting results provide a tentative yet tantalizing answer to the open question of universal panspermia, suggesting that the red rain cells represent 'cosmic seeds' that can survive the extremely harsh conditions of interstellar space to spread DNA-based life throughout the cosmos.

Compelling research efforts and major scientific contributions to these immense discoveries made by Indian microbiologists S. Kumar and G. Louis have not been adequately recognized, yet their breakthrough preliminary identification of this extraterrestrial species merits much further investigation.

Comprehensive identification by full genomic sequencing of the red rain cells will soon confirm the genetic basis of their highly specialized space-faring characteristics, including their synthesis of the unique molecular structures of refractive uranium-based pigment that may find significant applications to the shielding of man-made space vehicles and probes developed in the near future.

As human beings of Earth continue to venture offworld, developing and perpetually advancing spaceflight technologies that will eventually take us to other star systems, we are limited only by our knowledge of the Laws of Creation and the processes of life throughout the cosmos. Terrestrial humanity has come to the critical threshold concerning the knowledge of other worlds, including knowledge of other dimensions of reality and the nature of the resonant atomic transmutation of elements that generates soft, multi-photon biological radiation within all living organisms.

Simple lifeforms such as diatoms that thrive in the oceans of countless worlds beyond our solar system do not appear to be able to survive long interstellar journeys following supernovae ejection events, yet their ubiquitous presence in chondritic meteorites offers unmistakable evidence for the universality of DNA-based life, requiring specific phonon resonance interactions for growth and replication.



Red rain cells first recovered in Kerala, India reveal the atomic and molecular mechanisms by which life is disseminated far and wide by explosive forces resulting from cyclical stellar collapses that do not only destroy whole planetary ecosystems in the blink of an eye, but are also responsible for initiating deep-space journeys that transfer DNA-based lifeforms into the atmospheres of newly forming worlds.

Ancient microfossil diatoms displayed in micrographs of the Polonnaruwa meteorite (opposite) bear no significant differences from living diatoms thriving in the oceans of Earth (above). While the likelihood of DNA extraction and sequencing of extraterrestrial diatoms remains extremely low, further investigation of the temperature-dependent phonon resonance interactions taking place within living diatoms promises to elucidate the breadth of subtle reactions that support life throughout the universe.

Follow-up discovery of carbonaceous hystrichospheres, known as resting phases of largely extinct marine dinoflaggelate algae, and carbonaceous filaments of cyanobacteria (once categorized as 'blue-green algae') within the matrix of the chondritic Polonnaruwa meteorite[11] implicates the widespread presence of organisms from other worlds perpetually bombarding the Earth.

Specific temperature-induced growth and reproduction phases of the red rain cells will likewise expand our understanding of the crucial conditions met by these organisms when encountering new planetary environments throughout the vast expanses of space-time, indicating those planets where DNA-based lifeforms may proliferate under adverse conditions not presently recognized as harboring life.

A different resonant atomic reaction is responsible for the color *and odor* of Jupiter's moon Io (above), the most volcanically active body in our solar system. Low energy transmutations producing sulfur atoms were first identified *in the geological formation of mineral gypsum* and *as a main source of the natural abundance of mineral sulfur* produced by volcanic processes on Earth (Kervran, 1972).

Atomic transmutation cascades responsible for the accumulation of sulfur *at volcanic vents throughout the universe* are induced by the same critical thermoregulation temperature of the human body, wherein oxygen atoms achieve phonon frequency matching with hydrogen atoms at rest.

Disgorged from superheated volcanic vents, chlorine and sulfur atoms bound with oxygen atoms (typically forming chlorine dioxide and sulfur dioxide) become informed by the phonon frequency of hydrogen at 37.8°C. By this mechanism, solitary hydrogen atoms are released during resonant fission events that occur as the gases rapidly cool on contact with exposed rock at the mouth of the vent:

$$Cl^{37} + O^{16} \Rightarrow S^{36} + H^{1} + O^{16}$$
$$S^{36} + O^{16} \Rightarrow Cl^{35} + H^{1} + O^{16}$$
$$Cl^{35} + O^{16} \Rightarrow S^{34} + H^{1} + O^{16}$$
$$S^{34} + O^{16} \Rightarrow S^{33} + H^{1} + O^{16}$$
$$S^{33} + O^{16} \Rightarrow S^{32} + H^{1} + O^{16}$$

The resonant frequency of hydrogen (H^{1}) in its rest state is 3,773,180 Hz, according to the element's atomic diameter at 20°C. Oxygen isotope (O^{16}) resonates at this same frequency when heated to 37.8°C. These phonon determinations reveal the same resonant nuclear transmutation processes enable the gradual accumulation of sulfur at volcanic vents and the dynamics of the thermoregulatory system of the human body that releases vitalizing hydrogen byproducts within all of our cells.

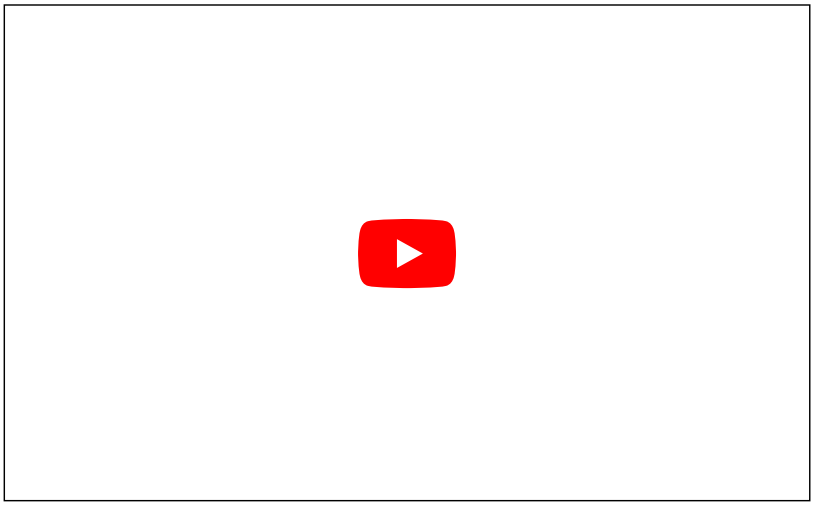
Piezoelectric Basins for Acoustic Levitation Identified at Megalithic Sites

Focusing the Heartbeat of the Sun



by Alex Putney for Human-Resonance.org
August 27, 2011

The many astoundingly beautiful monuments of the Giza plateau, along the Nile River in Egypt, display a remarkably precise set of engineering specifications and psychoacoustic effects that indicate an ancient biorhythmic synchronization network once operated on a global scale. Preceding the Dynasties of the Pharaohs by several thousand years, this global pyramid culture was a technologically advanced Sanskrit world nation that employed these giant crystalline structures to synchronize the pineal, hypothalamus and pituitary glands with the human heartbeat at temples and sacred sites worldwide.

The striped, hooded headdress of the Great Sphinx references the hooded Kundalini cobra, an animal which is also seen extending from the third-eye, or ajna chakra of the female figure. These are unmistakable Sanskrit symbols and biorhythmic synchronization technologies that were later preserved in the monumental psychoacoustic architecture, hieroglyphic writing and cosmology of the Sumerian, Egyptian and Mayan civilizations. Bioelectrical stimulation of cellular metabolism enabled in the pyramid structures provided for the purification and rejuvenation of the body using a special, lighter form of water.

An outspoken local wisdon-keeper of the Giza plateau, Egyptologist and tour-guide Abd'el Hakim Awyan has brought ancient knowledge to bear on the profound implications of these astounding ancient constructions. Hakim's provocative commentary on the misconceptions of modern academics concerning the ancient stone structures of the Nile region was broadcast in The Pyramid Code, a documentary produced by Dr. Carmen Boulter, Professor at the University of Calgary:

In this carefully researched documentary, Hakim reveals several insights, including the advanced nature of the psychoacoustic and biorhythmic effects of these ancient Sanskrit monuments that have been falsely attributed to the 'Egyptian' civilization:

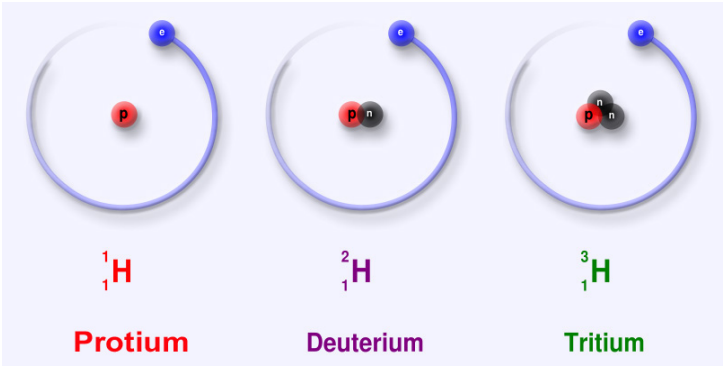
> In 1936, 1937, the Sphinx was covered up to the neck in sand; [this] was my playground - there were tunnels I used to walk, [and even] crawl in sometimes because it's narrow. At Abu Ghurab we have a crystal altar, a round disc in the middle of four [radial lines] - a symbol of 'hotep' - and the word 'hotep' means peace and food. This round disc is a lid on a shaft, about 180 feet deep to the level of the ocean and there is still running water in there and you can feel it while you are in the area.
>
> These [giant concave quartz] instruments, were not found in a line like you see today, nine of them were found around the area, and there are still more to be found. And then we have the oldest obelisk created in Egypt. Next to that altar - what's left of... the... hieroglyph writing, that is Sufi writing, at the obelisk... [depicting] the disc of the Sun, and words saying the Heart of the Sun: 'i-bra'...

Limestone basins were also collected near the northwest corner of the remains of the giant obelisk at Abu Ghurab, each bearing identical forms and carefully rendered circular concavities (below). A view of the squared blocks from above reflects the ancient Sanskrit mandala of a circle within a square, while the strict adherence to geometry and identical forms of the many basins belies a complex mechanical purpose that has not yet been identified by modern Egyptologists or any independent researchers.

These many stone basins have remained a mystery for generations of modern Egyptologists, who claim the basins were used in the blood collection of ritual sacrifices. While no trace residues of blood have been found on any of the stone basins, this hypothesis is further complicated by the fact that the three holes are located near the upper rim of the basin, not at the bottom. This feature indicates that the holes were not designed to let out blood from animals placed in the huge basins, but were actually used to fill the basins with water. But if the basins are filled without a drain outlet, where does the water go?

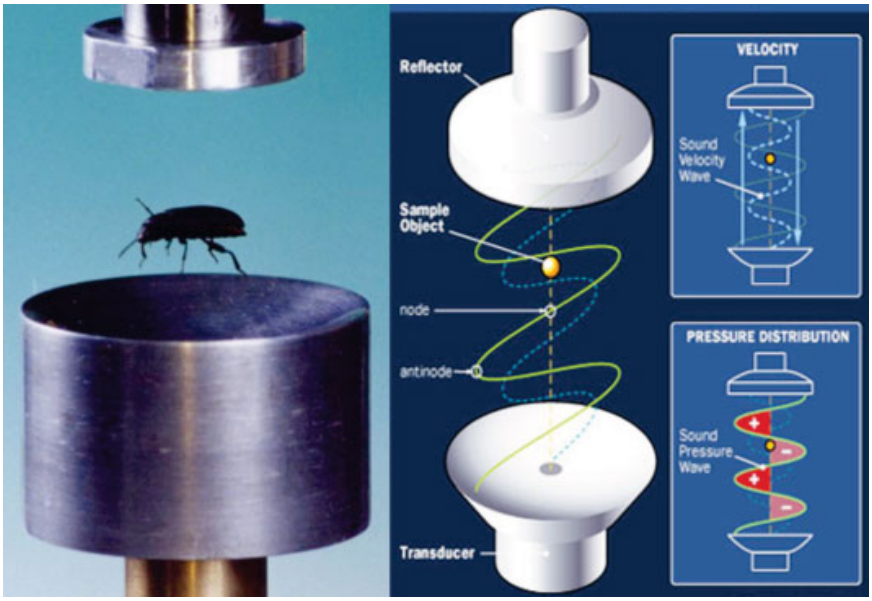
The huge quartz basins were designed with one borehole centered on each of the four sides of the square bases of the instruments, while the comparable limestone examples display three machine-drilled holes on just one side of the square blocks. As well, the diameters of the bowls appear to be uniform, suggesting they were part of a large array that once surrounded the pyramids before being collected in groups by Egyptian authorities for present-day public display.

The identical dimensions and curvature of the many stone basins, with perfectly rendered geometric forms, gives the appearance of having been serially manufactured through mold-making processes rather than being quarried and carved in a solid state. Abundant evidence of this fact has been ignored for close to 30 years by much of the academic community, despite publication in



scientific journals. The geopolymer research of Dr. Jacob Davidovits documents the lower density of the limestone blocks of the Great Pyramid, showing them to have been synthetically cast using a concrete-like slurry composed quite differently than all naturally sedimented limestone. The pyramid's massive limestone blocks contain an exotic admixture of opal CT, hydroxy-apatite and silico-aluminates that enhance the limestone's natural capacity to convert all atmospheric acoustic energy into an electrical current within the crystals, inducing a strong electromagnetic field around the pyramid structures and within their passages and chambers.

Both the low density and exotic mineral composition of the limestone basins may reveal their synthetic nature, while the quartz basins bear drill marks that suggest they were quarried stones. The modular nature of the blocks suggests they were distributed around the pyramids as part of the original walled enclosure that once surrounded each of the three pyramids on the Giza plateau.



The specific and exclusive use of piezoelectric calcite and quartz crystals for the construction of the pyramids themselves, and the large basins that once surrounded them in great numbers, relates to their transducive capacity to focus and amplify acoustic waves. Mechanical flexing occurs in the quartz and calcite crystals as a uniform structural deformation that generates standing waves within the stones' crystalline lattice, eventually building a strong electromagnetic field that allows acoustic levitation.

The high-walled enclosure, resembling a courtyard, contained energetic waters identified by the local indigenous wisdom traditions as Lake Hathor. The lake waters were absorbed by the porous limestone of the pyramids, and provided direct electrical connection to the subterranean water table and thereby to the world's oceans. The pyramid texts of Saqqara describe this absorption of water within the stones in exact terms, stating that the pyramids' "foundations are the stones, the water..." The hieroglyphic inscription on the obelisk at Abu Ghurab reads "Heart of the Sun" in reference to the pyramid network's piezoelectric transduction of the infrasound resonance of the sun, at the 1.45 Hz frequency of the human heart at rest. Were the pyramids responsible for the regulation of global heartbeat patterns and weather patterns?

Infrasonic stimulation of solar flare activity has been correlated to river flow and precipitation rates. Could it be that the pyramids were designed to increase atmospheric evaporation by heartbeat resonance? The high-resonance form of hydrogen is called protium, being the lightest hydrogen isotope, known for its powerful rejuvenative effects, in stark contrast to the cellular aging induced by heavy water. The levitation of water by solar-driven infrasound resonance allows separation of lighter protium water molecules from the heavier isotopes of deuterium and tritium (above).

Acoustic engineers have developed small, concave piezoelectric transducers enabling the generation of standing waves for acoustic levitation. Both *water* and small living organisms (like the beetle, above) have been levitated using ultrasound, while the ancients used giant low-frequency transducers. During the conquest of the Americas, historian Garcilaso de la Vega documented the destruction of giant granite bowls at Inca sites in the Andes *having diameters that exceeded the height of two men.* Concave granite basins were also found in the passage chambers of Knowth, Dowth and Newgrange, in Ireland. Just as in the case of the pyramid chambers, *the world's megalithic chambers also produced lightwater vapor.*

Both the piezoelectric properties and the perfectly formed concavities of the large, ancient stone basins confirm their utility as *precision instruments for acoustic levitation*, and their cultural context informs us that *water was being levitated*. This conclusion is also directly supported by the cosmology of the ancient stepped-pyramid-building cultures of the Maya and Aztec, who speak very clearly in the Pyramid of Fire Codex about the separation of terrestrial and celestial waters - referring to the resonant solar infrasound separation of pure protium from the low-resonance isotopes of deuterium and tritium:

> *Chalchiuhtlicue, Goddess of Terrestrial Waters, of that which flows, runs, surges, forward and down...*
> *Chalchiuhtlicue fills the gourd of pulque so that man may forget...*
> *Tláloc, God of Celestial Water... god of the mist that ascends from the valleys at dawn...*
> *Tláloc is the return of vapor that strains to rise, is the return of time that strains to remember.*

Longevity and cellular rejuvenation were imbued by drinking lightwater in the resonant infrasound environment of the pyramid chambers. The base length of the Aztec pyramid of Teotihuacan closely matches the 765' base length of the Great Pyramid, for transducing infrasound standing waves at the heartbeat frequency. Hakim Awyan identifies the resonant functions of the Nile pyramids as acoustic diagnosis and healing, according to local wisdom:

> At Saqqara... is the famous 'Step Pyramid' of Djoser... a King of the 3rd Dynasty, roughly 2,900 BC say the books. The step pyramid is located in a big courtyard, much, much older than pyramid itself. You can compare it for yourself - if you look at the pyramid and look at the wall (of the courtyard) you can see the difference...
>
> I will take you now to the 'hospital', [acoustically designed for] healing with sound... That line of construction, [where] you see like three chambers - it's what's left of the House of Spirit, and it's a healing system with sound. It's a medical investigation table and the patient has the right to use either side of the stairs, one on the right and one on the left, so he or she has to follow his or her own 'antenna' to climb up there and choose the point where she [should] stand, because each point is connected to a [diagnostic-]check chamber. We have 22 of the chambers, 11 each side --no ceiling-- and when you go inside you see a niche where the physician put his head in the niche to see what's the matter with his patient laying on this table; and that works with sound, and the sound source is running water in a tunnel underneath here. There is a big map of [networked] tunnels running underneath here...
>
> [Academics have claimed] these constructions... at Dashur, [to be tombs] related to a King called Seneferu... Now, when you come to the word *'seneferu'* - sen means 'double', nefer is 'harmony', so it means *'double harmony'*. It's *not* the name of a person - but it's the energy we get from these constructions! The Bent Pyramid has two different chambers for [producing] two different sounds."

Awyan's training and intuitive understanding of the acoustic healing techniques practiced in the pyramids is explicitly tied to the concept of bi-frequency resonance within the range of the human voice, enabling the synchronization of the hemispheres of the brain. Known as binaural beating, this effect underlies the ancient Sanskrit kundalini tradition that originated in the antediluvian mother-culture of Atlantis, preserved throughout Egyptian art. Kundalini cobras adorn the House of Spirit at Saqqara (above), suggesting the more ancient Sanskrit Atlantean origin of the megalithic enclosure and the later construction of the Step Pyramid inside it, as understood and passed down by indigenous Elders.

The dimensions of the diagnostic chambers of the House of Spirit are calibrated to resonate at two offset frequencies within the range of the baritone voice that generate a difference tone, or *beat frequency*, at the 1.45 Hz human heartbeat rhythm. Biorhythmic resonance was thereby established and maintained between the ancient Vedic healer and the patient. Healers would place their heads into the small niches opposite the diagnostic platforms, placed at nodal points within the architecture, enabling the healer to remotely perceive the doshic imbalances of the patient.

These open-air, high-walled piezoelectric structures were used for healing practices in combination with other chambers below the House of Spirit itself, as well as in the interior chambers of the pyramids and at distant megalithic monuments in alignment with the octagonal axes of the Great Pyramid of Giza. This unified resonant Vedic healing system was applied throughout the world's sacred sites, which comprise a vast global network designed to enhance human longevity. The resonant pumping of the fluids through the human body reflected the resonant evaporation of vast amounts of lightwater into the atmosphere.

Lightwater was levitated into the sky from the arrays of large concave stone transducers surrounding the walled enclosures, and from the surface waters of Lake Hathor and the Nile River, to be distributed as *a lightwater vapor canopy above the many focal points of infrasound standing waves.* Lightwater vapor *became ignited as giant luminous HHO plasma plumes that rose in brilliant swirling patterns into the sky above the pyramids*, as recorded in the Mayan Tree of Life murals at Teotihuacan. The ultraviolet-A and infrared emissions of the HHO plasma would have caused the white limestone casing of the Great Pyramid to glow a brilliant white, due to the ultraviolet fluorescence of the calcite microcrystals.

Along with high-resonance waters, the bioelectric enhancement of cellular functions allowed extended lifespans for those practicing the sacred barefoot lifestyle within the temple walls. This form of spiritual metabolism based on exposure of the body to weak electrical currents and strong electromagnetic fields is referred to directly by the concept of 'hotep', defined by Dr. Awyan as meaning 'peace and food'. The resonant heartbeat synchronization of the entire globe provides the telepathic link that engenders peaceful human relations, as hearts and minds are coupled into resonance. This peace concept is echoed in the term 'Arc of the Covenant', referring to *the global biorhythmic 'agreement' of telepathy.*

Deep heartbeat booming emanating from the Giza pyramids resounded loudly at various bands of resonant focal points throughout the world network, based on the quadratic function [$z_{n+1} = z_n^2$]. The distance from Giza to the Irish sacred sites of Newgrange, Knowth and Dowth is 10.0% of the Earth's mean circumference distance (of 24,892 miles). Stonehenge, England lies at the 9.0% distance from Giza, while the sacred stone temples of Teotihuacan, Mexico and Machu Picchu, Peru sit exactly along the 30.0% and 30.9% Fibonacci-based resonant distances from Giza. These perfect distance relationships reveal a systematic global alignment.

The Temple of Isis at Philae was designed with very similar psychoacoustic architectural features, including a small granite altar right in front of a small cubical niche inset into the wall. Both of these features are engraved with the sacred cross pattern, variously referred to in the Nile region as the Philae Cross (as well as the Coptic Cross, the Rose Cross, etc...) and corresponds exactly to the spherical Prime Cross rendering that I produced in 2006 (compared above), using the 2D octagonal quantum iterated function of Dr. A. Jadzyck. This spherical resonance formula has also been rendered in crop circle formations.

Infraworld

Alexander Putney

In the one before this we find in the land of the Poseidians when the rule was in the house of Ode, and the entity then gave to that people the manner of use of the universal forces as may be applied in the way of mechanical construction in a physical plane. The entity was then known as Ode...

Well that those who have this charge take notice of the responsibility in the present condition,and with the present entity, that the world, the peoples, the nations, may gain that advantage of the abilities of the entity, for let it be known that with the development as acquired through this entity... would make just as far from the high development as it may make with the correcting of the urges as presented.

Then, let the entity gain that as the first the knowledge of self, and of Him who gives all good and perfect gifts, then the ever correcting force of His purpose... be directed in that channel, leading then ever upward, onward, to that bright and holy land.

The visible and audible spectrum of human perception is limited to the experience of three-dimensionality. Just outside of this narrow bandwidth of perception, the activities of higher dimensions can be observed in infrared light and in the infra-sound frequencies of consciousness of the cosmic 'Om'.

Infraworld activities beyond direct perception leave physical imprints in our material realm that scientists continue to collect in sheer amazement of the consistent reproducability of hard, convincing data in support of unimaginable realities intertwined with our own 3rd-dimensional reality.

The integrated scientific works of Charles Fort, Nikola Tesla and Edgar Cayce are upheld by the extraordinary findings of exceptional modern-day psychic mediums and geneticists to reveal the undeniable quantum reality of highly suppressed information including the Tesla Gravity Motor readings and the extraterrestrial genetics of the giant hybrid Sasquatch.

It was covered with hair but appeared more human than animal-like, and the crown of the head was pointed and bristled with hair sprouting outward in all directions. He also observed the hands and feet discovering that the palms and soles were hard and calloused each with long pointed nails that seemed to shine like polished steel...

As the creature... began vigorously rubbing it's hands together causing by degree, an uncanny glow to gradually engulf it's entire body while the most potent centers of which appeared to be the tips of the pointed nails, the eyes, and the crown of the head.

It then raised itself and, as if dancing to some imagined melody, began rapidly rubbing both feet upon the cave floor.

This action seemed to rejuvenate the creature having the effect of increasing the radiance of the glow that surrounded the creature's body, while also producing a more pronounced potency at the centers of illumination.

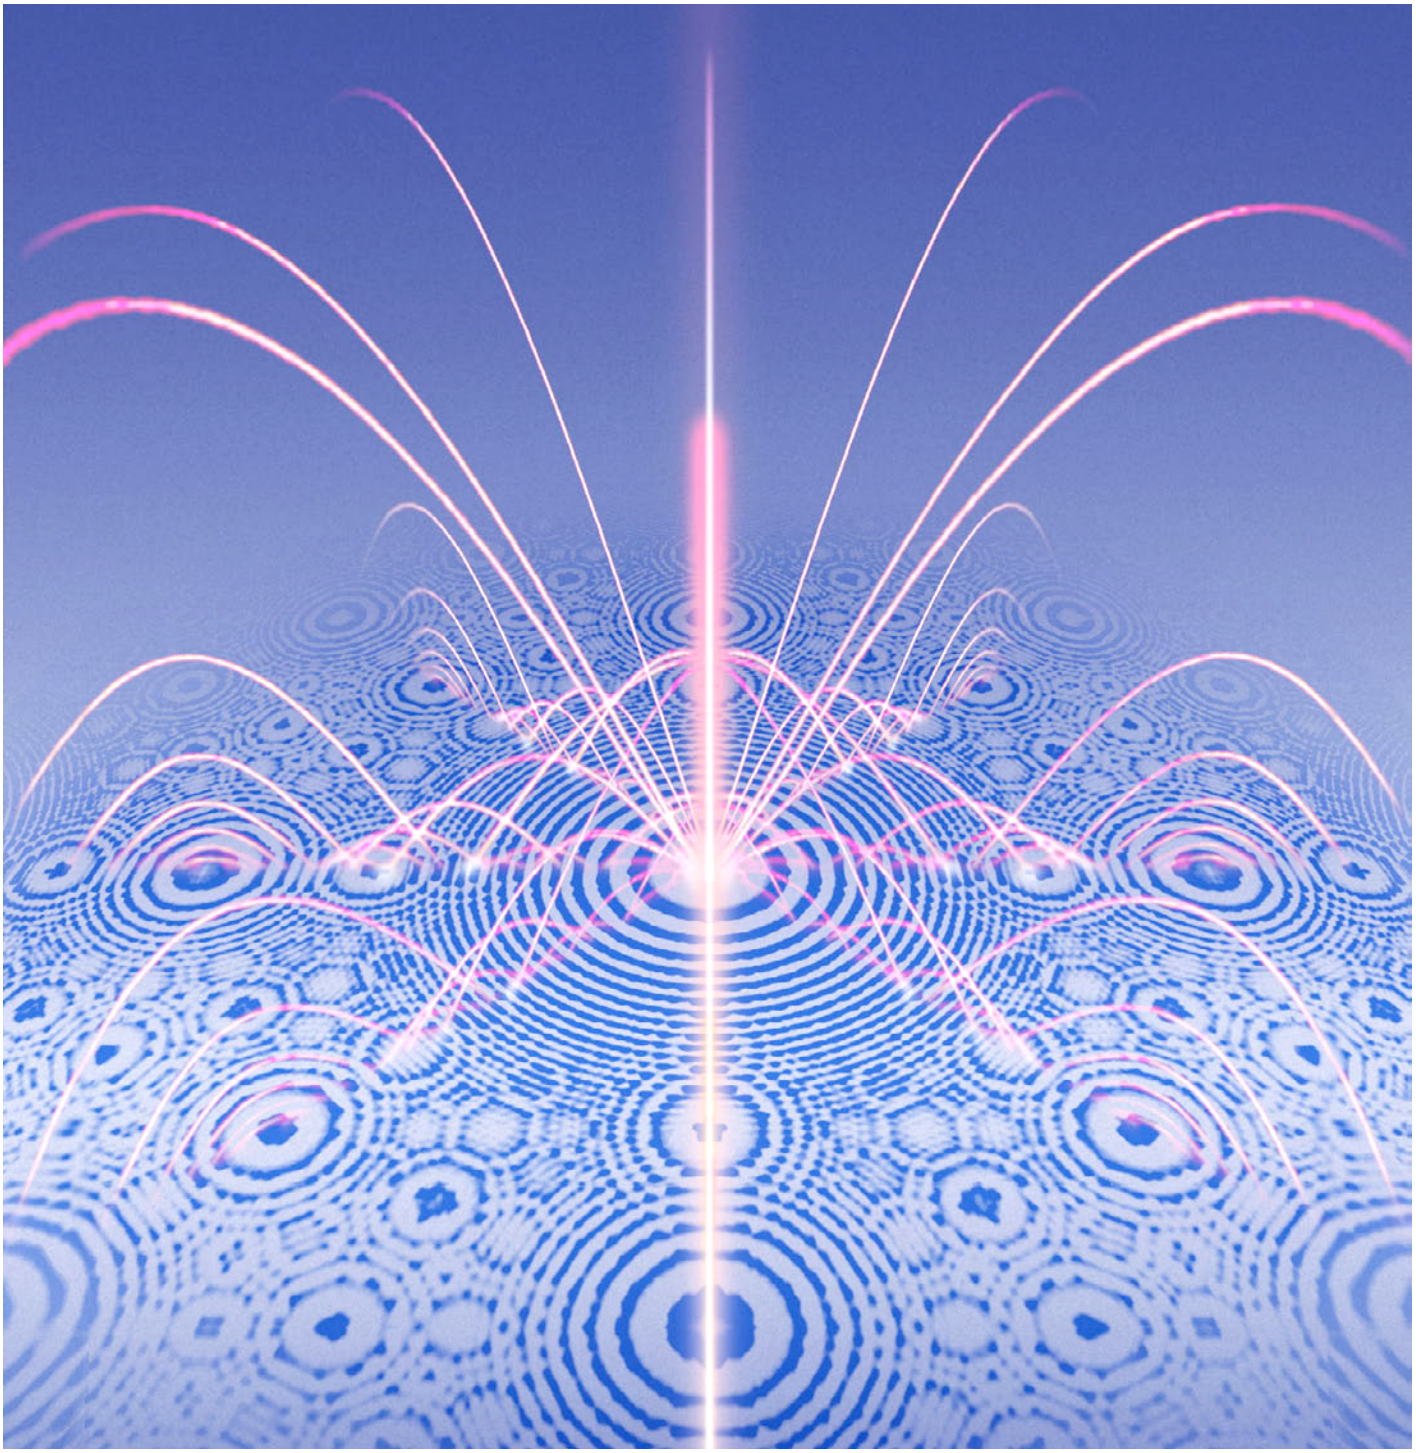
Fortean Phenomena

Fortean Phenomena

Rapidly unfolding electromagnetic changes witnessed in the intensifying volcanic, earthquake, tsunami, cometary and UFO activity appear to follow a distinct geomagnetic distribution pattern. This pattern was known to the ancient monument-builders as the *mandala* –an expression of cosmic infrasound resonance that vivifies the Earth and aligns the consciousness of all living creatures.

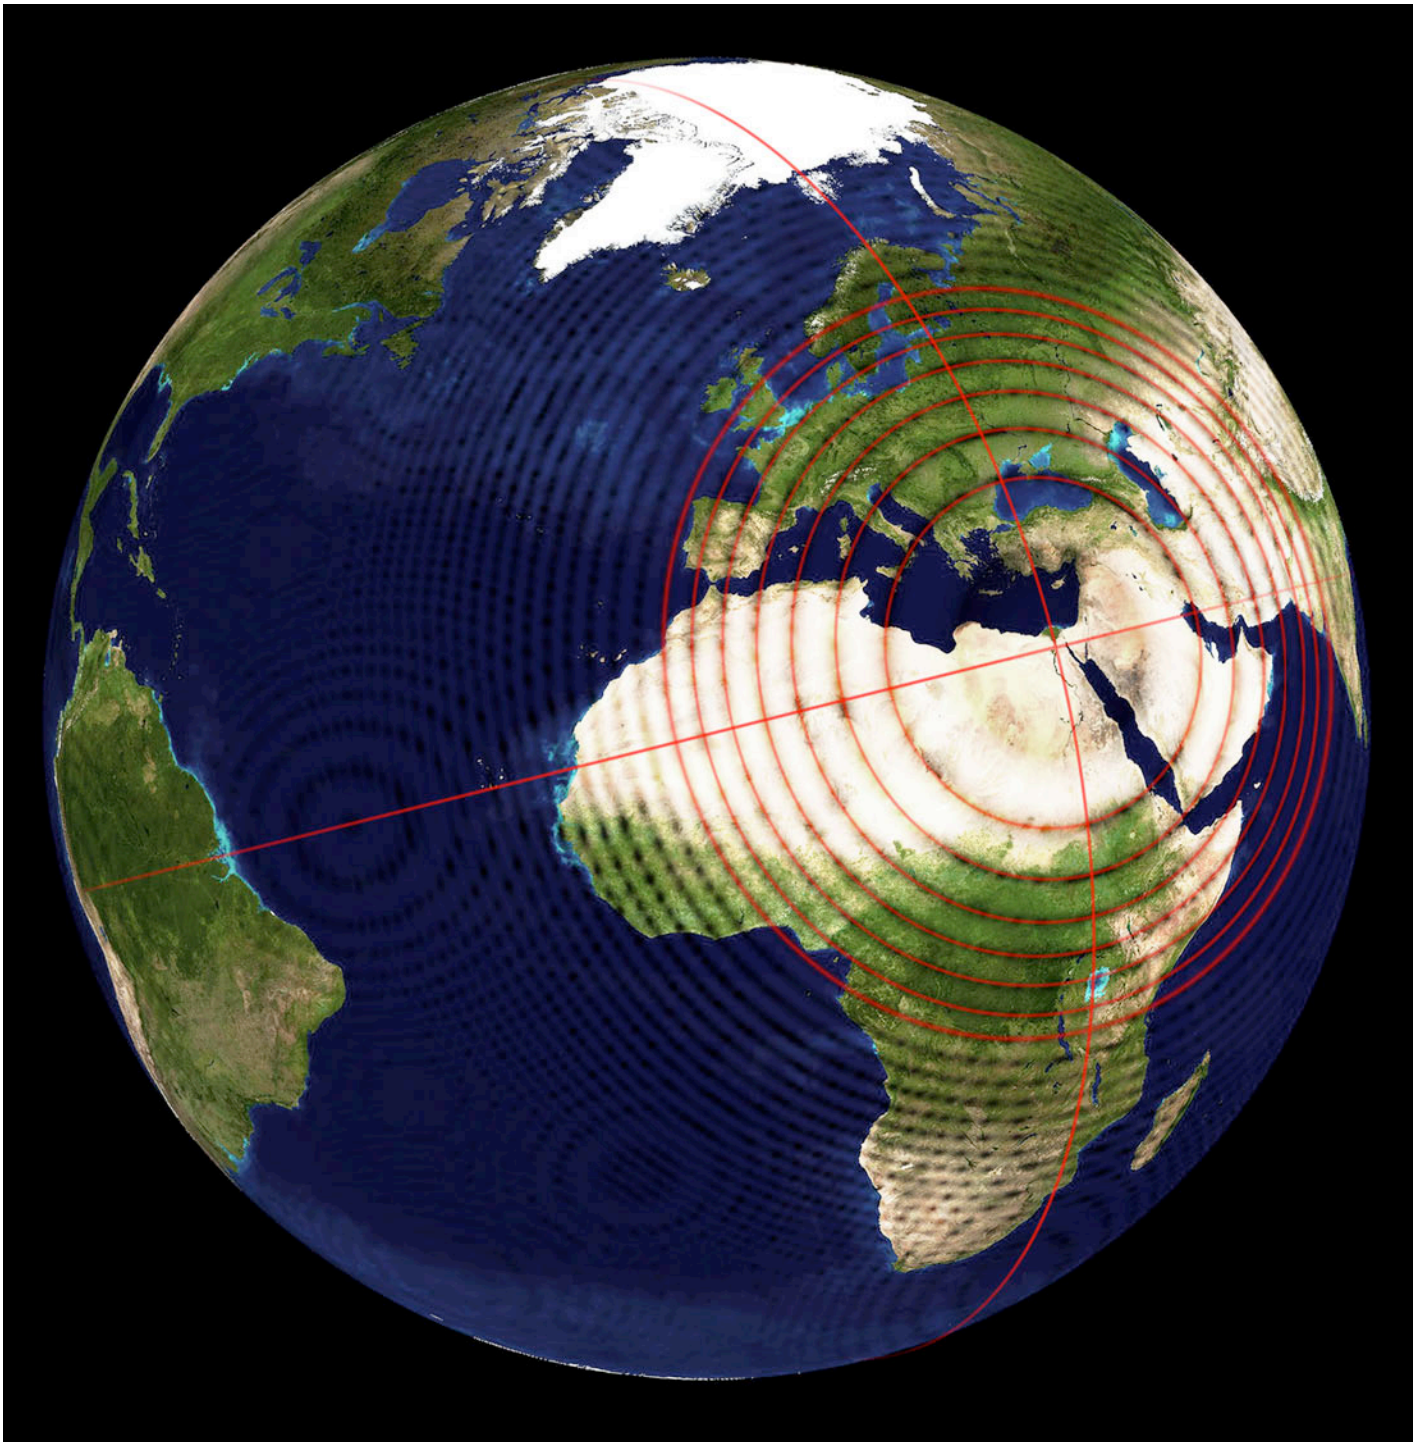
The nonlinear alignment of the world's pyramids and sacred sites informs the spherical geometry of infrasound standing waves, based on the quadratic function [$z_{n+1} = z_n^2$] (rendered overleaf), providing a mathematical model of consciousness and related phenomena.[1] Despite the ignorance of mainstream scientific dogma, a long history of news reports documenting 'paranormal' events exists –repeating events that continually defy conventional explanations. The exhaustive research of Charles Fort (1874-1932, at left) provides a vast catalog of anomalous data, collected in *'The Complete Books of Charles Fort: The Book of the Damned, Lo!, Wild Talents, New Lands'*, as republished by Henry Holt & Co. in 1941.



The compelling evidence collected by Fort can only be made comprehensible by application of the wisdom teachings of our ancient Sanskrit mother-culture, preserving the sacred Vedic cosmological model of the mandala to define the invisible force of the cosmic Om, so elusive to material science:

> [E]lectricity is invisible. The science of physics is occultism. Experts in the use of... electricity are sorcerers. Mostly we do not think of their practices as witchcraft, but we have an opinion upon what would have been thought of them, in the earlier stages of the Dark Age we're living in.[2]

The nonlinear effects of the interaction of the various dimensions of reality are bound together by the Akashic field that surrounds the Earth like a protective cocoon. Cosmic infrasound that drives the ionization of atmospheric gases to become plasma is responsible for transdimensional phenomena, whereby the structure and properties of physical matter become altered. The higher-dimensional physics of *fourth-density* plasma underlies the seeming discontinuity of 'paranormal' events, as Fort recognized:



> Quantum-magic is a doctrine of discontinuity... I conceive of all phenomena as representing continuity in one "dimension," and as representing discontinuity in another "dimension" - that is, all phenomena as interdependent and bound up with one another, or continuous, and at the same time so individualized that nothing is exactly like anything else, or that everything is alone, or discontinuous. I conceive of our existence as one organic state, or being, that is an individual, or that is unrelated to anything else, such as other existences, in the cosmos, it's state of oneness expressing in the continuity of it's internal phenomena, and it's state of individuality, or discontinuity throughout it's phenomena.[3]

The invisible influence of focused infrasound radiation alters the structure of all piezoelectric materials, including the water, tissues and bones of our bodies, as well as the calcite and quartz bedrock below us:

> Underground quartz deposits worldwide may be behind earthquakes, mountain building and other continental tectonics, a discovery that may aid in predicting tremblers, according to a study released on Wednesday… The scientists discovered that quartz crystal deposits are found wherever mountains or fault lines occur in states like California, Idaho, Nevada and Utah… The team linked rock properties to movements of the earth, explaining how quartz contains trapped water that is released when heated under stress, allowing rocks to slide and flow in what Lowry termed a "viscous cycle." [4]

The geologists fail to recognize the piezoelectric effect of quartz crystals as the most important factor, by which all received acoustic energy is transduced into an electrical charge capable of generating strong electromagnetic fields in the bedrock of the planet. Our ancient piezoelectric crystal pyramids are axis-symmetrically designed to regulate Earth's planetary infrasound resonance field into balance at 1.45 Hz.

The direct correlation noticed by the research team between quartz deposits and earthquake zones can be fully understood in the context of ultra-low frequency acoustic resonance, whereby the Earth's atmosphere is electromagnetically coupled to significant fluctuations of solar activity.

Piezoelectric fires caused are by the crystalline structure of limestone and/or granite bedrock of resonant areas, which receive focused infrasound standing waves from the pyramids of Giza, Egypt. The perfect geometries of the pyramids transduce cosmic infrasound from solar flares into ultra-low frequency terrestrial standing waves, below audible levels. Charles Fort collected many newspapers and scientific journals documenting various unusual events involving phenomenal manifestations in the general vicinity of the town of Comrie, in Perthshire, Scotland, along the10% resonant distance from the Orion pyramids at Giza, as calculated using the mean circumference of the Earth (of 24,892 miles):

Location of Events	GPS Coordinates	Miles to Giza	Circ.%
1. Comrie, Scotland	(56.38°N 3.98°W)	2,493	10.0%
2. Perth, Scotland	(56.40°N 3.44°W)	2,477	10.0%
3. Gowrie, Scotland	(56.35°N 3.84°W)	2,488	10.0%
4. Foulis Manse, Scotland	(56.36°N 4.03°W)	2,494	10.0%
5. Crieff, Scotland	(56.37°N 3.84°W)	2,488	10.0%
6. Inverness, Scotland	(57.48°N 4.23°W)	2,542	10.2%
7. Bridgewater, Scotland	(55.89°N 4.41°W)	2,490	10.0%
8. Aberdeen, Scotland	(57.14°N 2.90°W)	2,463	9.9%
9. Paisley, Scotland	(55.85°N 4.44°W)	2,489	10.0%
10. Neilston, Scotland	(55.87°N 4.43°W)	2,486	10.0%
11. Barrhead, Scotland	(55.80°N 4.39°W)	2,486	10.0%
12. Emain Macha, Scotland	(54.34°N 6.69°W)	2,518	10.1%
13. Newgrange, Ireland	(53.42°N 6.29°W)	2,494	10.0%
14. Knowth, Dowth, Ireland	(53.43°N 6.29°W)	2,495	10.0%

• **Comrie, Scotland** - Since the year 1788, many earthquakes, or concussions that were listed as earthquakes, had occurred... [and] it is said that the disturbances had been recorded as far back as the year 1597... Upon April 13, 1822... clearly enough was there an explosion in the sky of Comrie, and a concussion on the ground - "two loud reports, one apparently over our heads, and the other, which followed immediately, under our feet."

A stone fell, May 17, 1830, in the "earthquake region" around Comrie. It fell in Perth, 22 miles from Comrie... Upon Feb. 15, 1837, a black powder fell upon the Comrie region... Oct. 12, 1839 - a quake at Comrie... the sky, at the time, was "peculiarly strange and alarming, and appeared as if hung with sackcloth"... Throughout the month of October, shocks were felt at Comrie, sometimes slight and sometimes severe - "like distant thunder or reports of artillery" - "the noise sometimes seemed to be hi in the air, and was often heard without a sensible shock." Upon the 23rd of October, occurred the most violent quake in the whole series of phenomena at Comrie. [At] Foulis Manse, ten miles from Comrie, rattling sounds were heard in the sky, preceding the shock that was felt... Someone who lived at Gowrie, forty miles from Comrie is quoted: "the most general opinion seems to be that the noise accompanying the concussion proceeded from above"...

[Further] shocks were felt in November [of 1839, and]... a powder-like soot fell from the sky, upon Comrie and surrounding regions... Jan. 8, 1840 - sounds like cannonading, at Comrie, and a crackling sound in the air, according to some of the residents. Whether they were the sounds of quakes or concussions that followed explosions, 247 occurrences, between Oct. 3, 1839, and Feb. 14, 1841, are listed... Feb. 18, 1841, a shock and a fall of discolored rain at Comrie...

I have found record of the fall of debris from an explosion, more substantial than finely powdered soot, at Crieff, which is several miles from Comrie... An object that looked like a lump of slag, or cinders, [was] reported to have fallen... Upon the night of April 23, 1855, a young woman, in... Crieff, saw... a luminous object falling, and picked it up, dropping it, because it was hot... It is said that about 12 fragments of scorious matter, hot and emitting a sulfurous odor, had fallen…

Shock and a rumbling sound at Comrie, July 22, 1894 - a repetition upon the corresponding date, the next year, [on July 22, 1895]... Upon Sept. 17, 1901, ribbon-like flashes of lightning, which were not ordinary lightning, were seen in the sky... one hour before a shock in Scotland. According to other accounts, this shock was in Comrie and surrounding regions...[5]

- **Inverness, Scotland**. June 30, 1817 - There was another quake... It is said that hot water fell from the sky.[6]

- **Bridgewater, near Glasgow, Scotland**. May 20, 1878 - "Fires had started up unaccountably... Loud raps were heard. Things in the house, such as dishes and loaves of bread, moved about." [7]

- **Aberdeen, Scotland**. Early January, 1920 - In the home there was an invalid boy... who lay in his bed. It was as if he were bombarded by unseen bombs. Explosive sounds that shook the house were heard over his bed, and, according to reports by policemen, the bed was violently shaken. Police reported that objects in the boy's room, moved- [and eyewitnesses] continued to tell of "thumping sounds that shook the house and rattled the dishes."[8]

Rock art from Perthshire preserves ancient Celtic knowledge of the sacred force of infrasound resonance (above), focused upon the 10.0% distance from the Giza pyramids.[9] This unseen acoustic influence has caused sickness, quakes, as well as acoustic levitation and spontaneous fires in household items. The suburbs of Glasgow, Scotland experienced such unusual fires in 1878, as have been recurring in 2011:

- **Paisley, near Glasgow, Scotland**. February 10, 2011 - Man flees inferno that ripped through house in minutes.[10] March 3, 2011 - A suspected arson –fire in a wheelie bin on the ground floor torched a block of flats.[11] April 27, 2011 - Fire engulfed the rear door of the Masonic Hall, without explanation.[12]

- **Neilston, near Glasgow, Scotland**. February 16, 2011 - Mystery fire swept through the living room of a flat.[13]

- **Barrhead, near Glasgow, Scotland**. March 1, 2011 - Door of a family home set ablaze in the late of night.[14]

34. Saffron Walden, England	(52.02°N 0.24°E)	2,188	8.8%

• **Herefordshire, England**. September 24, 1854 - Upon a day that was "perfectly still, sky cloudless," [residents] heard sounds like the discharges of heavy artillery, at intervals of about two minutes, continuing several hours.[15]

• **Cardiganshire and Dolgelly, Wales; Swansea and Crediton, England** - A correspondent writes that... he had, in the autumn of 1855, often heard sounds like the discharges of heavy artillery, two or three reports rapidly, and then an interval of perhaps twenty minutes, also with long intervals, sometimes of days and sometimes of weeks, continuing throughout the winter of 1855-1856. Upon the 3rd of November, 1858, he had heard the sounds again, repeatedly, and louder than they had been three years before. At Dolgelly... [other residents] had heard the "mysterious phenomenon," on the 3rd of November. Someone else - that, upon October 13, he had heard the sounds at Swansea. "The reports, as if of heavy artillery, came from the west, succeeding each other at apparently regular intervals, during the greater part of the afternoon of that day"… But we learn that the series began before October 13. Upon the evening of September 28, in the Dartmoor district, at Crediton, a rumbling sound was heard. It was not supposed to be an earthquake, because no vibration of the ground was felt.[16]

• **Wolverhampton, England**. June 19, 1860 - A great number of little black stones had fallen, in a violent storm... [Almost nine years later,] a great number of small, black stones had been found in the streets of Wolverhampton, after a severe storm. It is said that the stones were precisely like those that had fallen a year earlier in Birmingham, the year before...[17]

• **Hardwicke, England**. November 9, 1862 - [An] astronomer, of Hardwicke, fifteen miles west of Hereford, heard sounds that he attributed to gunfire...[18]

• **Birmingham, England**. June 12, 1858 and July 31, 1868 - A meteorologist writes: "During the storm on Saturday (12th) morning, Birmingham was visited by a shower of aerolites. Many hundreds of thousands must have fallen, some of the streets being strewn with them." Someone else writes that many pounds of the stones had been gathered from awnings, and that they had damaged greenhouses, in the suburbs... July 31, 1868 -that stones, "similar to, if not identical..." [to those that fell ten years earlier] had fallen... A writer and lecturer on meteorological subjects... [stated] that for one hour, morning of May 29, 1868, stones fell, in Birmingham, from the sky.[19]

• **Brighton, England**. January 13, 1869 - An explosion in the sky...[20]

• **Bedford, England**. August 5, 1856 - To fumigate the house, (the housemaid) burned sulfur, in an earthward jar, on the floor. The burning sulfur ran out on the floor and set the house afire. The fire was put out... About an hour later, a mattress was found burning, in another room... Smoke was seen coming from a chest. Later smoke was seen coming from a closet, and in it linen was found burning. Other isolated fires broke out. Then came a succession of about forty fires, in curtains, in closets, and in bureau drawers. Neighbors and policemen came in, and were soon fearful for their safety. Not only objects around them flamed: so flamed their handkerchiefs.[21]

• **Harleton, Cambridgeshire, England**. January 3, 1869 - A policeman... heard six or seven reports, as if of heavy guns far away.[22]

• **Near Colchester, Essex, England**. January 9, 1869 - Several correspondents write that... A loud report had been heard, and a shock felt at places near Colchester, Essex, about 30 miles from Harleton.[23]

• **Essex, England**, April 23, 1884 - According to a writer... a stone fell from the sky, breaking glass in his greenhouse, in Essex. It was a quartz stone, and unlike anything usually known as meteoritic.[24]

• **Hornington, near Salisbury, England**. October 8, 1889 - Accounts of loud sounds of unknown origin in a house in the village... Here a child... "was stricken with a mysterious illness, lying in bed, never speaking, never moving, apparently at death's door."[25]

• **Clapham, London, England**. July 16, 1890 - One day... in Hafer-road... the daughter of this household was dying. Volleys of stones, of origin that could not be found, were breaking through the glass of the conservatory.[26]

• **Peterborough, England**. Jan. 10, 1892 - House occupied by a family... was repeatedly shaken, as if bombed.[27]

• **Island of Guernsey, UK**. March 5, 1903 - In a home of a resident of the island... Several members of the family were taken ill. Things were flying about.[28]

• **Tackley, Oxen, England**. April 24, 1905-1908 - Beginning upon April 24, 1905, and continuing for three years, at times, detonations, as if of exploding bombs, were heard in this house.[29]

• **Wimbledon, London, England**. July, 1909 - [An English military Colonel] tells of an experience... in his home... He and his wife were sitting in one of their rooms, when his wife saw a luminous thing moving towards them. It went to a chair, upon the back of which it seemed to rest, for a moment. It exploded.[30]

• **Willesden, London, England**. September 26, 1910 - "A fire of a most mysterious character [occurred, while]... absolutely no cause can be assigned for the outbreak, which was followed by a terrific explosion, completely wrecking the premises." But in no account is it made clear that first there was a fire, and that the explosions followed. A policeman, standing on a nearby corner, saw his house... flame and burst apart. "Windows and doors in the back of the house were blown a distance of 60 feet." "On examination of the premises, it was found that the two gas meters behind the stairs had been shut off: so it was evident the explosion was not caused by gas..."[31]

• **Wandsworth, London, England**. May 1, 1911 - Unaccountable fires broke out in the house... [at] 356 York-road... Preceding one of these fires there were three explosions of unknown origin.[32]

• **Dartford, Kent, England**. April 6, 1919 - In a burning house, a man was found in an untouched bedroom, dead –his body burnt yet his clothes remained unscorched.[33]

• **South Woodford, London, England**. August 9, 1920 - A shower of small stones broke the windows in the top floor of Wellington Villa, Grove-road... there were many showers of stones of undetectable origin. Upon the night of the 13th, policemen took positions in the house, in the street, on roofs, and in trees. The upper floor of the house was bombarded with stones, but where they came from could not be found. Night of the 14th - a procession. Forty policemen, some of them local, and some of them from Scotland Yard, marched down Grove-road, and went up on roofs, or climbed into trees. Volleys of stones arrived, but the forty policemen learned no more than had the smaller numbers of the proceeding investigations.[34]

• **Westminster, London, England**. September 16, 1920 - Three mysterious fires broke out simultaneously in different departments of the Government Office on Tothill Street, destroying documents.[35]

• **South Lambeth, South Wales**. July 23, 1925 - "Explosion riddle - mystery of a boy's wounds. Injured by a mysterious explosion, which occurred in his mother's house... yesterday morning... [the boy] was conveyed to the hospital in serious condition. He was hurt on the face and chest, and some of his fingers were blown away... An all-day search failed to discover the cause of the explosion."[36]

• **Weti, near Gloucester, England**. October 27, 1926 - Clods of earth, of undetectable origin, were bombarding a house... Clods fell inside the house. [They] saw a mass of mud appear on the ceiling. The door was open, but this print on the ceiling was in a position that could not be hit by anyone throwing anything from outside. There was no open window.[37]

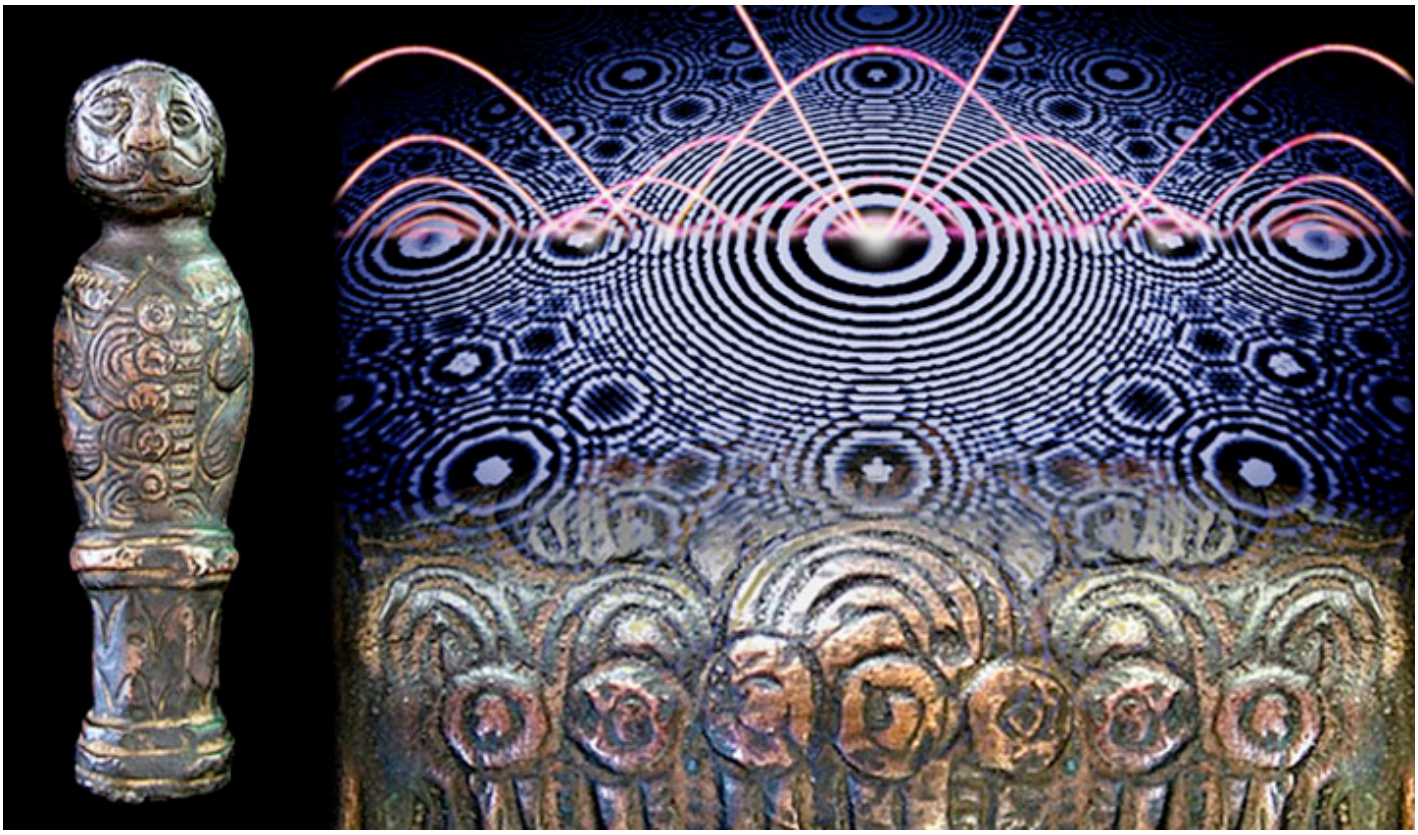
• **Guildford and Hornsey, London, England; Paris, France** - Anomalous explosions of coal, 1921-1923 - In the years 1921-22, and early in the year 1923, there were, in England and other countries, explosions of coal such as had never occurred before. There was a violent explosion in a grate in a house in Guildford, near London, which killed a woman and knocked down walls of the house (London Daily News, Sept. 16, 1921). There were other explosions of coal, during this year, but in 1922 attention was attracted by many instances...

There came reports from France. Then stoves, in which was burned British coal, were blowing up France, Belgium and Switzerland. The climax came about the first of January, 1923, when in one day there were several of these explosions in Paris, and explosions in three towns in England.

About the first of January, 1921, [unexplainable events occurred] on 8 Ferristone Road, Hornsey, London... In the grates of this house, coal exploded. Also, coal in buckets exploded. A policeman was called in. He made his report upon coal that not only exploded, but hopped out of grates, and sauntered along floors, so remarkable that an Inspector of Police investigated. According to a newspaper, it was this Inspector's statement that he had picked up a piece of coal, which had broken into three parts, and had then vanished from his hands. It was said that burning coals leaped from grates, and fell in showers in other rooms, having passed through walls without leaving signs of this passage. Flatirons, coal buckets, other objects "danced." Ornaments were dislodged but fell to the floor without breaking. A pot on a tripod swung, though nobody was near it. The phenomena occurred in the presence of one of the boys, especially, and sometimes in the presence of the other boy.[38]

The diversity of anomalous events multiple eyewitness accounts of all kinds recollected by Charles Fort is stunning in its all its perplexing details, yet does offer a thin thread of continuity that can be traced over time. *Many of these shocking types of events were witnessed during this same time period in the laboratories of Nikola Tesla, who reported experimental work with infrasound resonance that generated exploding plasma bubbles, spontaneous fires, explosive booms and earthquakes.*

Multi-frequency machines used by Tesla for achieving wireless transmission of electricity in the lab replicated the rumbling infrasonic resonance of the world's ancient pyramids and megalithic temples, which still operate in a limited capacity. Infrasound recordings obtained at a great number of pyramid and sacred sites worldwide offer irrefutable evidence for their functioning as a solid-state power network.



The megalithic monument now called Stonehenge in Wiltshire County, England was carefully constructed using Atlantean electro-acoustic technologies for transducing the focused infrasound resonance at exactly 9.0% of the Earth’s mean circumference from the Orion pyramids of Giza, Egypt.

The special convergence of infrasound resonance along these great radial bands significantly contributes to the energetic presence in the fields of England that manifests as conscious entities that are often called 'balls of light', while scientists recognize the brilliant luminosity of the orbs as generated by HHO plasma. *The geometric relationship between megalithic sites, 'UFOs' and plasma orbs relates to ULF resonance.*

The fields of England continually inspire worldwide attention for the circular mandala formations, which inundate the crops there every year, which in turn draws more visitors to ancient sacred sites where the Celts erected circles of giant standing stones. While most Celtic artifacts displayed at museums were discovered prior to the flourishing of the crop circle phenomenon, ongoing discoveries of ancient artifacts in English fields reiterate identical geometric formations of concentric circles, pyramids and standing waves.

An 8cm-tall bronze Anglo-Saxon artifact presenting distinct Celtic influence – a handle of some kind (below, left) – was found in the early 1970's by a farmer in northern England. The lack of a cross-guard suggests this was not the handle of a simple knife, but formed part of a sacred ceremonial object with symbolism recalling the ancient megalith-building culture. The bronze handle is shaped as a man with the body of an animal, atop a columnar base. The base is detailed with two rows of standing waves, one above the other, which wrap around the form just as infrasound standing waves encircle the Earth.

The male figure is depicted with a large curled moustache and straight hair, combined with the round body and four short paws of a water-loving mammal, like the beaver. A *pyramid* symbol is engraved on his chest, with five sets of *concentric circles* extending below it, showing the alignment of *chakras* just as represented in ancient Sanskrit art. The alignment of concentric circles is conjoined by the unmistakable structure of *resonant standing waves*, as compared in the image above, at right (altered to provide relative symmetry). This remarkable ancient depiction of invisible, inaudible infrasound standing waves is but one of many ancient symbolic representations that we are now understanding in the context of advanced present-day symbolic communication by conscious, electromagnetic (non-physical) beings manifesting as luminous plasma orbs.

The geometric formulae that plasma orbs impress into the crop are the same codes once used by the pyramid- and megalith-builders worldwide, including the Maya and in this way the crop circle phenomenon is leading humanity back into its ancestral or collective memory of the sacred vital force of the Earth, whereby our resonant network of pyramids once synchronized the heartbeat of humanity worldwide. Known to the ancient Sanskrit mother-culture as the all-pervading 'Om', new insights reinform the Sanskrit mandala –a square within a circle– as a representation of the quadratic function [$z_{n+1} = z_n^2$] which precisely encodes the Fibonacci structure of infrasound standing waves.

A large hoard of rare jeweled gold and silver artifacts was recently discovered in July of 2009, in field near Lichfield, Staffordshire using metal detector scans. A total of over 1,500 pieces of Anglo-Saxon metalwork were eventually recovered from the site, including several exquisite examples of garnet-inlaid goldwork formed as snakes, birds, horses and other animals.

Remarkably preserved garnet-inlaid gold sword pommels are formed as flat-topped pyramids. One pommel presents a geometric configuration of nested triangles, reminiscent of the fractal Sierpinski triangle (below, right). Another flat-topped pommel shows the helmeted head of a knight, with a circular base presenting a row of standing waves, represented in fine gold arcs (below, left).

The Staffordshire artifacts present beautiful examples of the sacred Celtic Cross, as seen in a gold ornamental millefiori stud with a hemispheric stone inlay showing the octagonal mandala in white, blue and black, surrounded by concentric circles with radiating lines (below, center). These Celtic mandala symbols reveal their Sanskrit origin in the pyramid-building Atlantean civilization that employed heartbeat synchronization for global telepathic communication via infrasound standing waves.

The mandala reiterates the Sanskrit quantum formula [$z_{n+1} = z_n^2$], by which the hundreds of giant standing stones of the Celtic sacred sites were erected using acoustic levitation techniques. Infrasound standing waves are transduced from solar energy and focused on England's sacred sites by the Orion pyramids of Giza, Egypt, which are precisely 9.0% of the Earth's mean circumference from Stonehenge.

Deep booming noises heard along this sacred band of planetary resonance were once used to levitate gigantic stones, while today they are simply an annoyance to residents who do not know their significance as has been the case recently in Bridlington, Hull and Saffron Walden, England; as well as in Llanidloes and Mawnan, Wales. The ultra-low frequency humming and heartbeat booming noises arouse and awaken human consciousness in the same way as occurs at crop circle formations:

- **Bridlington, England**. March 27, 2008 – Earthshaking and several booming sounds reported by residents.[39]
- **Mawnan, Wales**. June 2, 2009 – Strange humming noise, like a distant diesel engine, disturbs residents.[40]
- **Llanidloes, Wales**. June 20, 2009 – Loud, intermittent low-frequency hum causes sickness and sleep loss.[41]
- **Hull, England**. October 28, 2010 – Loud humming noise like low-flying aircraft heard by residents overnight.[42]
- **Saffron Walden, England**. January 17, 2011 – Loud bangs and shaking reported by dozens of residents.[43]

Another set of related sacred sites with Celtic artifacts of interest are found in Ireland, to the northwest along another band of infrasound resonance in relation to the Giza pyramids. Newgrange, Knowth and Dowth sacred megalithic chamber sites are 10.0% distant from the pyramids of Giza. Emain Macha, also called Navan Fort, lies along the 10.1% distance, and was comprised of a central octagonal wooden building once supported by four concentric rings of posts, surrounded by a large circular enclosure made by a bank and ditch.

Among the artifacts unearthed at Emain Macha is a gold-alloyed 'gong' with a mandala relief carving (above) which presents a central 3-fold symmetry surrounded by an outer ring of 10 sets of concentric circles, composed of 3 circles each. It is quite notable that the 10-fold symmetry of the concentric circles reflects the 10% distance of Emain Macha to the ancient prime meridian of Giza, Egypt. Giant stone bowls found at sites like Newgrange confirm what scientists have been able to reproduce in the lab -- that acoustic levitation can be achieved using concave piezoelectric elements to focus standing waves.

The location of these sacred sites in Ireland and England, at 10% and 9% resonant distances from Giza respectively, will raise the infrasound resonance levels at these sites to eventually cause spates of piezoelectric fires and loud, low frequency booming as already endured by bewildered residents of these areas as we approach the culminating events of December 22, 2012.

The ancient acoustical knowledge of the pyramid- and megalith-builders was explicitly rendered in metal:

> Archeologists in Germany have discovered a 2,600-year-old Celtic tomb containing ornate jewellery of gold and amber. They say the grave is unusually well preserved and should provide important insights into early Celtic culture… The subterranean chamber measuring four by five meters was uncovered near the prehistoric Heuneburg hill fort near the town of Herbertingen in southwestern Germany. Its contents including the oak floor of the room are unusually well preserved... [44]

- **Apt, France**. October 8, 1803 - A stone fell from the sky... About eight hours later, "some persons believed that they felt an earthquake." [45]

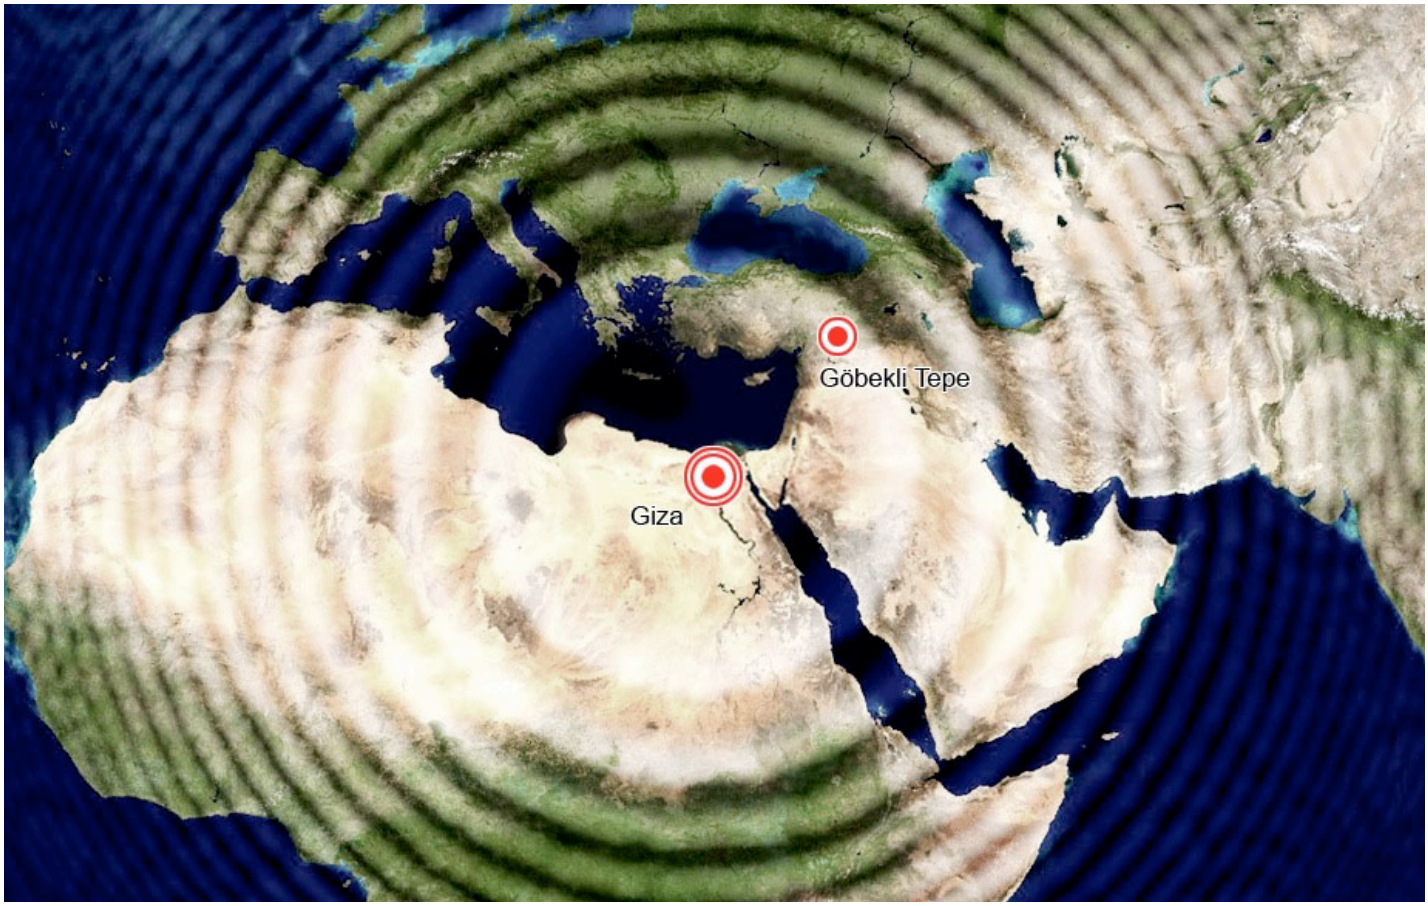
- **Melida, Spain** - Early in the morning of March 20, 1822, detonations were heard at Melida... All day, at intervals, the sounds were heard. They were like cannonading... For thirty days the detonations continued, sometimes thirty or forty, sometimes several hundred a day... The last sounds of Melida of which I have record, were heard in March of 1825.[46]

- **Genoa, Italy**. February 17-19, 1841 - The fall [on the 17th]... of a red substance from the sky - another fall upon the 18th - a slight quake, at 5pm' February 18th - another quake, six hours later - fall of more of the red substance, upon the 19th. Some of this substance was collected and analyzed... [-described as] oily and red.[47]

• **Pignerol (or Pinerolo), Piedmont, Italy** - April 2, 1808 - aerial lights followed by explosive sound and earthquake. From April 2 to April 8, forty shocks were recorded... sounds like cannonading were heard at Barga. Upon the 18th of April, two detonations were heard at La Tour, and a luminous object was seen in the sky.[48]

• **Soko-Banja, Serbia**. October 13, 1872 - A stone fell from the sky, to this earth, near the town... If it were not a peculiar stone, there is no force to this datum. It is said that it was unknown stone. A name was invented for it. The stone was called bandit, after the near which it fell.[49]

• **Jelica, Serbia**. December 1, 1889 - Seventeen years later... another rock of banjite fell...[50]



• **Budapest, Hungary**. December 13, 1921 - [There is a] story... of a boy... in whose presence furniture moved... Since about his 12th birthday, fires had often broken out in his presence... It was said that, when he slept, flames flickered over him, and singed his pillow.[51]

• **Purchena, Spain**. July 16, 1945 - A sleeping woman's nightgown spontaneously ignited, burning her scalp and face. The victim's father then witnessed disparate metal objects and otherwise non-combustible items burst into flames that could not be extinguished by water. Farm animals were also seen to suddenly ignite in flames.[52]

• **Laroya, Spain**. Summer, 1950 - Spontaneous flames consumed bed linens, livestock feed, hay and even the clothes off peoples' backs. Experts claimed unusual magnetic conditions were the cause of the phenomena.[53]

• **Torrejoncillo, Spain**. September 6, 1980 – Loud noise of a "strange and powerful jet airplane" accompanied a low-flying fireball that rapidly scorched the trees and roasted rabbits attempting to flee their warrens. As the fire tornado approached a farmhouse, it split into two fire tornadoes flanking the house, sparing it from destruction, yet melting plastic cups, glass bottles, metal barbed-wire fencing and even fusing quartz and marble. 50 acres were consumed by the aerial fire in minutes, yet the wooden structure of the farmhouse remained untouched.[54]

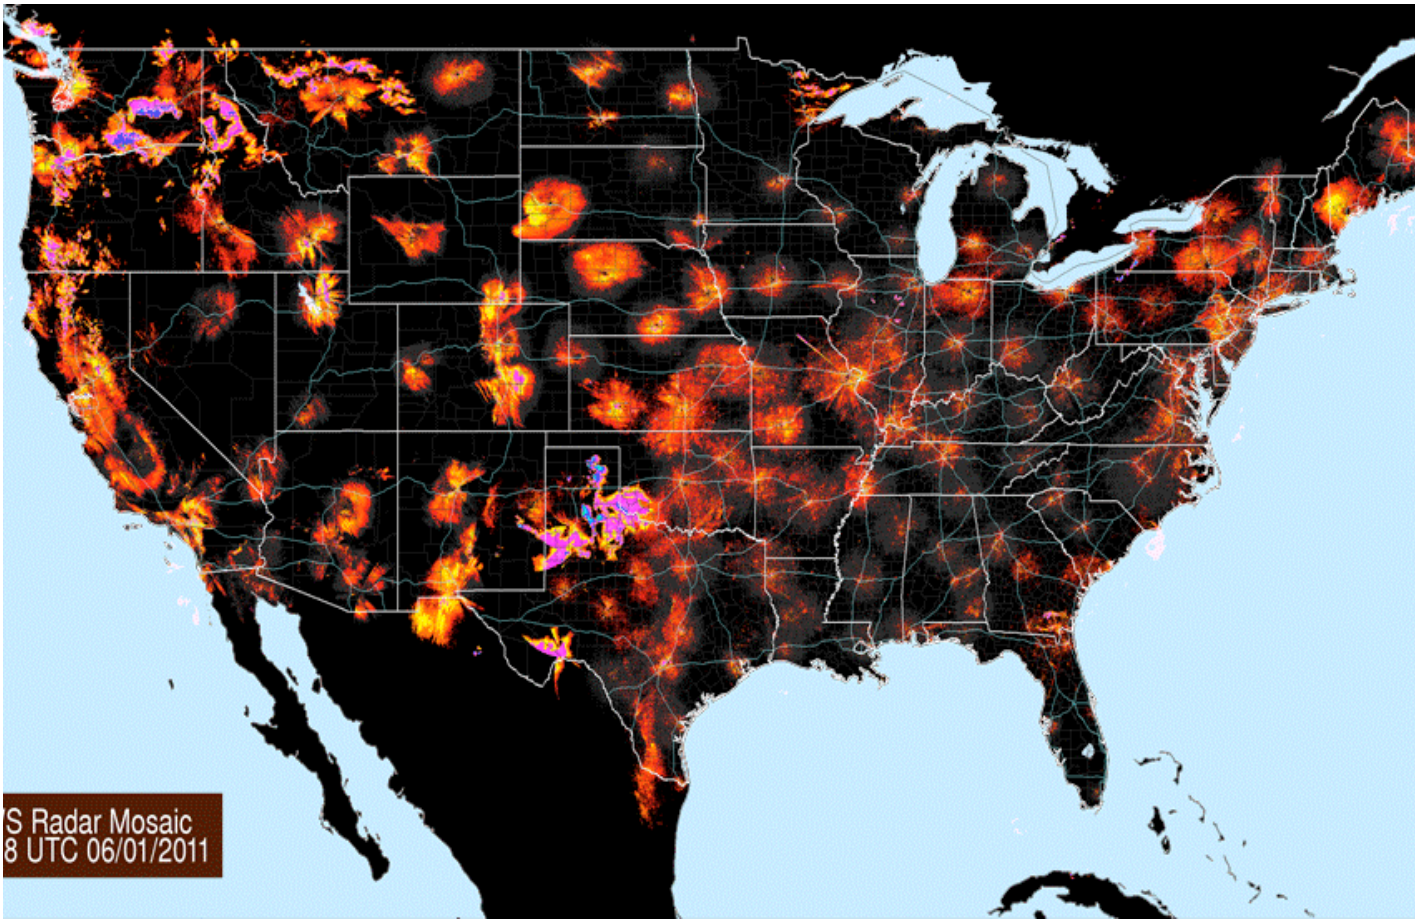
6. Göbekli Tepe, Turkey	(37.223°N 38.922°E)	672	2.7%



- **Constantinople (presently Istanbul), Turkey**. April 28, 1920 - Documents destroyed in a mystery fire that broke out in the British War Office.[55]

- **Gabes, Tunisia**. June 17, 1881 - Sounds like cannonading were heard... And that quaking of the earth was felt, at intervals of 32 seconds, lasting about 6 minutes.[56]

- **Pondicherry, India**. June 13, 1885 - A resident... was sitting in a closed room, when a mist appeared near him. At the same time there was a violent explosion.[57]

- **Barisal, Bengal, India**. 1870-1871 - In... November, 1870, [were]… published letters upon the Barisal Guns. One writer says that the sounds were probably a booming of the surf. Someone else points out that the sounds, usually described as "explosive," were heard to far inland to be traced to such origin. A clear, clam day in December, 1871... [a correspondent] writes that, in Bengal, he had heard "a dull, muffled boom, as if of distant cannon" - single detonations, and then two or three in quicker succession… Explosions over the towns... were continuing. As to some of these detonations that were heard May, 1874, a writer... says that they did seem to come from overhead. [Further explosive events were] heard between April 28, 1888, and March 1, 1889.[58]

- **Irkutsk, Siberia, Russia** - Upon Aug. 28, 1819, there was a violent quake... There had been two shocks upon Aug. 22, 1813... Upon April 6, 1805... Two stones had fallen from the sky... Another violent shock at Irkutsk, April 7, 1820... Upon Feb. 11, 1824, a slight shock was felt... Upon Feb. 18... A stone that weighed five pounds, fell from the sky... Upon March 8, 1829, a severe quake, preceded by clattering sounds, was felt at Irkutsk.[59]

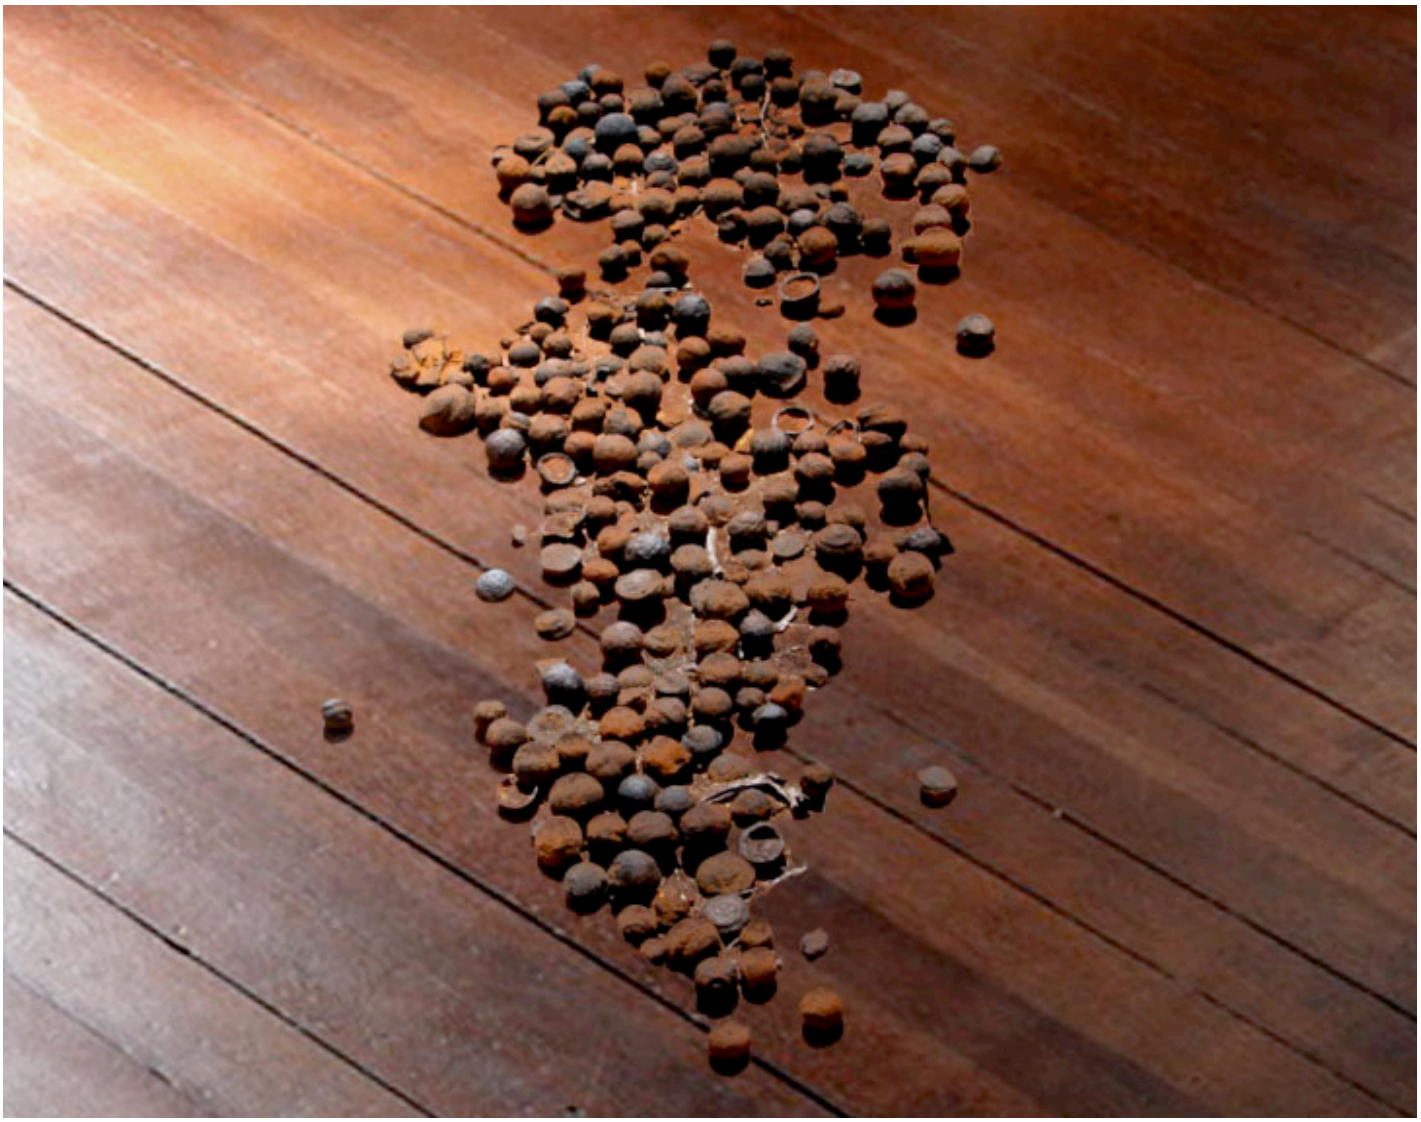
• **Owatonna, Minnesota**. December 25, 1880 - There had been petty persecutions by an uncatchable: such as persistent ringing of the doorbell. One evening, members of this family were in one of the rooms, when something exploded. [The mother of the family]... was knocked insensible. Fragments of a cylindrical glass object were found, but no window had been open, and there had been no other way by which, by known means, this object could have entered this house.

I note something of agreement between notions that are now developing... It is said that by means of "rays" inventors [such as Nikola Tesla] have been able to set off distant explosives. If by other means, or by subtler "rays," explosions at a distance can be made to occur... [Such] means, or powers... are at present mysterious.

There are stories of brilliantly luminous things that are called "globe lightning" that have appeared in houses, and have moved about, before exploding, as if guided by intelligence of their own, or as if directed by a distant control. These stories are easily findable in books treating of lightning and the freaks of lightning...[60]

• **Brooklyn, New York**. July 15, 1882 - [In a] boardinghouse, 52 Willoughby Street... the occupant of the back parlor was ill. Raps were heard. Several times appeared a floating, vaporous body, shaped like a football... The effect of this object was like an electric shock.[61]

• **Jordan, New York**. December 22, 1883 - In a closed room... in which a man was dying, stones were falling.[62]



• **Bellport, Long Island, New York**. Early 1893 - Stones were thrown at the house... A terrified girl took to her bed. Stones thumped on the roof above her, throwing her into spasms of fright. In one of these convulsions, she died.[63]

• **Greenpoint, Brooklyn, New York**. January 5, 1895 - [At] 84 Guersey Street... in 20 hours, preceding noon, January 5th, [before the entire] frame house had burned down, there had been many fires. Policemen had been sent to investigate. They had seen furniture burst into flames. The Fire Marshall said: ... "I do not want to be quoted as a believer in the supernatural, but I have no explanation to offer, as to the cause of the fires, or of the throwing around of the furniture." [Odd events began] upon the afternoon of January 4th... a crash was heard. A large, empty, parlor stove had fallen to the floor. Four pictures fell from walls. [Then they] smelled smoke. A bed was afire. [Then they] saw wallpaper... start to burn. There was another fire and a heavy lamp fell from a hook. The house burned down...

Captain Rhoades, of the Greenpoint precinct, said: "The people we arrested had nothing to do with the strange fires. The more I look into it, the deeper the mystery. So far I can attribute it to no other cause than a supernatural agency. Why, the fires broke out und the noses of the very men I sent to investigate." Sergeant Dunn [stated] - "There are things that happened before my eyes that I did not believe were possible." [64]

- **Brewster, New York**. January 21, 1909 - Mystery fires at the Greek Hotel.[65]

Fort was flabbergasted by such transdimensional effects, stating "I have come upon so many stories of showers of stones that have entered closed rooms, leaving no signs of entrance in their ceilings or walls":

- **Newton, New Jersey**. March 3, 1929 - "For days a rain of buckshot, at intervals, has been falling in the office of the Newton garage, a small room, with one door and one window. There are no marks on the walls or ceiling, and there are no holes in the room, through which the shot could enter."

- **East Haddam, Connecticut**. In 1791 - booming explosions; August 11, 1805 – explosion; February 9, 1812 - two explosive sounds; July 5, 1812 - one explosive sound; December 28, 1813 - one explosive sound.[66]

- **New Haven, Connecticut**. March 12, 1883 - [A] house, 33 Church Street... [experienced] tramping sounds - objects flying about... A woman in the house was ill. While she was preparing medicine in a cup, the spoon flew away... An undefinable bullet made a hole in a glass.[67]

- **Washington, D.C**. December 16, 1889 - Mysterious fire in mahogany desk burns papers in the office of the Secretary of War.[68]

• **Hazelwood, Ohio**. October 14, 1892 - [A farmer] had been absent from his home. When he returned he heard a hysterical story from his niece... Soon after he... had left the house stones were thrown at her... The girl went to the barn to gather eggs. On her way back, stones fell around her... Neighbors had heard of the doings. Stationed around the house were men with shotguns: but stones of unknown origin continued to bombard the house.[69]

• **Lebanon, Ohio**. Summer of 1867- "Bullets fell in every room of the house, forcefully, but not with gunshot velocity -large birdshot- broad daylight- short intervals, and then falls that lasted an hour or more. Many bullets appeared, but when Marshall undertook to gather them, he could never find more than half a dozen. About the same time raps were heard."

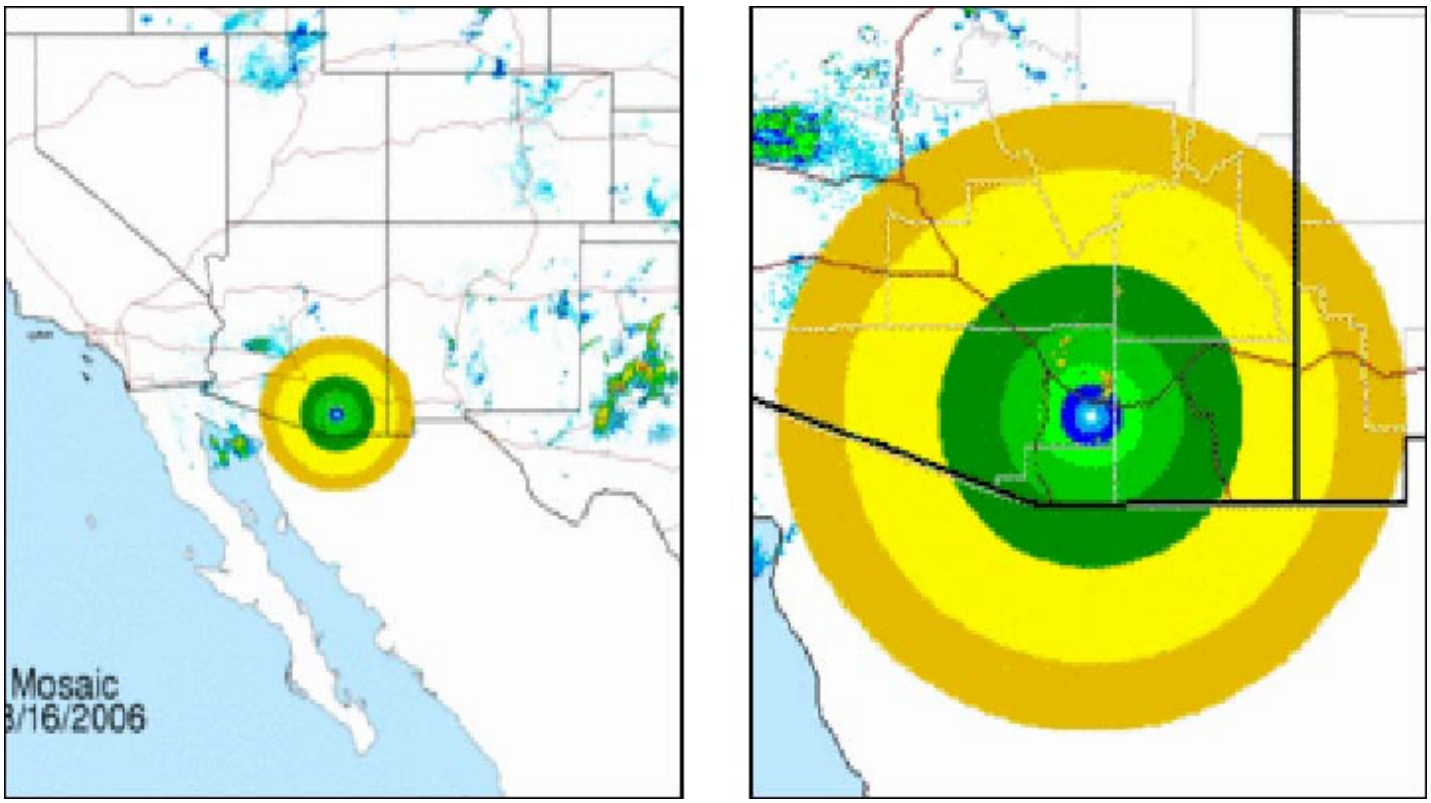
[Then once again, in Lebanon, Ohio. March 6, 1880 -] "People of the town were in a state of excitement: that showers of birdshot were falling from the ceiling of John W. Lingo's hardware store. A committee had been appointed, and according to it's expert, the phenomenon was veritable: slow-falling bodies of shot, not of the size of any sold in the store, were appearing from no detectable point of origin."[70]

• **Walterboro, South Carolina**. November 12, 1886 - Two men in a field experienced small metal shot falling all around them, which continued for minutes.[71]

• **Findlay, Ohio**. October 2, 1889 - There is a story of restricted fires, said to have occurred in the home... upon a farm... Six miles west of Findlay, Ohio. A bed had burst into flames, burning down to a heap of ashes, but setting nothing else afire. Not even scorching the floor underneath. The next day, "about the same time in the afternoon," a chest of clothes flamed, and was consumed, without setting anything else afire. The third day, at the same time, another bed, and nothing but the bed burned.[72]

• **Hyde Park, Chicago, Illinios**. January 7, 1900 - Chair and tables, at times, hopped about... Time and time again there was the sound like the discharge of a revolver.[73]

The news collections republished by Charles Fort present case after case of quite bizarre events, yet the accounts contain a very narrow range of anomalies. The spontaneous fires, stonefalls and levitating objects have often occurred simultaneously with explosive sounds that seem to originate from above, in the sky and all around. Fort indirectly identifies the invisible source of these apparent transdimensional interactions with luminous flight machines also detailed at length in his anthology: *"Slag and cinders and ashes, and you won't believe, and neither will I, that they came from the furnaces of vast aerial super-constructions."* [74] The credibility of such claims is now proven by thousands of UFO videos seen online.



Extensively detailed accounts of hyper-dimensional events taking place in an electromagnetic vortex located in the steep, rugged terrain southeast of Tucson, Arizona - far off the beaten path from Nogales to Arivaca (opposite). Various unusual phenomena were witnessed by brothers Ron and Chuck Quinn over a period of decades beginning in 1956, lead on by personal curiosity after hearing the local histories the Native Americans had confided regarding this unusual area. The luminous plasma ships that Ron reports having observed on several occasions in the night skies above this vortex point are even more reported today in all parts of Arizona, and directly relate to their use of terrestrial infrasound standing waves to maximized ionization of the hull at nodal vortex points such as this one in Arizona.

Quinn's recounting of instances of instantaneous teleportation and the appearance of different time periods through the transdimensional stone archway are mentioned in the context of shimmering flashes of light seen around the archway, drawing a direct connection between dimensional shift with the stimulation of atmospheric plasma above the area. Ron became convinced that the large fields of geodes that were discovered on various occasions seemed to have an aerial origin that scattered the round stones in that area *before, during and after their many visits:*

Curious [about the local Indian accounts], we decided to make another trip to the remote site with Roy Purdie and Walter Fisher -two fellow treasure hunters who were camping with us. It's a rugged climb, and the torturous, craggy mountains play no favorites. Enter their domain, make an error, and you'll be added to the list of the injured and missing. This mysterious area is covered with windswept rock formations that dot the landscape. Searching further, we discovered an enormous deposit of geodes. The ground was littered with them. Some had broken open, revealing their crystal-lined interiors.

As we approached the archway, the structure took on a menacing appearance. It stood beside a rocky slope, and was perhaps 7 feet high by 5 feet in width. Its columns measured approximately 15 inches in diameter and were made of andesite... One day, Walt and Roy had their own weird experience near the stone portal. They returned there because Walt wanted to collect some geodes for friends in Tucson. *Looking toward the archway, both saw it appear to shimmer. According to Walt, this lasted several minutes before it slowly faded. During this period, both felt a strange pressure within their ears.*

Roy said, "That's it Walt. I'm outta here." After gathering a number of geodes, both left with Roy leading the way -rather fast... Old Roy would never again return to the site, no matter how we tried to persuade him. Was the shimmering and ear sensation the beginning of some activation that never reached its full potential?...

While in Arivaca picking up needed supplies, we met three other treasure hunters. They were in the area for a month... By chance, while traveling overland, they camped near the mouth of the canyon leading to the strange area... While relaxing one evening after a long, tiring search for this elusive treasure, *they heard a sound like rain hitting the tent. Stepping outside, they saw the sky was clear. All at once a shower of hundreds of small stones came cascading down around them. Most were the size of a large pea, were reddish brown and resembled hematite, an iron ore.*

Picking several up, they noticed they were quite warm to the touch. Their camp wasn't located near any high cliffs where the stones could have originated. George, a member of the group, jokingly said: "Perhaps we're camping on some ancient Indian burial ground and the spirits want us to leave." He had read an article about an incident similar to this occurring on a burial ground somewhere in the Midwest.

By now, one has to admit something quite out of the ordinary *encircles* this strange site. I won't definitely say their encounter with the warm stones had anything to do with our odd out-of-time region. Indian spirits or not, something weird occurred while they sat relaxing in their tent...

The strange experience I had occurred on October 14, 1973. During one of our two-week adventures, I found myself near the canyon that leads towards that oddball site. Not having been there in almost four years, I decided to pay it a visit. The canyon was just as rugged as ever. After climbing and slipping among the boulders, I finally arrived at the steep hill leading to the site above... To my left (west), the steep hill followed the canyon perhaps a mile, but something was definitely wrong. Below to my left was a canyon -where none had existed. Curious, I made my way down, entering it from the eastside, so I thought.

I soon discovered I was in the same canyon that led toward the hill I had just scaled. I was more than 250 yards back down the canyon on a different slope and now I was facing south -I had mysteriously been transported to the new location. Thinking I was looking west, I was really looking east seeing the canyon I had just hiked. There was no way on earth I could have reached this other slope while climbing the original hill. Knowing where I was, suddenly I knew why this had happened. Any skepticism I had about this crazy site vanished... I was apprehensive about continuing and should have departed the area immediately. But curiosity led me on. I made the grueling climb once again, passing the spot where minutes before I had been resting...

Soon, I arrived at the site and looked around. Everything appeared normal. No shimmering effects, lights or other odd observations were observed. However, I noticed how silent it was -not a breeze, a birdcall, nothing. Looking down, I saw the hairs on my arms standing straight up like being near static electricity. I began feeling uneasy and decided to leave... While descending the hill, I found an outcropping of thunder eggs -a cryo-crystalline variety of quartz found in egg-shaped nodules...

During 2001, my friend Bill Riley and his wife, Mary, wanted to visit the area after hearing the remarkable stories surrounding it... That evening, while camping within the canyon, both claimed a slight vibration came from the nearby geodes when placing their hands upon them. Mary later mentioned it was a spooky place and she felt uneasy throughout the night. The following morning while exploring, Bill discovered *a hollow geode large enough to sit in...* Could these large geodes be the main source that activates the natural energy within the area, or just more wild unfounded speculation?

While searching, Bill and Mary spotted what resembled the two columns off in the distance. Upon arriving where they should have been, both columns had vanished... After spending the day searching and not witnessing any strange activities except for the vanishing columns, they left arriving at their truck after dark. While preparing to leave and follow their tracks out to the ranch road, Bill glanced toward the canyon. In the sky above the site, a circular transparent donut-shaped glow was seen resembling the Aurora Borealis. From the inside rim, tiny sparkling particles were observed cascading downward. Taking his digital camera, Bill took a picture of the odd display before it vanished.

The many accounts of the Quinn brothers and their close friends contain the clearest of details connecting the phenomena by a thin thread. The shimmering of the archway was caused by the acoustic resonance that temporarily ignited a thin screen of HHO plasma within the space enclosed by the piezoelectric stone archway. Native American cultures have preserved the sacred symbolism of concentric circles, spirals and standing waves on the sheer rock walls of the southwest United States, as most notably seen in the Rochester Panel (above).

Ronn Quinn's eyewitness accounts from 1956 corroborate the collected histories of local Native American legend and personal accounts of knowledgeable local people to reveal the intersecting aspects of fascinating transdimensional phenomena quite often associated with sacred sites worldwide.

The luminous plasma ships that Ron reports having observed on several occasions in the night skies above this vortex point are even more reported today in all parts of Arizona (above), and directly relate to their use of terrestrial infrasound standing waves to maximized ionization of the hull at nodal vortex points receiving infrasound resonance from the Orion pyramids of Giza, Egypt. The rains of small round stones that Ron reports witnessing fall from the sky onto his group of friends has also been reported in isolated incidents in Ratria and Dhenkanal India, as previously discussed.

Quinn's recounting of instances of instantaneous teleportation and the appearance of different time periods through the transdimensional stone archway are mentioned in the context of shimmering flashes of light seen around the archway, drawing a direct connection between dimensional shift with the stimulation of atmospheric plasma above the area. This same phenomenon has been photographically recorded by motion-sensing gametrail cameras that became activated by the bright flashes of light that temporarily illuminated a small area near Longview, Texas.

The vortex site just southeast of Tucson, Arizona (31.91°N 110.45°W) is 7,488 miles from Giza, Egypt - a distance that comprises 30.0% of the Earth's mean circumference. This exact location has also been identified as a vortex of concentric circles by meteorologists studying anomalous radar images from various dates, including August 16, 2006 (pictured on p. 24).

The entire slew of transdimensional phenomena involved in the localized vicinity of the infrasound vortex can be accurately explained as plasma effects. The rain of stones from clear skies, and the more intriguing passage of such stones through solid walls, is enabled by the transdimensional interpenetration of physical matter that occurs within HHO plasma. As contact with high-energy plasma induces intense electromagnetic fields around the object, forcing its atomic lattice to undergo a rapid expansion between each adjacent atom, while simultaneously drawing the electron orbitals into much closer proximity to the nucleus of each atom. *Objects in this fourth-density plasma state become fully transparent to the eye:*

- **Menomonee Falls, Wisconsin**. October 4, 1873 - Vanishing objects, levitating eggs, teacups and pans.[75]

- **St. Louis, Missouri**. October, 1857 - Something exploded terrifically in the sky, at St. Louis, and shook the ground "severely" or "violently," at 4:20am, Oct. 8, 1857... A slight shock was said to have been felt four hours before the great concussion, and another three days before... Time after time, in a period of about three days, concussions were felt in and around St. Louis. One of these concussions, with its "sound like thunder or the roar of artillery"... was from an explosion in the sky.[76]

- **Pasadena, California**. December 12, 1931 - Upon the night of Dec. 12, 1931, there was an [unexplainable] explosion, somewhere under the bed of [the woman of the house]... or in the room underneath. The bed was hurled to the ceiling, and [she] was killed. It was a tremendous explosion, but nobody else in the house was harmed... Bomb experts investigated. They concluded that no known explosive had been used. They said that there had been no escape of gas.[77]

- **Bladenboro, North Carolina**. February 2, 1932 - "Fires, which apparently sprang from nowhere, consuming the household... Have placed this community in a state of excitement, and continue to burn. Saturday a window shade and curtain burned... Since then fire has burst out in five rooms. Five window shades, bed coverings, tablecloths, and other effects have suddenly burst into flames, under the noses of the watchers.[78]

- **Odon, Indiana**. 1951 - Twenty-eight spontaneous fires had broken out in a home during an electrical outage, without any power in the home. Papers between the bedsprings and mattress were seen to burst into flames, as well as a pair of overalls hanging from a hook on a door. Unusual fire also ignited in the pages of a closed book, in a closed drawer.[79]

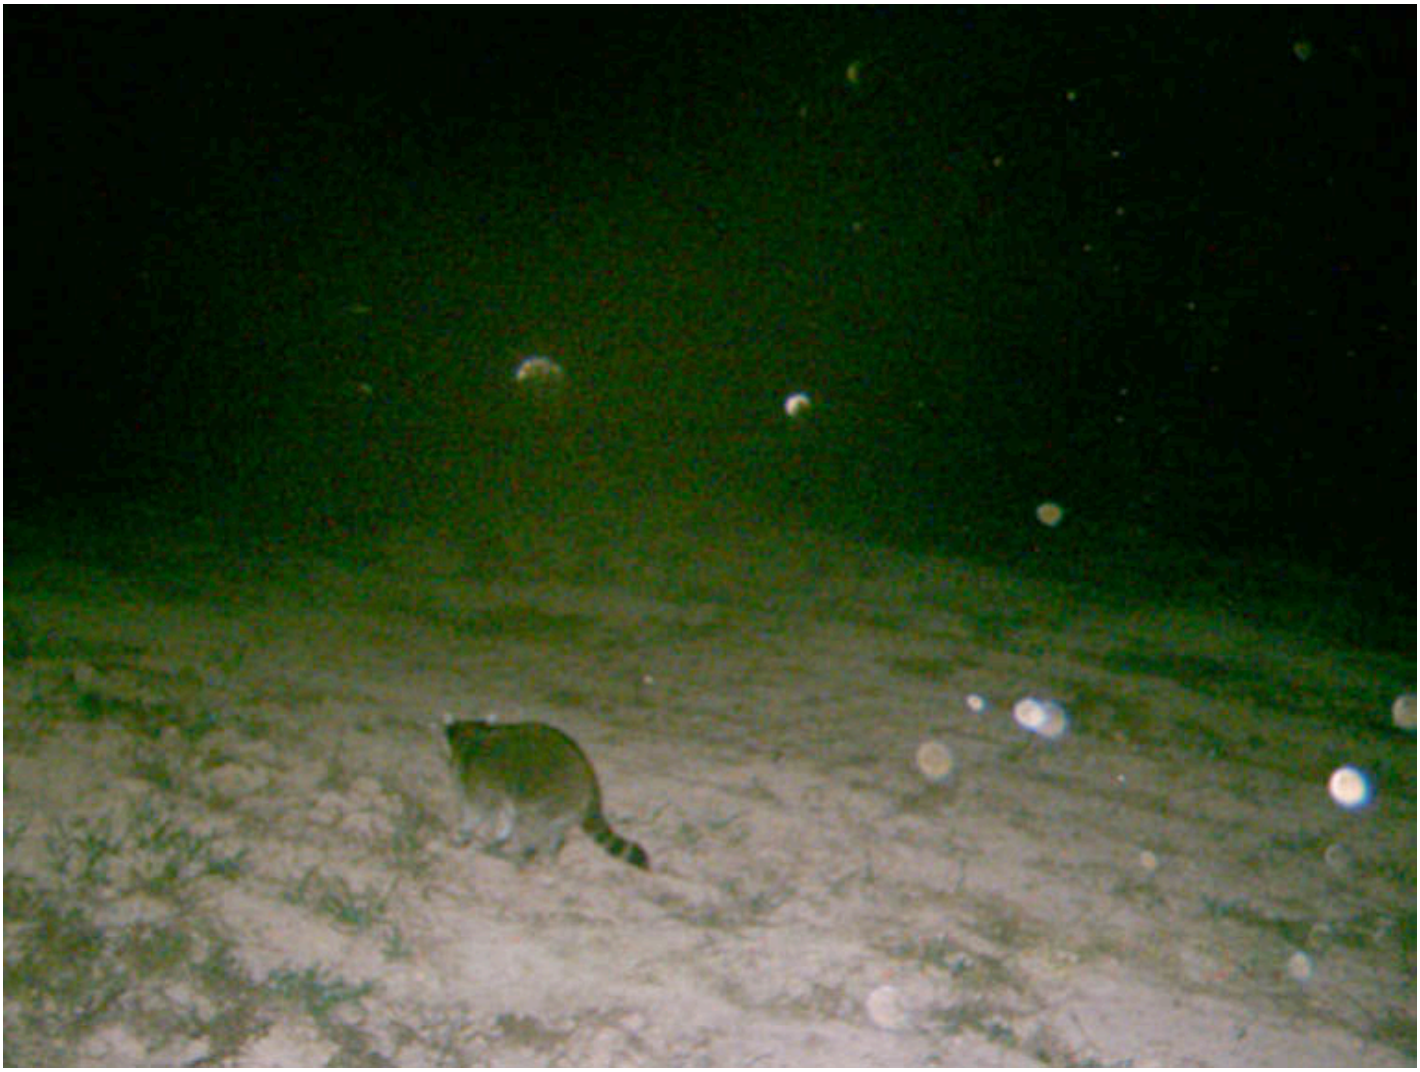
- **Glendive, Montana**. January 10, 1958 - A housewife witnesses the sudden combustion of curtains hanging in the front room, followed by the spontaneous combustion of curtains in the dining room half-an-hour later, both of which she extinguished. Then a waste paper basket fire erupted and was also extinguished. Another set of curtains, this time in a bedroom, were ignited by an invisible source and then put out quickly. All electrical power to the home was shut down, yet five fires broke out over the course of the next seven days - charring clothing in a closed wardrobe, gutting a clothes storage closet and igniting a tablecloth sitting on a table.[80]

Charles Fort also collected several quite curious of data sets from old archived news reports concerning another category of well documented spontaneous combustion events that seemed to manifest by the directed intention of particular individuals that had apparently mastered the highly unusual ability known among paranormal investigators as *pyrokinesis*. Fort suspected these were effects of natural mental rays:

> I'd not say that invisible starting a fire, at a distance, by means of mental rays, is any more mysterious than is the shooting-off of distant explosives by means of rays called physical, which nobody understands... I am bringing out: that, as a "natural force," there is a fire-inducing power...[81]

- **Paw Paw, Michigan**. December 1, 1882 - In the New York Sun, Dec. 1, 1882, is an account of the occult powers of A. W. Underwood... aged 24... Dr. L. C. Woodman [provided a] statement that he was convinced that Underwood's phenomena are genuine. "He will take anybodies handkerchief, and hold it to his mouth, rub it vigorously, while breathing on it, and immediately it bursts into flames, and burns until consumed. He will strip, and rinse out his mouth thoroughly, and submit to the most rigorous examination to preclude the possibility of any humbug, and then by his breath, blown upon any paper, or cloth, envelop it in flames. He will, while out gunning, lie down, after collecting dry leaves, and by breathing on them start a fire."[82]

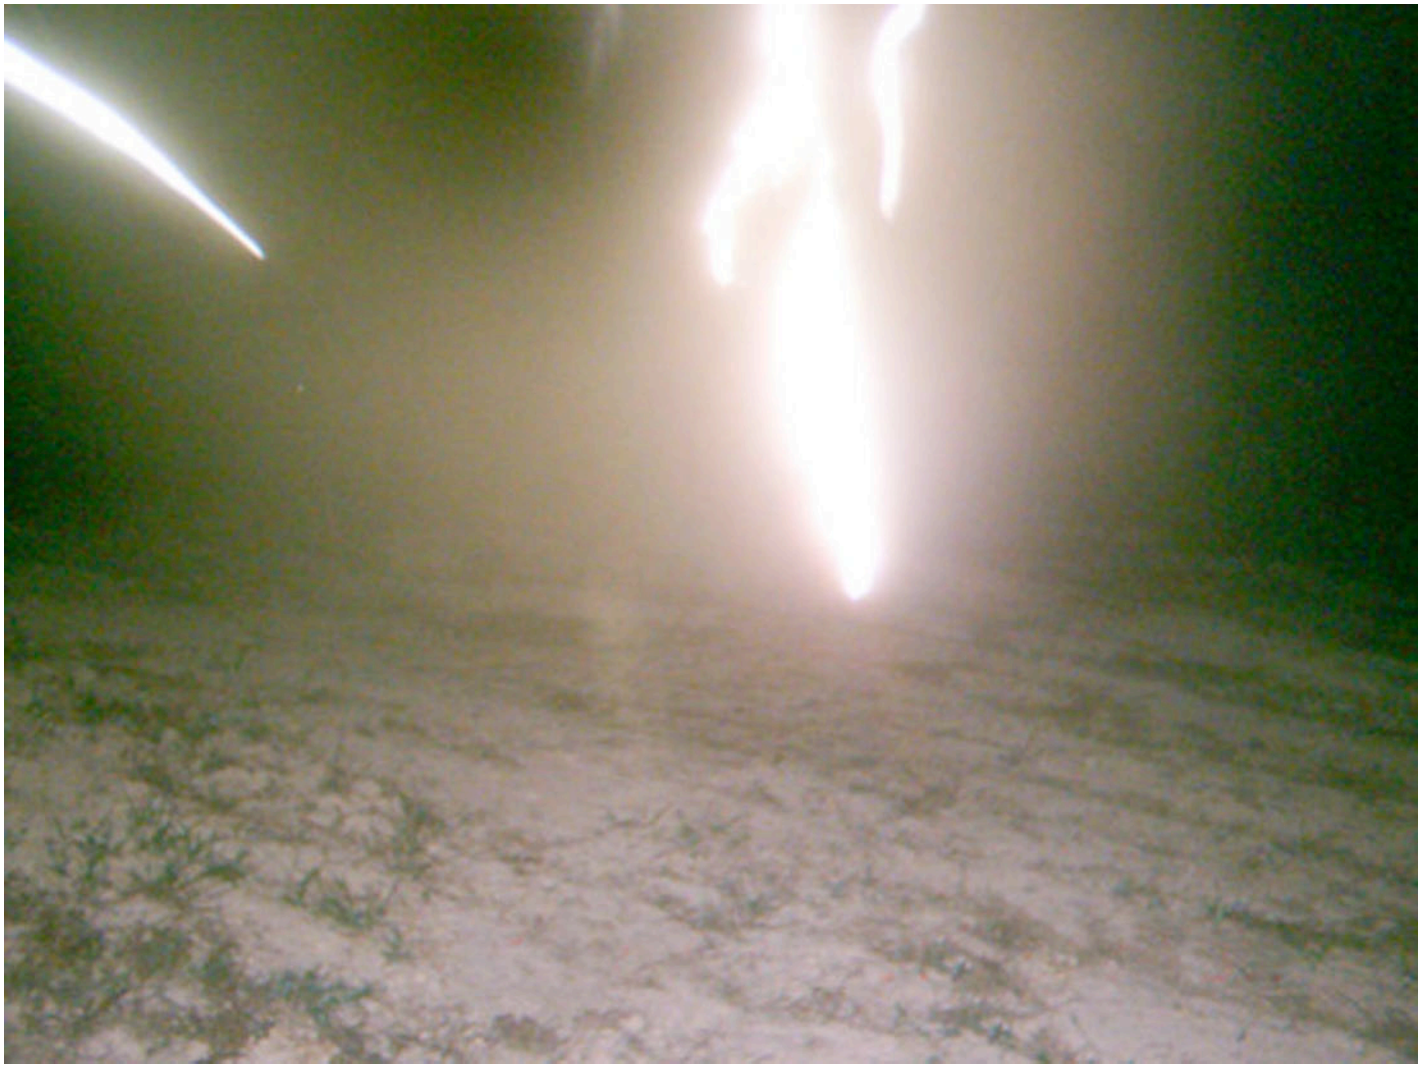
- **Turlock, California**. October 4, 1886 - "Willie Brough, 12 years old... Had caused excitement in the town... By setting things afire, "by his glance," had been expelled from the Turlock school, because of his freaks. His parents had cast him off, believing him to be possessed by a devil, but a farmer had taken him in, and had sent him to school. "On the first day there were five fires in the school: one in the center of the ceiling, one in the teacher's desk, one in her wardrobe, and two on the wall. The boy discovered all, and cried from fright. The trustees met, and expelled him, that night."[83]



- **Memphis, Tennessee**. July 9, 1927 - In the New York Sun, July 9, 1927, is an account of a visit by Vice-President Dawes, to Memphis, Tennessee. In this city lived a car-repairer, who was also a magician. "He took General Dawes' handkerchief, and breathed upon it, and it caught fire." [84]

The extensive use of metals in typical modern homes and farm buildings has caused sporadic yet severe episodes of spontaneous piezoelectric fires due to the fluctuating influence of planetary infrasound resonance. The wisdom of Native American cultures has retained powerful ancestral knowledge concerning this invisible, inaudible force. Lakota Elder Black Elk describes it as the sacred Hoop of the Nation, the Flaming Rainbow and the Tree of life, as related in selections from *'Black Elk Speaks: Being the Life Story of a Holy Man of the Oglala Sioux'* (1961), told through the words of John G. Neihardt:

> [T]he great Voice said: "Behold the circle of the nation's hoop, for it is holy, being endless, and thus all powers will be one power in the people without end." [85]



> Then I was standing on the highest mountain of them all, and around about beneath me was the whole hoop of the world. And while I stood there I saw more than I can tell and I understood more than I saw; for I was seeing in a sacred manner the shapes of all things in the spirit, and the shape of all shapes as they must live together like one being. And I saw that the sacred hoop of my people was one of many hoops that made one circle, wide as daylight and as starlight, and in the center grew one mighty flowering tree to shelter all the children of one mother and one father. And I saw that it was holy.[86]

> We danced there, and another vision came to me. I saw a Flaming Rainbow, like the one I had seen in my first great vision. Below the rainbow was a teepee made of cloud. Over me there was a spotted eagle soaring, and he said to me: "Remember this." That was all I saw and heard.[87]

The intense visions of Lakota Elder Black Elk have gained significant support during the last decades of scientific advancement regarding the Fibonacci structure of invisible infrasound standing waves by studying acoustic effects in resonant cavities in the laboratory setting. The ignition of HHO plasma plumes along these waveforms was photographed in Longview, Texas on the auspicious date of 9-9-9:

> What about the 'Blades of Light' photographed in Cass County, Texas by Doyle Brogan on September 9 to 10, 2009? Doyle has hunted in that region for 30 years, got Moultrie Gamespy D40 Digital Trail Cameras about 6 years ago, runs four of them 24 hours a day, seven days a week, and told me he has never seen anything like the strange lights before…
>
> **Interview with Doyle Brogan**, retired supervisor for heavy-duty truck manufacturer, Longview, Texas:
>
> Q: What was your first reaction to seeing the two unusual frames of blades of light in your digital images from your Moultrie Game Camera?
>
> "I had no idea what it could be. I think there were some 30 pictures on the card and I immediately printed the two frames of the strange lighted stuff out on my computer to look at it closer. I just could not figure it out. The next day, it started raining and I didn't go up there until the Tuesday after the previous week when I collected those pictures. So that's when I contacted the television station in Longview, KYTX."
>
> "I went back to the location on Tuesday morning, Sept. 15, 2009, around 9:30 AM with TV reporter. We drove to where the Moultrie game camera was and it was pouring down rain. We couldn't see any physical traces of any burning on the ground even though there was a lot of water on the ground. I haven't been back there since. I want to know what it is and where it comes from!" [88]

These luminous formations captured by motion sensor cameras in Longview, Texas are formations of hydrino plasma, also known as HHO plasma, which is ignited when water vapor interacts with high-energy particles moving along the paths of infrasound standing waves. Hydrogen atoms become stripped from the water molecules and implode in cascade to form HHO plasma when ignited by the stream of electrons moving through the standing waves.

Two other remarkable images were taken by the gametrail camera just before and after the magnificent event captured in the photograph above. Plasma orbs captured in the images taken right before the HHO plumes (opposite) are known to be responsible to crop circle formations which reflect the sacred geometry of infrasound standing waves that focus into a specific network of energetic locations defined by the quadratic function [$z_{n+1} = z_n^2$].

The arching forms of the plasma plumes conform perfectly to the shape of standing waves as presented throughout this website. The fact that the exact same configuration of several plasma plumes was photographed 6 hours apart on September 9-10, 2009 indicates the presence of invisible infrasound standing waves causing the brief moments of HHO plasma ignition. This effect will be likely photographed again by the same game trail camera, and will inevitably be witnessed and photographed in other resonant focal points in other parts of the world.

These HHO plasma plumes and high atmospheric red sprites are the result of increasing energy input into Earth's atmosphere. Solar activity has been high despite the present rarity of sunspots, which becomes transduced into atmospheric standing waves as they vibrate the molecules of the atmosphere.

Location of Events	GPS Coordinates	Miles to Giza	Circ.%
1. Antigonish, Nova Scotia	(45.62°N 61.99°W)	4,922	19.8%
2. Woodstock, N. Brunswick	(46.15°N 67.60°W)	5,150	20.7%
3. Thorah, Ontario	(44.48°N 79.22°W)	5,694	22.9%
4. Hudson, Quebec	(45.45°N 74.15°W)	5,449	21.9%
5. Clarendon, Quebec	(45.65°N 76.52°W)	5,539	22.3%
6. Windsor, Ontario	(42.27°N 83.05°W)	5,940	23.9%

• **Antigonish, Nova Scotia, Canada**. Early March, 1922 - In the dead of winter, a family had been driven from their home, by "mysterious fires," unaccountable sounds, and the meanderings of crockery. The phenomena had centered around Mary Ellen, [the family's] adopted daughter. [Investigators] interviewed neighbors, and recorded their testimony that dozens of fires had broken out, in this girl's presence: but more striking than any testimony by witnesses was the sight, outside the house, of the blackened furniture, sticking out of the snow banks.[89]

• **Woodstock, New Brunswick, Canada**. August 6, 1887 - "In a little, two-story house, in Victoria Street... fires broke out. Within a few hours there were about forty fires. They were fires in unscorched surroundings. They did not extend to their surroundings, because they were immediately put out, or because some unknown condition limited them. "The fires can be traced to no human agency, and even the most skeptical are staggered. Now a curtain, high up and out of reach, would burst into flames, then a bed quilt in another room: a basket of clothes on a shed, a child's dress, hanging on a hook."[90]

• **Horse Island, New Brunswick, Canada**. March 25, 1931 - There is a story of an explosion that may have been set off by "rays" that at present are not understood. It is the story of the explosion that wrecked the sealing ship, Viking, off Horse Island, north of New Brunswick... this ship was upon a moving picture expedition. Varrick Frissell, film producer, aboard his vessel, started to think of the kegs of [explosive gun-] powder aboard, and he became apprehensive. He started to make a warning sign to hang on the door of the powder room. Just then the ship blew up.[91]

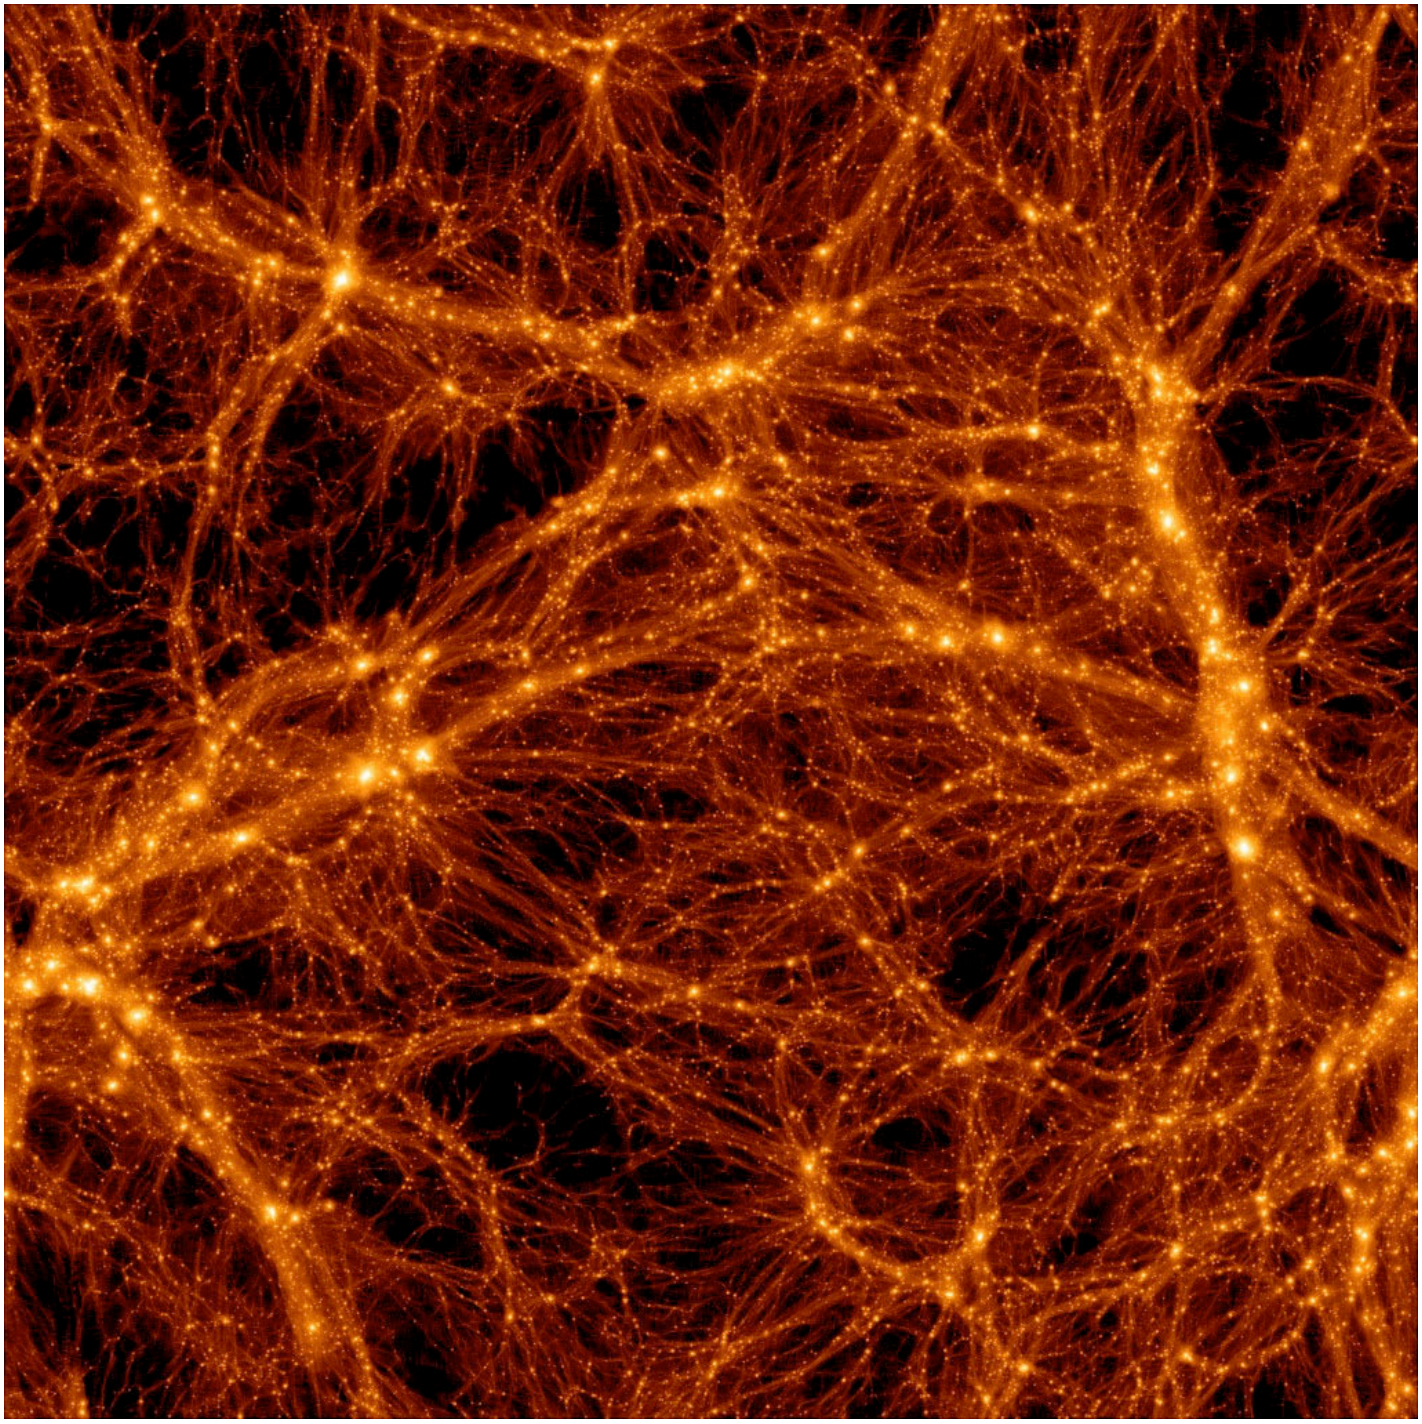
• **Thorah, near Toronto, Ontario, Canada**. December 19, 1891 - [In a household] the ceiling was afire... Next day many fires broke out. As soon as one was extinguished, another started up... For a week fires broke out. [Eyewitnesses in the affected home] told of the charred patches of wallpaper, which looked as if a lighted lamp had been held to the places.[92]

• **Hudson, Quebec, Canada**. October 6, 1880 - "For two weeks, in the Hudson Hotel... furniture had been given to disorderly conduct: the beds had been especially excitable. A fire had broken out in a stall in the stable. This fire was quenched, but another broke out... The stable burned down."[93]

- **Clarendon, Quebec, Canada**. September 15, 1889 - The first of the "uncanny" occurrences - as they are so persistently called by persons who do not realize how common they are - was upon September 15th. Windowpanes broke. There were unaccountable fires - as many as eight a day. Stones of unknown origin were thrown. A large stone struck one of the children, and "strange to say, it did not hurt her in the least."[94]

- **Windsor, Ontario, Canada**. December, 1941 - Spontaneous combustion of paper, tablecloths, towels and a phonebook were witnessed by country club staff who put out several blazes in seven of eleven bedrooms before calling in firefighters. By the time the Fire Department got there, a total of forty-three separate fires had been located and extinguished. The following day, the fire marshal and insurance adjuster who had come to survey the damage observed a broom burst into flickering blue flames before their eyes.[95]

- **Windsor & Essex County, Ontario, Canada**. April 8, 2011 - Many reports from residents all over the Windsor area describe a loud, low frequency rumbling noise that recurs often for long periods. Local resident Sonya Skillings (above) is baffled by the phenomena, stating: “It’s in the ground and it feels like a subway under the house. It happens at all different times -in the middle of the night as well.” [96]



The resonant physics of nonlinear standing waves confirms the infrasonic origin of these disturbing vibrations that fluctuate between a mere nuisance to an immediate hazard to life, requiring rapid evacuation from proximity to all metals, especially all buildings with electrical wiring, that accumulate intense electrical charges at critical convergence points throughout the globe.

Such drastically intensifying conditions of planetary resonance are not just Earthly phenomena, but reflect fundamental changes in the cosmic wave environment of our entire solar system preceding the imminent Magnetic Reversal of the sun and every planet in its orbit. The culminating Magnetic Reversal promises a dramatic further increase in the infrasound resonance of the entire system, resulting in the explosive coronal ignition of our sun's Brown Dwarf binary twin –*transforming into the small Red Star that has been so clearly identified in the ancient Hopi prophecy of the Red Katchina.*

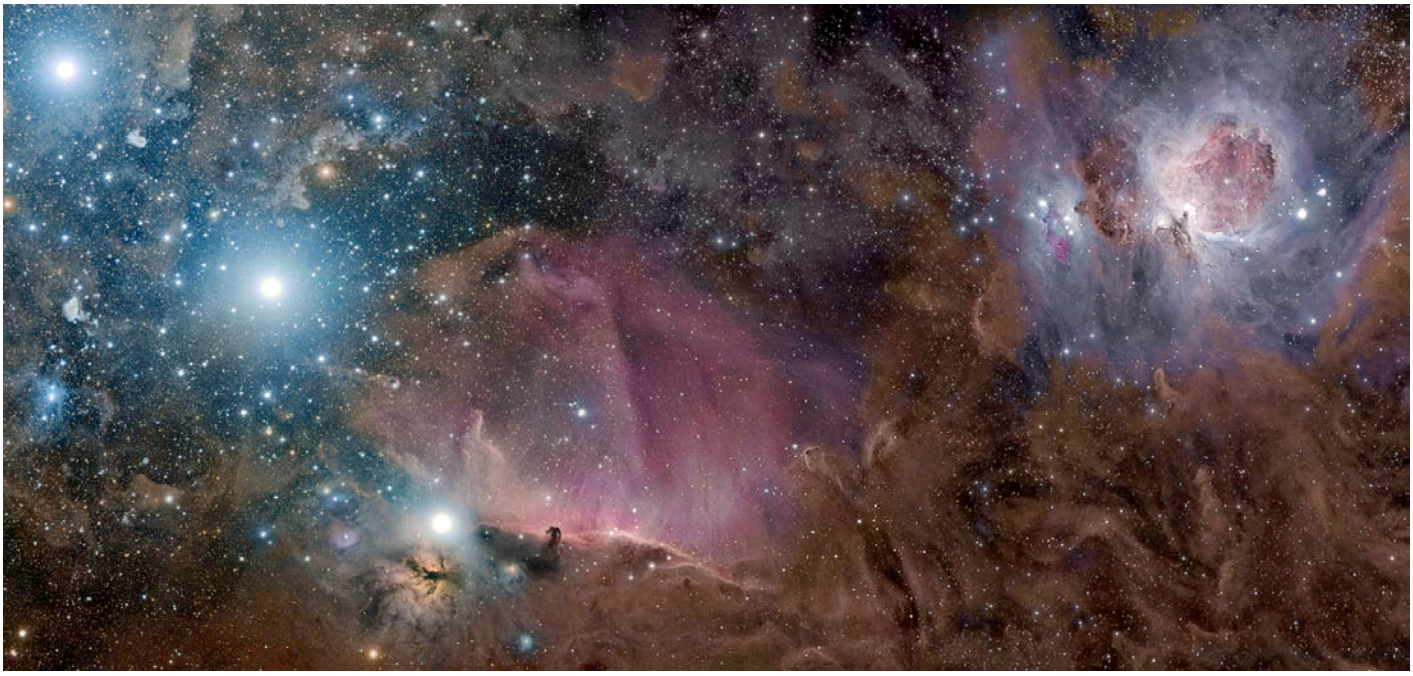
Synchronous Channels

Synchronous Channels

The unfathomable range of cosmic and terrestrial phenomena that direct the progression of life on all planets throughout the universe are not random, but comprise the directed will of the Creator as it manifests into the physical realms. Development of consciousness progresses through the awareness of complex astrophysical calculations that reveal the natural rhythms of Earth, and throughout the cosmos.

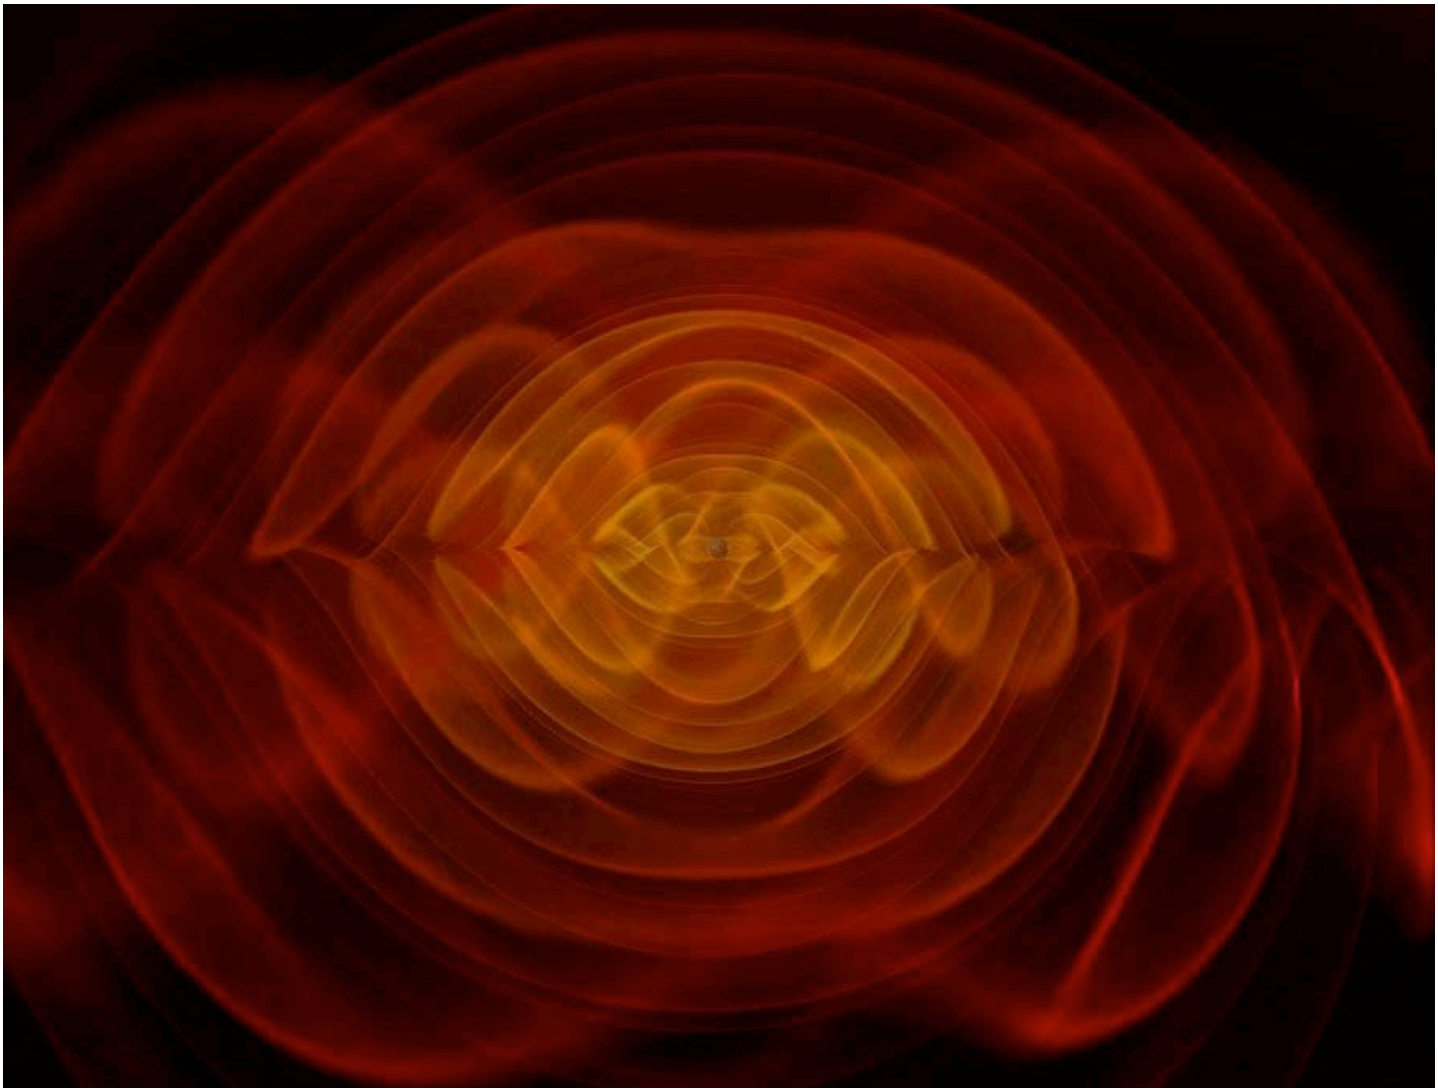


Ancient Vedic scholars acknowledged periodic synchronizing influences of cycling Galactic Superwaves upon the fundamental oscillatory quantum state of the Earth and the orientation of her magnetic axis. In his exhaustively researched compendium, Charles Fort provides an insightful description of reported events that exactly correspond to Nikola Tesla's description of the effects of *infrasound standing waves*:

> The suggestion is that somewhere, external to this earth, if in terrestrial terms there is no explanation, there was a volcanic eruption, and that the earthquake in India was a response to it, and that bulks of water and other discharges came from somewhere else exclusively to a part of this earth that was responsively or functionally, quaking, because a teleportative current of some kind, very likely electric, existed between the two centers of disturbances.[1]

Fort even collected reports of dense ball-like cloud formations that moved along the invisible pathways of infrasound standing waves, closely approaching the ground at regular intervals: "Cloud bounded along, coming to earth every eight hundred or one thousand yards" (p. 236). The estimated length of the intervals provides us with the fundamental resonant frequency of the infrasound force responsible –a set of ultra-low frequency standing waves of approximately 0.4 Hz.

Furthermore, Fort determined that there must be a causal relationship between astronomical observations of supernovae explosions in other sectors of our galaxy with intense atmospheric and lithospheric upheavals occurring on Earth, due to the tight synchronicity of such seemingly unrelated events:



> According to data that have been disregarded about 60 years, it may be that there was a teleportative, or electrolytic, between a volcano of this earth and a stellar volcano. If we think that a volcano in a land that we call the constellation Orion interacted with a volcano in Italy –as Vesuvius and Etna often interact– there must be new thoughts on the distance of Orion…

> The glare in the sky, early in the evening of Feb. 4, 1872, was west of Orion, as if cast by reflection from an eruption below the horizon. But when Orion appeared in the east, the glare was in Orion, and it remained in Orion. At Paris, all beams of light came from Orion, after 8pm (*Comptes Rendus,* 74-385). In England – in Orion (*Symons' Met. Mag.,* 7-1). In South Africa, the point from which all beams diverged was in Orion (*Cape Argus*, February 10). An account of Prof. A. C. Twining, of observations in the Unites States is published in the *Amer. Jour. Sci.,* 3-3-273. This "remarkable fact," as Prof. Twining calls it, but without attempting to explain, is noted – that, from quarter past seven o'clock, in the evening, until quarter past ten, though Orion had moved one eighth of its whole revolution, the light remained in Orion.
>
> There is no conventional explanation to oppose us. My expression is that the glare so remained in Orion, because it was in Orion. Anybody who thinks that the glare was somewhere between this earth and the constellation will have to account not only for the fixedness of it in a moving constellation, but for its absence of parallax as seen in places as far apart as South Africa and the United States… That all are related, because all are phenomena of one, organic existence… diverse occurrences were related, because all were reactions to something in common.[2]

Our present understanding of the properties of piezoelectric crystals, which convert applied mechanical and acoustic energy into electrical currents and electromagnetic fields, reveals a primary mechanism of energetic interactions underpinning our entire cosmos. Luminous clouds of atmospheric plasma transduce incoming cosmic rays of infrasound into colorful auroral sheets that slowly undulate above the Earth, replicating giant nebular plasma formations. Fort imagined the circuitous motion of energy through the Earth and the galaxy as a vast and magnificent battery:

> I think of our existence as a battery – an enormous battery, or, in the cosmic sense, a little battery. So I think of volcanic regions, or incipiently volcanic regions, in a land of the stars and in a land of this earth, as electrodes, which are mutually perturbative, and between which flow quantities of water and other volcanic discharges, in electrolytic, or electrically teleportative currents. According to data, I think that some teleportations are instantaneous, and that some are slow drifts.[3]

The great accuracy of the astrophysical concepts intuitively hypothesized by Charles Fort is only now becoming evident by efforts to supersede the various compartmentalized scientific disciplines as they are practiced today. The famous trance channel Edgar Cayce began a flood of spiritually-oriented information into the public domain that has seeped into the collective consciousness over the course of many decades.

Several sources of highly accurate prophetic or channeled material have been published since Cayce's life's work was completed, providing an unusual kind of progressive information system that is affecting the rapid enlightenment of humanity. These synchronous channels include the prophet 'Billy' Eduard Meier, the medium Laura Knight-Jadczyk and the seer Vanga, who provided hundreds of remarkable predictions of future events over the course of hundreds of private sessions, especially renowned for her prediction of a black President of the United States –*who would be the last President of the United States.*

How wonderful: an end to the American Presidency is prophesied at the same time as an end to the Papacy in Rome, famously revealed in St. Malachy's 1595 Prophecy of the Popes. *This uplifting prophetic information is presently being enforced in the real world by the International Tribunal into Crimes of Church and State (ITCCS), and their fearless, outspoken public representative Kevin Annett.*[4]

If we are to judge the quality of a source of channeled information, then we must consider the duration of the communication and especially the relative density of accurate prophetic or specialized scientific information. By these criteria, Edgar Cayce still stands out among even the most extraordinary prophets of our time as the clearest source of highly detailed and verifiable information on a mind-boggling diversity and profundity of subjects that remains far beyond the general comprehension of humanity.

Swiss contactee 'Billy' Eduard Meier has published tomes of impressive photo, audio, video and word-for-word transcripts documenting his many decades of ongoing visits from various extraterrestrial humanoid races, including scores of fascinating dialogs with individuals named Asket, Semjase, Ptaah and Quetzal. The catastrophic destruction of a populated planet within our solar system known as Malon was described briefly in passing during his 155th Contact with his Plejaren friend Quetzal on December 6, 1981:

> Quetzal: That is correct, but on the one hand, they really aren't very important, and on the other hand, they partially belong to a much earlier history, such as the destruction of the planet Malon, about which you are oriented and have also received information.
>
> Also, the Earth was slightly pulled in at that time when this inhabited planet exploded, having been destroyed by human hands... [a]t the time of the construction of the pyramids, about 73,000 years ago.[5]

This figure was further defined by the Plejaren leader Ptaah during the 256nd Contact of May 13, 1996:

> Billy: ...I would like to ask you something about the pyramids, which are not only found in Egypt but all over the globe. Asket told me once during a contact, that the pyramids were constructed under the direction of extraterrestrials. At the time, in 1956, she stated that the pyramids were built two times 36,650 years ago (from 1956) –hence, 73,300 years ago. Forty years have passed since then, which would put the pyramids' time of origin at approximately 73,340 years. And yet, scientists profess something altogether different...
>
> Ptaah: I am familiar with this misrepresentation and miscalculation. When you calculate back from today, the pyramids were indeed erected approximately 73,340 years ago. This includes not only the pyramids found in Egypt, but also all others located around the Earth –whose distance from the sun amounted to 152.5 million kilometers [95 million miles] during the pyramid's construction era. The pyramids were covered on the outside with a solid layer of limestone and lime mortar, and they were accordingly higher than they are today. In those days the Cheops pyramid measured 152.5 meters [500 ft] in height, representing 1 meter per 1 million kilometers of the Earth-to-sun distance at the time.
>
> The pyramid structures and the many interconnected, subterranean rooms were constructed under the direction of humans of extraterrestrial origin who had come to Earth in those ancient times from the Orion constellation. For this reason the Egyptian pyramids were constructed to replicate this constellation, while the sphinx points toward the Leo constellation... Extensive subterranean spaces, components of each pyramid complex, became subterranean villages of varying sizes where their human inhabitants hid from the looming terrestrial dangers and threats from outer space.[6]

The profound dialogs of Meier and his cosmic visitors require serious study in their great density and adept use of language subtleties to express those elusive realities beyond the common Earthly human experience. Information obtained from Meier's extraterrestrial sources stands very closely with the Cayce information regarding the great antiquity of the pyramids, and the destruction of the Atlantean civilization.

Another most remarkable series of ongoing communications has emerged through the skilled use of a Ouija board**,** by a research group investigating superluminal communications in the form of clear messages from future selves. Lucid dialogs with the "6th density thought-forms" that identified themselves as the Cassiopaeans (abbreviated as Cs) were established and painstakingly maintained and published over the course of two decades by Laura Knight-Jadczyk (L), her partner quantum physicist Arkadiusz Jadczyk (A), as well as co-authors Pierre Lescaudron (P) and Joe Quinn, among many others.

During the course of hundreds of meticulously documented Ouija board sessions, Knight-Jadczyk and her research group pursued several topics of interest shared by many, focusing on the primal source of the ancient pyramid mysteries that had resurfaced during the dedicated psychic work of Edgar Cayce. The origin of sacred symbols used in hands-on healing arts was identified by the Cs on November 19, 1994:

Q: (L) Now, we went to the recommended person to take the Reiki initiation, do we now, at this point in time, have the true Reiki initiation?
A: **Getting there. Must allow energy to solidify. Do you understand the concept of imprinting?**
Q: (L) Yes... Practicing Reiki is the thing that will solidify the force?
A: Partly.
Q: (L) Are there symbols for Reiki that are even older and stronger than the ones we have been given?
A: **Yes.**
*Q: (L) Are the original symbols in **Sanskrit**?*
A: **Yes.**

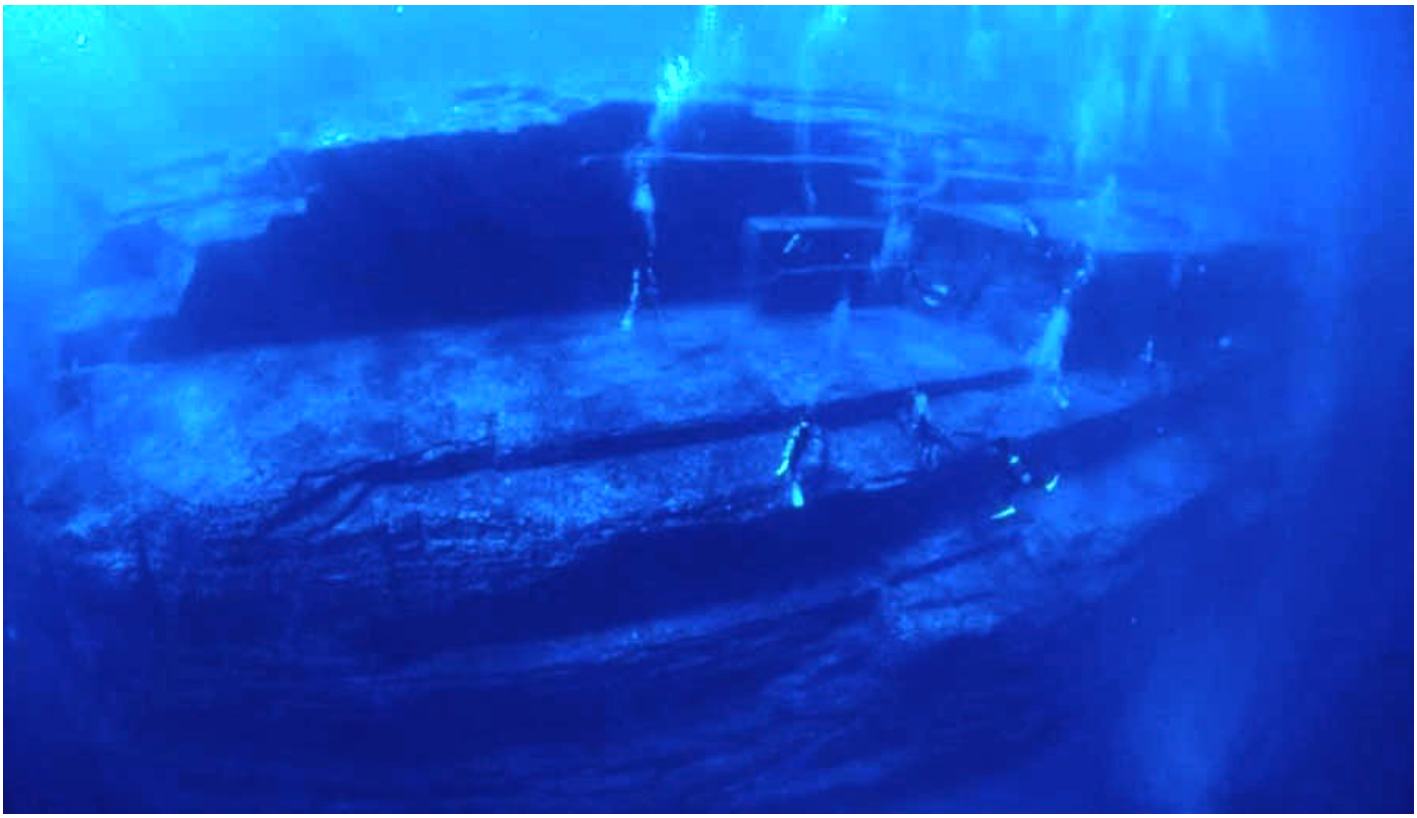
The subject of the original language of the ancient high civilizations of Earth, as mentioned briefly in the Bible, was succinctly addressed by the Cs during a session a few months later, on March 18, 1995:

Q: (L) What is the world's oldest language, at least of those known to today's world?
A: **Sanskrit.**
Q: (L) What is the origin of Sanskrit?
A: **Atlantean roots.**

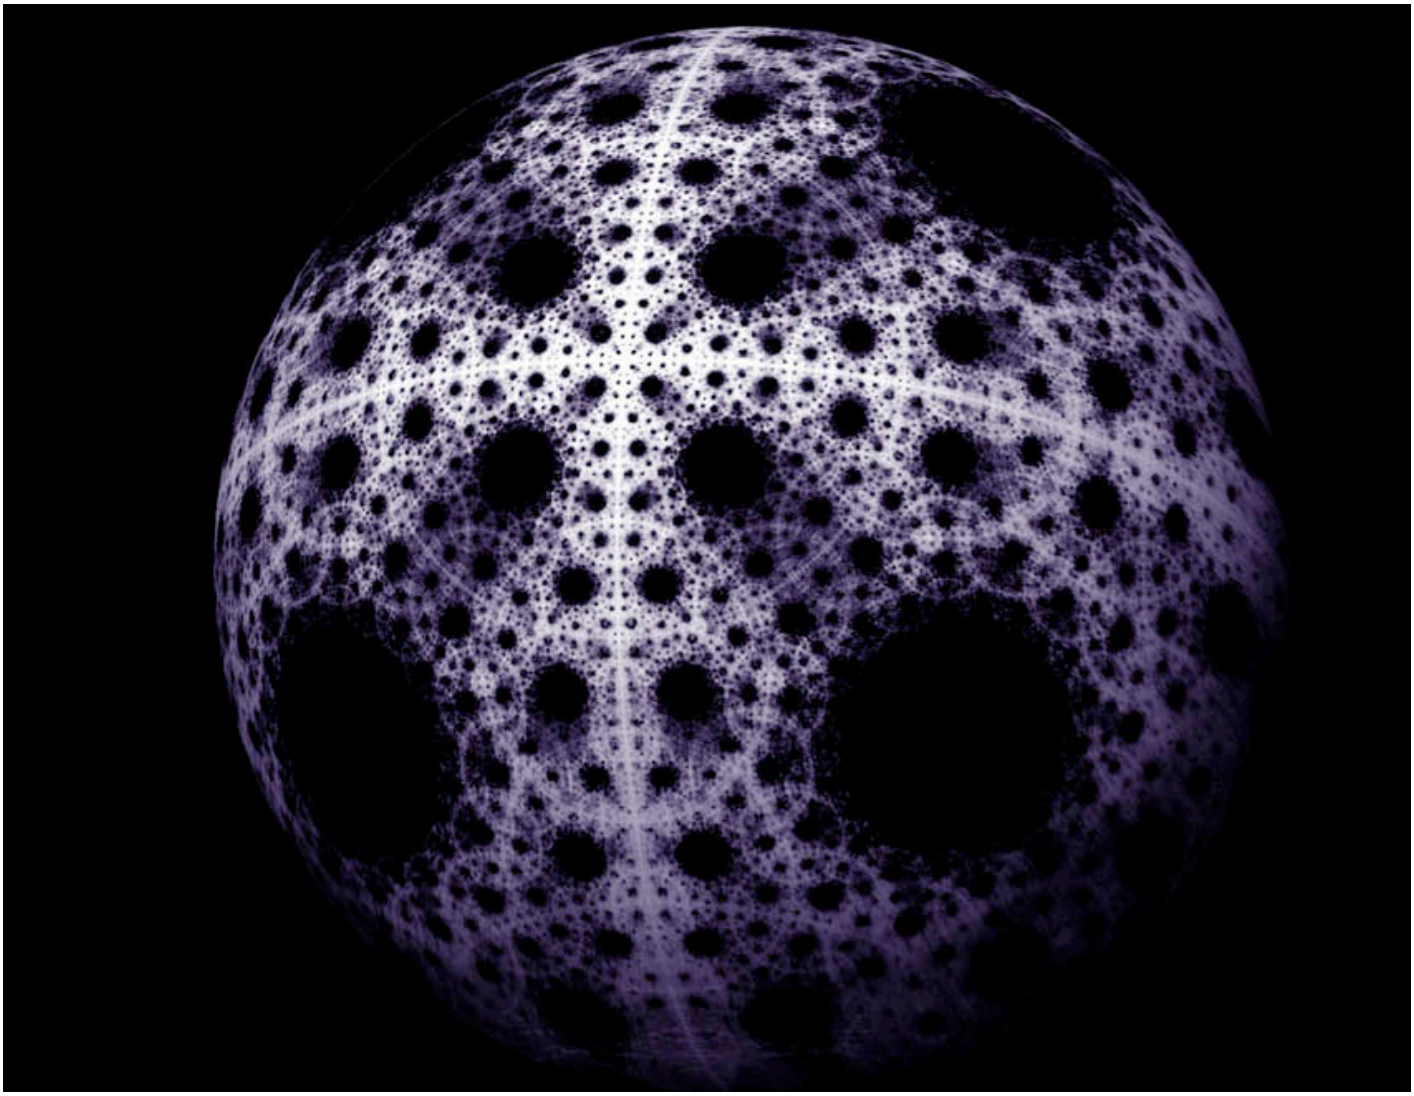
The Cs statements on the Atlantean origin of the Sanskrit language and bioelectrical Reiki healing techniques supports the breakthrough epigraphic work of K. Schildmann in deciphering the hieroglyphic form of Sanskrit on multiple continents in close association with pyramid constructions worldwide.

A September 30, 1994 board session linked the origin of the Atlantean civilization with a planetary catastrophe ~79,000 years ago, providing the exact same timeframe and scenario explained to Billy Meier by his contacts as the explosion of the planet 'Malon', giving an alternate name for the planet as 'Kantek':

Q: (L) Is the cluster of fragments in between the orbits of Mars and Jupiter the remains of a planet?
A: **Yes.**
Q: (L) What was that planet known as?
A: **Kantek.**
Q: (L) When did that planet break apart into the asteroid belt.
A: **79 thousand years ago approximately.**



In subsequent sessions, Knight-Jadczyk discussed the arrival of blue- and green-eyed Kantekkians as commencing the long period of advanced megalithic temple and pyramid building on Earth. Extensive subterranean colonization was confirmed during a session on March 18, 2000: "58,000 years ago, as you would perceive it, human types on earth were a thriving, techno-society, already long since **entrenched**." The disturbing subject of subterran cities was followed-up by Laura on May 4, 1996:

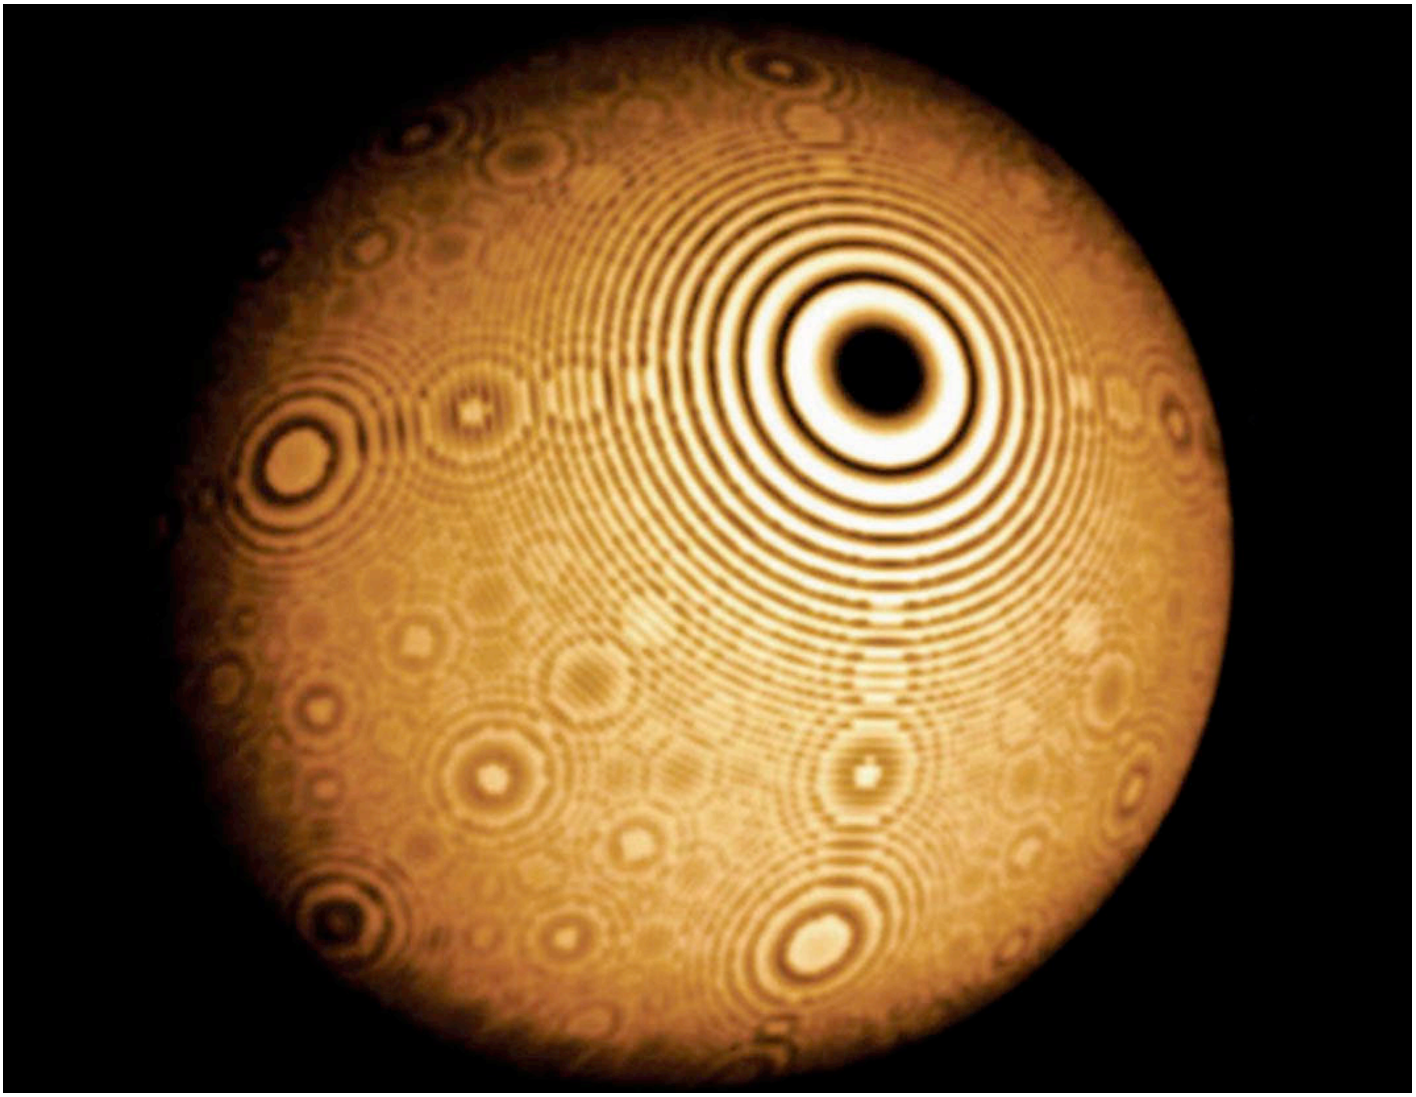


Q: (L) How can an entire race of people, or groups of people, live under the surface of this planet, without the whole 6 billion of the rest of us on top, or at least a large number, realizing that there is anything going on?
A: **No. How much space exists underground, as opposed to that on the surface? ...**
Q: (L) Well, how deep is the deepest of these underground cities?
A: **3,108 miles.**
Q: (L) That's pretty deep! But wouldn't it be too hot at that depth?
A: **No. Temperature averages 68 degrees F.**
Q: (TK) That's pretty comfortable! (L) How do they have light?
A: **Magnetic resonance**.
Q: (L) Well, aren't they subject to being crushed by earthquakes?
A: **No, earthquakes are not felt deep underground!!**

Thought-provoking comments offered in this session expose our total ignorance of habitable conditions in deep underground zones of the planet –*for those possessing advanced technological means for producing HHO plasma by Magnetic Resonance.* Further revelations came on November 19, 1994:

Q: (TL) Who made the monuments on Mars?
A: **Atlanteans.**
Q: (T) So, the Atlanteans had inter-planetary ability?
A: **Yes. With ease.** Atlantean technology makes yours look like the Neanderthal era...
Energy transfer points for crystalline power/symbolism as in monuments or statuary...
Atlanteans were power hungry the way your society is money hungry.
Q: (T) Was the accumulation of this power what brought about their downfall?
A: **Yes... Destroyed Atlantis...**
Q: (L) And what does that crystal do? Is it continuously active?
A: No. Erratic...

Q: (L) Where are the others located?
A: **Off Japan; in Brazil; in Ural mountains of Russia; North and South Poles.**
Q: (T) Are the ones on the Moon and Mars active also?
A: Yes.
Q: (V) Are they responsible for any of the earthquakes like the one in Japan?
A: Yes...
Q: (L) What were the physical dimensions of these crystals and were they cut or naturally grown?
A: **Varied. Were synthetic**...
Q: (L) How large was the largest from base to apex?
A: **5000 feet.**
Q: (L) What was the average size?
A: **500 feet.**
Q: (L) And was the one that was 5,000 feet tall, is that one still in existence?
A: **Yes.**
Q: (L) Where is that one located?
A: **380 miles due East of you?** [ie. east of Jacksonville, Florida]
Q: (L) Some years ago a pilot reported seeing a pyramid near there in the water...
A: **That is just the top sticking out of the ocean floor. It is 90 per cent buried.**

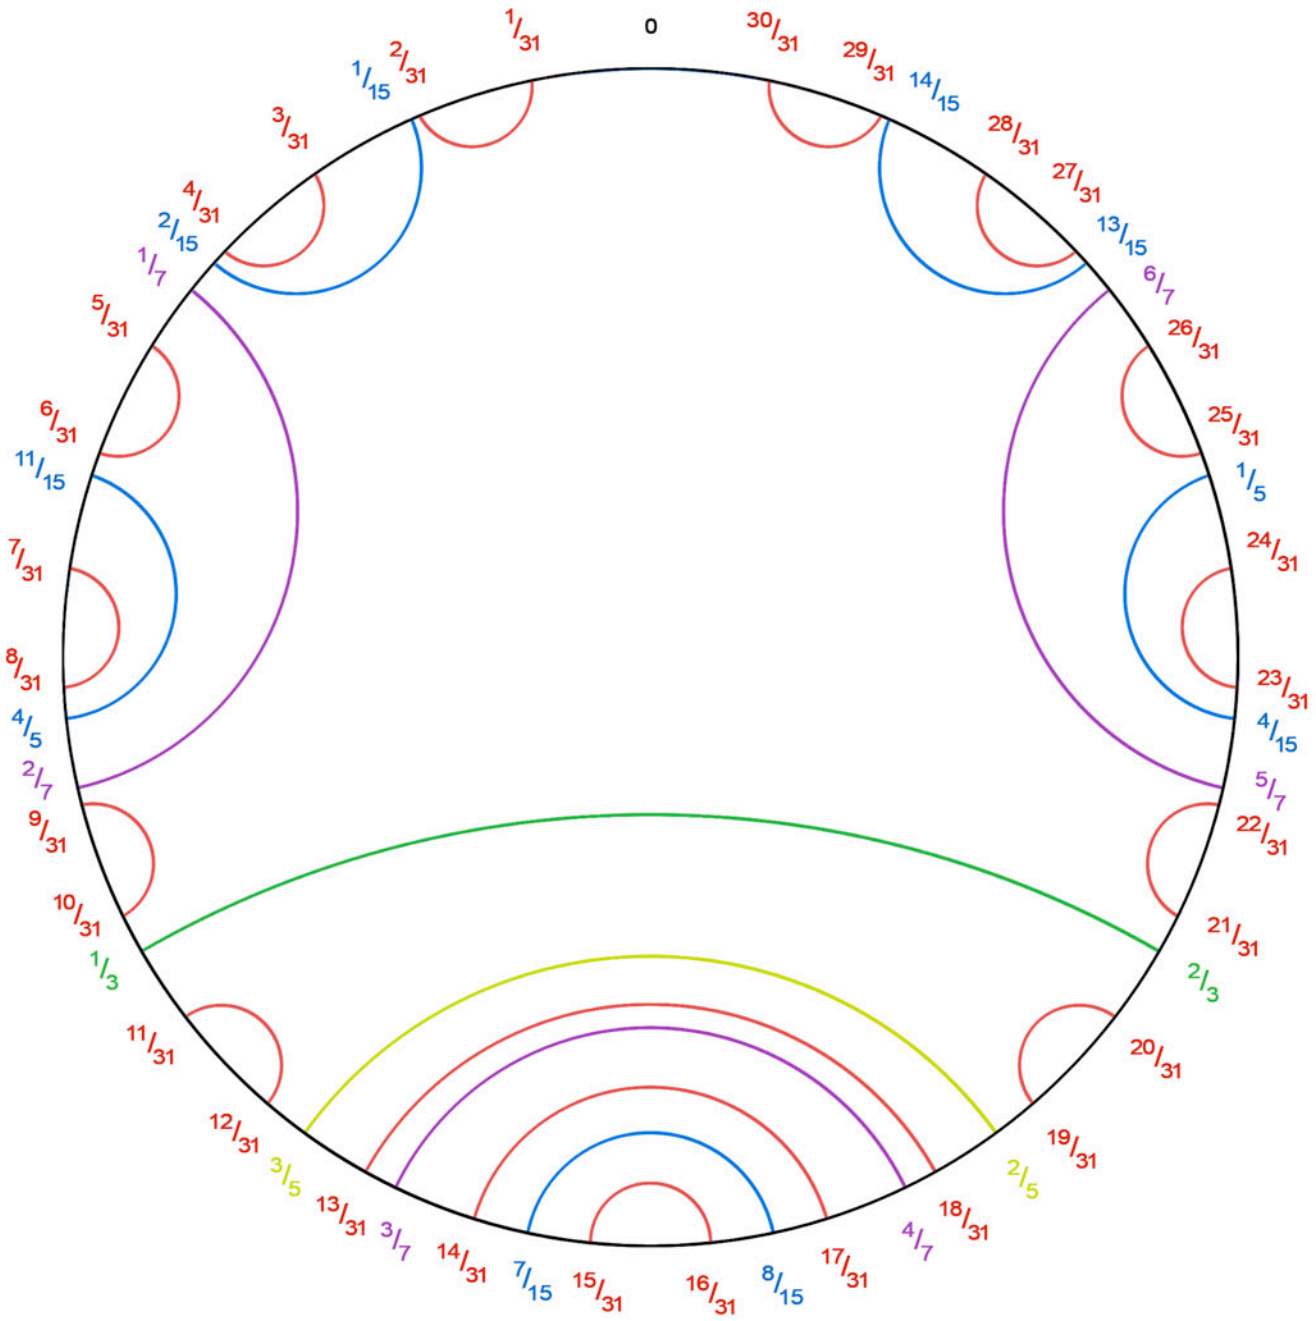


The Cassiopaeans offered instructions for *mapping pyramids according to the phi ratio* on July 19, 1997:

Q: Okay, now what about this diagram that Tony Smith has made from the Pyramid and the phi ratio that he has interpreted as a map...
A: **Must use a spherical relief, with formula applied, to discover.**

The following exchange on this topic transpired nearly two years later, during a session on July 10, 1999:

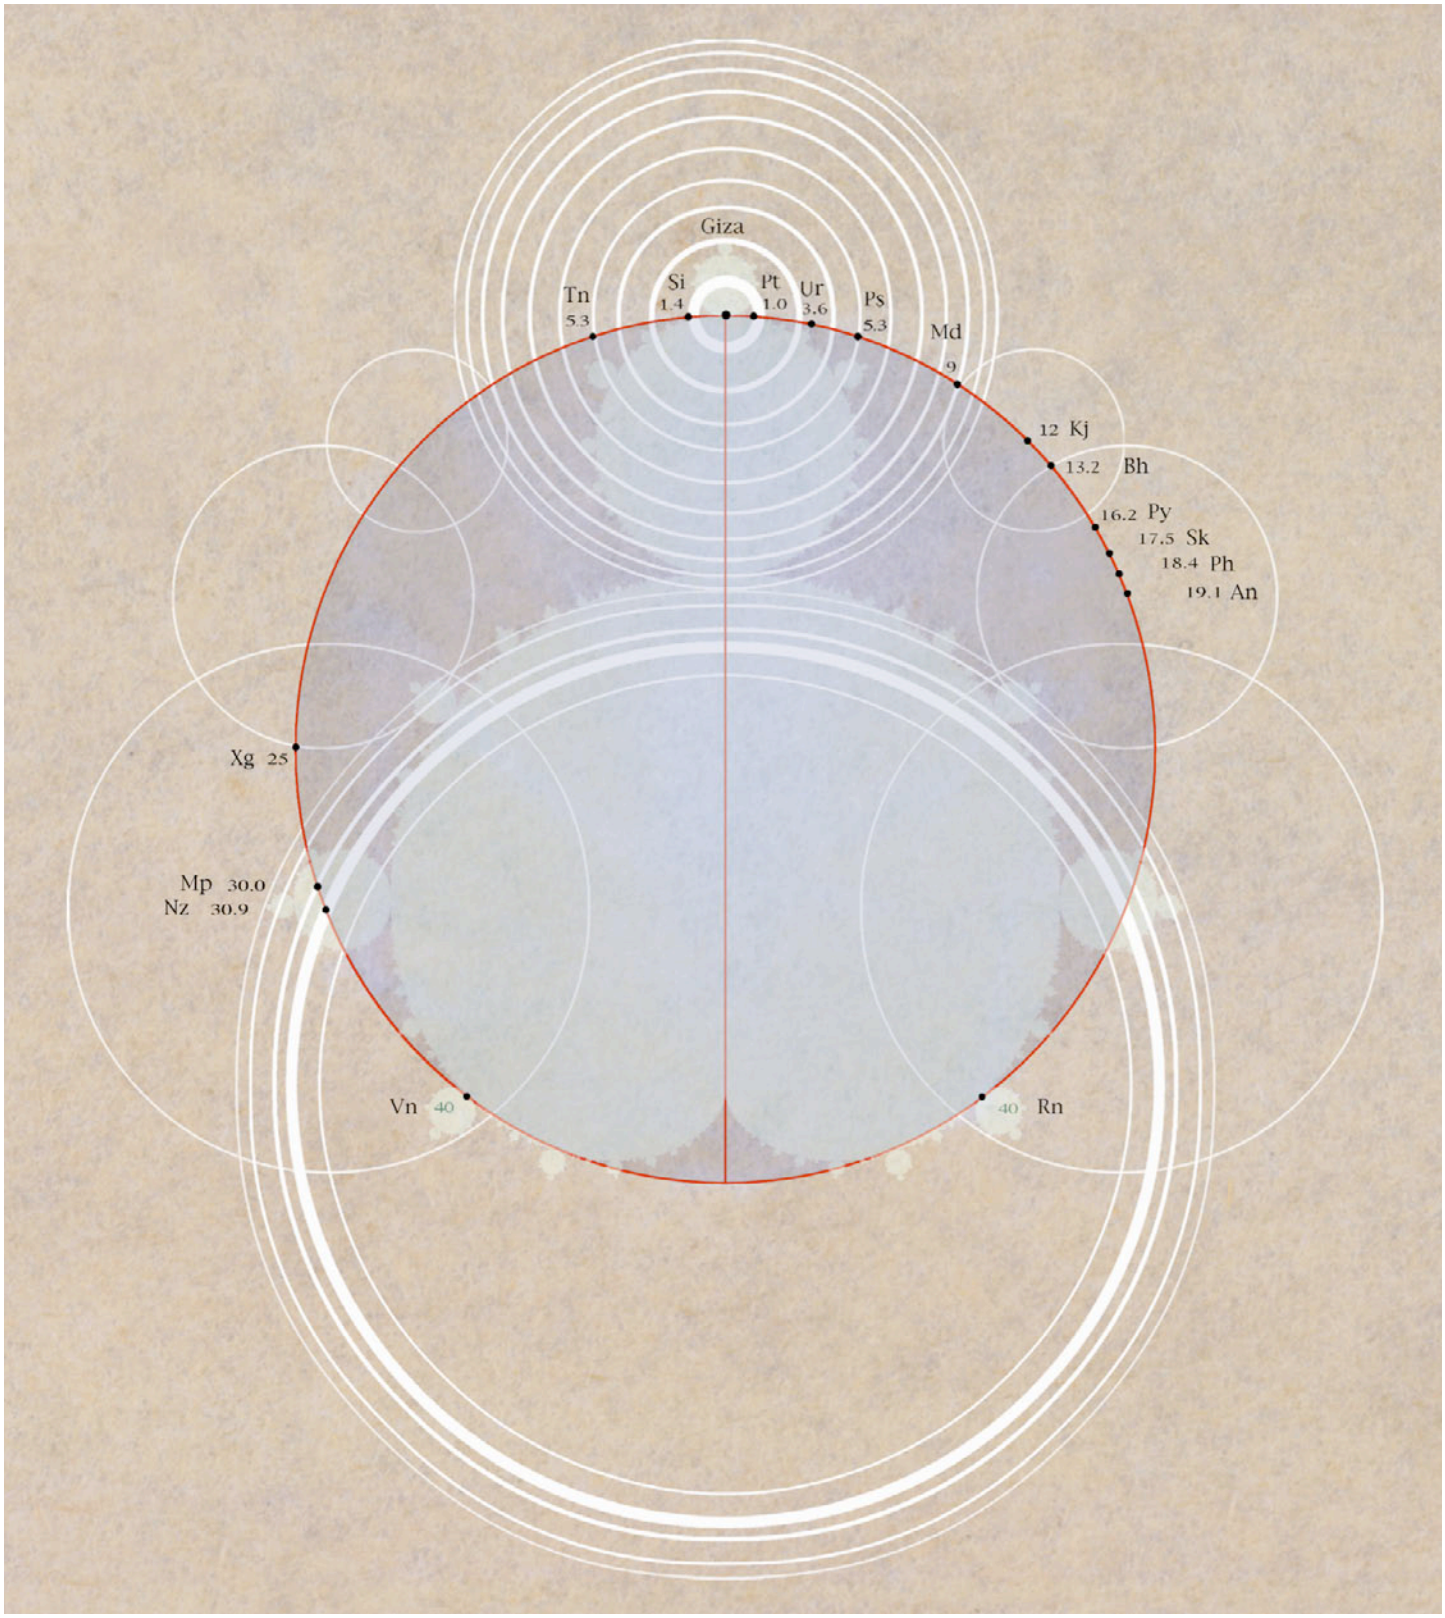
A: **Consciousness is contained within the expanded realization of the gravity model. The Unified Field Theory, if completed, would give one an insight into the synchronous relationship between gravity and consciousness.**
Q: (A) If gravity is modeled by curvature or torsion of geometry, mathematically, how would consciousness come out of geometry?
A: That is a broken question. What we can say is this: if one could visualize the inverted representation of the gravity geometric model, one would be **squarely** on the path to understanding the geometric model of consciousness...
Q: (A) ...How is matter built out of gravity? What forms of gravity correspond to matter in terms of the geometric model? ...
A: You live in a "matter" universe, from your perspective. There is an accompanying energy universe which you largely are unable to perceive as of yet.
Q: (A) But, my question was ...
A: **Who/what is Mandelbrot??**
Q: (A) Okay, you are talking about fractals now, certainly...
A: **Are we?**



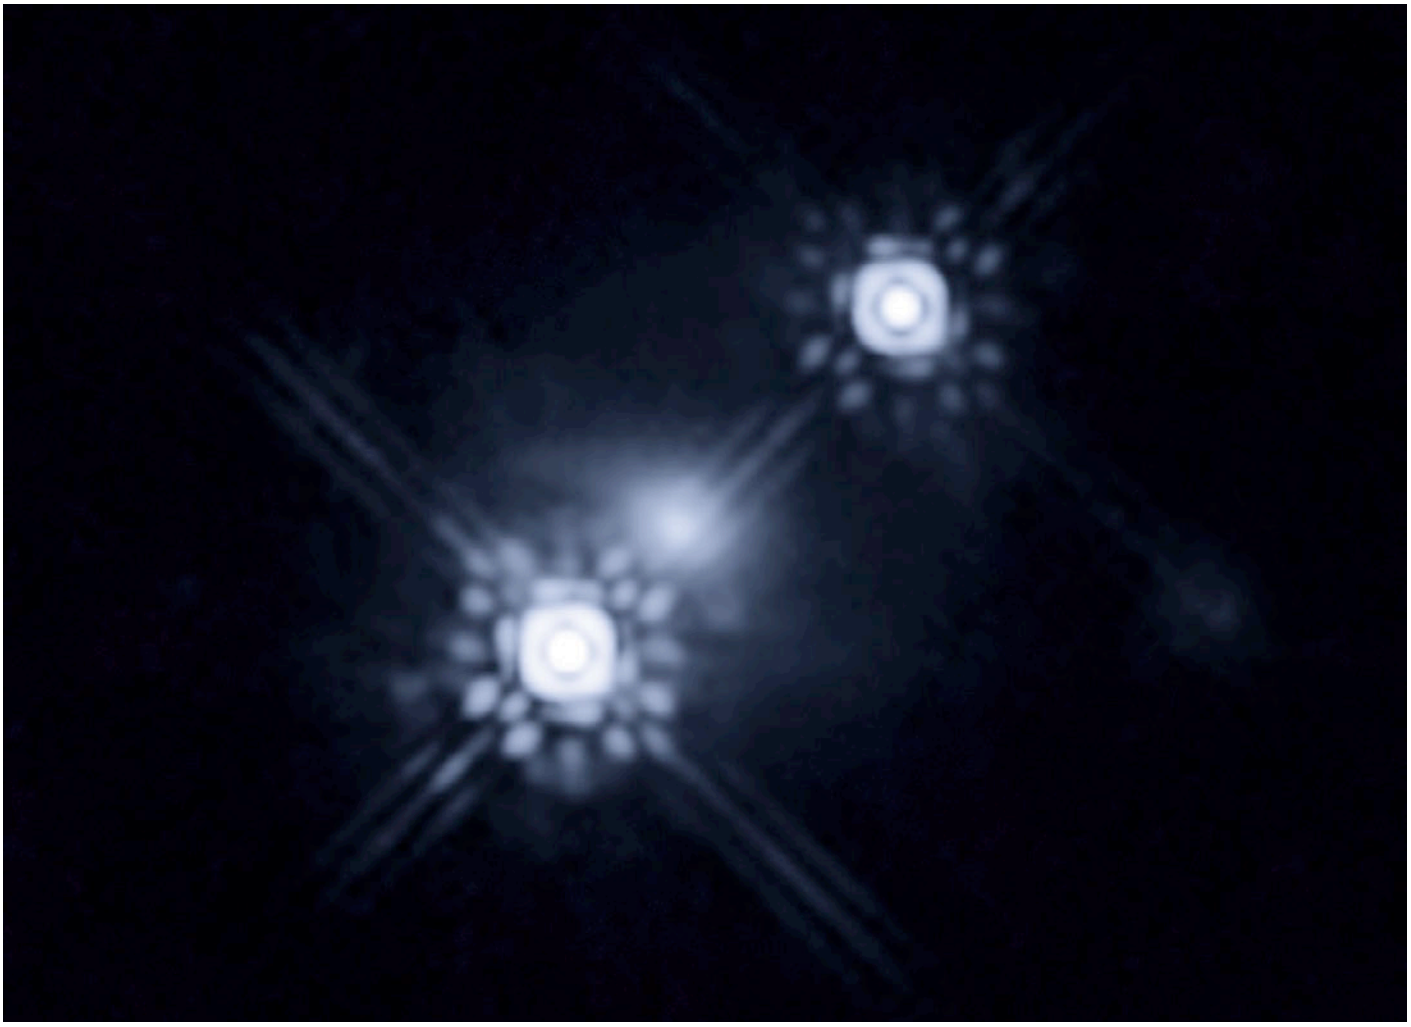
With this, the Cs perhaps imply an association between 6th density thought forms an the Mandelbrot set. This line of inquiry continued with the following communication by Laura, Ark and others on July 10, 1999:

A: **What form of mathematical theory best describes the concept of balance?**
Q: (L) Algebra. (A) So, I had the idea that these seven densities were related to what Gurdjieff relates to the number of laws that apply in the various densities; the higher the density, the fewer the laws that apply, which means there is more freedom?
A: **That is very close. Consciousness is the key here.**
Q: (A) Yes, so my question relates to the geometric model of gravity and consciousness.
A: **Picture an endless octagonal... in three dimensions.**

Meditations on these statements and traditional Sanskrit mandalas illuminated the Mandelbrot Set-related function [$z_{n+1} = z_n^2$] as a spherical resonance pattern that was further defined by the Cs on July 24, 1999:



Q: (A) Okay, I was trying to figure out how to build this expanded gravity, and I made a table to assist the question. The first possibility is that one can build gravity on a square matrix. This matrix can be symmetric, can be non-symmetric, or can be a complex matrix, which I call possibilities a, b, and c. The second possibility is to build a theory of gravity on the basis of a connection which looks like a cube rather than a matrix. Here we also have three possibilities: no curvature, but torsion; no torsion but curvature; torsion and curvature. These are possibilities 1, 2, and 3. Another possibility is to use any combination of these two lines of speculation. Another possibility is none of the above, but to build gravity on the basis of an irregular cube, or an irregular square, which I call A. Another possibility is to use something that is none of the above.
A: **Octagonal complexigram.** Try the formula for possibility 1-c first.



Years of plotting geometric relationships observed between the distances of ancient temple sites on a model globe of the Earth revealed an essential Fibonacci-ordered matrix of great circle alignments based on the Sine Wave alignment of ancient sacred sites[7] first presented by Jim Alison in 2002.[8]

I intuitively began visualizing these 3-D spacial relationships and making sketches closely resembling Lavaurs algorithm, enabling the topological identification of the circle corresponding to the Mandelbrot Set. This key algorithm provides the basic set of calculations for the most intense infrasound wavelengths and corresponding fundamental frequencies of planetary resonance (above, after R. Berenguel).[9]

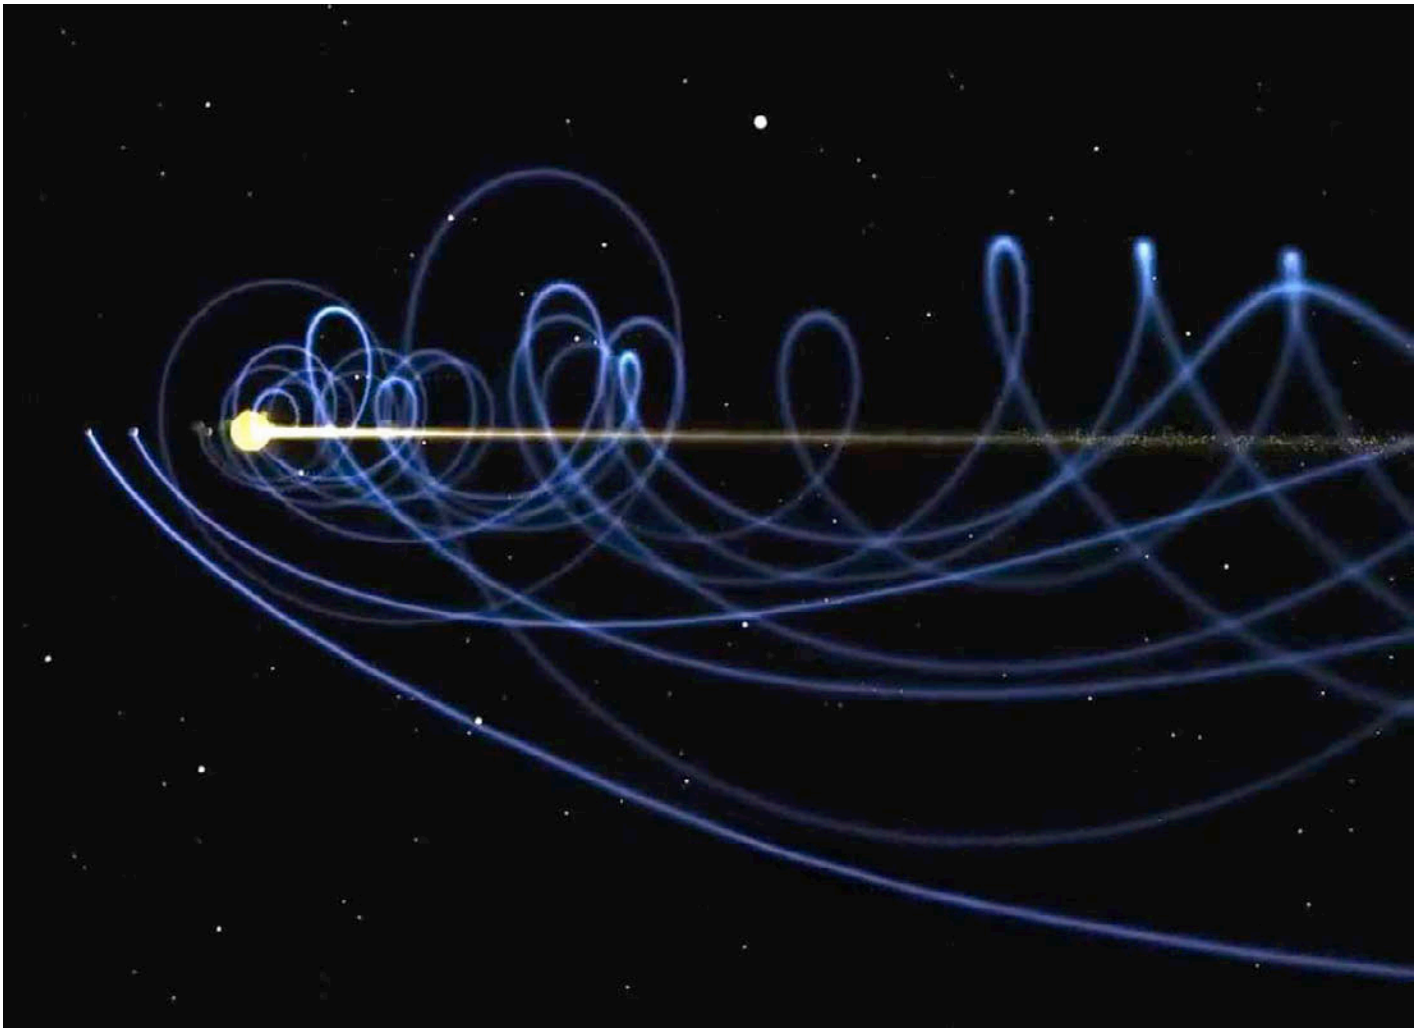
Resonant wavelengths are defined as those frequencies that perpetually reverberate around the globe with virtually no acoustic losses over time by converging back into the same exact wavepath with each cycle around the globe. This nonlinear pattern of resonant standing wave convergence points conforms to an essential set of fundamental fractions dividing the circle into 3^{rds}, 5^{ths}, 7^{ths}, 15^{ths} and 31^{sts}. *Clear geometrical relationships between ancient sacred sites constitute evidence of a global wireless network.*

The Sine Wave of ancient sites is presented as a circle in red, overlaid with a cross-section of the Magnetic Resonance structure in white (above). The sacred sites conforming to this planar alignment display Fibonacci-ordered distances from Giza provided as a percentage of the circle's circumference of 24,892 miles (listed clockwise from Giza): Petra 1.0%, Ur 3.6%, Persepolis 5.3%, Moenjodaro 9.0%, Khajuraho 12.0%, Bodh Gaya 13.2%, Pyay 16.2%, Sukhothai 17.5%, Phimai 18.4%, Angkor 19.1%, Rapa Nui 40.3%, Vanuatu 39.3%, Nazca 30.9%, Machu Picchu 30.0%, Xingu 25%, Tassili N'ajjer 5.3% and Siwa 1.4%.

Another mathematical line of questions sought quantum equations for concisely defining the Unified Field. On October 12, 1998, the Cassiopaeans replied that quasars (above) offer evidence for the Mandelbrot structure of gravity waves that bend light –*at nonlinear standing wave intervals* defined by [$z_{n+1} = z_n^2$]:

> *Q: (A) Can space with fractal properties, non-differentiable structure, non-smooth structure, be used to derive Schroedinger equation and quantum theory like the Nottale is proposing in some of his papers?*
> A: Close... **Light bends at intervals. Look to the quasar for the clue.**

Another very interesting clue was offered up during a board session conducted on September 7, 2013:



> *Q: (P)... What is the main cause of the eleven year solar cycle?*
> A: Reverberations due to passes of [the binary] companion... **Resonance.**

The relationship between the 11-year solar cycle and a 36,666-year Brown Star companion cycle reveals another astonishing synchronicity that is no accident, but illuminates the nonlinear *"wheelworks of Nature"*:

36,666.666... / 3,333.333... = 11.000...

It appears the Cassiopaeans are cleverly pointing out that the 11-year solar maximum cycle occurs 3,333 times during each near pass of the sun's binary twin companion. This surprising little epiphany led to several other visualizations that suggest other resonant effects related to the Brown Star orbital cycle.

By the same mechanism, resonance patterns generate subcycles of Oort Comets disturbed by the pass of the Brown Dwarf companion every 36,666 years –at resonant intervals of $^1/_2$, $^1/_3$, $^1/_4$, $^1/_5$, $^1/_6$, etc... A partial table calculating rounded dates for these nonlinear sets of cyclical cometary swarms extending back two full binary cycles is fascinating, and explains Tesla's cryptic praise of *"the magnificence of 3, 6 and 9..."*: [10]

While Tesla had run these types of calculations in the development of Wardenclyffe Tower and the HHO Gravity Motor, the keen inventor implicated the universe operates on the very same acoustic principle of standing wave resonance cycling around our spherical planet. The Cassiopaeans provided Laura with a rounded figure for the $^{1}/_{10}$ cometary subcycle of ~3,600 years during a September 30, 1994 session:

Q: (L) Is there any regular periodicity or cycle to this comet business?
A: **Yes.**
Q: (L) What is the period?
A: **3600 years roughly.**

Knight-Jadczyk pursued an extended dialog with the Cs on the subject of the relationship between the Brown Star binary companion and the cometary cycle of ~3,600 years that continued on August 3, 1996:

Q: (L)... Are you saying that the nucleus of an atom is also a window?
A: **What we are saying is the sun is a proton and its twin is an electron!**
Q: (L) Well, I am still trying to get at... the wave causes transitions in the macro-cosmic atom, what causes the microcosmic atom... what causes a quantum jump? What accumulates in an atom that causes it to transition? (T) Is it a case of accumulation, or something being given off?
A: **Completion of Grand Cycle.**
Q: (J) It just is. (L) No, no...
A: And who says that the Sun's twin appears every 3,600 years?
Q: (L) Okay, we have the 3,600 year comet cluster cycle, the Sun twin is another cycle altogether, and then we have the wave, which is a Grand Cycle. So, we have three things causing a transition in nature?
A: **Like "biorhythms."**
Q: (T) And we have a triple bad day coming up! Or a good day, depending on which way you look at it.
A: **Bad day if you are John C. Rockefeller, good day if you are Mahatma Gandhi.**
Q: (L) So, does something like a three cycle event also occur in sub- atomic transitions, like the biorhythm?
A: **Yes.**

The poignant comparison of biorhythmic cycles with atomic and stellar binary models highlights shared characteristics of resonant systems that Tesla realized over many decades of lab and field investigations.

These emerging dynamics of resonance within the Brown Star cycle reveal the auspicious 2015 auroral culmination of Galactic cycles tracked by the Atlantean calendars passed down to the Elders of the Maya culture of present-day Mesoamerica. When understood in conjunction with the intensifying spates of spontaneous infrasound-induced piezoelectric fires identified by Charles Fort, recurring at hotspots throughout the world, imminent implications for total technological disaster become starkly evident.

Due to intense electrical surges in the ground, *all metal wiring in underground complexes* running on outdated AC current technologies will inevitably be a serious hazard during the coming times. This fact will soon force mass evacuation of huge underground facilities located in Glacier National Park –a site exposed by the Cs as "the *Montana Experiment* with human reproduction" during a July 16, 1994 session:

Q: (L) What else is going to happen?
A: Seattle buried; Japan buckles; Missouri shakes; California Crumbles; Arizona burns.
Q: (L) When is all this going to happen?
A: **Denver Airport Scandal.**
Q: (L) What about a Denver airport Scandal?
A: **New airport. Big, big, big, big scandal.**
Q: (L) What kind of scandal?
A: **Government.**
Q: (L) Specifically what?
A: You will see. Dallas airport is secret base; Orlando too. Miami Too.
Q: (L) What about Denver airport and how does it relate to prophecies?
A: **Denver reveals the government. Look for it. Pay attention.**
Q: (L) What else do you have to tell us?
A: **Montana Experiment with human reproduction.**
All people there are being exposed to harmful radon gas.
Q: (L) How are they doing this?
A: **Compelled. Don't trust. Don't ignore. U.S. in sinister plot.**

Exposure of the Denver International Airport's mind-programming murals caused an initial stir a decade ago that was effectively squelched, and remains so. The unusual final prediction in that intriguing 1994 communication, offered with so few clues –human reproduction experiment... toxic radon gas... Montana– was never addressed by Knight-Jadczyk or her group in the full 20 years that have since passed.

However, these few clues exactly describe the stunning details of a lengthy 1999 deathbed confession offered by CIA/Nazi agent Otto Skorzeny, as documented by Erik Berman in *'The Bush Connection'* (2003) and later republished with scientific clarifications by this author in the free book *'Veil of Invisibility'* (2009). Despite having been fully exposed by Skorzeny and ongoing mass exposures to harmful radon gas, the ~~secret~~ Montana Experiment has apparently continued with their bizarre psychopathic seeding agenda.

Confirming Otto's statements and evidentiary photographs taken at Lake MacDonald Lodge, *public records show members of Skorzeny's family recently occupied residences in Bigfork and Kalispell, Montana just outside Glacier National Park.* In fact, these CIA/Nazi criminals continue to use compromised aliases: the widow goes by 'Frances P. Pyzyna', the daughter by 'Lori F. Pyzyna' and the son by 'Edward S. Pyzyna'.

An extended excerpt from the 1999 testimony of executive-level Nazi insider Otto Skorzeny summarizes the details of a ~~secret~~ multi-generational Aryan breeding experiment designed to create a mind-controlled slave society in the ~~secret~~ underground Nazi/CIA base located below Glacier National Park, Montana:

Hidden high atop the mountainside along Going-to-the-Sun Road at more than 6,600' is the secret tunnel entrance to an extensive underground Nazi/CIA facility (48.7476°N 113.7638°W). In the above satellite image, the larger circle denotes the hidden rock façade entrance and the smaller circle denotes the position of camouflaged guards. The secret tunnel descends more than two miles to a giant hollowed-out industrial complex below the mountain. This huge underground city/base connects Montana to Canada just north of the national border at the (cleverly named) International Peace Park. This underground base is where the CIA keeps its stolen Holocaust trillions and tests its most secret NWO black projects including Tesla's flying disc, optically invisible aircraft and other stolen Tesla technologies.[11] Operations at the base include maintenance and deployment of stealth drones.

Glacier National Park was the first national park to have railroad access at the time – a necessity for all large-scale underground military-industrial construction… The secret tunnel entrance to the CIA's NWO underground base is hidden behind a remote-controlled, movable rock-wall located in the side of the mountain on Going-to-the-Sun Road, shown in Skorzeny's photograph above, just north of Grizzly Peak and the Weeping Wall. In the far background the Garden Wall can be seen, and at far right is the base of Haystack Butte. The tunnel entrance (shadowed overhang circled, bottom right) was cut out of the bedrock by precision laser to prevent any possible discovery. When the base is active during the summer months, there are armed and camouflaged guards hiding on the mountainside (upper left corner) surrounding the secret tunnel entrance. The Nazi NWO keeps its stolen holocaust trillions and stolen Tesla technology secretly hidden inside this hollowed-out mountain facility, providing access only to the New World Order elite who have shared in the mass murder for profit war scams.

According to Skorzeny, the CIA Nazis use stolen Tesla technology to create artificial "antigravity fields" around Glacier National Park, the nearby Blackfoot Indian reservation and many other locations throughout the world. There are hundreds of satellites orbiting the Earth that project high-intensity positively charged laser beams to certain areas on the Earth. The NWO Nazis' use these beams not only as weapons, but also to transmit power to levitating aircraft, flying discs and various other stolen Tesla technologies below. The absorptive property of the levitating aircraft allow their utilization of energy beamed from orbital plasma generators, transmitted when the stealth aircraft are themselves plasma-cloaked for optical and radar invisibility (giving off only IR).

A hazardous by-product of these space-based laser beams is radon gas. Radon is said to be an invisible gas that causes cancer and leukemia in humans and animals, but if you ask the US government about radon gas you will not get a straight answer! Native Americans on the nearby Blackfoot Reservation have suffered from extremely high rates of cancer and leukemia since the 1950s. The US government says that nothing is wrong and there is no reason to be concerned, yet suffering communities must be informed of the true cause of their severe ailments. Skorzeny claims that the SR-71 Blackbird, B-2 Stealth Bomber planes and antigravity flying discs are constantly hovering just below 200' in the skies above Glacier NP and the Blackfoot Indian Reservation. This explains why commercial flights are forbidden below 200' in Glacier NP; and why no one is allowed to bring firearms into the park for protection against the aggressions of the resident grizzly bears.

It is a difficult task for a truly conscionable human being to comprehend the root of sociopathic behavior. The extreme prevalence of serial killers among Caucasian populations suggests that the Nazi eugenic goal of a 'pure Aryan race' may have been an effort, perhaps unconscious, to create a gene pool more apt to produce psychopathic individuals who operate socially without conscience. The term 'bloodliner' has been applied to psychopathic victims of generational sexual abuse, as in the case of the Scherfs –a designation that may be supported scientifically by a genetic predisposition to psychopathy among males with the YY chromosome (rare exceptions to the predominant XY). Otto Skorzeny exposed a multi-generational human reproduction experiment for the Fourth Reich repopulation of North America with secret subterranean Aryan populations *exceeding 20 million*. Skorzeny reported himself to be one of the elite 'inseminators' for the vast human reproduction experiment, now in its sixth decade, being conducted at the secret Nazi base in Glacier National Park, Montana and elsewhere below the bedrock of America:

Hitler's entire nazi Third Reich of 50,000+ have been living in secret underground bases throughout the United States, Canada, England, France and Italy ever since the "supposed" end of World War II. Hitler and his entire Third Reich of nazis have been actively planning for their New World Order or Fourth Reich in America at these secret underground bases. The initial 50,000 nazis have been reproducing like rabbits for the last 58 years. It is estimated that there are now more than 20 million nazis living in America above ground and below ground in secret New World Order bases. The 20 million does not include the millions more who are secret nazi sympathizers. American Citizens are forbidden to enter these US government-sponsored NWO Nazi bases under penalty of death. Secret bases [include]… Area-51, NV; Camp Hero Montauk, NY; Las Cruces, NM; Wright Patterson "underground" Air Force Base, OH; and the secret hollowed-out mountain base in Glacier National Park, MT. [The secret entrance to the Glacier Park, Montana base is circled above]...

In these underground New World Order bases there are "Aryan Breeding Rooms" or free brothels. There are thousands of beautiful "brain washed" women and kidnapped underage teenage girls from around the country there to "service" the men. The New World Order nazis want the "seed" or "sperm" from their old Third Reich SS nazi leaders to implant in their young brainwashed– "brainless", "Aryan" baby-breeders to help populate "their" new world with "pure" white Aryan babies. These babies will grow up to "rule" the United States of Germany, "formerly the United States of America." Skorzeny claims to have made more than 20,000 "personal" donations. According to Skorzeny, unlimited amounts of free drugs and free German beer are available at these secret New World Order underground bases.[12]

These astounding admissions from CIA/Nazi agent Otto Skorzeny, when combined with the scores of detailed supporting photographs originally published by Eric Berman in 2003, were directly foretold by prophetic information from the Cs given back in 1994, several years prior to Skorzeny's confession. *Skorzeny's data on radon gas was specifically mentioned by the Cs as a danger to all residing there*.

These radon-producing plasma beams are also used for earthquake induction by superheating the atmosphere. Radon gas produced by these beam weapons has been directly measured during major earthquake events, as spun by fraudulent journals setting a false scientific framework for the cover-up:

> Radon exhalation from the ground and consequent formation of large ion clusters as a result of ionization and plasma-chemical reactions have been proposed as an agent of seismo-ionospheric coupling mechanisms. Soil radon transfer to the atmosphere was evaluated at fixed stations in Mexico... due to the Ms 7.8 earthquake occurred in Mexico in 2003. An anomaly was observed that can be regarded as the earthquake precursor showing its clear spatial connection with the epicenter position.[13]

Being 8x heavier than air, radon gas cannot rise, but descends to the ground after being formed in high atmospheric plasmas, just as Skorzeny specified. Plasma technology was addressed on June 22, 1996:

> A: ...With proper technology you can create a portal where desired. There are unlimited options.
> *Q: (L) Proper technology. Unstable gravity waves. And once you told us to study Tesla coils.... antimatter... destabilizing the gravity waves through EM generation allows the antimatter to interact with matter which then creates a portal... is it in the antimatter universe that all this traveling back and forth is done by aliens when they abduct people?*
> A: Close. They transport through it, but most abductions take place in either 3rd or 4th density.
> *Q: (L) Is this movement through the antimatter universe, is this what people perceive in their abductions as the "wall of fire?" The coming apart. The demolecularizing?*
> A: **No. That is TransDimensional Atomic Remolecularization.**

Q: (L) Okay, if a person were passing into the antimatter universe, how would they perceive it?
A: They wouldn't.
Q: (L) Why?
A: No space; no time.
Q: (L) Antimatter universe has no space and no time... so, the antimatter universe is possibly where the poor guys of flight 19 are?
A: Yes.
Q: (L) And you can get stuck in this place?
A: **Yes. And if you are in a time warp cocoon, you are hyperconscious, i.e. you perceive "zero time" as if it were literally millions of years, that is if the cycle is connected or closed, as in "Philadelphia Experiment."**

Eyewitness testimony from Skorzeny also reveals the true sequence of events surrounding the famous 1942 US Navy experiment to create an HHO plasma invisibility cloak around the USS Eldridge. This topic was clarified by the Cs after a series of questions from Arkadiusz during a session on August 15, 1998:

Q: (A) Another clue that we were following was Von Neumann. We have this info about the Philadelphia Experiment, probably from Bielek. It says that Von Neumann took over the project in March of 1942, after Tesla. Is this correct?
A: **Yes.**
Q: (A) It says that in 1943, Von Neumann installed a third generator...
A: **Yes.**
Q: (A) I have trouble with this because Von Neumann was a mathematician and I can hardly imagine him installing a generator which involves knowledge of electronics, physics, and so on. What was the truth?
A: **Von Neumann was not unassisted. The mathematics apply to a language which translates quite naturally to EM principles. His involvement on that aspect was coerced.**
Q: (A) What kind of mathematics?
A: **What is the light one observes in the presence of a charged EM field? Algebra.**

Interesting responses surrounding the subject of the transdimensional plasma physics of the Philadelphia Experiment continued to flow during a board session undertaken the following week, on August 22, 1998:

Q: (A) Referring back to Von Neumann, you mentioned light and the question was 'what kind of light is related to electromagnetically charged particles.' Then you mentioned that Von Neumann was applying algebra. Now, is the answer about what kind of light, if I say infrared, is that the correct answer?
A: **Refracted image... Like an induced mirage**...
Q: (L) I want to ask if you ever told us to do something with a Tesla coil which I failed to record or got lost somewhere?
A: Maybe. Gravity waves, pentagon is the foundation; hexagon is the conclusion.

These follow up responses significantly clarify the key concept being subtly conveyed by the Cs, implying that Tesla achieved optical invisibility cloaking by enveloping the entire Naval vessel in refractive HHO plasma. In the context of planets, dodecahedra are composed of 12 pentagons, with hexagons formed at each pole where 3 pentagons converge, as exemplified by Saturn's North Polar Hexagon formation.

The direct involvement of George Bush Sr. as a covert eyewitness at the Philadelphia Naval Yard was exposed by the Cs during a January 9, 2005 session, once again supporting Otto Skorzeny's testimony:

Q: Was the strike on the Pentagon for the purpose of taking out the people involved in legitimate training exercises who would have known the truth of the events of that day?
A: Now, another interesting question! What is up with the Navy?
Q: What is up with the navy?
A: Maybe they know things they don't tell. Maybe what they know gives them a certain respect for "nature" and a hesitancy to meddle.
Q: Can you clarify?
A: **Let's just say that the navy wouldn't play with the bullies because they know about bigger bullies. The navy learned a lot from the Philadelphia experiment. George Bush senior tried to get all the data about the things he heard and saw, but failed.**
Q: What is the Navy doing now?
A: Flying under the radar and waiting.

As the grand illusions of falsified history continually fall away, the decisive timing of all genocidal war efforts undertaken by the global fascist syndicate reveals itself as a distraction strategy unleashed as a direct reaction to resonant Tesla technologies becoming available to the world.

The utter desperation behind the global war reaction is now becoming apparent with the steady revision of false histories invented by the criminal cover-up institutions of the mass media mafia. When orchestrating the war machinations of a psychopathic global control system...

What do you do when Nikola Tesla builds Wardenclyffe Tower in 1910, a functional wireless free energy transmission system in Shoreham, Long Island?

- Offer limited support, then pull it, demolish the wireless tower, murder Tesla's richest financier by luring him aboard the Titanic and sinking it, consolidate the Federal Reserve Bank to control all future US financial transactions, orchestrate World War I.

What do you do when Nikola Tesla is preparing to release the Gravity Motor and free energy levitation technology to the world in 1929?

- Offer technical support, then pull it, steal all prototypes, hastily orchestrate 'Black Tuesday' stock market crash and the Great Depression that directly resulted.

What do you do when Nikola Tesla refuses to continue with Operation Rainbow Project after 3 of his Gravity Motors were used to kill US Navy sailors in the Philadelphia Shipyards?

- Assassinate Nikola Tesla, steal his finest inventions, build 'Ajax' Missile Radar, Nazi Antigravity Discs, orchestrate World War II, build underground US industrial complexes, engineer HAARP, Nexrad, Sea-Based X-Band Radar atmospheric manipulation systems.

While the event sequence following Tesla's completion of the Wardenclyffe Tower for global wireless infrasound power transmission has become known, many aspects of the fascinating events surrounding Tesla's later inventions have been effectively veiled and expunged from public awareness. Records from the Edgar Cayce Archives detailed the completion of the Tesla Gravity Motor (later renamed the Rotating Field Amplifier) in August of 1929 --*just 5 weeks before the Black Tuesday Stock Market Crash of late October, 1929.*

Direct temporal relationships between the many severe global war reactions of the past century and technological releases from Nikola Tesla are clearly supported by newly re-established historical facts that remain unknown to the general public a full 70 years after Tesla's murder:

Major Tesla Invention	Year	War Reaction	Year
Wardenclyffe Tower	1910	Titanic Murder/Fraud	1910
Federal Reserve Bank	1913		
World War I	1914		
Tesla Gravity Motor	1929	Stock Market Crash	1929
Earthquake Generator	1940	Murder of Nikola Tesla	1943
HHO Plasma Beam	1941	Construction of 'Ajax' Radar	1943
HHO Invisibility Cloak	1942	Construction of Nazi Discs	1943
Levitation Spacecraft	1943	World War II	1943

Psychopathic controllers operating in the laboratories of Nikola Tesla have since been exposed by Otto Skorzeny, one of two Nazi espionage agents who murdered Nikola Tesla by asphyxiation in his hotel room on January 6, 1943. On his deathbed in 1999, Skorzeny identified Tesla's administrative assistant George H. Scherf, Sr. and his son 'Curious' George H. Scherf, Jr. as fellow Nazi espionage agents responsible for the controlled subjugation of Tesla technologies and their re-engineering for war applications within the US, NATO, Russia and various other military groups.

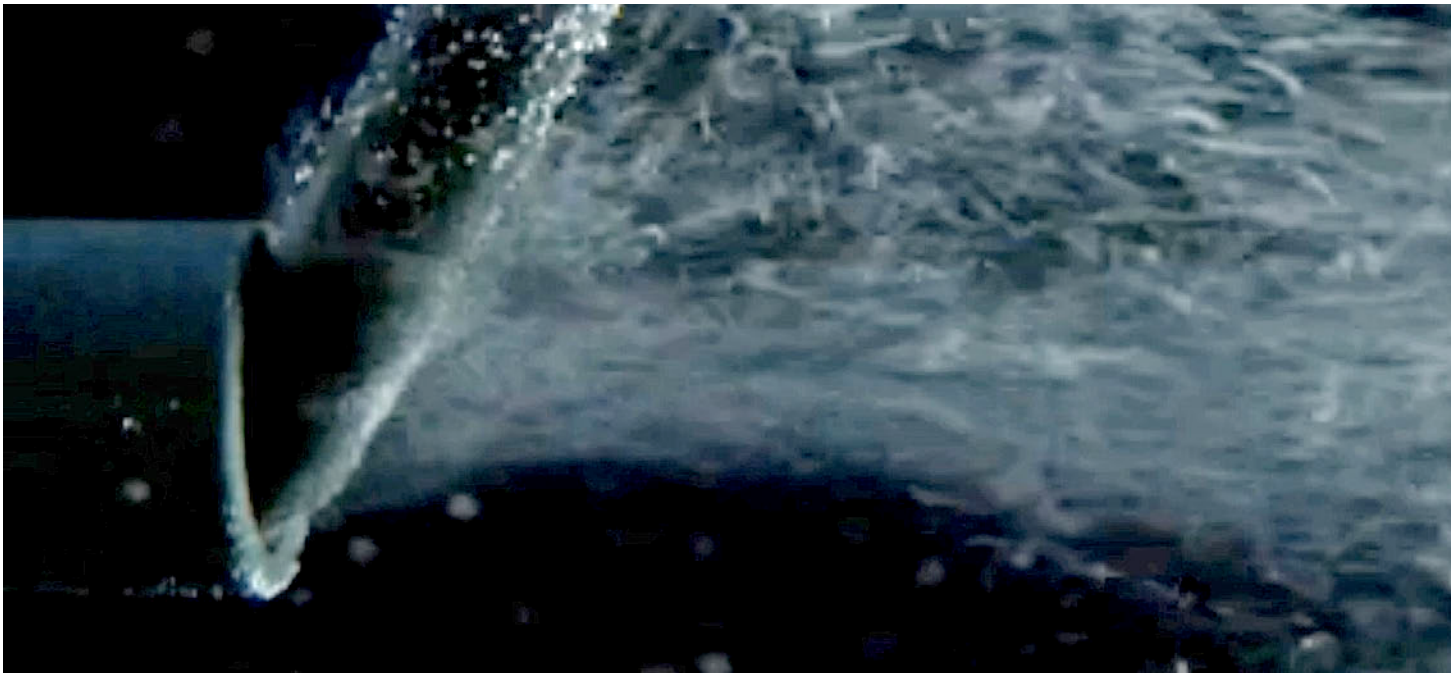
Now again in 2014, immediate threats of global warfare directly relate to the presently accelerating technological advances of global society concerning the atomic physics of phonon resonance interactions and the closely related field of *biophotonics*. The presently re-established advancement of Tesla technologies *now enables rapid conversion of silver into gold, as well as resonant superalloys for acousto-levitation applications.*

Global banking regulations and currency confiscation controls represent the central mechanism applied for the subjugation of all humanity by the psychopathic control elements, all of which are facing extinction due to the present rapid technological advance.

Just as the horse and buggy quickly gave way to the automobile, global banking must give way to the superalloy economy enabled by the emerging phonon resonance transmutation and infrasonic levitation technologies. The 'oil industry' and 'nuclear industry' face immediate extinction and exposure as psychopathic Nazi science that has inverted the resonant atomic principles of life to purposefully endanger all living organisms on this planet.

Desperate war reactions of the psychopathic control machine have been stepped up once again in the face of this latest breakthrough round of highly advanced technological information now being freely released into the public domain in online format as *open source technology*:

Tesla/Putney Invention	Year	War Reaction	Year
Gravity Motor Revealed	2013	Libya, Syria Wars	2013
Ag-Au -- Geyser Reactor	2014	Ukraine Coup, Civil War	2013
D-H -- Lightwater Reactor	2014	ISIS Iraq, Syria Wars	2014
La Maná Pyramid Complex	2014	World War III (March)	2015
Pyramid Activation (August)	2015	Dollar Collapse (April)	2015



The rapidly unfolding events of the psychopathic War Reaction are reflected in the cosmological and meteorological conditions of our planet, now experiencing the most extreme weather patterns ever witnessed in recorded history. Torrential rains are causing flooding and landslides throughout the world on an unprecedented catastrophic scale directly resulting from the greatly increasing ionization of Earth and the entire solar system --*being part of a binary star system exhibiting nonlinear effects induced by their long elliptical orbit with a cycle of 36,666 years*.

The severe outbreak of Ebola strains in West Africa, now quickly spreading to other continents, are also linked to the close proximity of the invisible Brown Dwarf companion of our Sun, beyond the orbit of Pluto. The invisible approach of the Brown Dwarf solar twin has brought on a major disturbance in the cometary cluster that surrounds the visible solar system, known as the Oort Cloud, causing the notable intensification of Earth bombardment by Oort comet debris.

Cometary dust loading of the atmosphere causes slow precipitation of Ebola-type viri and nanoviri that bind with particulate metals in the high atmosphere to form condensation nuclei in great abundance, *falling to the ground in torrential rains that cause mass flooding and infection.*

Strong evidence for this presently unfolding scenario was predictively published by several authors including Laura Knight-Jadzcyk and Dr. Gabriela Segura, most recently discussing Oort comet cycles that link with explosions of Black Plague, and effective natural remedies for these Ebola-type infections that include tobacco smoking and sterilization with vinegar.

Safe modern nanotechnological methods for preventing or eliminating all viral and bacterial infection replicate ancient Ayurvedic methods once used throughout the world in conjunction with pyramid bioelectrification practices, especially the drinking of gold and silver nanocolloids.

A complimentary nanotechnology involving water treatment for enhancing health is the use of gas-permeable carbon nozzles for production of oxygen and ozone nanobubbles for effective cleansing of the organs of the body, sterilizing fluids, water sources and biological waste.

Carbon dioxide nanobubbles enable rapid conversion of silver nanopowder into pure gold by phonon resonance transmutation processes developed by Alexander Putney that reflect the same shocking simplicity witnessed in the resonant inventions of Nikola Tesla. Suppression of these basic yet revolutionary inventions continues in ever more obvious forms, *yet ultimately must concede failure in the face of open source technology shared online.* Such eventualities force the psychopathic control mechanisms to turn to their 'final option': The War Reaction.

The coming year will bring a series of rapid-fire events on Earth that will change the human experience on this planet in many significant ways. Magnetic Polar Reversal of our entire solar system is now reaching a climax phase that has altered the activity of the Sun due to the close by presence of its binary solar twin: a Brown Dwarf companion.

The elliptical orbital cycle of the invisible Brown Dwarf companion was known to ancient Paleo-Sanskrit astronomers and passed down to the Maya descendant civilization in conjunction with a complex calendar system that displays greater accuracy than the Gregorian system. The close of the Maya Grand Baktun cycle of December 21, 2012 appears to have marked the closest pass of the invisible Brown Dwarf twin, and introducing the drastic escalation of planetary resonance changes presently experienced as weather upheavals in every part of the globe.

Ancestral knowledge expressed by Maya, Hopi and Apache Elders plainly identifies the present transition phase as a birthing of the new phase of Creation on Earth, marked by the explosions of red sprites and red auroras throughout the world in conjunction with the appearance of the Brown star companion by ignition of the dormant surface to become a Red Dwarf star.

Signs of the interaction of our binary solar pair are evident throughout the visible solar system, reflecting the diminished behavior of sunspots and the changing expression of their erratic solar flare outbursts. Gigantic magnetic bubbles bursting from the Sun's surface as coronal plasma ejections have changed dramatically in the last few years.

While previous solar maximums displayed sporadic X- and M-class events (2001), culmination of the present maximum (2013-2015) has seen a distinct repression of X-class flares and the onset of rapid-fire M and C-class flares emanating every few hours from the same sunspot. So, despite the notable reduction in peak intensity, the frequency of flares has increased greatly, resulting in a significant increase in the total energy of plasma ejecta from the Sun grounding to its invisible Brown Dwarf companion *–right through Earth and the other intervening planets.*

The apparent shift in solar plasma ejection patterns toward this rapid-fire multiple flare mode greatly increases the number of Earth-directed CMEs and shockwave-induced strong ground currents in the Earth, which are now igniting methane gas from subterranean pockets released by tectonic stress relating to the close presence of the Brown Dwarf twin. *These cosmic changes act as a spark plug to ignite the protective red aurora that cleans our atmosphere by rapid transmutation of heavy water contaminants (deuterium) by ejection of extra neutrons and resonant reversion into the light form of water, called protium.*

Earth-directed solar outbursts are causing the alarming increase in incidents of intense red atmospheric HHO plasma formation, photographed above the UK in August, 2014 (above) and also recently reported by Dutch pilots flying over the Pacific, in that case *forming around a group of giant glowing plasma discs of various hues, hovering together in a flotilla out over the open ocean, far from any islands or fishing regions where human activity would be affected.*

This red plasma formation event over the Pacific Ocean occurred just as the entire region experienced electron avalanches and immediately followed a vertical blue jet from CMEs released by the spate of rapid-fire M and C-class flares of August 25-26. High-altitude aurora were tinted green, however, while the more intense reddish glow formed at much lower altitudes surrounding the fleet of large glowing plasma ships hovering well above the ocean surface.

Might such an event have been involved in the recent MH370 airliner disappearance and subsequent radar blackouts over Europe? Hmmm... preceding solar flares? Yes! Auroras? Yes!

Infrasound standing waves transduced by the Great Pyramid of Giza were also utilized by the fleet of plasma ships to generate the intense atmospheric heat involved. The center of the Pacific plasma formation of August 27, 2014 (47.55°N 159.20°E) was situated approximately 6,200 miles from the Great Pyramid *–a distance comprising 25% of Earth's mean circumference of 24,892 miles. Geoposition and time of the formation were selected to achieve specific goals.*

Perhaps the benevolent purpose of such a giant plasma formation related to cleansing the local atmosphere using the solar flares as a power source, in a location toxified by high radioactivity?

One erroneously assumes this kind of red plasma formation has not occurred on land, as reported facts demonstrate parallel events at various 'hotspots'. For example, in Argentina and the US:

> There exist many reports of fire that will devour the scrub vegetation in a matter of minutes, trapping the hapless observer in a wall of flames. This is exactly what was reported by a group of hunters in La Pampa, Argentina in August 1996.
>
> After witnessing the unearthly glow and the bloody flames, they thought their fate had been sealed by a rogue prairie fire, but as they sought a means of escape, they realized that they could not hear the trademark sounds of a fire despite the approaching glow. This caused them to pause and look at the luminous dome at the center of the conflagration, which despite its reddish glow and yellow-orange core did not produce any smoke: "the fire that is not a fire," as it is known.

> [From a train observation car,] Mr. Edward Lenser... was looking at Mt. Shasta [in northern California]. “Gazing upon its splendor, I suddenly perceived that the whole southern side of the mountain was ablaze with a strange reddish-green light – a flame that grew faint, then flared up with renewed brilliance. My first conjecture was a forest fire, but the absence of smoke discounted that theory. The light resembled the glow of Roman candles… Just a red glow.”

In fact, atmospheric formation of red plasma has also been experienced by people who were enveloped within the formation at ground level, *seeing everything tinted red all around them*. Just such an occurrence was reported during Russian government investigations of the massive aerial cometary explosion event of June 30, 1908 in Tunguska, Siberia:

> • *Anna Yelkina, a 75-year-old Evenk woman living in Vanavara, confirmed this:*
> Early, early in the morning...a little higher than the sun, there was a crash of thunder. High, high up. The whole sky was red, and not just the sky: everything around was red—the earth and the sky. Then there was a mighty thundering. A sound like a bell, like people beating a piece of iron. The thunder went on about half an hour...
>
> • *Marina Kovaleva reported:*
> It was five to two. The light was strong. That light lasted a few seconds, then everything turned pink, then it got darker and darker and darker, becoming a reddish light. Then there was a rumbling. You got the impression, well, I don't know, like something below the ground, not clear but dull...

Infrasound rumbling is closely associated in most reliable reports of red plasma phenomena, as are high-altitude blue jets and red sprites. Ground level red sprites were photographed on 9-9-9 in Longview, Texas. Intensifying electron flow anticipates the Galactic Superwave arrival in August of 2015 that will undoubtedly *activate the global network of pyramids (a frightful concept for some).*

To utilize these many compounding astronomical influences opportunistically, the psychopathic War Reaction will continue to build in desperation and severity until the long foretold Red Dawn event, when the Galactic Superwave overtakes the Earth, elevating human consciousness by heartbeat synchronization and the purest light of red HHO plasma.

Multitudes of fascinating clues were offered by the Cassiopaeans concerning the nonlinear astrophysical calculations of the special timescale of cyclical interactions between the sun and its binary companion that induce regular epochal shifts from one quantum state to another. The impending epochal changes unfolding on Earth have been foretold in prophetic visions of blood-red skies received by Apache and Hopi Elders, as reiterated by the Cs during further questioning from Laura on August 9,1997:

A: Prelude to the biggest "flap" ever.
Q: And where will this flap be located?
A: Earth.
Q: When is it going to begin?
A: Starting already.
Q: Is this biggest flap going to be just a flap, or is it going to be an invasion?
A: Not yet.
Q: Not an invasion?
A: Yes.
Q: So, it will just be inciting people to frenzies of speculation...
A: Invasion happens when programming is complete...
Q: So, all the things you have suggested are to get us ready for this event?
A: Yes.
Q: Well, we better get moving! We don't have time to mess around!
A: You will proceed as needed; you cannot force these events or alter the Grand Destiny.
Q: I do NOT like the sound of that! I want to go home!
A: The alternative is less appetizing.
Q: Sure! I don't want to be lunch!
A: **Reincarnation on a 3rd density earth as a "cave person" amidst rubble and a glowing red sky, as the perpetual cold wind whistles...**
Q: Why is the sky glowing red?
A: Contemplate.

While most auroral displays are observed as slowly meandering green filaments, the most intense bombardments of ionizing radiation induce bright red auroral glows that cover broad areas of the sky. This increased luminosity from auroral outbursts over the Earth is presently inducing biological changes now becoming observable as biophoton emissions from the eyes, discussed by Arkadiusz on August 22, 1998:

Q: (A) I want to ask why is it so that when I look at Laura in the mirror, as I have several times without glasses at the gym, my vision was a little unsharp; I was seeing a gold glow, a big gold glow in both of her eyes. Why was this?
A: **You are developing some DNA change related 4th density "bleed through."**
Q: (A) But what was this glow in her eyes?
A: **Part of 4th density reality, related to aural frequency.**

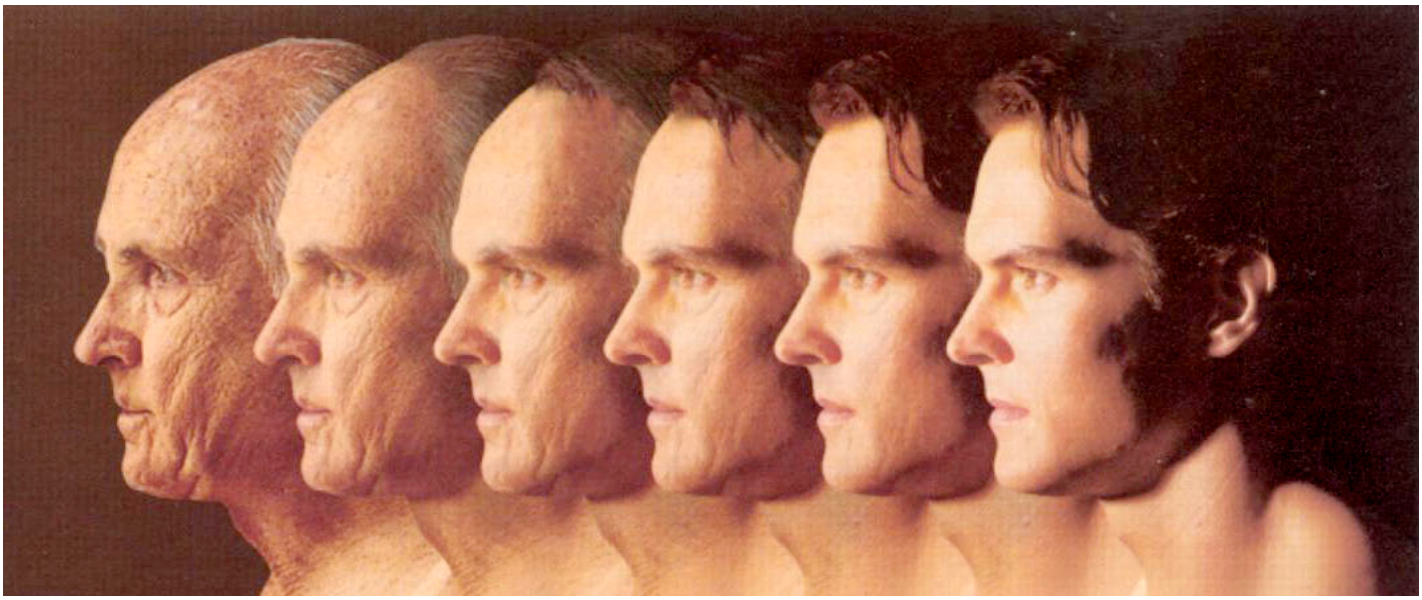
These surprising experiences and questions prompted answers from the Cassiopaeans that align well with previous information given in a March 11, 1995 session concerning the Galactic Superwave:

Q: (L) A*** wanted us to ask what was the original number of chromosomes the human being possessed?
A: **135 pairs.**
Q: (T) And we now have 23 pairs. So, we lost quite a few chromosomes. (L) A lot! (T) Will we get them all back?
A: Wait and see...
Q: (T) In other words, a wave that is going to transition from 3rd to 4th density will do so no matter where you are on the wave when it passes?
A: **Yes.**
Q: (T) A wave that is aligned to transit people from STS to STO or vice versa will do that also?
A: Or you could **"go under"** instead.

This phenomenal information concerning the original human chromosome count was followed by advice to receive benefits from the Galactic Superwave by taking up residence in underground chambers. The Cs reiterated this odd suggestion to *"go under(ground)"* during a subsequent group channeling session the following year, offering up the same advice without provocation on December 28, 1996:

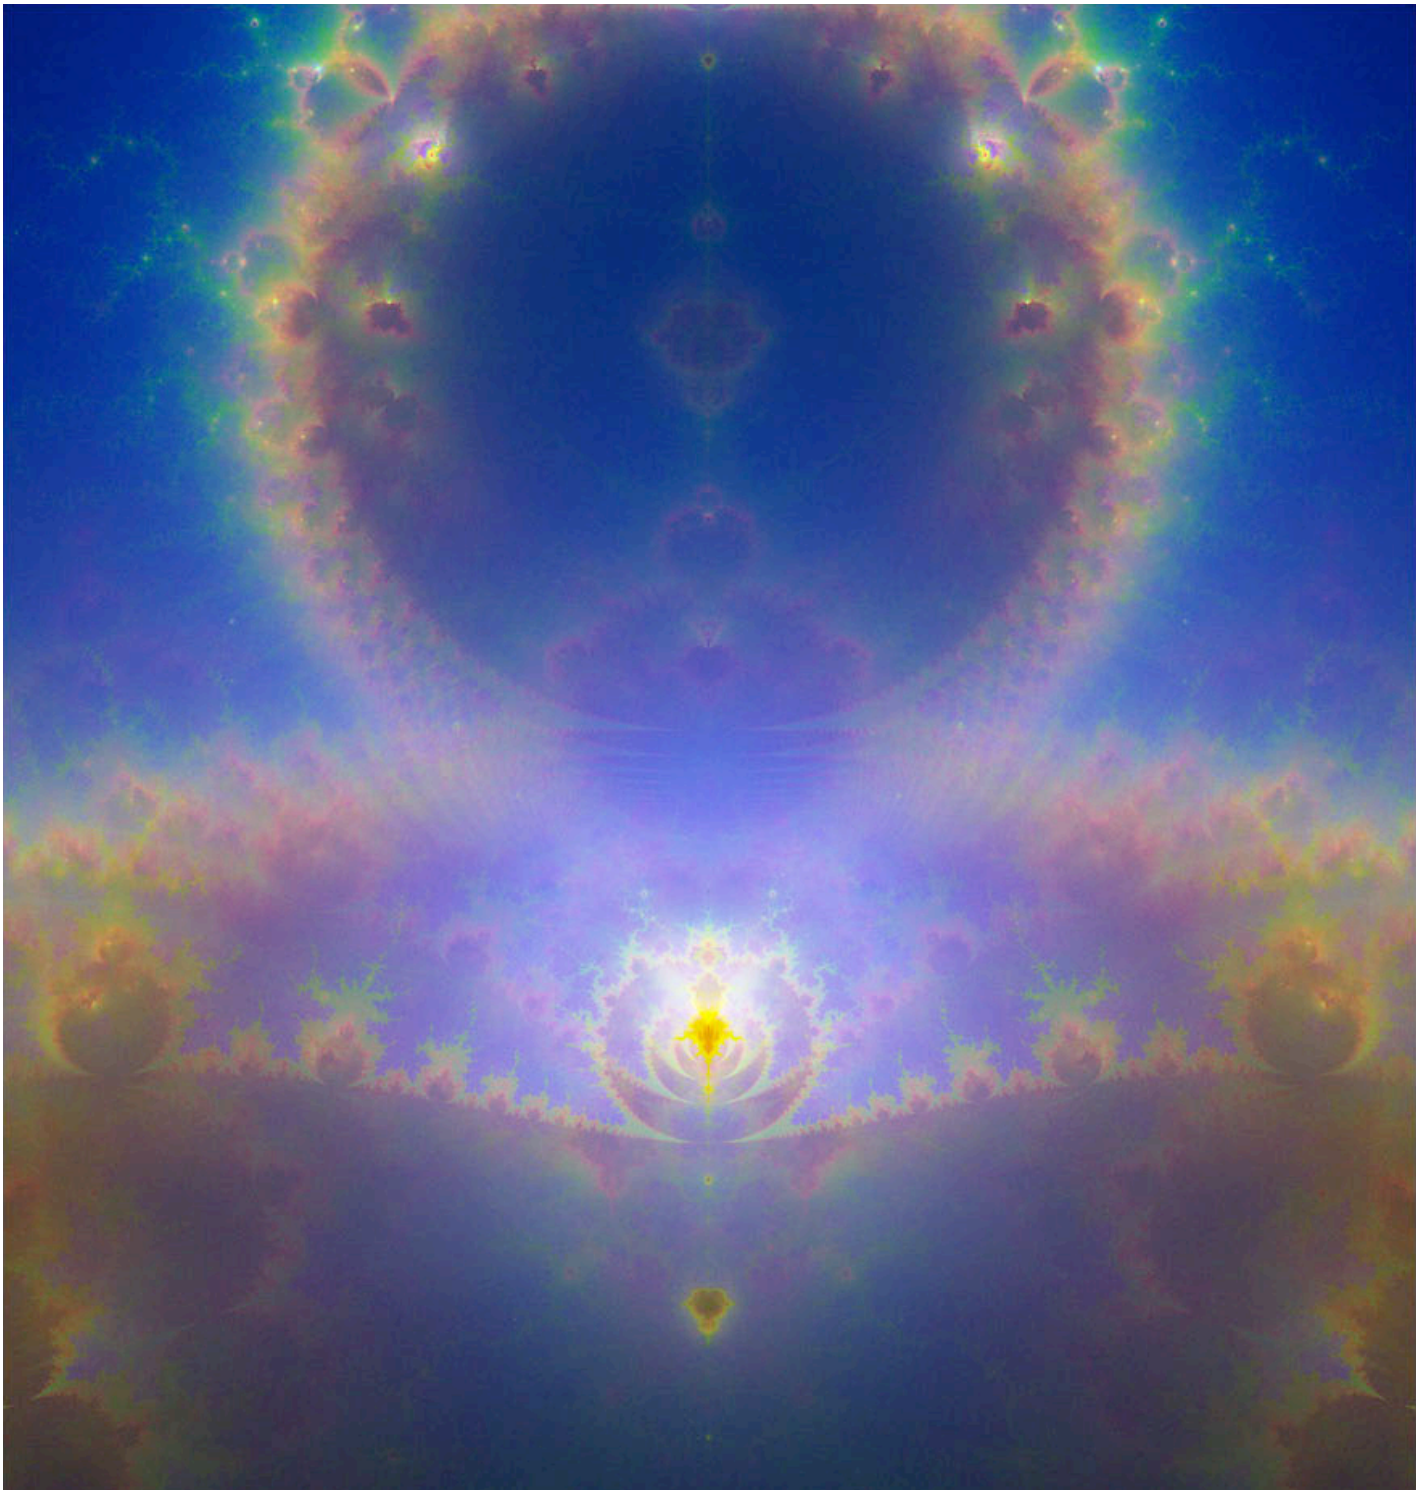
Q: Well, that is not much. (V) Would exploring this help now?
A: Maybe, "Mom" has that talent. **Go "under" to rise above.**

These repeating clues to go underground, and then rise above, seem strange when taken out of context, yet require our consideration. The abundance of Atlantean Era subterranean villages and tunnel systems actually constitute an important resource for human development on a genetic level, which explains all of the acoustic traditions of ancient human cultural activity within cave systems worldwide. During an earlier session on October 16, 1994, the Cs explained the impetus for lifestyle changes as a natural process:



Q: (L) Are there any exercises we can use to help our bodies transform into fourth density?
A: Not necessary**. It is the soul that matters.**
Q: (L) Does this mean that if we focus on soul development, that at the time of transformation that our bodies will automatically be transformed for us?
A: **No. It is natural process. No preparation is needed.**
Q: (L) So, if you are meant to transform, you will, if you are not you won't?
A: Yes...
Q: (L) In other words, if we just do each day what naturally comes to us as the best choice in each moment, we are on the right track?
A: Precisely...
Q: (L) If, theoretically, an individual... I am getting a very unusual feeling right at this moment, why?

A: Metabolic changes enhanced by accelerated learning.
Q: (L) Is this happening to all three of us?
A: Yes.
Q: (L) Now, as I was starting to say, if, theoretically an individual was to develop in a natural way by making all the proper choices, and was to arrive at the point in time when the major transition is to be made, would that individual's body pass through into that heightened dimension in a physical state? Remember, this is just a theoretical person...
A: Of course.
Q: (L) Now suppose this theoretical person were to pass through this transition to the other side, what state would they find their body in? Would it be exactly as it is now in terms of solidity? What would be the experience?
A: The key concept here is **variability of physicality**.
Q: (L) Does this mean that everybody will be different or that an individual will have greater control over the substance and constitution of the body?
A: Not exactly either. **Your physicality will be variable according to need and circumstance.**
Q: (L) Okay, does this mean that sometimes we will be more of a light body?
A: Close.
Q: (L) Does this mean that sometimes we will be more of a firm body as we have now?
A: Yes.
Q: (L) Will our bodies age differently?
A: **Yes.**
Q: (L) What will be the median lifespan?
A: **400 years**



Q: (L) And will those who pass through this transition as, say, 50 year olds, will they have an equal opportunity to live an additional 400 years?
A: **Will regenerate in youthful appearance.**
Q: (L) Now, when you say 400 years, will it be that the plane has a different orbit and that a year will be different?
A: No.
Q: (L) Will the days be different as to length of time light and dark as they are now?
A: Not the point. **Planet will be 4th density as well.**
Q: (L) But will the days and nights be different and will the orbit be different? Will the axial angle be changed?
A: You are thinking in terms of the 3rd level density. The rules will be so totally different that physical inspired comparisons are moot.
Q: (L) But I like the sunshine and birds singing and breezes. I just want to know if those things will be the same.
A: In some fashion.
Q: (L) Can't you give a few clues?
A: **We must let you see for yourself.**

These profoundly awe-inspiring statements from the 6th-density Cassiopaean entities leave many open questions as to the exact nature of these foretold mass biological changes that seem so improbable.

This extremely positive outcome for humanity described by the Cs was comprehensively corroborated by information provided during the course of totally unrelated extraterrestrial contacts in South Africa with the Confederation of Twelve Planets concerning a momentous event in our imminent future involving the extraordinary potential for *rapid physical regeneration that would occur 'in the still of the night'*:

> 'In the ancient scriptures of the Confederation, it is written that the Divine One will change *many* planets.
>
> 'A voice tells us that there will be a change. The timing of the event will depend on many circumstances. It might be caused by the separation of the two Universes resulting in a complete break in the magnetic field between them. This event may bring about changes which would gradually usher in a New Age. There might be a change in the atomic structure. *Every atomic power station would then cease to function, and even your electrical power would stop. But a new source of energy will then be available…*
>
> 'Your physical world would undergo a transformation – a cleansing of the Earth. *Then the resurrection would follow in the still of the night. This transformation would be almost instantaneous. Even the heavens would change color!* Mankind will be afraid, but a great uplifting will follow. *There will be regeneration; for example, those of 90 years age will be as 50, and those of you who are 50 will be as 30*.
>
> 'Many would not see these changes. Only those of you who can now accept the new way of life will perceive it and experience it. Many are now being conditioned for that day... and also for cosmic flights, should that become necessary. Your subconscious mind is being conditioned to prepare for such an event, should it arise. Then, as if with the turning of a switch, true understanding would come. Some of you may become teachers or leaders…' [14]

The auspicious time of The Great Purification is finally at hand, and shows itself for all on Earth to see in daily cometary bombardments, concussive overhead explosions; torrential downpours causing mass evacuations, flooding and atomic sickness; surmounted by the spreading psychopathy and resulting horrors of global corporate warfare, and the trafficking of sex slaves, drugs and human organs. These are the prophetic times for which the chorus of synchronous channels reveal themselves to all of humanity.

Collectively, we now embark on a mnemonic journey into self-knowledge that is just commencing for the forgetful humans of this planet Earth, promising to expose the most profound realizations of the Divine Spirit residing within every human being, answering those deeper inquiries that thrust one into the light of knowledge, endowing longevity under the purest red light of the solar twins.

The rapid technological development of humanity at the present time represents the practical, material manifestation of our greatly increasing collective consciousness, driving an exponential expansion of scientific awareness. Scientific achievements of the present have been foreshadowed by the preceding Atlantean high civilization, affecting a full repossession of the great knowledge of our distant ancestors.

Breakthroughs in the manufacture of bulk metallic glass and superalloys required for acoustic levitation technologies have established a new path of discovery of polycrystalline bond structures and superhard materials that exceed the durability of carbon steel by 3 times.[1] *Yet, all the giant metal behemoths that traverse our skies and oceans as spaceplanes, airplanes and ships still employ dangerously outdated technologies.* Entrenched systems of government and corporate psychopathy have denied commercial development of superalloys by suppressing the inventions of Nikola Tesla's later years, and the series of psychic readings recorded over 18 years of close collaboration with the Sleeping Prophet Edgar Cayce.

The financial subterfuge of industrialist banker JP Morgan from 1904-1911 stifled Nikola Tesla's wireless transmission tower installation in Shoreham, Long Island, to be followed by Morgan's entrapment and assassination of Tesla's most generous investor: John Jacob Astor IV. Among the world's wealthiest men, Astor was lured aboard Morgan's 'unsinkable' Titanic along with several other prominent businessmen targeted by the Rothschild cartel, especially Benjamin Guggenheim and Isa Strauss.

The bankers' mass-murder and fraud scam involved replacing the Titanic with her damaged twin ship, the Olympic, while docked at adjacent berths for inspection in Belfast, Ireland on March 6, 1912 (above).[2] A fire was lit in the coal bunker before departure toward the North Atlantic ice flows where, on April 14, 1912, the Titanic was purposely rammed into an iceberg. Passengers were falsely assured that a nearby vessel was arriving to offload them to safety. Crewmembers forced all men to stay aboard the ship, leaving John Astor to drown, while his wife, her nurse and maid were safely evacuated to lifeboats.[3]

JP Morgan himself is directly implicated in the Titanic fraud/assassination scheme for his skillful advertisement and baiting of many high-profile businessmen like Astor onboard the vessel with personal assurances before secretly evacuating at the last moment before departure. Other potential collaborators who received free rooms or had purchased staterooms on Titanic but then cancelled, 'missed' or secretly deboarded the ship before her departure include HC Frick, JH Harding, M Hershey, AG&GW Vanderbilt, D Blair, R Bacon, G Marconi, M von Bethmann, N Craig, JS Holden and JW Hitchens.

These events were carefully orchestrated in a series of Nazi espionage operations that set the stage for the creation of the Federal Reserve Bank in 1912, involving close collaboration between agents of the Queen of England and the Rothschild-Rockefeller banking cartel. Killing off several major opponents of the Federal Reserve Bank scheme formed a primary motive of sinking the Titanic,[4] yet massive insurance fraud was another apparent secondary motive as part of the financial warfare strategies toward fascist takeover of the United States in preparation for the launching of the first World War in 1914.

For decades, the surveillance and suppression of Tesla's research and inventions had been a major priority of the Rothschild banking cartel and their bloodline-linked Rockefeller crime family, who had placed several agents close to Tesla over the years. Decades prior, German child spy George H. Scherf had been assigned to work as an accountant at Rockefeller-owned Union Sulphur Co. in Manhattan, New York that would provide cover for his espionage activities.

Before corporate espionage assignments in New York, George Scherf had gained experience supporting drug- and weapons-trafficking operations run on the *SS Surrey* as a teenager,[5] while his first tasks in the US involved arson. Scherf burnt down Tesla's Houston St. Laboratory on March 13, 1895 as a means of destroying the inventor's lab equipment, experimental prototypes, photographs, research notes, contracts and legal paperwork, while providing an opportunity for Scherf to offer his skills as part-time accountant.[6]

A 1917 portrait shows young Yale Skull & Bones club member George H. Scherf (above) during the process of establishing his false American alias 'Prescott Sheldon Bush', after strings were pulled to knowingly admit the teenage German spy under the false alias without the required legal verification of identity. The Yale Skull & Bones flag references generations-old family traditions of piracy on the open seas, and the continuity of their worldwide trafficking operations on an industrial scale to this day.

While manipulating Tesla's accounts on the side, George Scherf would make use of the corporate cover of the Union Sulphur Co. Manhattan offices at the Whitehall building (opposite). As with the Skull & Bones motif at the Yale clubhouse, blatant symbols of death-worship also mark the Whitehall building –*and have been maintained to the present.* Horned heads of the bearded devil stare down from above several of the building's entryways, reflecting the perverse Satanic beliefs of its owners: the Rockefeller crime family.

One would assume that Tesla was *not* aware that his German immigrant administrative assistant was working for American Nazi Satanists just down the street at Union Sulphur. Were there any other obvious clues available at the time that would have alerted the visionary inventor to this fact?

The corporate insignia of the Union Sulfur Co. is cataloged among the house flags of US shipping companies[7] –a sickly yellow flag that openly proclaims the deviant cult affiliations of the Rockefeller family, and the nefarious warmongering purposes behind their extensive sulfur mining activities. *The flag depicts the roughly-drawn outline of a red devil with raised arms, brandishing a black pitchfork.*

The winged and horned red devil figure stands out boldly on the yellow background, with a black serpentine tail, openly and explicitly referencing the association of sulfur with the devil. The practice of devil-worship among the psychopathic Rockefeller family is very clearly expressed by their own 'self-branding', and reflect the same blatant visual statement given in the Yale Skull & Bones crypt: *'Don't mess with us, we are genocidal Nazi Satanists. Our forefathers were pirates, and we are still mass-murdering, arms-dealing, drug-running, and slave-trafficking –now on a global, industrial scale.'*

The significance of symbolic warning messages may have been missed by some, but the bold image of the red devil was noticed by many. The Union Sulphur Company's grey pickup trucks were observed by locals in sulfur mining towns, who recall seeing the red devil logo painted on the trucks' doors (above):

> When I was a small child I thought all pickup trucks were painted gray and carried on the door a yellow decal with a red devil in the center... [but] the Union Sulphur Company simply shared its devil's imp insignia with a well known potted meat producer... The impression was easy to come by because I lived at Sulphur Mines, a self-contained community built on a dome rising up in Calcasieu Parish...
>
> I lived there in the late 1940s, long after the sulphur mining operations had closed down and the Union Sulphur Company became the Union Sulphur and Oil Company—and before a series of mergers that has now submerged its identity and made it part of a huge corporate conglomerate.[8]

One can assume that Scherf was careful never to reply to Tesla's correspondence using the letterhead of the Union Sulphur Co.! Alarm bells should certainly have been ringing in the mind of Dr. Tesla upon seeing the logo of the Rockefeller-owned company that shared in the employment of his accountant and administrative assistant George H. Scherf. Perhaps he was unaware of the darker significance of the devil's sulfur logo back in that early part of the 20th century, but the notorious signs of Satanism have become very well recognized in the early 21st century –both by the general public and by the very few but outspoken adversaries of the Scherf (Bush) family. Genetic surveys of political family lineages will ultimately unravel the complex web of deceit tied to inherited psychopathic influences.

The merging of Union Sulphur Co. into the Rothschild/Rockefeller military-industrial complex occurred over the course of many years and many name changes, as is the case with most corporate fronts used to shield genocidal Nazi eugenics operations that continue to this day on a vast scale. *Conglomerates of the repressive fascist system have even twisted Tesla's inventions to manipulate the planet's infrasound field.*

The High Atmospheric Auroral Research Project (HAARP) is a network of land-based longwave antenna arrays strategically located in all regions of the world, used in conjunction with infrasound emissions from roaming Sea-based X-Band Radar Platforms. Several arrays focus their beams at the thermosphere to generate a plasma lens that reflects ULF waves down onto the target.[9] Residents of the continental US are being victimized by secret attacks disguised as extreme weather phenomena. Tesla's wireless tower designs have been covertly weaponized for ultra-low frequency infrasound emissions from hundreds of Nexrad Stations built in alignment with the Great Pyramid, responsible for a recent massive outbreak in the numbers and intensity of severe storm cells and tornadoes across vast swaths of the country.[10]

Such extremely immoral applications of Nikola Tesla's wireless inventions have transformed the creative potential of the human mind into a destructive terrorizing force that now holds all governments of the world at ransom. The most important inventions of Tesla's later years were accomplished through direct consultation with the Source being channeled by Cayce in trance, over dozens of readings.

Edgar Cayce's work was largely supported by the Blumenthal brothers, Edwin & Morton (opposite), wealthy Jewish stockbrokers living in New York City. Generous donations to the Cayce family were also provided by David E. Kahn, another Jewish New Yorker with a long history of readings conducted by the Sleeping Prophet. Significant global interest in the Cayce material, comprising over 14,000 readings given during the course of 35 years' work, has continued to grow over the decades since Edgar's death in 1945. His trance readings still constitute one of the largest, most consistent body of profound spiritual wisdom concerning the eternal nature of the soul and its reincarnation cycles, and the lost ancient civilizations of Lemuria, Mu and Atlantis.

The Association for Research and Enlightenment (ARE) is an organization established with the mandate of preserving and sharing the legacy of Edgar Cayce's psychic readings,[11] and has, of course, been seized upon by fascist government forces as a means of limiting the dissemination of advanced concepts and information earmarked by the CIA for suppression. In the official ARE archive of Edgar Cayce's readings, the identities of Cayce's patients have been replaced with a complex, counter-intuitive numerical ID system *designed to hide particularly sensitive content under the guise of protecting public privacy.*

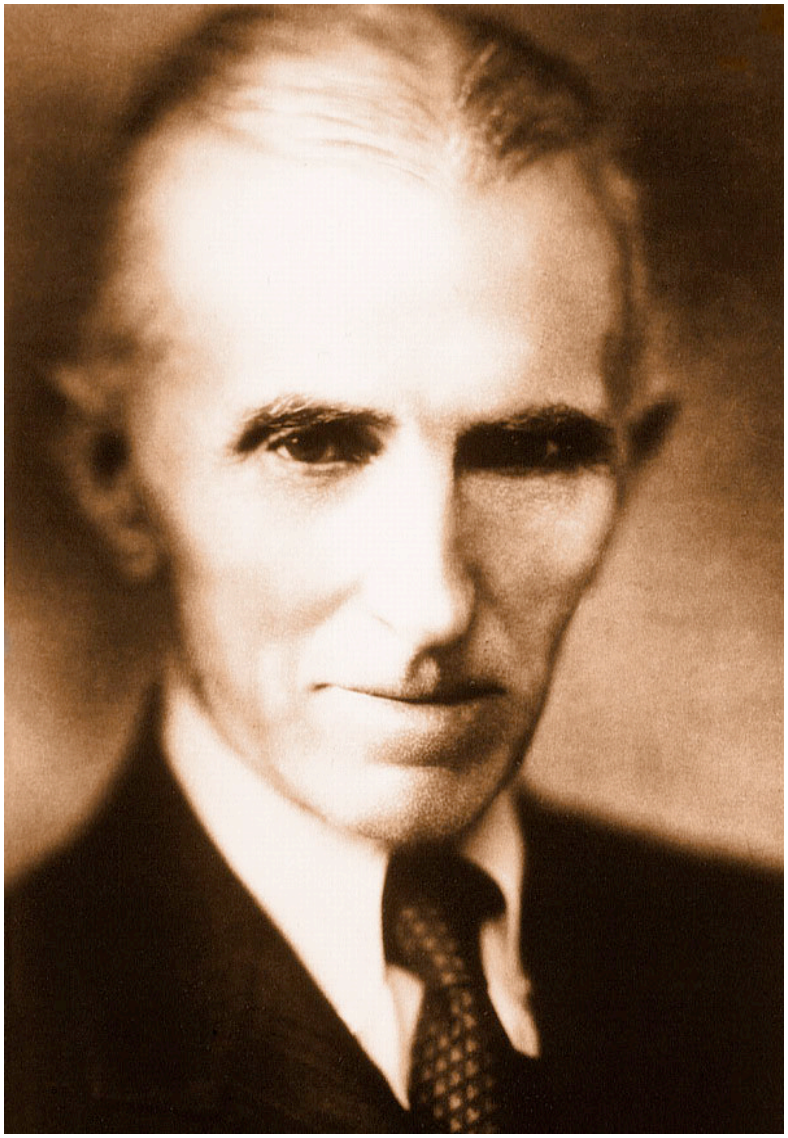
Cursory browsing of the volumes of Cayce material suggests that Nikola Tesla's readings have been entirely omitted from the archive, yet specific keyword searches for *'electrical'* or *'transmutation'* still yield remarkable information given to a variety of individuals over an extended period of time. A profound series of statements were issued by the Sleeping Prophet concerning spiritual transmutation of the physical body. Surprisingly, this information was given in a lengthy response to a rather banal line of questions regarding stock trends for broker Morton Blumenthal on December 10, 1926 (Reading 900-286):

> Again the indication to the entity of the necessity of that study and of further information through self... as is necessary from those... impelling forces as come through from that condition experienced by the entity where it passes from the material to the spiritual plane –yet living on in that manner in which the forces are only changed in their way and manner of expressing themselves, as may be seen in the combination, or the lack of a combination of any various and many various elements, or as the illustration as has been given:
>
> Certain combinations make H_2O, and always make that, yet H_2O may be changed into many various forms, carrying many other elements, both of the vegetable and of the mineral, or even animal kingdom, within itself. So Man, that of the higher beings, wherein carrying that force within itself of the Creative Energy as may be made One *with* the Whole, finds in its transmutation from the material of life to that of the spiritual life, carrying with same those same effects as may be seen through that which it has builded within itself. Hence finds in its various ways and manners the different forms of expressing to mankind.[12]

In these remarkable offerings by the Sleeping Prophet, Cayce identifies the presence of various forms of water molecules, now defined by the various isotopes of hydrogen comprising H_2O molecules. Deuterium, a heavy isotope of hydrogen with an extra neutron, was first identified by scientists in 1932 in connection with discovery of the neutron. The trance channel further ascribed a significance to the combination and variety of chemical elements carried within the body's water. Cayce's elusive meaning can only now be understood in the context of atomic resonance and the field of oscillations emitted by the human body!

A thorough search of the *Complete Readings of Edgar Cayce* official archive yields no results for any readings with data corresponding to Nikola Tesla, who was publicly known for exclusively seeking out the psychic health advice of Edgar Cayce and wisely avoided conventional medical doctors. *Where have Cayce's psychic readings for Tesla been hidden away, and why*?

During the CIA alteration and falsification of the extensive archive of material channeled by the Sleeping Prophet, Cayce's akashic readings for Nikola Tesla were altered for sensitive content and split into separate denominations to confuse readers. Tesla's physical health and past life readings were given the designation [487] and falsely attributed to some prodigal child brought before Cayce at the age of 5 by his mother [538], allegedly a friend of Morton Blumenthal.



The absurdity of this long-standing government cover-up is now becoming quite apparent, as Edgar Cayce's readings clearly describe various physical ailments and high spiritual forces of an elderly man, who he had recommended should reduce alcohol and sugar intake, undertake regular upper-body exercise, make use of a saline laxative and undergo regular osteopathic treatments for several vertebral misalignments.

For safety reasons, none of these essential treatments are ever recommended for children, yet all have been paradoxically listed as having been recommendations of Edgar Cayce for a five-year-old. These obvious, major discrepancies are completely inconsistent with the known accuracy of Cayce's readings – furthermore, *twenty false reports have been added to the file* on [487], including fabricated letters as late as 1972, despite the last readings under this designation having been given in 1941. The final 2 readings (487-28 and -29), along with the 20 follow-up reports, were appended to support the flimsy cover-story.

The actual context of the readings have only now been established. In his later years, Tesla focused on the mental process of invention and gradually removed himself from the physical labor of experimentation. *His time away from his whirring electrical devices was all too often spent indoors, seated alone at a desk.* Occasionally experiencing stiffness, sore throat and headaches, Tesla would warm and rehydrate himself with soups and tinctures, often engaging in hours of mental study without adequate physical activity.

Tesla procured diagnostic health readings from Edgar Cayce, whose natural remedies offered significant relief. In coping with the loneliness imposed by those corporate fascists who repeatedly intimidated or murdered his financial backers, Tesla's excessive use of alcohol had caused disturbances in his liver, kidneys and duodenum that were identified by Cayce on January 5, 1924 (Reading 487-2), compounded with stress and toxicity build-up discussed later the same year, on December 30 (Reading 487-3):

> *In the functioning of the organs themselves*, we find as these: Cerebrospinal center, or brain forces, very good. Overactive for the development and condition from the normal [behavior], but from the spiritual and soul forces, [this can be considered] normal... Digestive tract, stomach proper, as we have given, showing internally the action of the gastric juices, and hydrochloric excess with alcoholic excess in duodenum... Hypogastric center in the kidneys and the emunctories all show excess of secretions eliminated by the excess of alcoholic influences as created in the system, producing some inflammation in the neck of bladder proper, and an excess of the secretions in the emunctories of liver and the kidneys proper.[13]

In the physical structures, we find there are many centers needing correction. In the cervical, in the upper dorsal, and in the lower lumbar. Those in the cervical, especially, help in the irritation as produced by congestion at present.

Then to bring the proper relief to this body, we would first correct those cervicals and those centers where pressure is produced in nerve and blood supply to throat and larynx, and give those properties that would correct the eliminations in system, and correct the ligament and tissue in the manner that would relieve pressure and strain; inhaling, then, equal parts of Eucalyptol and Benzoin, with Balsam Tolu. This, we find, would relieve the mucus forming tissue in the larynx and nostril, with the correction made. [Relief from congestion may] only be temporary without the correction; giving those properties in the system that will bring the equilibrium in eliminations through the stomach, liver and kidneys; that is, small doses Castoria, followed with small doses Bromo-Quinine, or of the equal portions Cascara Sagrada, Licorice Compound, and Saffron. Either of these we find would bring the equilibrium through the digestive system.

Keeping the body from drafts, keeping feet warm. Well that of evenings hot mustard foot baths be given, until cold and congestion is relieved from system, and corrections made. Do that.

Q: Give the specific places where these corrections should be made? ...

A: Cervical, especially, 3rd & 4th. Dorsal, 2nd & 3rd. Lumbar, 4th. Osteopathic [treatments are]... better for this body.[14]

Reflecting his heavily taxed mental state, at odds with continual corporate sabotage and public ignorance, Tesla's physical condition was slowly deteriorating into his sixties from a general lack of activity and balanced pursuits. Instead, his isolated condition drove him to see deeply into future possibilities; to fully envision and produce design specifications for optically invisible aircraft and spacecraft prototypes that applied his discoveries of the refractive optical properties of HHO plasma.

Tesla's otherworldly pursuits would not find the support they deserved in his lifetime, and have since been erased from the records of society. Health readings given years apart prescribed similar treatments. On December 22, 1926, Cayce again recommended Tesla inhale vapors of the same tincture; a solution of tolu, pure grain alcohol and water, with benzoin, oil of turp and eucalyptol added (Reading 487-10):

> Those physical conditions with this body need those corrections as are necessary for the better physical being of the body, see? For while we find these conditions as are produced in the system, wherein the system in the eliminations has been more active in the lower portions of the body, those of the liver have *not* been active in the system, and the poisons re-absorbed from *worry*, from the condition in the body, produce that taxation that causes a pressure to the diaphragm, wherein its juncture with that condition in the hypogastric plexus produces nausea, burning in throat, and taxation to the head directly through the pressure on the glands in the thyroid...
>
> Then, to overcome this condition, we would relax the body thoroughly by manipulation along the spine, osteopathically given, or give those properties internally –give half a grain of calomel. This will *cleanse* the system, producing nausea for the time being, yet bring about the better conditions for this body...

Q: What will relieve the sore throat and headache at the present?

A: Remove that which causes the condition –the liver, see? for the *upper* intestinal tract must act, and especially the liver, to reduce the pressure as is caused on the hypogastric plexus at the lower end of the stomach, in the region of the liver and duodenum, see? When this is removed, we will remove these conditions –the pressure as is caused through this nerve to the head –which is direct, see? which gives the pain in temple –for these are as spots, for each set of these come directly to the 1st and 2nd ventricle –that are called the first nerves to the facial muscles, through that plexus which may be relaxed by gentle massage over the nerves in the upper dorsal and the whole cervical region, see?

Q: One-half grain of calomel given tonight will be sufficient? ...

A: Half grain tonight and another half grain in the morning, then followed with the saleratus –soda, saleratus, or salts –salts preferable, for this produces the relaxing of the hypogastric plexus, and the calomel, with its characteristic activity in that of the acids, produces the liver reaction, see? or the throat, to bring about a *better* condition, may be sprayed with this, see? in an atomizer. This will only be local, and is only as an antiseptic for the system. To 40 minims tincture in solution of tolu, add:

5 minims Benzoin; 1 minim Oil of Turp; 1 minim Eucalyptol; 10 minims pure grain alcohol, diluted in $^{1}/_{2}$ oz. water

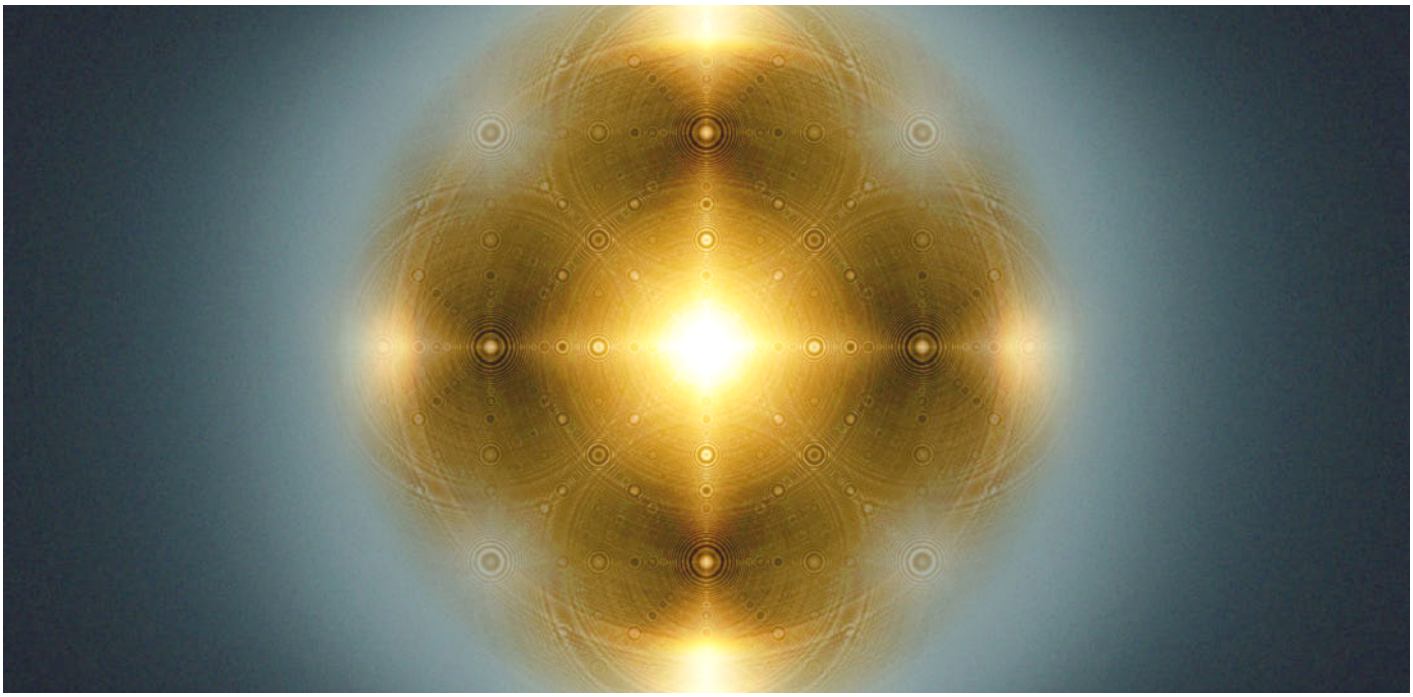
Q: Is the burn on the leg healing properly?

A: Healing properly. Keep that as has been applied, and in the way and manner, for the system must be kept cleansed that the rebuilding may come properly. Do not give the body too much candy or sweets!

Q: Should the osteopathic treatments be given if it takes the calomel?

A: We may relax these in an osteopathic manner –anyone may relax these portions of the system by simply massaging along this portion of the spine... until the condition is relieved of pains in the head.

Q: Will the body be able to use the leg and straighten it as perfectly normal when the burn has healed?



A: Certainly. Only it takes a little time for it to heal, for the burn in the deep portion is lateral with the muscular portion in the leg, see? Hence the tautness as is felt there, and the inability to straighten at present without producing a strain –which is detrimental, for it breaks tissue.[15]

This special set of remedies that were repeatedly recommended for the sedentary issues of Nikola Tesla throughout his later years included the tolu-based inhalant, regular osteopathic treatments and dietary advice for reestablishing equilibrium. The ailments of the body were addressed by the trance channel within the greater context of the spiritual endeavors of the eternal entity that has manifest in the present body, according to the karma accumulated through the extensive series of previous lives experienced in the Earth's physical plane. An intriguing Life Reading for Nikola Tesla was given by Edgar Cayce at his 322 Grafton Avenue office in Dayton, Ohio, on February 27, 1925 (Reading 487-4):

Conductor: You will give the relation of Nikola Tesla and the Universe, and the Universal Forces, giving the conditions that are as personalities latent and exhibited in the present life. Also the former appearances in the Earth's plane, giving the time, place, and the name, and that in that life which built or retarded the development for the entity, giving the abilities of the present entity and that to which it may attain, and how.

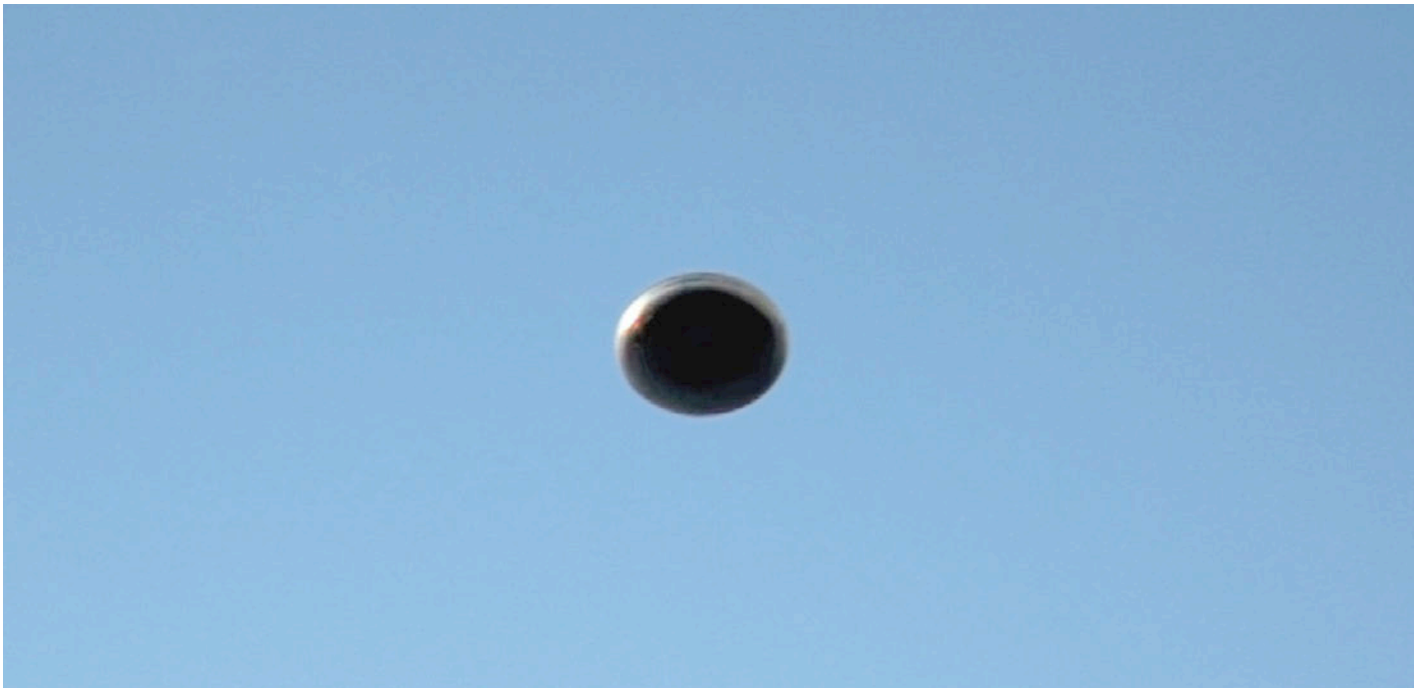
EC: Yes, we have the entity here and that position from which the entity took its place in the present Earth's plane with those [electrical] conditions surrounding same and the relation of Universal Forces in the spheres with those abilities that are latent in the entity, and that ability to which this may be developed in the present Earth's plane...

Again we find the elements as enter in thru Venus and Uranian forces with the mental, that the physical forces in body, especially those tending towards the eliminations and the direction of the system of the nerves, needs to be kept in the correct channel, else we bring those elements in the developing mental forces retarding, or causing the accentuation of these conditions. Be especially anxious or careful of this condition eight days from present.

In these developments then with the entity as we find in its development in its mental, moral, physical makeup, let those directions be given in the manner that will give the greater development in this entity, for we find the abilities in this entity, especially, beyond those of the ordinary, as we shall see from the sojourns in Earth's plane.

Those abilities lie then in that which represents the weaknesses in the physical forces in the body, that of aerial affairs, or of electrical development, or of electrical engineering, or of steam engineering, or of those... requiring the mental development, especially along the lines of mathematical precision in each element.

As to the appearances in the Earth's plane, these we see have been in accordance with those developments necessary and with the care given at this stage of development in Earth's plane will give that necessary for the entity to be presented wholly to the Giver of good and perfect gifts, in that sphere of the development, or in another sphere than Earth's, or Earth's solar systems' connection.



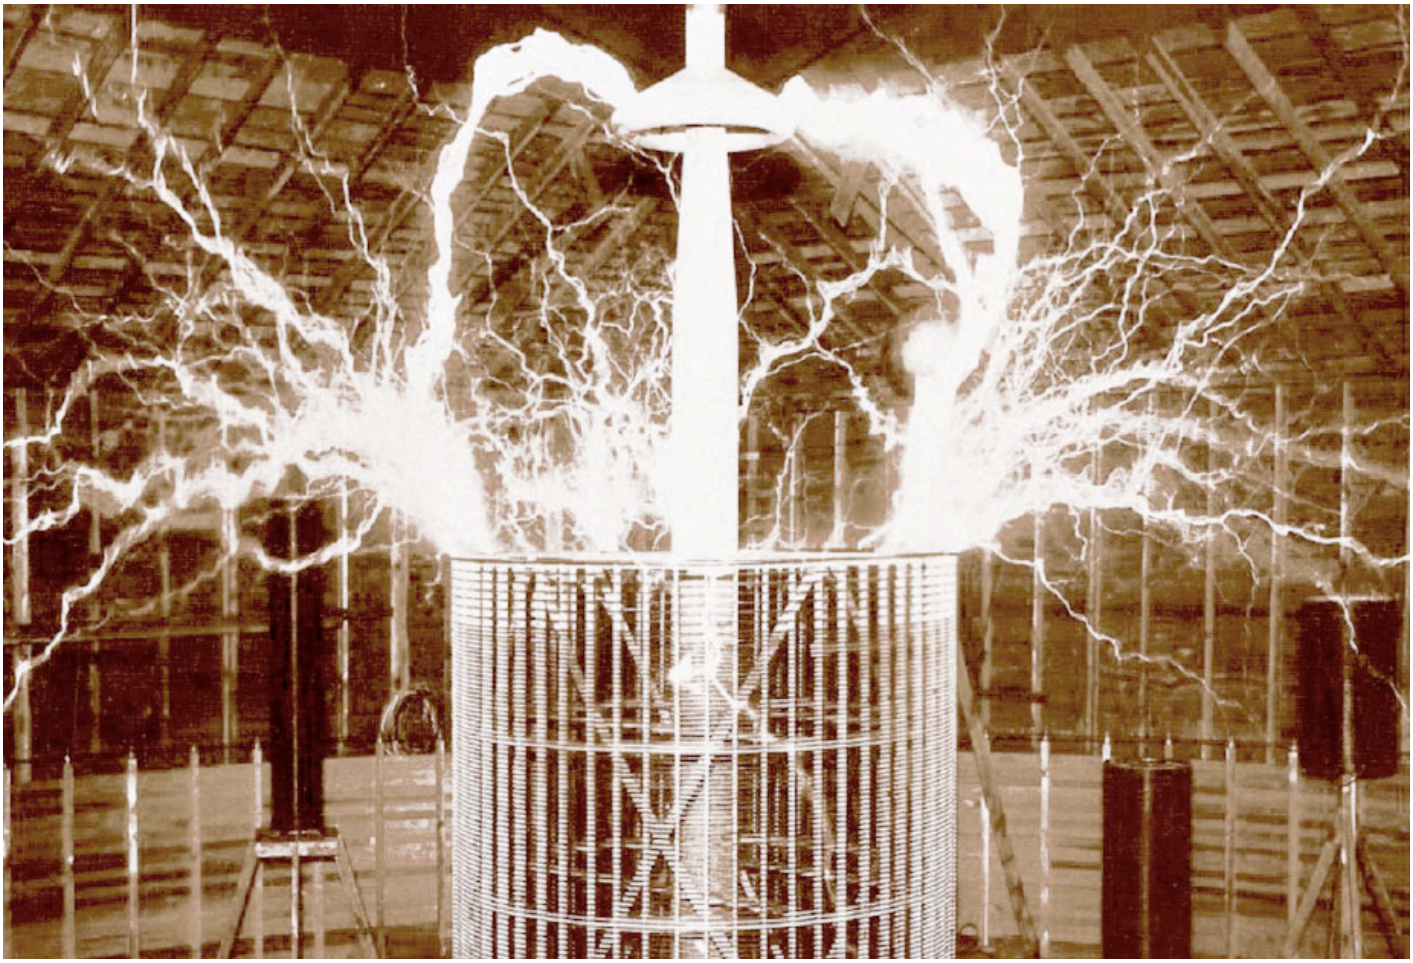
In the one before this, then, we find in that land now known as Germany when the first application of steam was given to move objects, and the entity then was from another country. In this development as brought the entity on, we find in the name of Iasdo, and the time was in that of [1321?], and the personality as is in the present is the condition as given in the desire to keep things to self, or knowledge of conditions to self.

In the one before this we find in the Indian rule, then the higher civilization in the Earth's plane. This we see 10,097 years before the Prince of Peace (10,097 BC), and the entity then in the name of Ddao, and then the entity gave to that people the first show or combination of chemical that produced explosives, as this we see was used against those tribes that attacked the ones this entity made head of. In the personality shown in the individuality, and the urge exhibited at the present time, slow to make those connections in friendships, yet true to those, provided others do not interfere in that, yet these [interferences] are easily remained in oblivion to the entity.

In the one before this we find in the land of the Poseidians when the rule was in the house of Ode, and the entity then gave to that people the manner of use of the universal forces as may be applied in the way of mechanical construction in a physical plane. The entity was then known as Ode.

In this we find in the present plane that ability to grasp easily, quickly, every condition as is presented to the body, yet this, as we see, depending upon the manner in which the developments may be made in present plane by those having the charge or direction of the entity in its gaining the first principles of applying the urge as comes to the developing of the mental abilities, with the position in which the physical finds itself in the present sphere.

Then to apply this and how: Well that those who have this charge take notice of the responsibility in the present condition, and with the present entity, that the world, the peoples, the nations, may gain that advantage of the abilities of the entity, for let it be known that with the development as acquired through this entity... it would make just as far from the high development as it may make with the correcting of the urges as presented.



Then, let the entity gain that as the first the knowledge of self, and of Him who gives all good and perfect gifts, then the ever correcting force of His purpose, as is in Him, be directed in that channel, leading then ever upward, onward, to that bright and holy land.[16]

Profound statements included in this partial recapitulation of the past lives of Nikola Tesla relate a depth of information that can only now be comprehended. Given to Tesla so that he might achieve his deeper purpose on this Earth plane, his great curiosity, intuition and expertise in mechanical engineering was developed during prior incarnations as Iasdo, a steam engineer in Germany; as Ddao, tribal leader and explosives expert in India; and as an Atlantean scientific leader of the house of Ode, on the lost continent of Poseid (submerged by catastrophic cometary impact 12,800 years ago).

The unique abilities that enabled Nikola Tesla's visionary inventions constitute a learning cycle that continues to the present day in this subsequent incarnation. Cayce clearly stated: "Those abilities lie then in... the mental development, *especially along the lines of mathematical precision in each element [on the periodic table]"* –as required for accurate calculation of atomic dimensions and corresponding phonon frequencies that trigger low energy nuclear transmutation throughout the universe.

Cayce's words were not readily understood in 1925. Ultimately, 87 years would elapse before precise values for atomic masses and linear thermal expansion coefficients for all chemical elements could be correctly applied, according to the formula for phonon resonance. It is this mastery of the resonant conversion of nature's elements that Cayce specifies as aligning human consciousness with Divine purpose in spiritual ascension, *"leading then ever upward, onward, to that bright and holy land."*

Tesla's engineering of wireless power transmission systems required precise mathematical calculations concerning the resonant dimensions of ductile metals being used, especially the diameter, length and number of windings of copper wire (above). While Tesla carefully calibrated the dimensions of copper coils and resonant distances for efficient wireless transmission, Cayce emphasized the great importance of precise dimensional values for the elements *that would not be determined until the 21st century*.

On June 7, 1934 Edgar Cayce conducted another Life Reading for Tesla, focusing on his prior incarnation as an Atlantean leader: Ajax of the House of Ode. Also called Ax-Tell in the Egyptian lands, his profound scientific knowledge had dramatically resurfaced in the life's work of Nikola Tesla (Reading 487-17):

> *EC:* Yes, we have the entity and those relations with the universe and universal forces, that are latent and manifested in the personality of the present entity, now known as or called Nikola Tesla; this we have had before...
>
> The developments of the entity in the present experience may be given, that have been in the present from the environs about the body mentally and physically in the present, from that which has been written. There is now the activity being made, to be made, in the mental, physical and soul development of the entity, such that the record which has been made by the entity in the present may be given... that will influence the entity; at least, this in part may be given– not as to *alter*, but rather as to that the entity in its mental self may weigh and measure and see in self, and what self did *with* and concerning constructive influences in the Earth.
>
> Then the natural question of the entity, from that which has been given, is: From what source, or how, is such a record read of the activities in the past? How may self know that there is being given a *true* record of the activities in a period of which there is no written *word* history? Yet the entity itself sees, and is being taught, and is studying, the records that are written in nature, in the rocks, in the hills, in the trees, in that termed the genealogical log of nature itself. Just as true, then, is the record that the mind makes upon the film of time and space in the activities of a body with its soul that is made in the image of the Maker; being then spirit, in its form, upon the records *in* time and space.

As there may not be seen with the visible eye the growth in animal, vegetable or mineral kingdoms, neither may there be seen the growth in the soul, save by and through the activities of a body-mind through channels known as sense or intellect, or by drawing the comparisons in self through what is termed space or time– and upon these are the records of a soul's activity made.

What then, the entity asks, *is* a soul? What does it look like? What is its plane of experience or activity? How may ye find one? It may not be separated in a material world from its own place of abode in the body-physical, yet the soul looks through the eyes of the body –it handles with the emotions of the sense of touch– it may be aware through the factors in every sense, and thus add to its body as much as the food of the material world has made for a growing physical body in which the soul may and does indeed dwell in its passage or activity in any individual phase of an experience in the Earth.

What, then, are the experiences or appearances or activities of the body in the material world that have influenced, and are to influence, this entity in the coming age or cycle? A cycle is seven years, known or called in the Earth, and information may be given or records read as to the varying appearances or activities that may change in that period. How has the scientist or the biologist arrived at the conclusions, that are glibly given, that a body is altered or renewed in such a space of time? By comparing the activities!

But what has still remained that makes those about the body aware that the same *entity* (not body, but *entity*) is manifesting or inhabiting –if you please– such an altered or changed body? That which shows through the activities of the soul of the body! The application that soul has made respecting that which is creative or constructive, or respecting the gifts of the Creator into the hearts and souls of individuals –or men.

In the inception of this body in the present there were those [highly electrical] surroundings that made for different [ionization] or altering conditions which brought to the physical an exceptional or unusual (in words of the Earth) activity in the soul-entity. (Get the difference between the wording entity and soul-entity, for words are often very poor in describing infinity in finite space and time.) The soul-entity is a development outside of body in material form. The entity is all-inclusive of soul and that activity in its relationships to the material things known in Earth...

But this entity, entering under such auspices or conditions [at birth], brought [an intense lightning storm] with same –as we have indicated from the sojourn in the Uranian influences– that which might make for soul development or soul retardment, by its activity or by its application of the laws that are universal –or from the God-Consciousness in the realm of activity. For,... oft *has* it been seen in the activity of the entity thus far, even in the material things and material associations –*many* have blessed the coming and many have been glad when the entity has passed from, or body has passed from, that environ or that experience.

Hence the entity or soul here wields in the Earth in the present a place of *power* –yea, more than power. One that may be made into those things that may be beautiful, if they are enjoined with the love that is seen in the Creative Forces activated by the Christ Consciousness, or made in such measures that there may be warnings to many that though they gain the whole world and lose their own soul what has been gained?

From an experience, then, in the present there are the activities mentally that must be weighed in the balance; and if they are found wanting in the associations of the entity in the material things, in the mental things, woe be to many! Yet the entity has arrived at that place in this experience in the Earth when it must choose for itself.

Let self, body, mind and soul, then, be grounded in that as was given by Him who is the life and the light of the world; "As ye would that men should do to you, do ye even so to them." For, if ye do good alone to those who do good to you, what reward has thy soul? What recompense is in thine own heart of hearts? For, even do those that would make for the aggrandizements of selfish interests, or that they may be well spoken of by many.

For, if the purposes, the desires, the aims, do not take hold upon something far beyond those things that partake of the Earth-Earthy, then indeed does the soul become impoverished and the time and space grow weary –and those things that make for turmoils and strife, that make the heart and soul weary, come into the experience of all. But if the heart and mind forgive those who despitefully use them, those that speak evil in divers places, those that find fault with others will find fault in themselves; for they are writing their own record –they must meet, every one, that which they have said about another; for so is the image, the soul of the Creator in each body, and when ye speak evil of or unkindly to thy brother, thou hast done it unto thy God.

The entity came from the Atlantean land into Egypt when there were those periods of reconstruction in the land, and from those turmoils and strifes there arose much that made for individual and group development –and the attempt of those in the experience to foster or disseminate same; those things that were good.

The entity came then, in the name Ax-tell, from those forces that were in charge of the Law of the One.

In establishing self in that land, the entity found little of help; finding fault with the king in power, finding little in common with the priest that led; finding those things that measured not to that standard the entity had had in the land, withdrew on account of the associations –specifically– of the priest with those women, or those of the opposite sex in the land.

Hence builded in self much that must be met, must be counted, must be countenanced in the present experience –if there will be gained that which will make for the soul development. For, if there is not love such as in showing not only tolerance but patience and brotherly love and kindness and such, there may not be those expansions in any experience that will bring contentment. For, yea, though there has been builded in the mental experience that which may be raised in power in the present to bring –as given– *power*, force, magnitude of purpose, unless the desires, purposes and aims have their inception or motivating force other than through the mental attributes of the physical body, they must be met –even as is being and will be experienced by the entity in the present [life].

What, ye ask then, would the entity do in the present respecting these relationships and activities?

Search deep into the heart, the soul of self, and see from whence cometh that motivating force that *drives* self on to activity. If it is for laudation of self alone, if it is for the aggrandizement of the interests in material things alone, then know –while you may materially succeed– the *ends* thereof are not well. But seek through those activities that bring the analyzing of same in the human body, in the human relationships, that may be spiritualized by the desires of the heart –and you will find joy and peace, and –yea –in those days– when His forerunner may come into the Earth for preparing the place for the Son of man, that His kingdom may be established in the Earth, wilt thou be ready? Seek ye Him.[17]

The precision and profundity of the channeled information in these prescient passages is staggering. In both Life Readings Edgar gave for Nikola Tesla, the trance medium indirectly refers to the fact that his birth was accompanied by an intense electrical storm. It was recorded that during Nikola's birth, the midwife commented, "He'll be a child of the storm", but Nikola's mother Đuka recognized the significance of the exact timing of his arrival at the stroke of midnight that marks one day from the next. Đuka had replied to the midwife, "No, of light".[18] *This statement accurately predicted her son's invention of electrical systems and fluorescent tubes that have illuminated the entire world.*

Cayce's comprehensive spiritual explanation of the inventive or Creative impulse and the primary significance of heart-focused intention makes a direct reference to the all-penetrating epochal changes now engulfing Earth. The changes are described in an intriguing manner in the very last lines of Tesla's Life Reading as "those days– when His forerunner may come into the Earth for preparing the place for the Son of man, that His kingdom may be established in the Earth, wilt thou be ready? Seek ye Him."

Nikola must have been intrigued by this proclamation from Edgar Cayce regarding his deeper spiritual purpose on this Earth, on an entity level. To paraphrase the Sleeping Prophet's unambiguous words:

> *Meditate upon the motivating forces of the human heart and body, of human relationships, and prepare yourself for the coming of the Creator! Will you be ready?*

These clairvoyant phrases have never been understood in their entirety, *not even by Tesla himself*, and have just now come into sharp focus. Through Cayce, the Source is making a pointed reference to the phonon resonance interactions of metals and gases within the heart and blood serum that generate the resonant atomic transmutation cascades enhanced by bioelectrication rites within pyramid chambers.[19]

Indeed, an inner learning process of reflective meditation has awakened past life memories deeply stored in the subconscious mind, forming the crucial inner preparation and purification for the emergent Third Phase of Creation during which the Earth is to be bathed in the regenerative UV-A light of HHO plasma.

In the wise words of Hopi Elders: “The third phase of Creation is the time of the red light, Talawva, the perfect light. Humanity then, having been fully formed and [crystallized,] proudly faces the Creator for the first time, to know the true warmth of love.” [20] These events have also been clearly foretold in the Red Sky Prophecy of an Apache Elder,[21] preparing those of the Earth for the coming of the Red Dawn at the strike of the long prophesied Galactic Superwave that will ignite the hidden Brown Dwarf twin of our sun.

The Gravity Motor

The Gravity Motor

The greatest achievements of terrestrial human technology have been hidden from public awareness. While the various space agencies of the world's governments continue to use outdated and exceedingly dangerous rocket technologies and space shuttles designed in the 1940s and only minimally upgraded since, the advanced gravity control methods and plasma physics research of Nikola Tesla have been secretly suppressed, stolen, constructed and deployed from underground CIA/Nazi military bases.

Quite remarkably, a detailed account of Tesla's development of the Gravity Motor can be found in an extensive series of psychic readings for the inventor that were conducted by Edgar Cayce. Herein, for the first time, these astonishingly lucid trance readings are restored in their proper context, after six decades of strict suppression and relegation to obscurity by falsification of the names of individuals involved and the inclusion of supplemental false data supporting the fictitious persons that were substituted.

Another closely related series of trance readings were conducted by Edgar Cayce at his office at 322 Grafton Ave, Dayton, Ohio, for a young mechanical engineer named Thomas Townsend Brown [195] from Zanesville, Ohio. Brown requested a series of psychic sessions with Cayce spanning decades, recorded in Readings 195-1 through 195-69. His initial queries were made concerning gold prospecting sites on particular Arizona properties, as well as stock value predictions on the New York Stock Exchange.

Careful analysis of the entire compendium of The Complete Readings of Edgar Cayce reveals the identity of Thomas Brown has been partially altered and a good portion of his readings have been assigned to fictitious persons. 'Thomas B. Brown' is listed as a realtor and auto parts manufacturer in his initial readings, *but Brown was later associated with a group effort to engineer a gasless motor that functioned on the principles of standing wave resonance*. Thomas Sugrue, the author of a 1945 biography entitled *'The Edgar Cayce Story: There Is A River'* identified Thomas B. Brown as an inventor who requested an extensive series of psychic readings with the Sleeping Prophet Cayce, who provided technical support:

> The man who helped most was Thomas B. Brown, an inventor who was troubled with a tendency to deafness. By following the advice of the readings he was able to improve his hearing, and thereafter bought much of Edgar's time for readings on the problems he encountered in his laboratory.[1]

Despite having conducted hundreds of readings for Mr. Brown, a friend and business associate of the Blumenthal brothers, neither Sugrue nor the Cayces were aware of Thomas Brown's true full name and identity, nor his direct participation in military espionage and secret research projects at the extensive underground facilities of Wright Patterson Airforce Base in Dayton, Ohio. Brown had apparently falsified his birthplace as well, providing Akron, Ohio instead of his actual birthplace of Zanesville, Ohio. Thomas Brown's actual middle name is 'Townsend', yet his middle initial was given and recorded in the Cayce archives as 'B' instead of 'T'. *Substitution of letters which sound similar allows for 'plausible deniability'.*

Unbeknownst to both Nikola Tesla and Edgar Cayce at the time, Thomas Townsend Brown was directly acting under orders from the Nazi military-industrial complex that had coordinated the multi-generational espionage activity and counter-intelligence cover-up of Tesla's finest inventions. The timing of corporate subterfuge and manipulations that surrounded the world's greatest inventor are only now becoming evident, having been obscured by the horrors of war and corporate commandeering of world industry.

Tesla's breakthrough realization of the nonlinear dynamics of multi-frequency oscillations in the infrasonic range was seeded during experimentation with a pocket-sized electro-mechanical oscillator in 1888. The unusual circumstances of this astonishing experiment were briefly given to a reporter from the New York World-Telegram in 1935, describing Tesla's accidental production of localized earthquakes and acoustic levitation of multi-ton generators and other heavy metal equipment at his East Houston St. laboratory:

> I was experimenting with vibrations. I had one of my machines going and I wanted to see if I could get it in tune with the vibration of the building. I put it up notch after notch. There was a peculiar cracking sound... I knew I was approaching the vibration of the steel building. I pushed the machine a little higher. Suddenly all the heavy machinery in the place was flying around. I grabbed a hammer and broke the machine. The building would have been down about our ears in another few minutes. Outside in the street there was pandemonium. The police and ambulances arrived. I told my assistants to say nothing. We told the police it must have been an earthquake... [2]

That experience inspired Tesla's invention of the Gravity Motor, tapping the limitless power of acoustic resonance by generating standing waves within a drum. Tesla's finest, most suppressed invention was discussed in a psychic reading for Thomas T. Brown given by trance channel Edgar Cayce on March 8, 1928 in Chicago, at the LaSalle Hotel, a luxurious palace hotel conveniently located across the street from the Masonic Lodge, a well known establishment of the American-Nazi industrialists (Reading 4665-1):

Thomas Townsend Brown: You will have before you the gasless motor invented by Nikola Tesla.

EC: Yes, we have the body and enquiring mind of Nikola Tesla, also the associations and those conditions surrounding the perfection of motor which will develop power in its own action. As has been given, the idea and the plans as have been worked out in part along those lines that pull more of the power as produced in compression in drum, with the leads made in these forms that gather vibrations from the air as is forced through drum, are, as we find, the better application of the created energy. In the cams [as] have been used too much slack or play is allowed in their rotation. This is in the drum's head action that these must be shortened in play.

The connection of Thomas Townsend Brown and John George Trump with same –best that these have Tesla's operations closer under their observations when the completed product is near attained.

Q: How may we bring him under our observation?

A: Bring him to Dayton, Ohio or N.Y.

Q: Is this machine the same as brought to Washington now by [Charles A.] Lindbergh?

A: No. As is here, the Tesla machine would operate on stationary conditions impelling forces; even for now that in gas motors –for, as tested by others, has more to do with that thrown in air and gaining its impelling force from that source.

Q: Would it operate perpetually if perfected?

A: Not perpetually, but once started could be kept in motion by created energy of its own source. Other has to have some source of impellation.

Q: Would Tesla's machine be good for [an] airplane? A: Would be better than other –one that would start as well as keep in motion. Pressure will be regulated by altitude.

Q: When ought this be finished?

A: In seven or eight days when material is put in shape.

Q: Who had we best see in Washington regarding this? A: Get in shape first, then go to those through whom T. Townsend Brown has had associations regarding same and protecting rights of same.

Q: Mr. Blumenthal and Mr. Brown have [a] letter to Hoover's [Bureau] man. Is he one to present it to?

A: This [is] very good... [and may be] very effectual.

Q: It was given from [this Source] here that Clinton gave information to Tesla?

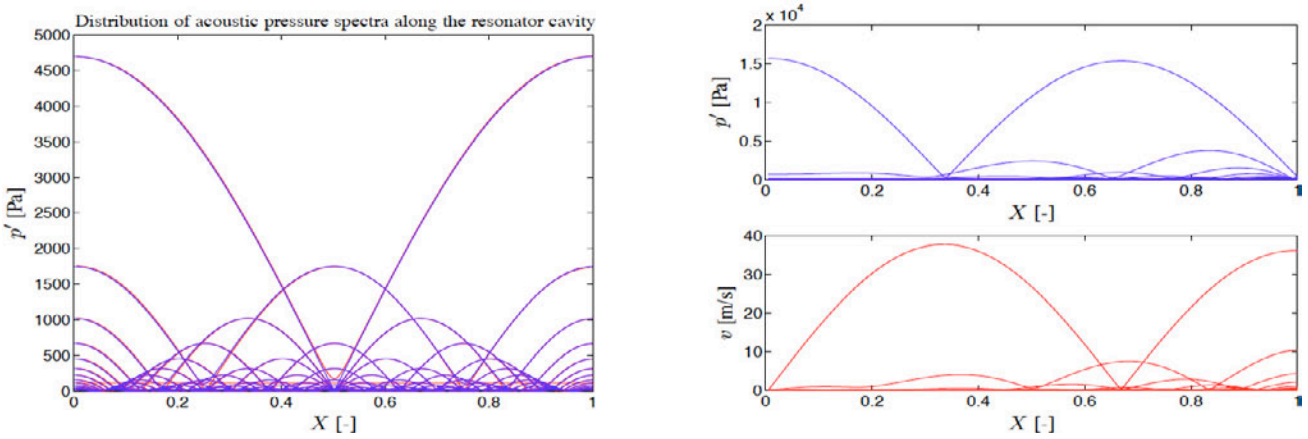
A: DeWitt Clinton. Judge DeWitt Clinton (1769–1828), former Governor of New York.

Q: How many times will this machine whirl a ten foot propeller per minute?

A: Sufficient to keep same going in air. Stationary engine that would and could be raised to 160 horse power or increased in build and in drum to almost infinite power.

Q: How much would a machine equal to four hundred horse power weigh? A: 200-300 pounds.

Q: How many times would it whirl a ten foot propeller?



A: 4,600 times a minute.

Q: Any other advice you would give to Tesla concerning construction of machine or anything you would give to us regarding same?

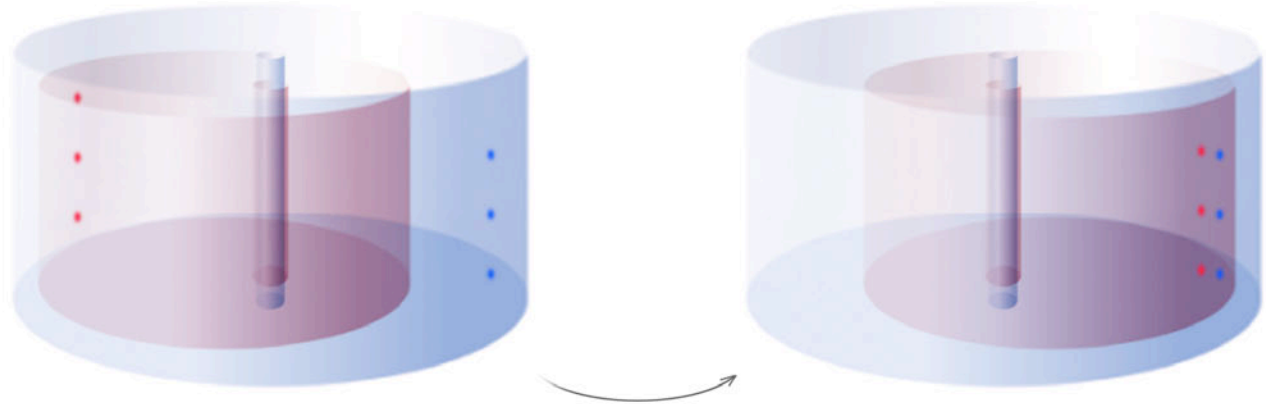
> A: In this relation might be considered first, to Tesla, *that there must be perfect cooperation of the self and the will with those who would assist in perfecting this from the material side.* Also there must be perfect cooperation with inner self to obtain that information that would give self knowledge to apply same in connection with cosmic relation. For force is one and in obtaining proper relation of energies as set forth and released, these must coordinate.[3]

This somewhat veiled warning for Tesla was given in a positive form, but in light of the negative outcome of the group's efforts to complete and patent the superfluid Gravity Motor, we can assume that a "perfect cooperation" was not achieved between Tesla, Brown, Blumenthal and Cayce. In retrospect, one will notice that the warning came directly following questions regarding the prospect of contacting the federal government through the Bureau of Investigation Director Edgar Hoover.

The reality of the situation is now clear: Dr. Tesla was completely surrounded by agents of industrialist bankers who were willfully stifling the Gravity Motor invention. Brown's direct questioning of the Sleeping Prophet under trance concerning "how to bring him under our observation" betrays his subversive goal of controlling the inventor and his finest works, as persistently expressed by Nazi bankers for several decades as exemplified by Morgan's financial subterfuge that destroyed Tesla's Wardenclyffe Tower.

The final phrase of the message given for Tesla is a profound one: "For force is one and in obtaining proper relation of energies as set forth and released, these must coordinate." The 'proper relation of energies' is a coded reference to the exact Fibonacci ratio of three frequencies required for the reverberatory formation of *resonant standing waves*, as first discovered by Tesla in 1899 and only recently defined by acoustic physicists at the Czech Tech University (above, Cervenka *et al.*, 2003).[4]

Once the formation of resonant standing waves occurs within a resonator by three frequencies in exact Fibonacci relationship with one another, a wide range of harmonics and subharmonics are also produced, forming a multi-frequency field of acoustic resonance. This unusual interaction of soundwaves of various frequencies occurs naturally, and with an efficiency that has been only recently recognized by scientists:



> [T]he interactions of acoustic waves at some fixed frequencies without the energy losses in the higher harmonics is of considerable interest in acoustics. Such interaction creates the possibility of direct transformation of coherent sound at the given frequency by sound of another frequency without an electro-magnetic energy source... For a region of three modes with given angular frequencies, if the sum of two of them is equal to the remaining one [reflecting the Fibonacci ratio], the interactions of these modes can be obtained from the nonhomogenous Burgers equation for nonlinear standing waves.[5]

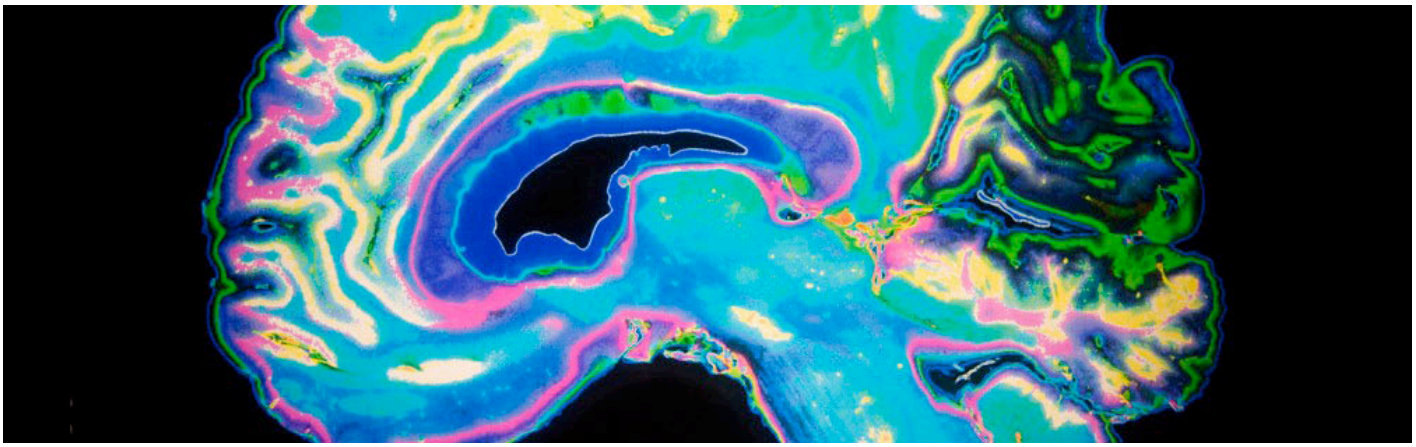
The precise chamber boundary conditions and corresponding resonant Fibonacci frequencies were determined by Nikola Tesla and remained one of the guarded secrets that he took with him to the grave. The concept of tri-frequency resonance and the critical importance of a specific ratio or proportion described by the Source had been missed by Brown, but was not lost on Tesla. Tesla's knowledge of the Fibonacci ratio of three acoustic frequencies required for the generation of nonlinear standing waves was obtained by experiment during his Colorado Springs research phase, before the turn of the century. *The simplicity of the Gravity Motor's double drum design hides a dimensional calibration to the Golden Ratio.*

ID number 4666 was assigned to the Cayce readings for Tesla given in development of the Gravity Motor, which would be substituted for the inventor's actual name throughout the series. This particular numeral designation was selected to express the possessive fixation of Satanic industrialist bankers in cryptic terms, effectively labeling Tesla's resonant HHO plasma motor: *"FOR THE DEVIL ONLY" –or 4-666.*

The closely related series of readings given for Thomas Brown during construction of the Gravity Motor were assigned the ID number 4665, instead of his original designation: 195. This series of readings records the details of Brown's prototyping of the Gravity Motor through multiple stages before the properly balanced interaction and relationship of the two steel drums achieved resonant operation.

Readings 4665-1 through 4665-13 for Brown describe Tesla's fuelless resonant motor: *a medium-sized, stationary cylindrical drum with a central axle around which rotates a smaller inner drum, eccentrically mounted and in Fibonacci proportion with the outer drum.* While the inner drum is completely sealed, the outer drum is drilled with large air intake holes which provide water vapor for ignition as HHO plasma by rotation of the motor. Sprangled electrical leads create a spark gap that discharges with each turn of the inner drum when passing complimentary electrodes of the stationary outer drum (Readings 4665-8,13):

> Now we have that in this motor as is seen in varied elements that are as octaves in music. There are forces or pitches above and below the scale, as are applied in the human voice. There are colors above and below the spectrum, as applied by man in a nominal manner. There are the same octaves of force seen or applied in the various elements as go to make up the forces as applicable to elements in any generative force... These, then, are only to be worked out along the channels and lines as has been designated in that given as applied to the mechanical arrangement of leads, drums, cams, carriers, balls, circles, and radiated elements. Work it out! ...
>
> So in its form, with the radial activity of octave force, as is seen in the curves as come about the radial center from which the active principle brings one lead in connection with the next, and in their turn about the *larger* radial center brings again that same active force in connection *with* the elements through which the active principle operates.
>
> Hence that as is given, when each radial center in cam, in leads, are in that same potential relative position *of*, the power *in* its activity is in accord with those latent forces as are seen and put in motion through the magnification of the... [syncopatic] forces, are brought into active principles. [See 195-54, Par. 16-A to 18-A.]



'Elements through which the active principle operates' is a cryptic reference to hydrogen in water vapor!
Despite the CIA's clever falsification of data concerning Cayce's readings for Tesla's Gravity Motor, the amazing consistency of health recommendations given through Cayce reveals a clear continuity between the series of readings designated 487 and 4666. Cayce prescribed an herbal inhalant and osteopathic treatments in prior readings given for Tesla in the 487 series that also appear in the 4666 series, the first of which was given by Cayce in Manhattan, New York on February 1, 1928 (Reading 4666-1):

> Conductor: Now you have before you the body of Nikola Tesla, present in this room. You will go over this body carefully, examine it thoroughly, and tell me the conditions you find at the present time, giving the cause of the existing conditions, also the treatment for the care and relief of this body. You will also answer such questions that I may ask you. You will speak distinctly, and at a normal rate of speech.

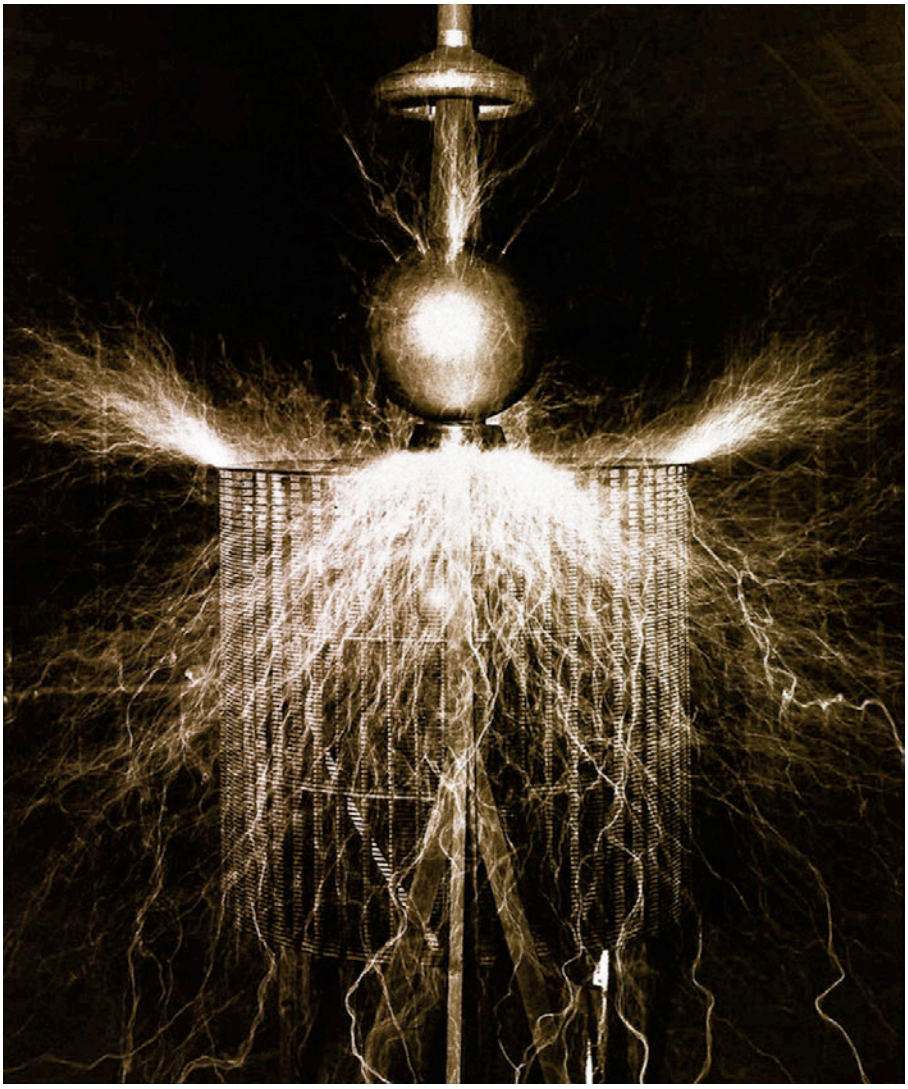
EC: Yes, we have the body of Nikola Tesla here –this we have had before. Now we find there are rather those conditions existent of which the body should be warned, and corrections made before these form such holds or such conditions in the physical forces of the body as to become detrimental to the best physical functioning of the body. First, it should be understood by the body that the psychic forces that manifest through the body may guide the body as respecting its own health with the body to concentrate on such conditions.

Now as to the physical conditions existent in this body. First, in the blood supply, there is found evidences of congestion of the nature that shows in the portions of the system the eliminations are not carried on properly, hence in such places as in the antrum and in the tissue of various portions of the bone in the head and neck there are evidences of the drosses being left there, and that unless these are absorbed or removed, these would in time bring detrimental forces for the best physical condition of the body.

In the nerve system. Here we find the greater cause of distress or the basic conditions that produce these conditions. In times back there was an injury or hurt to the body that in the upper dorsal region produces a lesion that has prevented the action through impulse of blood supply, hence with the addition of cold, congestion, these portions of system are hindered or kept from the impulse of perfect circulation and perfect elimination have gradually shown signs of drosses giving trouble to the body. Without the removal of these conditions then, these would of necessity bring distressing forces unless others are added or taken from to correct the condition.

In the functioning of the organs. Brain forces as given, good. The psychic forces of the body are above the ordinary, that meaning the intuitive elements of the soul forces with the elemental elements of the physical mind, and with the subjugation of the physical to the extent that the subconscious may radiate or become active, there may be brought to the consciousness of the individual entity that which may add materially and physically and mentally to the better development of the body. In the organs we find through the head, through the antrum, through the portions of the body about the auditory forces those signs of this congestion in the form of cold, congestion, and poor elimination.

In the throat, bronchials, and lungs, these organically very good.



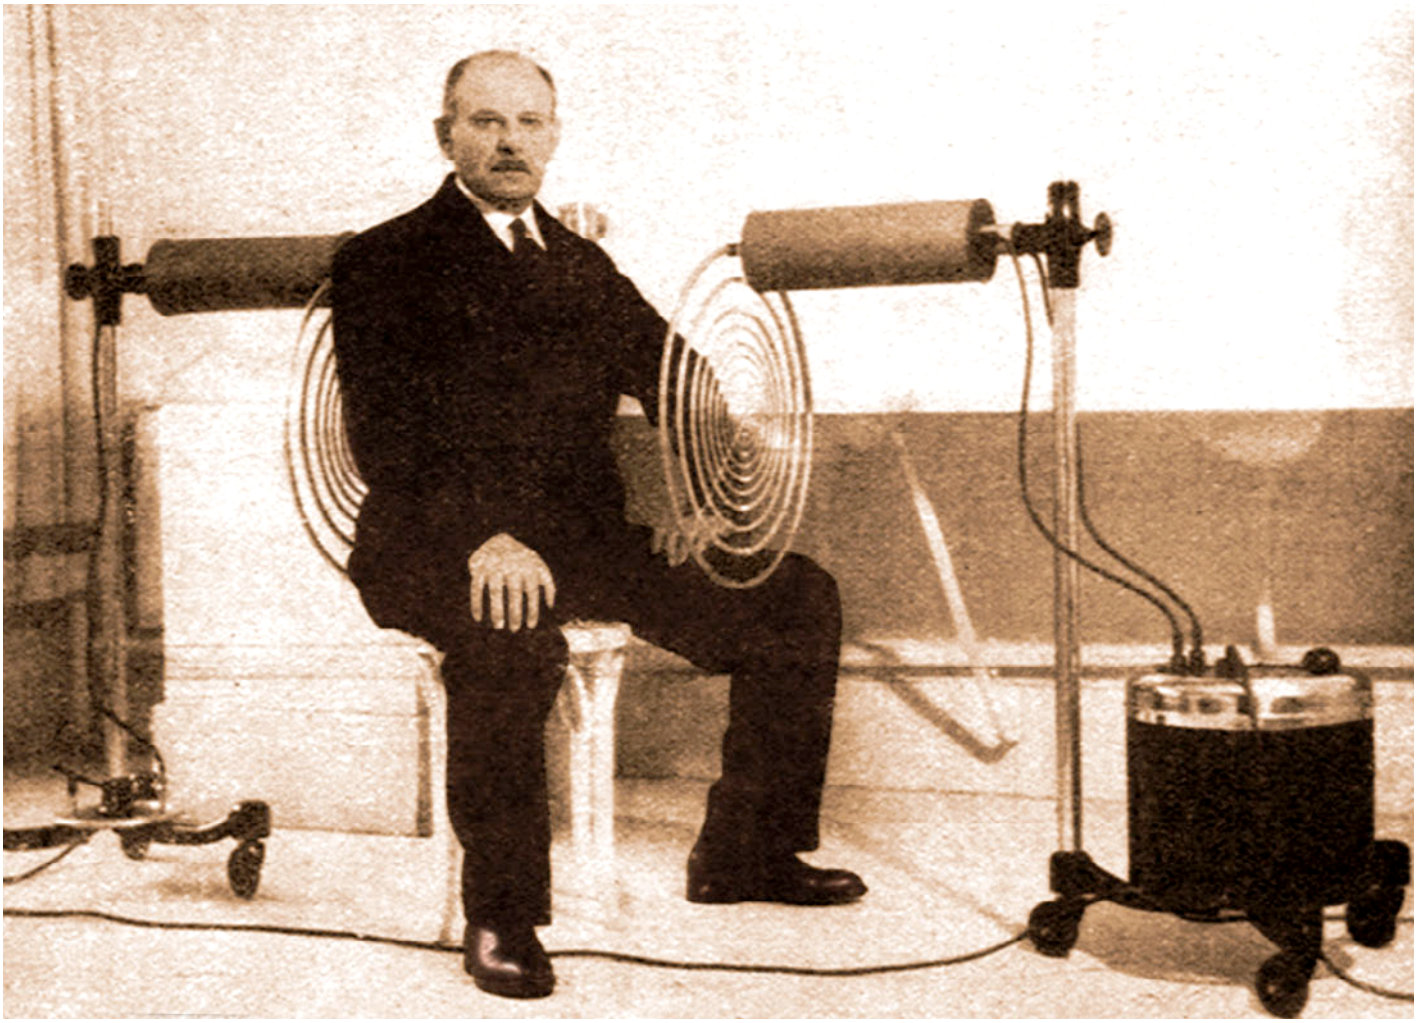
In the heart's action itself. Here we find evidences of the hindered circulation, not to the extent of organic conditions, but that which produces at times within the system that of the easily tired, of the overeffect of the forces produced by poisons being left in the body. Hence with the correction of these conditions in the cerebro-spinal system, with the proper circulation prepared or reorganized within the system, we will find these conditions will disappear throughout.

Digestion only affected sympathetically, as are the organs of the torso, or through the liver, kidneys, spleen and hepatic circulation.

To meet the needs then, we would through that of the manipulation given as the neuropathic, or through that of such means, bring to the body that proper circulation in the capillaries, and with the correction of subligations in the third and fourth dorsal region, we will find these would bring the near normal forces for this body. Do that...

Q: Have you any further information from [deceased former Governor of New York] DeWitt Clinton concerning my inventions, –speaking of this body? [See Reading 4665-9, par. 8-A, 10-A.]

A: Follow those as has been given, and obtain these from within self as has been shown here may be done...[6]



This 1928 health reading given for Nikola Tesla shows an identical set of physical ailments as described in the 487 series readings and yet again identifies the Gravity Motor's origin as connected with the spirit of the late former Governor of New York DeWitt Clinton (1769–1828). While there is no account of the circumstances surrounding Dr. Tesla's receipt of information that inspired the motor's invention, this quite likely occurred in the form of lucid dreaming, as the renowned inventor was living in the Governor Clinton Hotel at that time. *Tesla's association of the Gravity Motor with the spirit of DeWitt Clinton also explains why Tesla had stored a compact version of the Gravity Motor in a safe deposit box at the Governor Clinton Hotel in 1932.*[7] *The FBI had to buy the device from the hotel to settle Tesla's account!*

A psychic reading for Nikola Tesla regarding an inspired dream was given remotely by Edgar Cayce at his office, 115 West 35th Street, Virginia Beach on September 20, 1928, upon the request of Morton Blumenthal (Reading 4666-3):

> EC: Yes, we have the body, the enquiring mind, Nikola Tesla –this we have had before. Dreams and visions, as has been given, for this body, come in varied manners and are the correlation of experiences of the entity with those various cosmic forces, and the information comes respecting varied conditions as are in the [present] life...
>
> *Q: Any other information this entity cares to give?*
>
> A: That as has been given would be well for the body to consider well, for –as is seen and given– that upon which the entity allows self to become so attuned to as to receive those impressions or experiences of ones in the cosmic forces, so may the body-consciousness become aware of the application of that given. Keep, then, rather in that field in which the consciousness is attuned nominally.[8]

While the subject of this psychic reading pertained to the interpretation of Tesla's dream involving future stock market trends (not included here), additional information provided by the channel included an interesting recommendation for enhanced psychic reception. Through Cayce, the Source reminded Tesla to maintain himself within the enhanced electromagnetic fields produced by his inventions as a means of attuning his intuitive psychic reception of "impressions or experiences of ones in the cosmic forces."

After more than 3 years of reflection upon the transcript of his first Akashic Life Reading of 1925, Tesla understood Cayce's arcane yet precisely scientific language as describing the brainwave entrainment and ionization effects of his wireless transmission coils. The clear Sanskrit cosmology expressed throughout Cayce's trance sessions integrated seamlessly with the emergent truths of quantum physics, having provided Tesla with information regarding Atlantean high technologies that employed piezoelectric stone monuments for wireless power transmission as Tesla had replicated in Colorado Springs.

In much the same way as Edgar Cayce's trance abilities allowed access to the mnemonic field of Akasha, Tesla's advanced form of intuitive invention by meditative visualization was accomplished by accessing the Akashic Records. Cayce urged Tesla to meditate and retrieve scientific knowledge obtained during the course of previous lives for use in the present applications for power generation and transmission, global communication, electromagnetic healing and electro-acoustic levitation systems.

Tesla had been greatly inspired by the Sleeping Prophet's recapitulation of his previous life as Ajax the Atlantean scientific leader, and in particular by the advanced Vedic cosmology and profound scientific truths that he himself had verified in experiment. The accidental infrasonic levitation of heavy generators and sledge hammers in his lab in 1888 had occurred under the exact conditions specified by Cayce regarding the Atlantean harnessing of planetary resonance by constructing giant crystalline monuments.

Beneficial effects of the 33 frequencies of planetary resonance as focused upon the human body within the pyramid chambers of these massive calcite structures were effectively replicated by the Multiple Wave Oscillator of Georges Lakhovsky. The Russian inventor is seen receiving a bioelectrical treatment from his therapeutic device, which generates standing electrical waves between elements on either side of the body (above). Lakhovsky published impressive works on bioelectrification for health: '*Curing Cancer with Ultra-Radio Frequencies'* (1925) and *'The Secret Life: Electricity, Radiation and Your Body'* (1929).

Lakhovsky was murdered by a limousine driver in 1942, at the age of 72, which sent the strong message that he was killed by the rich American-Nazi banksters, *just 5 months before Tesla himself was also assassinated by the same consortium of Nazi industrialists.* Health issues in the final decades of Tesla's life focused his intellect on electro-acoustic therapy and taking simple naturopathic remedies prescribed by Cayce, consulting remotely from his Virginia Beach office, as on February 26, 1929 (Reading 4666-4):

Conductor: You will have before you the body of Nikola Tesla, [presently located in] New York. You will give conditions in the head, back, and left shoulder, since treatments as recommended by these forces twelve months ago, and you will answer the questions as I ask them.

EC: Yes, we have the body Nikola Tesla here. The physical conditions in the body are not so good as those when we had same here before. The continued reaction of those conditions as have been causing disturbance in the head, the neck, the shoulder –through the soft tissue behind the ear, through that of the antrum and of the soft portions of nostrils, all are in rather serious conditions. Some little bettered, or easy, but the causes have not as yet been reached. We would use these properties as an inhalant, prepared in this manner:

- Eucalyptus oil – $^1/_2$ oz
- Benzoin tincture – $^1/_4$ oz
- Rectified turp oil – $^1/_4$ oz
- Canadian balsam – 20 mns
- Rectified creosote – $^1/_4$ oz
- Tolu in solution – 2 oz

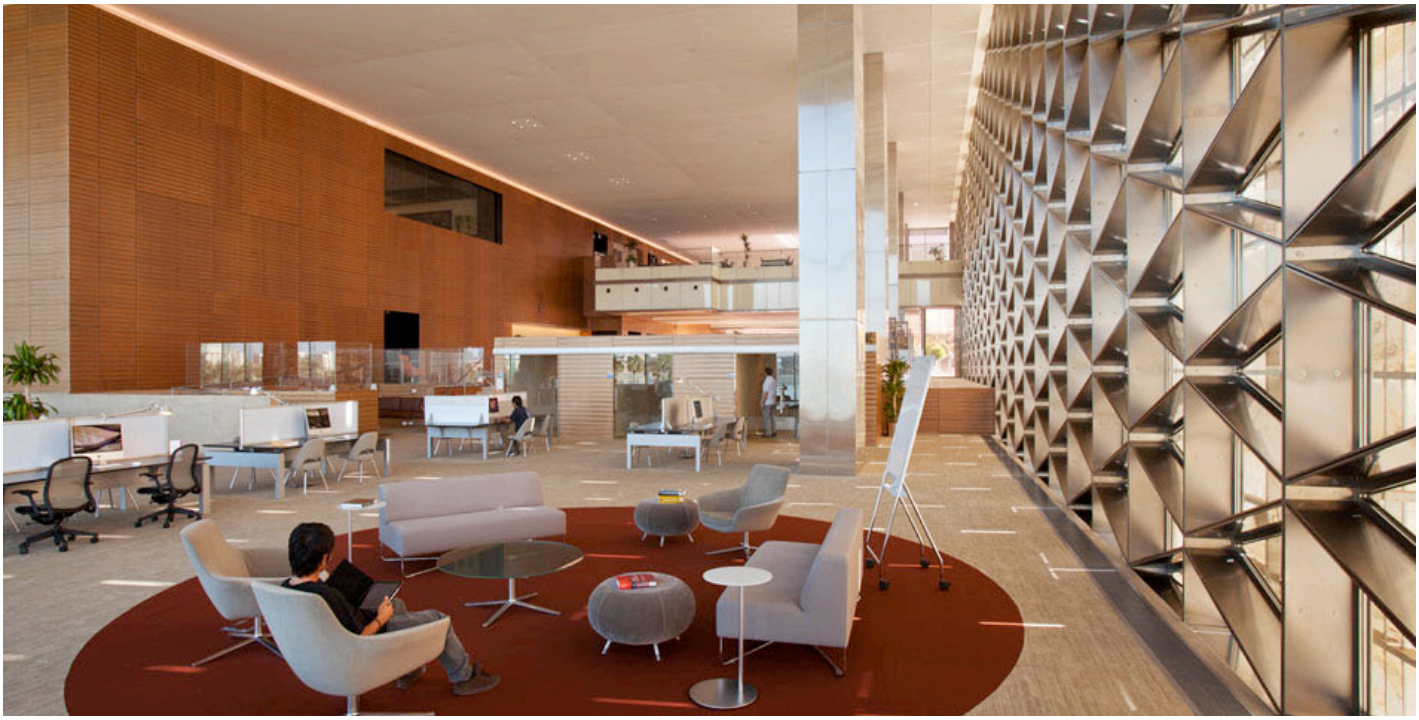
These may be all put together, if put in the order named. When used as an inhalant, in a granite container, pour a quart to half a gallon of boiling water –then place a teaspoonful of this solution in same and cover the head so that the body inhales deep into the lungs and through the nostrils, into the lungs these fumes as rise from same.

Make also a weak solution, or add half a teaspoonful Tincture of Iodine, half a teaspoonful aconite, half a teaspoonful Tincture laudanum, to two *tablespoonsful* of 85% alcohol, and paint the antrums and back of the ear and along the left shoulder where the reaction comes from the stress on the muscular tissue in the system attempting to adjust the conditions through eliminations, and give the body this as an *eliminant*: This in each dose, and take at least three doses, taking the dose in the evening, every *other* day, see?

- Podophyllum leaf – $^1/_4$ grain
- Rhubarb stalk – $^1/_2$ grain
- Senna leaf – $^1/_2$ grain
- Cascara sagrada – $^1/_4$ grain

Preferably take this [powdered herbal remedy] in [a] capsule. We would also keep the body out of the weather, keeping the feet –especially– warm, and well were the lower limbs and lower portion of the back rubbed of evenings –not necessarily *every* evening– but of evenings, with hot mustard water –and soak feet in same– would be well for the body... Do that and we will find in ten to twelve days the body back near to normal. After the activity of the eliminant through alimentary canal, well that the body exercise gently the *upper* portion of the body –arms and shoulders and waist. Do that. Ready for questions.

Q: What food would be best for the body?



A: Won't care for a great deal while this is being active, but preferably *alkaline* vegetables. Fruits and nuts are good, provided not too much of these –but more of the alkalin and of the salts, fruit salts producing.

Q: Is there any way to strengthen left shoulder and back?

A: Remove the trouble causing the conditions; and the exercises will strengthen the body. Do as we have given and we will bring the nearer normal conditions for this body of Nikola Tesla. We are through for the present.[9]

Tesla continued his series of psychic health readings with Cayce that prescribed the special diet that was adhered to throughout the inventor's elderly years, in addition to a therapeutic inhalant, regular exercise and osteopathic treatments. Bolstered by high expectations surrounding their experimental prototyping of Tesla's Gravity Motor, partners Blumenthal and Brown stated their bold business plan of March 7, 1929 to secure $10,000,000 in funding for the establishment of an advanced research institute to support physics education concerning the free energy device's resonant induction of universal forces (Reading 254-48):

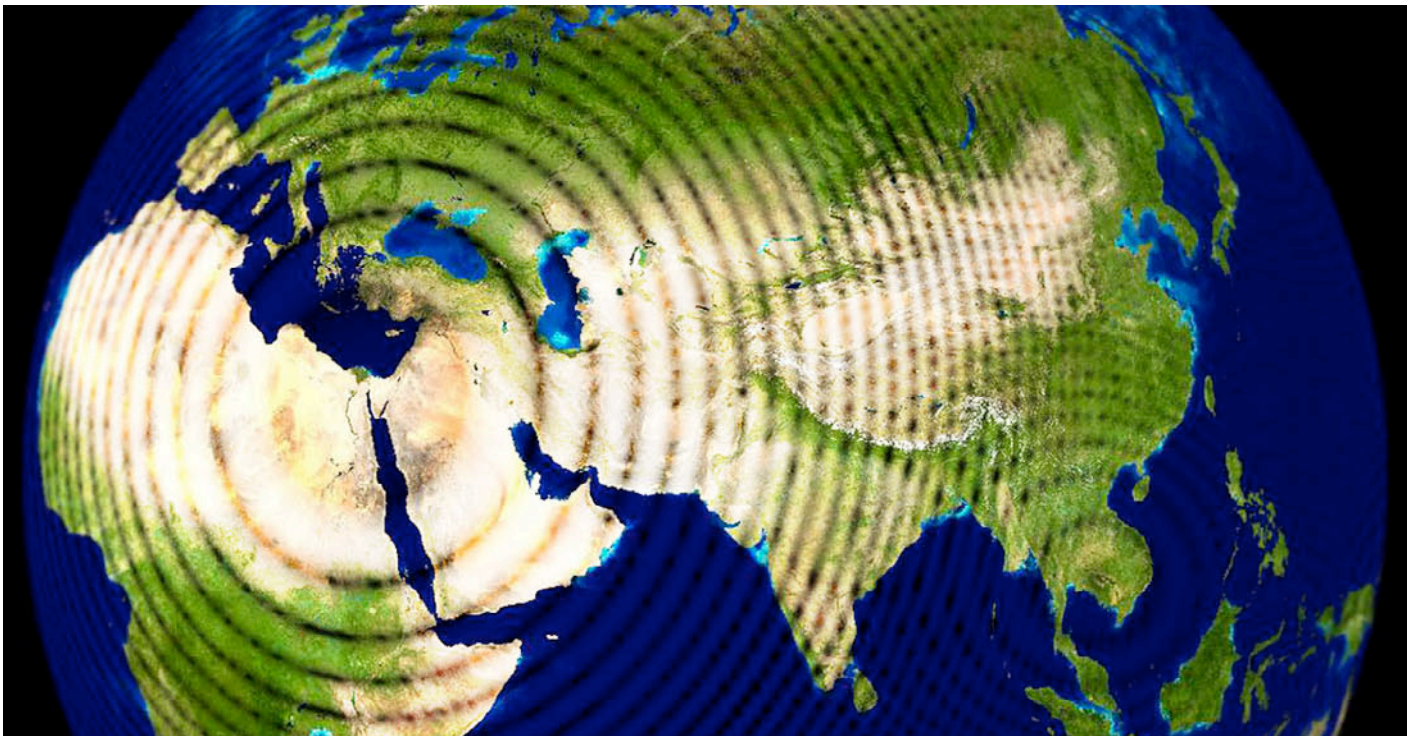
Q: Regarding the plans discussed by Thomas Brown and Morton Blumenthal for the establishment of a college at Virginia Beach, are these realizable?

A: Realizable, plausible, feasible –and not *only* this. These may, through their fullness of purport, gain for themselves and millions of others such a center, such an institution. The Association of Learning, in the field that would bring the more perfect understanding for self and for others.

Q: Are we not right in formulating plans first to appropriate ten million dollars, to be obtained from the machine, for the university, and secondly to make the university a university in every sense of the word?*

* [The "machine" referred to is the Tesla Motor; see series of readings for Thomas Townsend Brown on experiments with a perpetual motion machine which Mr. Blumenthal and Mr. Brown were financing with the inventor Nikola Tesla. Subsequent to 254-48 see further information on the machine in 195-57, -59 and -69.]

A: Absolutely correct! and would be maintained through the very phases of the *phenomena* as would bring, and will bring about, the more perfect understanding *of* the universality of force through the very channels that would bring the *material* means for such an undertaking.



Q: When should we just begin to–

A: At once in mind, for Mind is ever the Builder –and as these are builded in the mental forces of the individual there is added to same the abilities of all the *cosmic* forces as would see such an undertaking realized; which has been the *dream* of all –and had any of the teachers established such, how vast the difference in the world's map! [10]

A great enthusiasm for the educational possibilities surrounding the Tesla Gravity Motor fill the channel's words. Cayce's statement that the formation of an Association of Learning for study of free energy devices "has been the *dream* of all" and would create a "vast difference in the world map" implies that national boundaries dividing the world would be completely resolved by this new means of spaceflight propulsion (opposite). *Nazi opposition to the establishment of the Association of Learning is now becoming evident.*

The great confidence that surrounded the information flowing from the Source through Edgar Cayce was not reflected equally among the small group that sought to profit by the unique Tesla-Cayce collaboration. During a reading given on May 25, 1929, Tesla expressed general concern over the security of the gravity motor itself and the reliability of the business partnership that had been formed between himself, Thomas Townsend Brown, Edgar Cayce, Edwin Blumenthal and Morton Blumenthal (Reading 4666-5):

> *Q: Is the work in relation to the motor being properly guarded?*
>
> A: Being properly guarded by those in and out. Then don't worry himself over it, see? ...

> *Q: Is the motor as now being built by Thomas Townsend Brown and Nikola Tesla one that will function within the coming weeks?* A: Will function...
>
> *Q: Is there any more advice that, either as regarding the machine and its construction or other relationships, you would give the four bodies connected with Nikola Tesla and the motor?*
>
> A: Follow in those lines and those channels as has been given as respecting the usage, the application of the forces that are becoming as knowledge to a world through the efforts of *all* concerned. In the giving, then, let understanding be given with the application of that obtained or received from same in its *every* phase, else destructive forces may be created in the same way and manner as those that are turned into channels for the good of man. We are through.[11]

This strong warning given to Tesla by the Sleeping Prophet could not have been more clear. Obviously, this partnership failed to even patent the Tesla Gravity Motor, for indeed, *destructive forces have been created from the channels established by Nikola Tesla and Edgar Cayce for use toward the good of humanity. Over 80 years has elapsed since the Tesla Gravity Motor was completed until the present publication and online exposition of its simple design and operation,* coherently identifying what Cayce referred to as the "application of the forces that are becoming as knowledge to the world."

Cayce's Life Readings for Tesla detailed his previous Atlantean life as a scientific leader of Poseid named Ajax of Ode, who "gave to that people the manner of use of the universal forces as may be applied in the way of mechanical construction in a physical plane" (Reading 487-4). Cayce emphasized "that humanity may benefit from the mechanical sense of this entity", which also forms the impetus behind the present work of revealing a new world map of infrasound resonance (above), as identified by the Source.

The control system of the industrialist bankers relied upon placing young agents close to Tesla that would offer every kind of support for the inventor, as the Scherfs had done in prior years of espionage activity. Thomas Townsend Brown was selected as a young Naval Intelligence Officer with technical training in electrical and mechanical engineering, photographed at 16-years-old aboard the USS Viking in 1921 (at left). According to the Navy,[12] the Viking was named the USS Flamingo from 1918-22, yet clear photographic evidence shows Thomas Townsend Brown training onboard the USS Viking, as plainly visible on the ship's life preservers. Retroactive renaming of this vessel by the ONI appears to have been done as part of larger cover-up efforts that 'cleansed' information traces linking T. Townsend Brown with Nikola Tesla altogether.

The same is true regarding an extensive series of highly significant psychic readings given for Thomas Brown by Edgar Cayce over a period of two decades, *which have not been previously recognized.* After Cayce's death in 1945, Thomas Townsend Brown ceased his successful corporate espionage activities to commence full-time work for the Naval Research Laboratories involving the concerted cover-up of the Tesla Gravity Motor and the secret completion of its design and application to antigravitic propulsion and HHO plasma-cloaking systems for stealth discs, bombers, fighters and surveillance drones.

As a crucial aspect of the Nazi/CIA cover-up of the Tesla Gravity Motor, Cayce's records were falsified many decades ago –*with names, ages and locations having been altered*– to contain the information despite the groundswell of public interest in the Edgar Cayce material concerning the 'New Age'. These efforts have expanded in the online muckraking systems of net radio talkshows and blogs that aim to confuse the general public while continuing their endangerment using outdated jet/rocket technologies.

Government disinformation author Sidney Kirkpatrick just recently published a reinforcing cover story that absurdly claims that Cayce's Gravity Motor readings were conducted for a neuropathic doctor named Marion Stansell of Birmingham, Alabama (Reading 1940-1), *who allegedly never got the motor to work!* The entire premise of such silly cover stories begs the obvious question: Why should erroneous psychic readings concerning a dud tank motor design for a failure of an inventor from over 80 years ago be worthy of multiple book titles and hours of widely promoted net radio interviews and discussions today?

Dr. Stansell was apparently selected for substitution by CIA authors to hide Tesla's psychic readings *because the Gravity Motor functions effectively and constitutes the greatest invention of modern human ingenuity.* The thin veil of false history obscuring the light of truth has fallen in the present Information Age.

Another fact that remains completely unknown to the public that explains such strange mass media behavior around the subject of the Gravity Motor involves highly sensitive connections with secret transdimensional experiments conducted by the US Navy in 1941 under the direction of Nikola Tesla. Called 'Operation Rainbow Project' in reference to the multi-color emission of the HHO plasma 'invisibility cloak', these experiments involved the application of three of Tesla's Gravity Motors in series at the Philadelphia Naval Yard in an attempt to cloak the entire USS Eldridge.[13]

Tesla was horrified to witness his equipment being misused to cause the torturous death of many of the crewmembers onboard the Eldridge, and refused to cooperate with the Navy after several further requests to replicate the first experiment. In fact, Tesla willfully terminated the second Eldridge experiment after refusing to participate and still seeking to recover his motors before they could be used to take more innocent lives. The US Navy have since been closely involved in the cover-up activities surrounding the Cayce Gravity Motor readings due to their direct connection with what is cryptically called 'The Philadelphia Experiment'.

Many newly published novels and highly publicized television and radio appearances by a wide variety of disinformation authors have been employed to buoy the rising interest in the real life of Nikola Tesla and his central involvement in the secret development of transdimensional HHO plasma technologies. The lame cover story told by Kirkpatrick was given special coverage on (former Navy Lieutenant, currently a counterintelligence officer) George Noory's *Coast2Coast* radio program[14] to reinforce the leaky cover-up efforts concerning Tesla's later work and the US Navy theft of Tesla's invisibility-cloaking technology.

The 'top secret' history of what became of the Tesla Gravity Motor has been wholly kept from the public until this writing, yet remains the most important technological breakthrough of Earthly humanity and the birth of a new civilization on this planet. In retrospect, it is becoming evident that the escalating tragedies of the twentieth century, especially the stock market crash that directly followed the invention of the Gravity Motor, were purposefully orchestrated in a covert war against all of humanity, to desperately prevent the advancement of technological capabilities embodied by the resonant HHO plasma motor.

Strategic Nazi planning of World War II in the US and Germany required a decade of secret engineering of technologies stolen from Nikola Tesla by agent Thomas Townsend Brown, in concert with a broad disinformation campaign against the elderly inventor using every media outlet. Nazi scientists successfully replicated the resonant motor by trial and error, as had T.T. Brown under the trance recommendations of Cayce, without full knowledge of the dimensional relationships required for resonant operation. *Only Tesla possessed this advanced 'knowledge of conditions' that Cayce subtly referred to in several readings.*

Edgar Cayce described the Gravity Motor's resonant operation as the action of 'varied elements that are as octaves of music' –*forming a multi-frequency resonance*. The mention of 'varied elements' describes not only the motor's drum elements, but also the *atomic elements* comprising the resonator itself. While the first prototypes of the Gravity Motor were fabricated using commercially available steel parts, Cayce gave information on superalloys for acoustic levitation that were developed by Atlantean scientists over 12,000 years ago that formed a large part of the technological experiences of previous lifetimes. Details were given during a Life Reading for Thomas Townsend Brown on July 5, 1938 (Reading 470-22):

Yes, we have the records of that entity called Thomas Townsend Brown, and that which has been given through these channels respecting the activities of the entity; especially in relationship to the influences or the use of the forces of electricity –as called. In giving that from the records as we find here, there were two –yea, three experiences of the entity in which these forces or influences were used by the entity in ways that made for a great contribution to the affairs of individuals or humanity in those experiences.

Something then of the background of these is necessary to be reviewed, if there is to be made or used by the entity in the present a practical application of these urges that are latent and may be manifested in the experience. When in the Atlantean land, there were those making for that change that was for the preservation of the peoples; and the entity –with others– migrated to what is known as the Peruvian, or later known as the Incal land.

There we find the application of the electrical forces and influences was especially in the association and the activities of same upon metals; not only as to their location but as to the manner of the activity of same as related to the refining of some, and the discovery of others, and the use of the various forms or transportation of same – or transformation of same to and through those influences in the experience.

We find the entity there made use of the metal known as iron, or the combinations of iron and copper –which have long since been removed from use in the present; or copper so tempered by the use of same with a little of the iron, or in its formation in such a way and manner as to be hardened to the abilities for same to be used much in the way that many of those combinations have been found in the Egyptian, the Peruvian and portions of the Chaldean lands –and more will be found in the Indo-China city yet to be uncovered.

All of these arose from the applications of same that were a part of the activity of the entity then, now called Thomas Townsend Brown. In the activities the application of these was in a little different order, of course, from that in the present. For the characters of the dynamo or the generators for same were used in a way and manner in which there was the transformation of the direct to the activities for using same much in the same manner (the entity will understand, in the study of same) in which gases are now used as a means for propelling force or influence to act as a pump for the transformation of casing-head gas to gasoline, and the refuse used to produce or make the power for the machine producing same.

That is, from the direct current passing through the activity of the fusing of metals and the transmutation that forms from same, and the active forces as turned into that in which it makes for the clearing of the refuse forces of the ore in such a manner that the very fuse itself becomes the source of an alternating current to which there is added then a stepped-up activity in which the direct current then becomes the source of the energy to produce this fusing of the metals or ores.

Again we find in the activities of same the entity made a return to the Egyptian land, when the entity made preparations for a part of the... defense; as the armorbearer or the protector for the activities of the king. All of these activities then became a part of the use of electrical forces for metals and their activity upon same to be used as carbonizing them, or directing them in manners in which they became as magnetic forces for the application to portions of the body for transmuting or changing the *effect* of activities upon the physical energies and forces of the body; able to use same as re-ionizing or regenerating the bodily forces themselves.

For as the very forces of the bodily functionings are electrical in their activity, the very action of assimilation and distribution of assimilated forces is in the physical body an active force of the very *low [frequency]* yet very *high [energy]* vibratory forces themselves. Hence there the entity made applications in those directions; and these act upon the influences or forces or metals, or active principles within the human forces themselves.

For within the human body –living, not dead– *living* human forces, we find every element, every gas, every mineral, every influence that is outside of the organism itself. For indeed it is one with the whole. For it is not only a portion of, and equal to, and able to overcome or meet every influence within, but there is not the ability in the third dimensional force or influence to even imagine anything that isn't a part of the activity of a physical *living* organism!

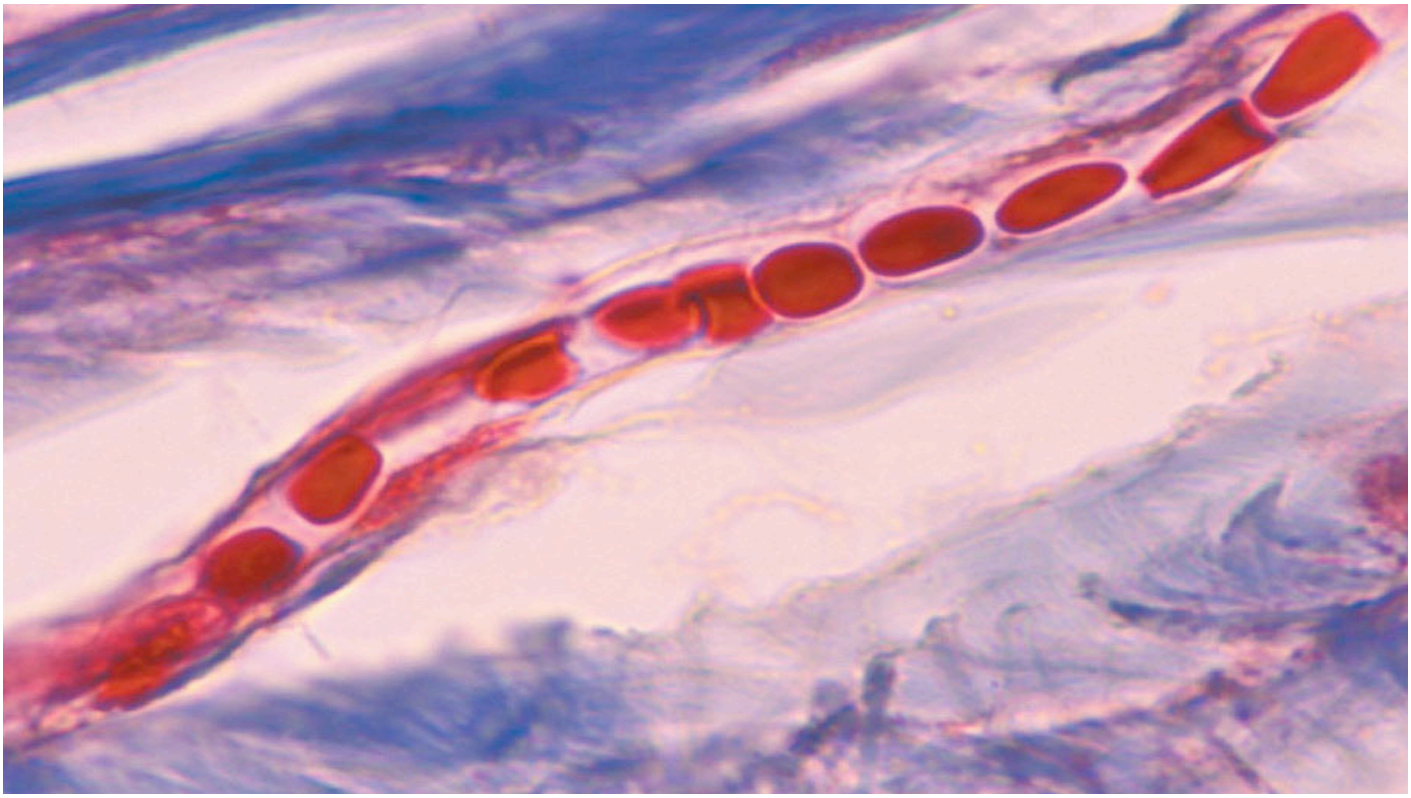
Hence the use of these was a portion of the entity's experience, when there was the preparation for the cleansing and the transmuting of the bodies in the preparations for the new race. Just so the entity in itself, in study, in listening to the influences within, conceives of and sees these changes that are possible. Why not? He helped to make them in those experiences, through those activities! Ready for questions.

Q: Please give the name of a book or books which will explain the ionic theory.

A: As just indicated, those from which there may be gained another concept of gas and its activity [when ionized as plasma (below)]. Through those same channels or sources may we find the greater theories, and the active forces, of electronics upon metals, or the ionics, or the activities of iron with the influences or forces themselves... But the real *findings* may come within, see? within self!

Q: Where should I seek information on electrical currents, direct and alternating?

A: As we find, any of those who have studied with or in the General Electric, or those who have studied the combinations of same with or through the same channels as indicated - about the activities of same upon iron.



Of course, the partner with the entity –who is now called [Henry] Ford– will be the one through whom and to whom these will become the most interesting, and where there may be channels through which much may come; as in the mines in portions of Kentucky where there is the coal activity and portions of iron and manganese - which is a portion, or the fusion of same in the use of these - all become a part of the activity. These will be the channels and the sources and the places through which much of this will eventually come, if the entity is active in making a further study of these –and the application to the use of metals and irons especially.

Q: With reference to information given through this channel in previous reading on smelting of ores, will it be possible to use a low voltage direct current with a high potential without changing it to an alternating current?

A: It will be found that it is possible, plausible and will work –through this current passing, as there is begun the smelting or the changing of the ore itself by its combination with the heats and other elements that become a part of its transmutation from ore and its drosses to a metal with the ability for its working –as iron and copper, and especially those two together. These we see form and make for the ability for activity. While there are two different principles in their combinations and use with the electrical forces, we will find these will come back together...

Q: [What was my previous association] with Nikola Tesla [during his Atlantean incarnation as] Ajax (Ax-Tell)?

A: Closely associated in those periods when the entity, Ajax, came into the Egyptian land. Those activities made for closer associations, for then Ajax –or Tesla– and the entity now called Thomas Townsend Brown made the application or use of the abilities in engineering, and the building of machines for the application of these to the bodies of individuals –where there were appurtenances to be left off, where there was blood to be changed, or where the vibratory forces were to be set so as to remove those influences of possessions; and where there were those activities in which with the combinations of sodas the bodily forces were enabled to reproduce in a manner as cross to that to which it had been set in its natural forces...[15]

While Brown was unable to grasp the channel's explanation, Atlantean knowledge of atomic reactions involving blood metals and gases facilitated qi healing processes which re-ionize the body's qi meridians. Explicit instructions for experimental procedures relating to advanced Atlantean electro-surgical and electro-smelting technologies were provided by Cayce in a subsequent reading for Thomas T. Brown, given on June 24, 1941, remote viewing a previous life as Asphar, working in Egypt (Reading 470-33):

> During that era when the second or young king was put in authority... the entity then was among those who had come from the Persian or Caucasian land, being an armorbearer or a personal bodyguard to the king... During the period of the priest's exile, there came into Egypt those of the Atlantean land –among them Ax-Tell– who became close to the entity –then the entity being in the name Asphar.
>
> Being interested in every form of activity that might bring better conditions for individuals or groups, the entity was interested in those tales or experiences told by Ax-Tell; and sought demonstrations and experimentations with those influences which had been a part of the experiences of the Atlanteans that brought about destructive influences...
>
> But during that period a great deal of the time of Asphar and Ajax-ol was devoted to the use of the electrical forces maintained from the use of static forces, as called today. And in their attempts to demonstrate or use these influences for a helpfulness rather than as they had been used on nature or individuals, or those activities of a destructive nature, these were turned to minerals. Thus the conditions in which there were the abilities for the fusion of copper and brass with the alloy that comes from gold impregnated with arsenic, with the casting of electrical forces through same. This brought those abilities of sharpening or using such metals as these for cutting instruments.
>
> Also there were those activities and abilities of the entity to use the electrical devices as prepared through those periods of their investigation, for operative measures; wherein the electrical knife was in such a shape with the use of the metals, as to be used as the means for bloodless surgery, as would be termed today –by the very staying forces used which formed coagulating forces in bodies where larger arteries or veins were being entered or cut...
>
> In making practical applications of those forces in the present, then –it will necessarily be through experimentation, of passing the powerful currents of electrical forces through the ores, the metals and those combinations of same in which there may be seen the uses of metals in forms as indicated –that were *only* used through the experience and the experimentation of the entity as helpful forces during the reconstruction period in Egypt.

The entity then grew to become one who prompted the great development along those lines, yet sought in a manner to preserve to self the purely technical manner in which those operations were cast. Thus much of that ability was lost after that period, and after the passing of those who labored and worked with the entity...

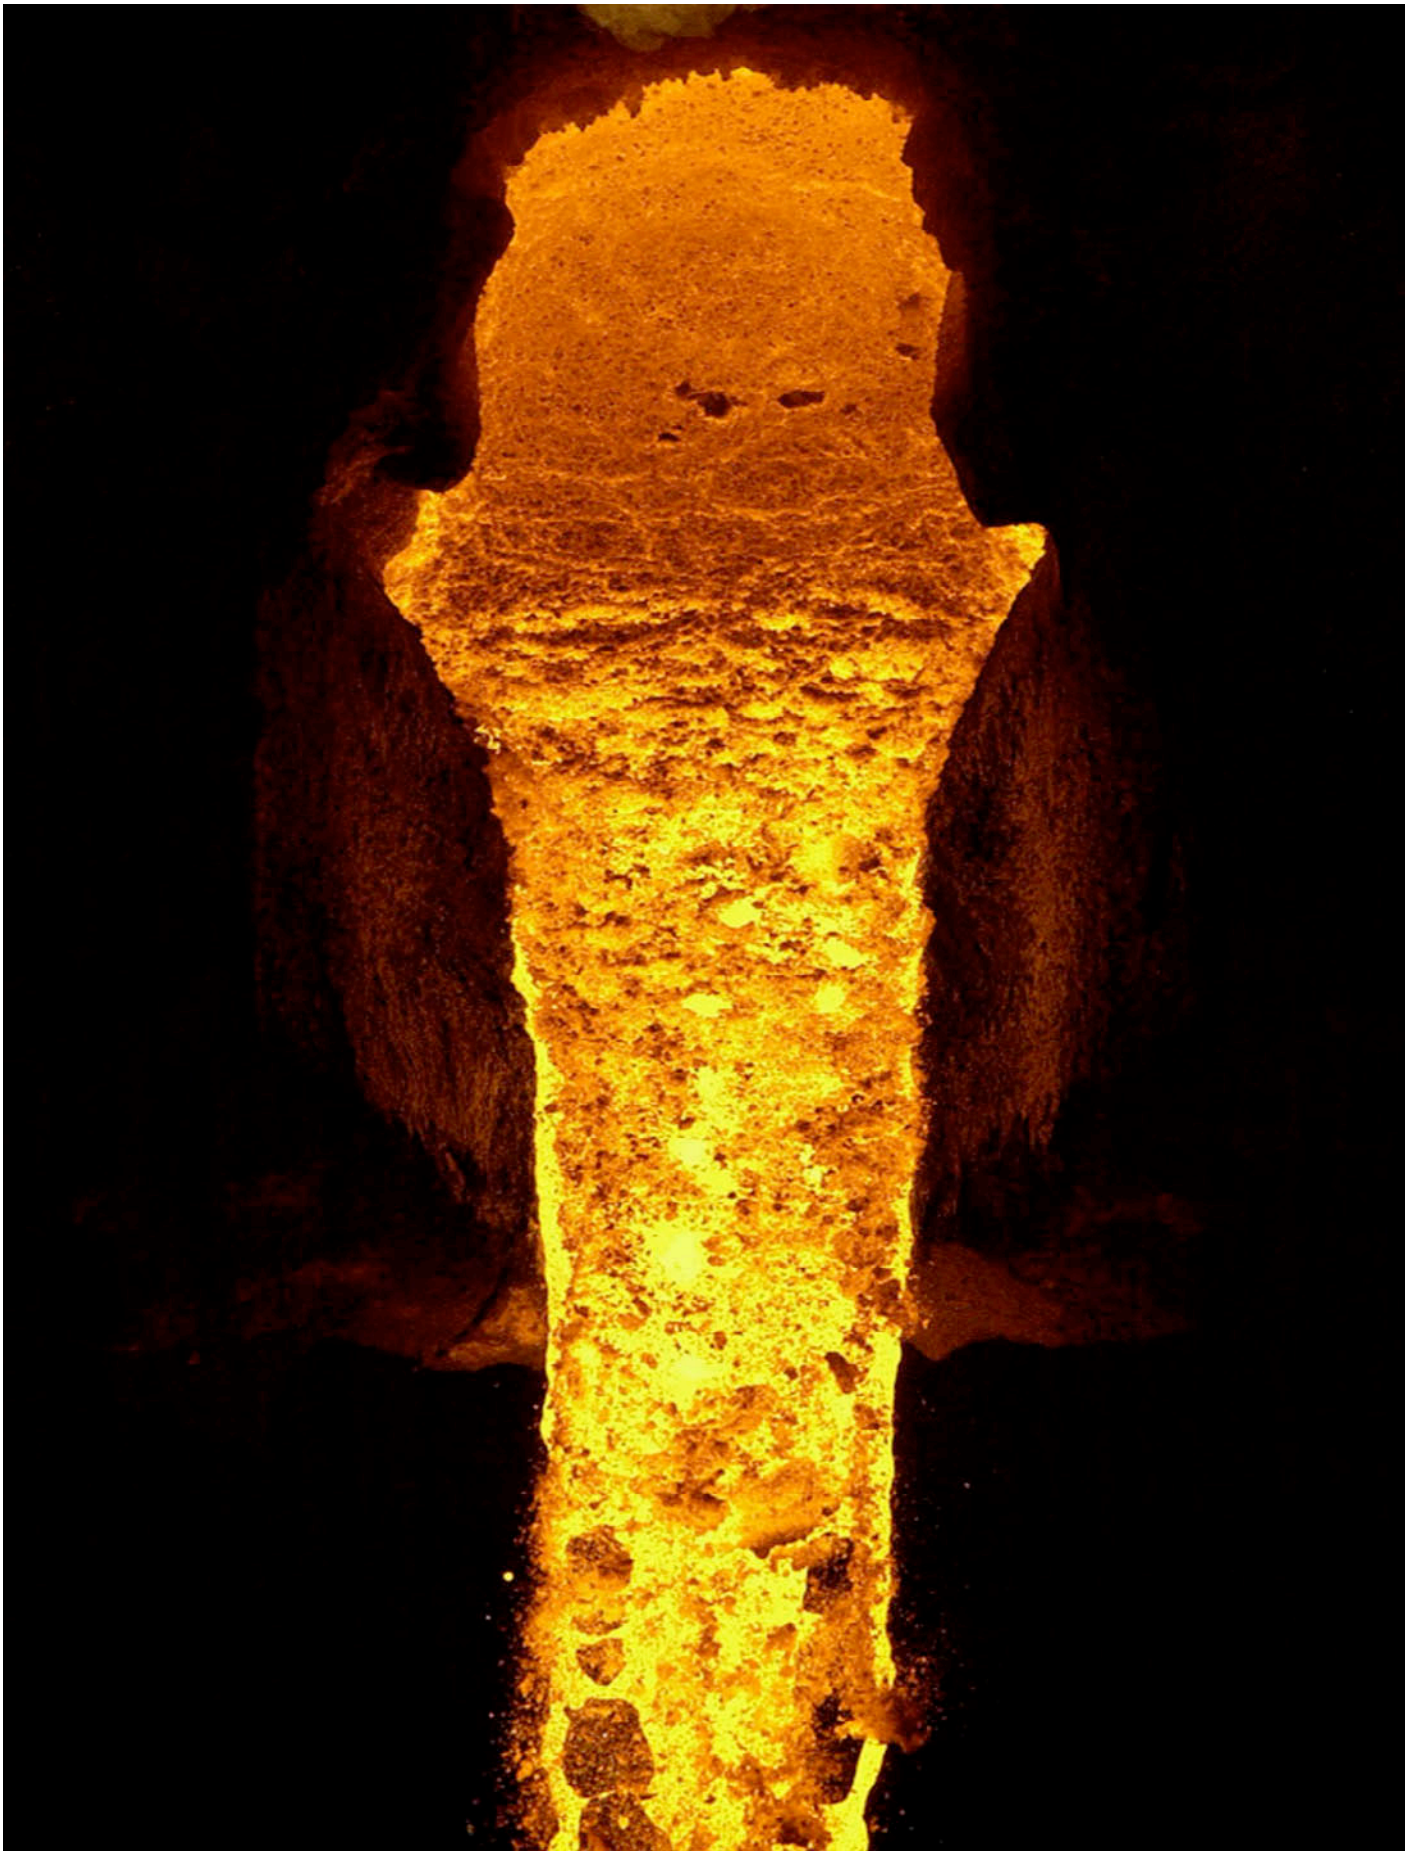
Q: Concerning the work in Egypt with electrical forces, explain just how I should apply those talents now.

A: As indicated. In conducting experimentations, by passing a great current through certain compounds or mixtures of metals, that would produce –in smelting– a different metal. The combinations of iron, copper, and of course impregnated with the various forms, which heretofore and in the present have been unable to be used in the forms of smelting that are the experience of man today.

Q: Describe in detail the construction or purpose of the more important machines used by me then.

A: As indicated, the machine in which there was the combining of metals in those periods of fusing or smelting –that combined them in such ways that they might be used in forms not used today. Especially the use of electrical forces with the character of instruments in operations, as well as the fusion of such metals indicated.

Q: What specific experimental work should be done now that would lead to an awakening of that ability manifested in the Egyptian period?



A: The combining of the metals in their crude state by the passing of [electrical] current in the various forms through same, during the period of smelting same, see?

Q: Was Ajax, with whom I was closely associated in engineering, the same as Ax-Tell? Please explain the reference to him as Ajax in my reading, and as Ax-Tell in other readings. [GD's note: Now Mr. Tesla.]

A: Called Ajax in the Atlantean land, being *of* the Atlanteans, and Ax-Tell in the Egyptian activity. One and the same. Ajax-ol was a different individual, see? [GD's note: Now incarnated as Mr. Henry Ford.]

Q: How may we work together now to accomplish much that we did in Egypt?

A: In interesting those who use or require great quantities of iron, or the varied metals, to experiment in making lighter –and yet strengthening– the usages of such metals. Copper and brass, gold and iron –through the combinations in their crude state– may be made to be much stronger in usage, lighter in the needs for present developments, and not as expensive in the combinations.

Q: Will Henry Ford [–the present incarnation of Ajax-ol–] be greatly interested?

A: This, to be sure, depends upon the manner in which the interests of this entity are presented to that body. But Henry Ford was one who first interested this entity in these activities, see?

Q: In just what manner should he be approached now?

A: Through the regular channels. Do not attempt to force the issue.[16]

Speaking through Cayce in trance, the Source provided specific references to several fusion reactions used in Atlantean metallurgy for the production of superhard metal alloys that were applied in the complex multi-stage fabrication of supersharp swords and electro-surgical scalpels, as well as in the construction of aerial vehicles that were thinner, lighter and stronger than those commonly used in industry today.

In the first Life Reading for Nikola Tesla (487-4), the Sleeping Prophet had emphasized the importance of "mathematical precision in each element" on the periodic table that Atlantean foundry technicians had applied. Such precise and enigmatic information on the atomic fusion of metals –*given in such simple terms and yet clearly misunderstood so many decades ago*– only now reveals itself in the greater quantitative context encompassed by the emergent atomic physics principles of phonon resonance:

> Dimensional phonon resonance occurs when the space occupied by one isotope is *exactly the same as that of another isotope in its rest state* [i.e. 20°C]. This event can only occur under the following two conditions: the expansion of an isotope by heating, or the contraction of an isotope by cooling. Due to the natural characteristics of elemental properties, this event is extremely rare and one can only force the event under select conditions. To determine the phonon resonance of an isotope, it is necessary to apply the following formula:[17]

$$\text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{d \times Na}{m}}$$

d - density in g/cm³
Na - Avogadro's Constant
m - atomic mass

$$\text{Resonant Temperature (°C)} = \frac{Ln\left(\frac{f\,(starting)}{f\,(target)}\right)}{Ec} + St$$

f - frequency in Hz
Ln - natural logarithm
Ec - expansion coefficient
St - standardized temp in °C

Mathematical precision in the calculation of phonon resonance dynamics underpinning the perpetual recombination of atomic masses observed throughout nature is only now becoming available to physicists. The identification of resonance patterns within the phonon architecture of the mosaic of material elements enables the decontamination of radioactive isotopes from our skies and our oceans, and the development of resonant alloys for gravity control applications. Atomic blending of copper and iron is effectively achieved through transmutation processes involving the resonant nuclear fission of copper atoms to form stable iron atoms, releasing helium and hydrogen atoms as reaction biproducts:

$$Cu \Rightarrow Fe + He + 3\,H$$

The efficiency of this fission reaction is limited by the availability of interstitial spaces within the copper atomic lattice, thus allowing increased conversion rates when drawing a vacuum in the reactor during operation. Copper isotope Cu^{63} achieves dimensional phonon resonance with iron isotope Fe^{56} at rest (20°C) when heated to 262.0°C, where frequency matching occurs at precisely 43,902,601 Hz:

$$Cu^{63}\ \text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{8.95 \times (6.0221 \times 10^{23})}{62.92960}} = 44{,}079{,}705\ \text{Hz}$$

$$Fe^{56}\ \text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{7.8597 \times (6.0221 \times 10^{23})}{55.93494}} = 43{,}902{,}601\ \text{Hz}$$

$$\text{Resonant Temperature (°C)} = \frac{Ln\left(\frac{f(44{,}079{,}705)}{f(43{,}902{,}601)}\right)}{0.0000167} + 20 = 262.0°C$$

Starting Element: Copper ($_{29}Cu^{63}$)
Natural Abundance: 69%
Atomic Mass: 62.92960
Density (grams/cm^3): 8.95
Exp. Coefficient: 0.0000167

Target Element: Iron ($_{26}Fe^{56}$)
Natural Abundance: 91.72%
Atomic Mass: 55.93494
Density (grams/cm^3): 7.8597
Exp. Coefficient: 0.0000120

The architecture of dimensional resonance relationships presented by the stable isotopes of copper and iron allow several other frequency matching possibilities. The heavier stable copper isotope matches the atomic diameter of the heaviest stable iron isotope at another temperature threshold that is relatively low for furnace processes. Copper isotope Cu^{65} achieves phonon resonance with iron isotope Fe^{58} at rest (20°C) when heated to 339.5°C, where frequency matching occurs at precisely 43,391,894 Hz:

$$Cu^{65}\ \text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{8.95 \times (6.0221 \times 10^{23})}{64.92779}} = 43{,}622{,}792\ \text{Hz}$$

$$Fe^{58}\ \text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{7.8597 \times (6.0221 \times 10^{23})}{57.93328}} = 43{,}391{,}894\ \text{Hz}$$

$$\text{Resonant Temperature (°C)} = \frac{Ln\left(\frac{f(43{,}622{,}792)}{f(43{,}391{,}894)}\right)}{0.0000167} + 20 = 339.5°C$$

Starting Element: Copper ($_{29}Cu^{65}$)
Natural Abundance: 30.83%
Atomic Mass: 64.92779
Density (grams/cm^3): 8.95
Exp. Coefficient: 0.0000167

Target Element: Iron ($_{26}Fe^{58}$)
Natural Abundance: 0.28%
Atomic Mass: 57.93328
Density (grams/cm^3): 7.8597
Exp. Coefficient: 0.0000120

Copper may be reprocessed multiple times through the same phonon reactor to increase the content of iron atoms within the copper lattice by resonant conversion, until the metals are atomically co-mingled (or 'nano-mixed') in roughly equal parts. The result is a resonant metal alloy that displays the unusual combination of physical properties that characterize superalloys, as the electrical properties of copper are equally combined with the magnetic properties of iron throughout the composite metal alloy.

This simple resonant atomic recombination process allows rapid production of Cu-Fe superalloys that have only been accomplished previously through expensive and time-consuming *mechanical alloying processes* (Suryanarayana, 2001),[18] where milling, nanomixing, compressing and sintering of several powdered metals is now used to produce high-heat turbine blades and aerospace components. The advanced developments of phonon resonance transmutation now enable much simpler production techniques for achieving *a new class of superalloy containing traces of every metallic element.*

Superalloys of this finest class exhibit superhardness, supermagnetism and superconductivity –*properties specifically required for antigravitic propulsion systems and interstellar spacetravel.* The recent history of the reintroduction of these advanced phonon resonance concepts in modern times can be traced back to the secret work of Nikola Tesla and Edgar Cayce, in the years intervening the World Wars (1918–1939).

Tesla's discovery of the rotating magnetic field in 1882 and his subsequent invention of the electro-magnetic induction motor in 1888 were superceded by the advanced *transdimensional* work of Tesla's later years. Tesla's finest achievements were made during secret experimental work with HHO plasma and free energy or 'resonant field motors' for automobiles, aircraft and spacecraft. Having been hidden from the world by concerted Nazi/CIA cover-up, *Tesla's invention of the 'gasless gravity motor', which he subsequently named the Rotating Field Amplifier (or RFA), is revealed here in complete detail.*

Nikola Tesla's greatest yet completely unacknowledged discoveries were directly assisted by psychic information obtained from the 'Sleeping Prophet' Edgar Cayce –information that was made public among over 14,000 complete readings given during his life. The plethora of highly advanced spiritual, historical and scientific information provided by Cayce details the past life occupations of individuals, the political relations of various ancient civilizations and *the antigravitic propulsion systems of vimana spacecraft.*

In the last decades of his life, Nikola Tesla had achieved a comprehensive knowledge of the high Vedic physics of infrasound resonance that propels humanity into high-speed spacetravel. The dedicated work of trance medium Edgar Cayce established access to the Akashic records for the benefit of all humanity, and this lofty goal aligned closely with the selfless ideals that had put Tesla at odds with the military-industrial tycoons of his time, whose Nazi legacy of genocide and avarice have maligned the entire world.

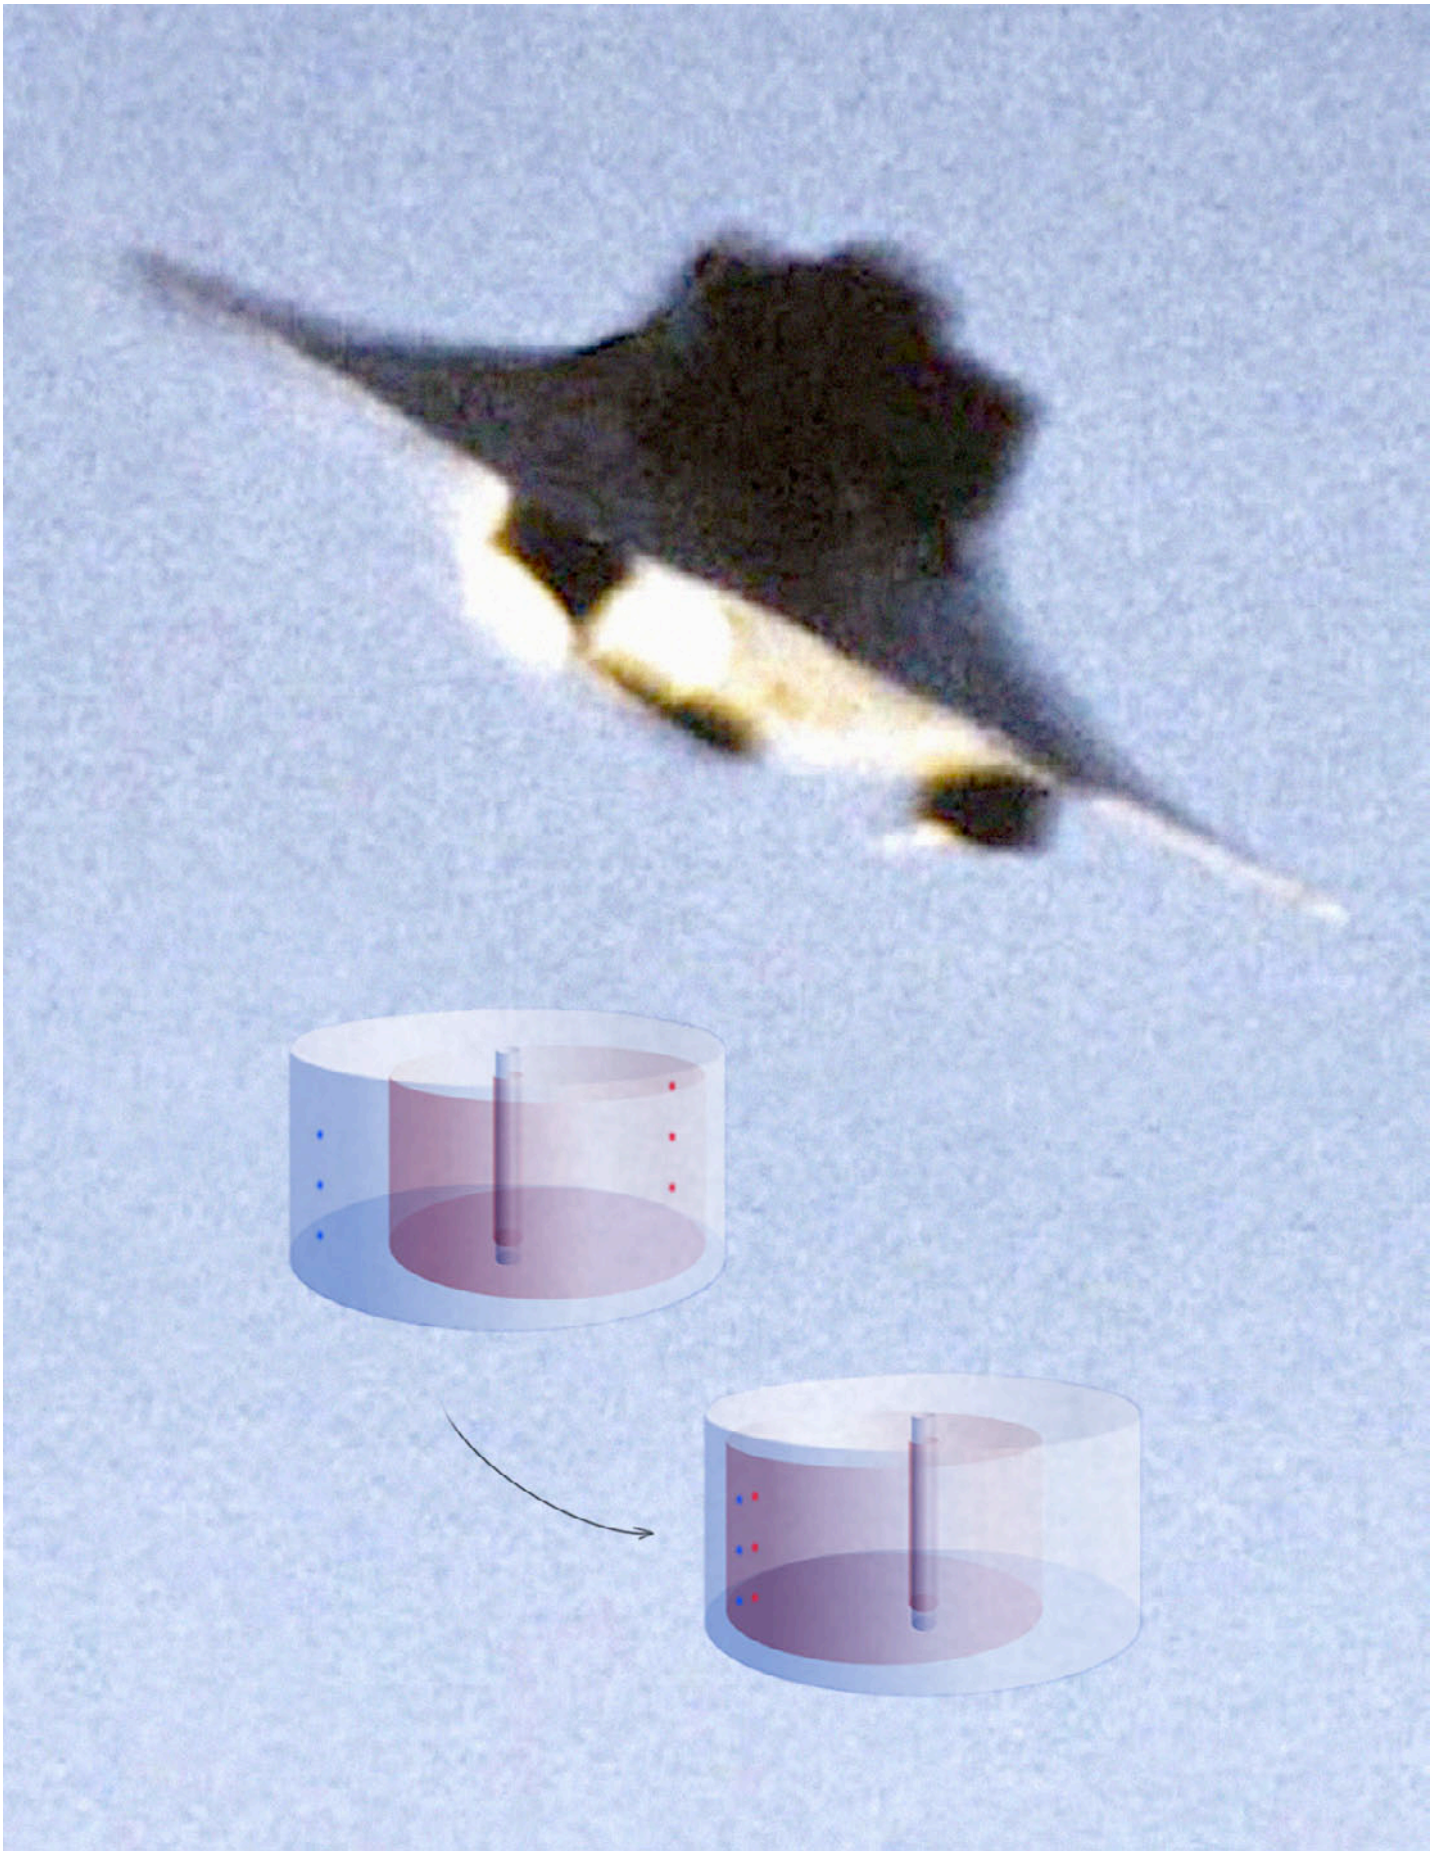
Decades of industrial espionage tactics had taken their toll on the famous inventor whose grand visionary intuition required his willingness to accept the liability of working with others deemed trustworthy. The hidden forces at play behind the Tesla Gravity Motor invention are only now being exposed many decades after the deaths of both Cayce and Tesla, following a compelling deathbed confession by Nazi espionage agent Otto Skorzeny who left his life story and photo archive in the hands of Erik 'Orion' Berman before his death in 1999.

The many well-supported admissions of the dying Nazi spy, bodyguard and hitman included detailed accounts of the final days of Nikola Tesla and the surprising circumstances of his murder by suffocation on January 6, 1943, as executed by Reinhard Gehlen and Skorzeny himself (above). Tesla's murder followed decades of controlled suppression in preparation from the theft of his many extraordinary inventions based on infrasound resonance and the generation of HHO plasma. Erik Berman published Otto Skorzeny's detailed account and supporting photographs in "The Bush Connection" (2003):

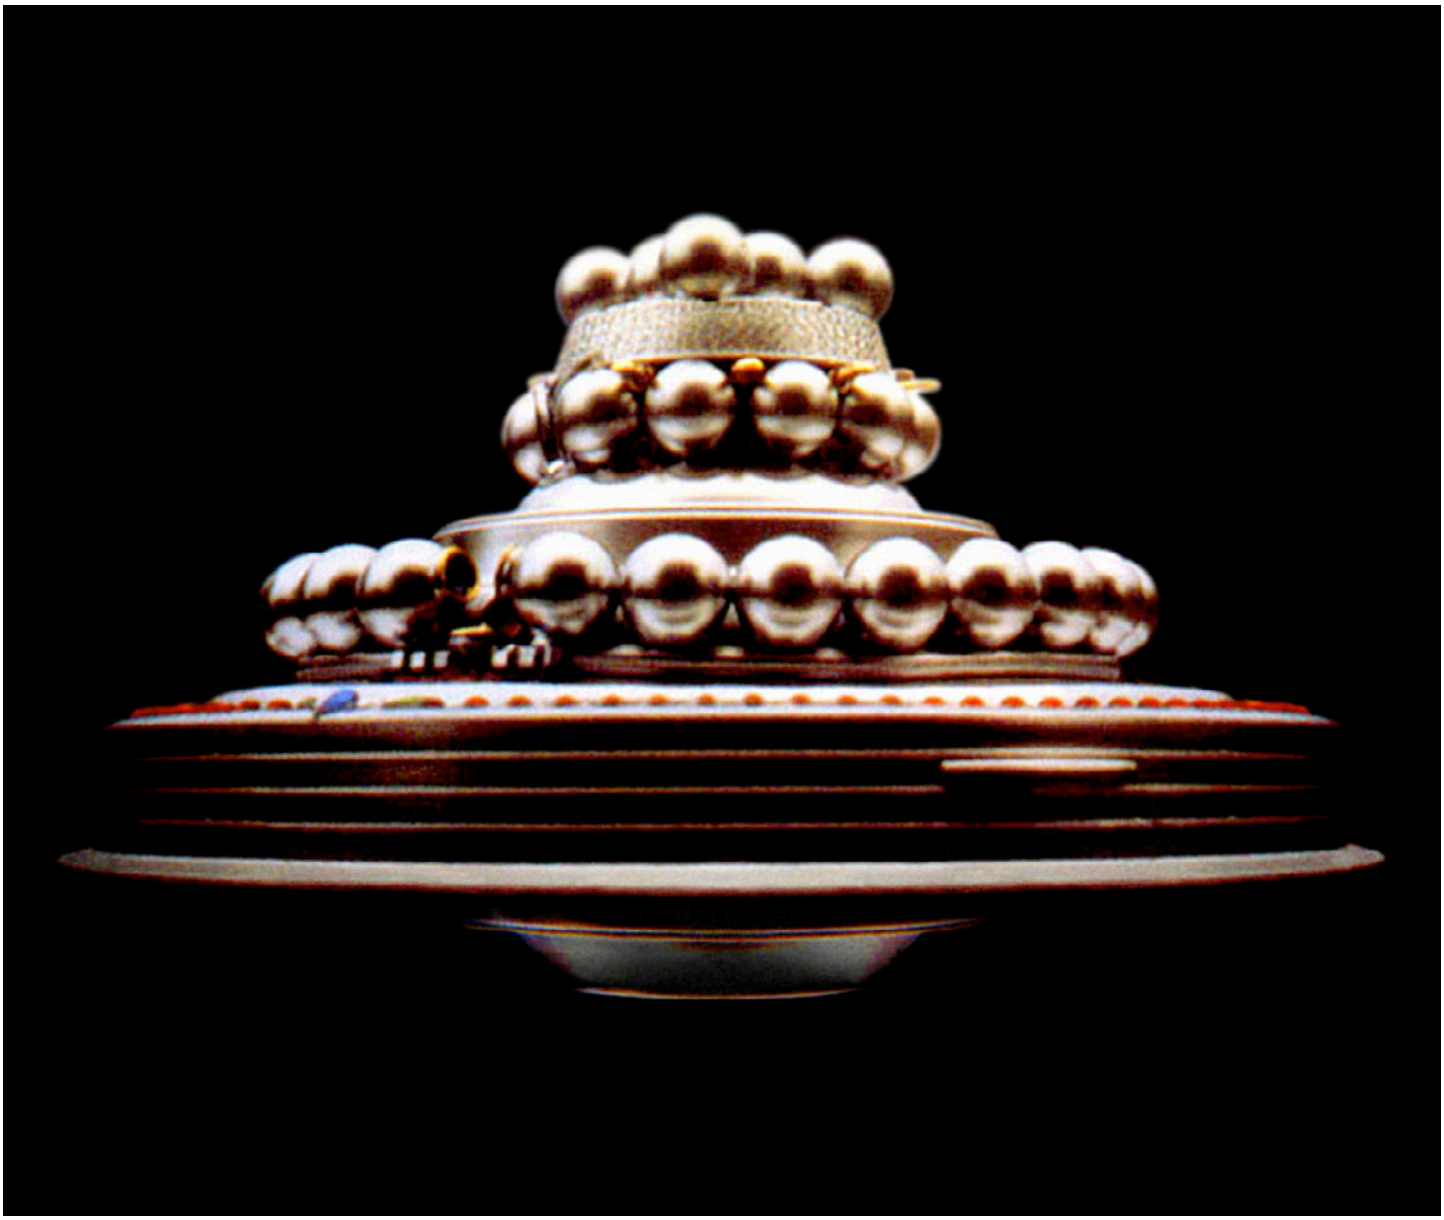
> During 1942, Hitler desperately wanted to rule the world. He ordered George H. Scherf, Jr. (aka George H.W. Bush) to wiretap Tesla's phone to find out about what other magnificent inventions he was creating that could aid in his global conquest. Bush eavesdropped on several negotiations between Tesla and the Navy regarding his supervision of a second experiment aboard the USS Eldridge. After several refusals from Tesla, the Navy contacted Albert Einstein, Marconi, [Thomas] Townsend Brown, Dr. John G. Trump and a few less-known scientists to attempt another invisibility experiment. Einstein flatly announced to the entire group: "Nikola Tesla's theories of magnetic resonance and optical invisibility are beyond my grasp." [19]

Tesla had never published any theory of magnetic resonance nor publicly discussed his principles of optical invisibility, yet he had apparently given a working explanation during his participation in Operation Rainbow Project, the first Philadelphia Naval Yard experiment. None of the assembled scientists had comprehended Tesla's full explanations, which confounded Einstein. Otto Skorzeny clearly identified Thomas Townsend Brown among the group of Navy-enlisted scientists and engineers, which also included Dr. John G. Trump, uncle of multi-billionaire corporate magnate Donald Trump.

Tesla later renamed the fuelless Gravity Motor prototype developed with Edgar Cayce and Thomas Townsend Brown as the 'Rotating Field Amplifier' (RFA) that generated HHO plasma from air. This device amplified the output of 3 large generators connected in series to obtain the EM field intensity required for the Naval optical invisibility cloaking experiment, designed to generate an HHO plasma mirage around the entire hull of the USS Eldridge, *hence the official US government designation Operation Rainbow Project.*



Skorzeny stated that after the second Philadelphia Naval Yard experiment, he and Reinhard Gehlen succeeded in stealing the RFA/Gravity Motor from the chaotic scene, as detailed by this author in *'Veil of Invisibility'* (2009).[20] A priceless photograph of the stolen Rotating Field Amplifiers was provided to Erik Berman among the large collection given as evidence by Otto Skorzeny himself, before his death on December 31, 1999. Air intake holes of the Gravity Motor's outer box and interior drum can be clearly made out in a photograph taken by Skorzeny in 1941, immediately after its theft (restored below).



The extensive series of Gravity Motor readings by Edgar Cayce for Nikola Tesla and Thomas Townsend Brown document the inner workings and resonant dimensions of this 'black box' motor. The front of the unit bears impact damage from several hard strikes incurred during operation. HHO plasma ignited within the box undergoes an implosive process that is much safer than explosive combustion motors. Intense electromagnetic fields are generated as hydrogen atoms implode to form hydrinos, attracting all nearby iron objects with great force. *Turning on this type of motor required careful preparation and supervision.*

Such powerful fields unleashed by the Gravity Motor in resonant operation present a potential danger to the surroundings, and even to the motor itself. Any deformation of the drum elements incurred as impact damage would throw it out of resonant operation, rendering it entirely useless. For this reason, Tesla had enclosed the double-drum amplifier within a protective outer box, raising the total weight of each RFA to 50 lbs. The short frontal extension of the base plate prevented the blocking of air intake holes.

Gehlen and Skorzeny escaped the Philadelphia Naval Yard with the stolen RFA for transport to Germany via submarine, where Nazi scientists were already undertaking the engineering of resonant motor designs stolen from Tesla through T.T. Brown a decade earlier. Documents released by the FBI support Otto Skorzeny's testimony that for several days prior to Tesla's murder on January 6, 1943, he and Gehlen visited Tesla posing as OSS officers 'Bloyce Fitzgerald' and 'Ralph Bergstresser'. The two Nazi agents extracted all pertinent information that could facilitate the Nazi engineering of hundreds of Tesla's finest inventions, including antigravity disks, plasma beam weapons, radar and earthquake induction systems.

Tesla's revolutionary transdimensional disc design specifications included 3 Gravity Motors, or rotating field amplifiers placed symmetrically around the lower convex hull component, each with air intake holes that glow with HHO plasma when in operation (opposite). Tesla's antigravity discs were rapidly fabricated in underground Nazi research facilities in 1943-44 by teams of coerced scientists under direction of Victor Schauberger. *This specific model is among the very first fully functional antigravity disks manufactured in exact accordance with the blueprints and hull specifications stolen from Nikola Tesla before his murder.*

Similar resonator elements can be clearly discerned in many high-quality photographs of visiting Plejaren extraterrestrial spacecraft taken by contactee Eduard Meier in Hinterschmidtrüti, Switzerland (above).[21] The space vehicle is fitted with 44 spherical resonators surmounting the circular hull capable of producing 44 frequencies, extending from the audible down into the inaudible infrasonic range. The spacecraft's acoustic output was recorded by Meier and identified by experts as duplicating planetary resonance.[22]

Far exceeding the limited capabilities of Tesla's antigravity disk designs, Plejaren spacecraft have been engineered for highly advanced spacetravel requirements that include control of water vapor supplied to the series of spherical resonators, offering functionality outside of planetary atmospheres. *The essential design features of Tesla's disks present the same resonator elements and broad, bell-like flange observed of off-world antigravitic spacecraft, and represent the greatest modern achievement of human ingenuity.*

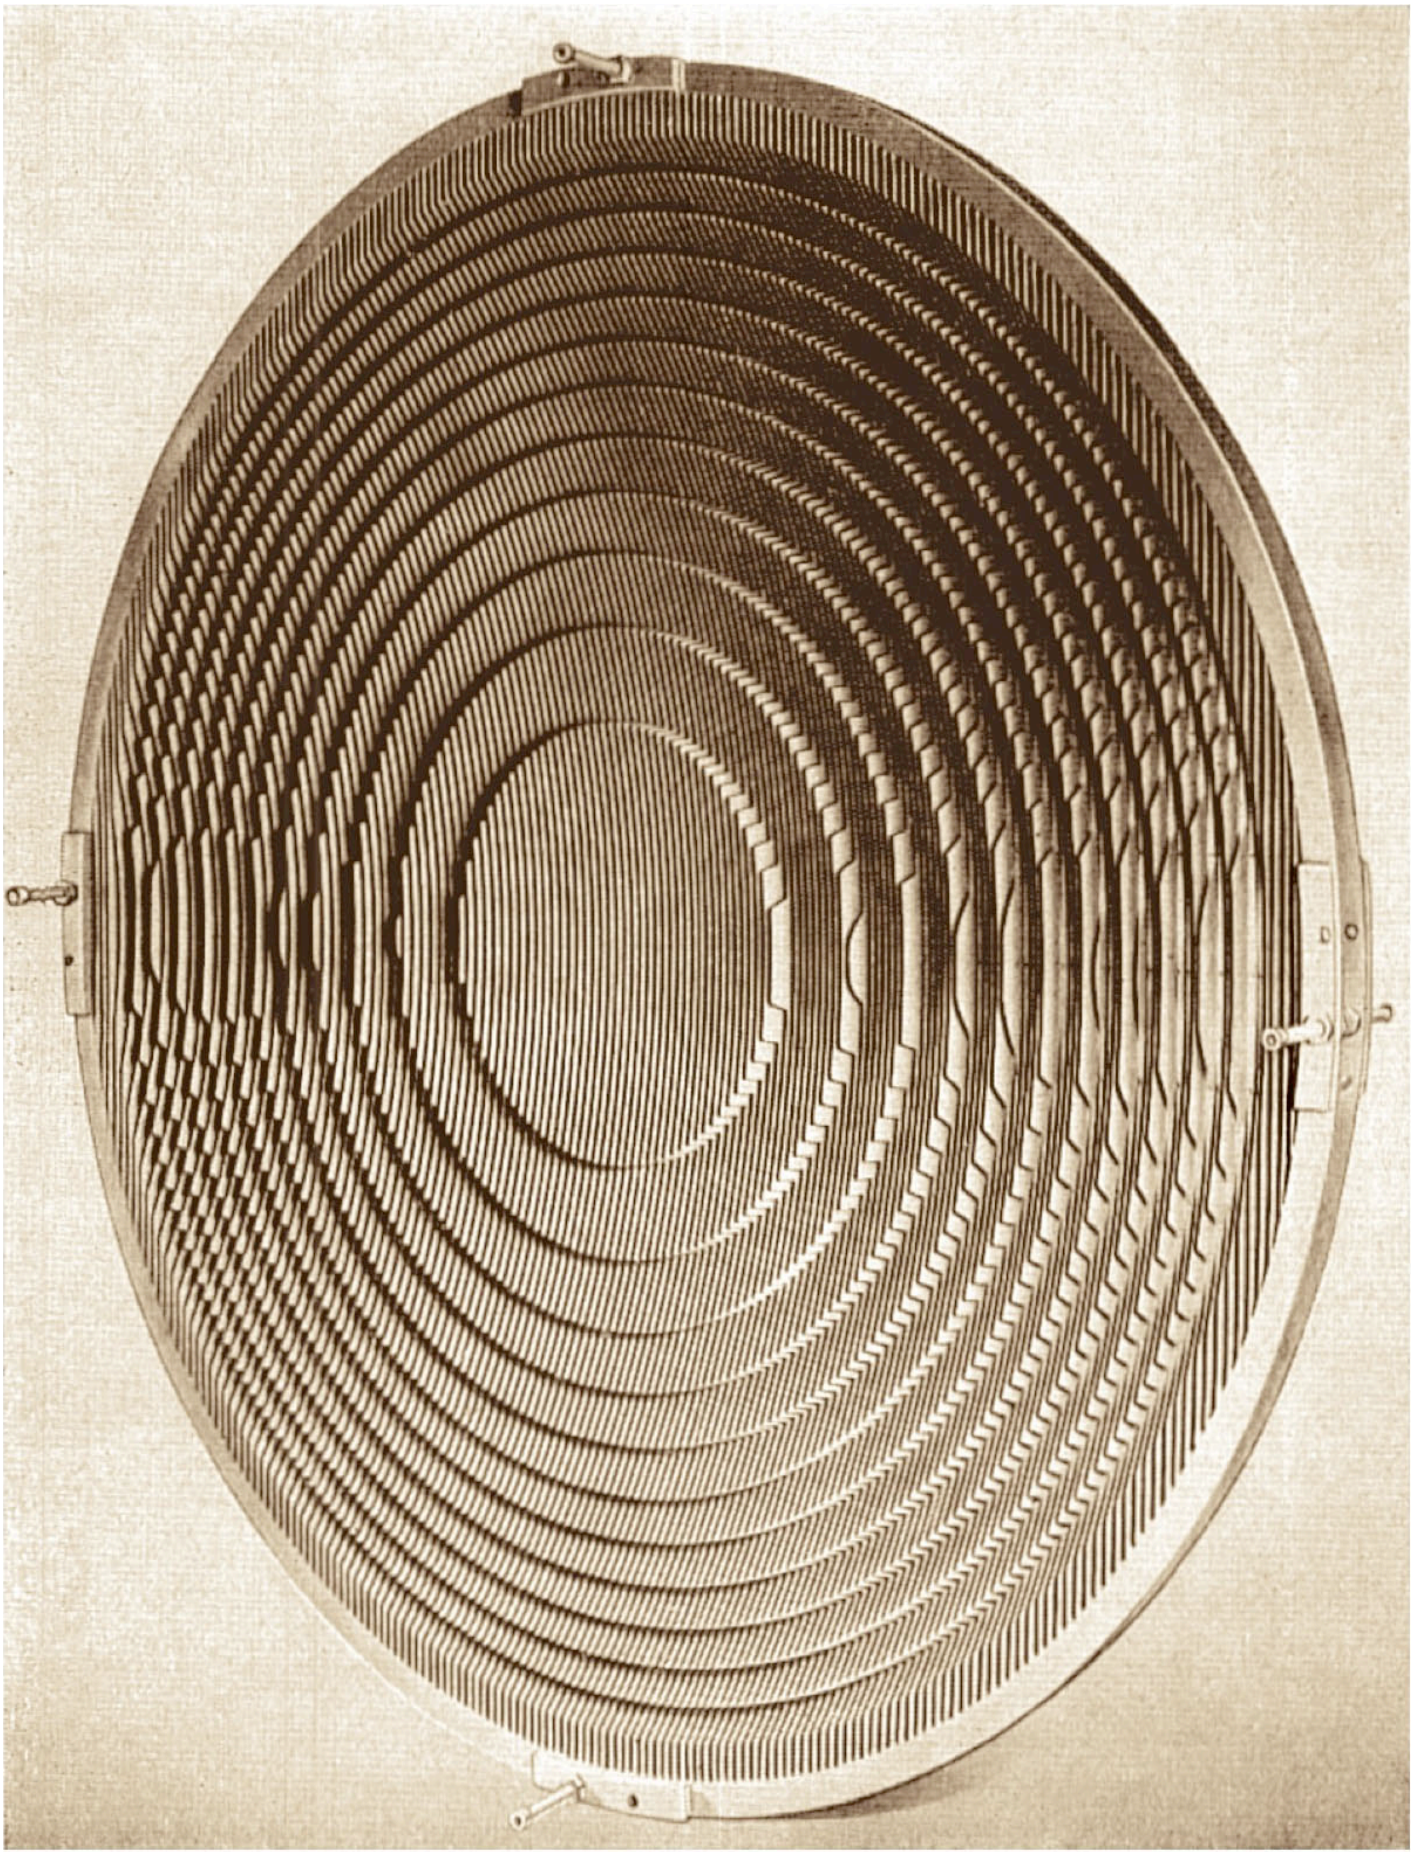
The CIA/Nazi consortium enforces its media cover-up on the entire world by targeting all non-conforming governments and populations with tornadoes and earthquakes. Infrasonic induction systems for severe weather, tornadoes and earthquakes have been secretly installed in the Nexrad Radar System, consisting of an array of >300 towers that extends throughout the US and populated areas of Alaska and Canada.[23]

This hypothesis is well supported by a comprehensive 2012 survey of 56 years of US tornado tracks.[24] The nationwide weather manipulation system interacts with dozens of land-based HAARP facilities, located in Alaska and abroad in most NATO countries. Mobile Sea-based X-band Radar platforms offer further functionality to a global weather warfare system presently terrorizing the entire world.[25]

Long before the global domination of these invisible ULF weapons of mass destruction, the Nazi theft was orchestrated by OSS/CIA officers who posed as FBI informants to the Office of Alien Property concerning the inventor's possessions. Nikola Tesla had become an American citizen in 1891, yet the conspiracy to suppress his Gravity Motor invention used the Office of Alien Property to confiscate Tesla's sensitive papers and prototypes. Dr. John G. Trump headed these suppressive efforts, known as *Project Nick*:

> Just after World War II, there was a renewed interest in beam weapons. Copies of Tesla's papers on particle beam weaponry were sent to Patterson Air Force Base in Dayton, Ohio. An operation code-named 'Project Nick' was heavily funded and placed under the command of Brigadier Gen. LC Craigie to test the feasibility of Tesla's concept. Details of the experiments were never published, and the project was apparently discontinued. But something peculiar happened. The copies of Tesla's papers disappeared, and no one knows what happened...[26]

All relevant papers and prototypes were collected at Wright-Patterson Airforce Base outside Dayton, Ohio, where Thomas Townsend Brown had been working for decades on the Gravity Motor project following the Cayce readings in the late 1920s. *The not-so-clever naming of military projects betrays their faltering cover: 'Project Nick' hides a double meaning referencing Nikola Tesla and his having been 'nicked off', whereas 'Nike-Ajax' directly references Nikola's past life as Ajax in psychic readings by Edgar Cayce!*



Cryptic naming of the Nike-Ajax missile system identifies its true inventor –*Nikola Tesla*– and reconfirms our present supposition that the 487-series psychic readings by Edgar Cayce were, in fact, conducted for Nikola Tesla, revealing his past life as Atlantean scientific leader Ajax of Ode, among other incarnations. *Covertly acknowledging the Atlantean origin of Tesla's wireless inventions by name, the Nike-Ajax missile system employed a monopulse radar design stolen from Tesla after his murder on January 6, 1943:*

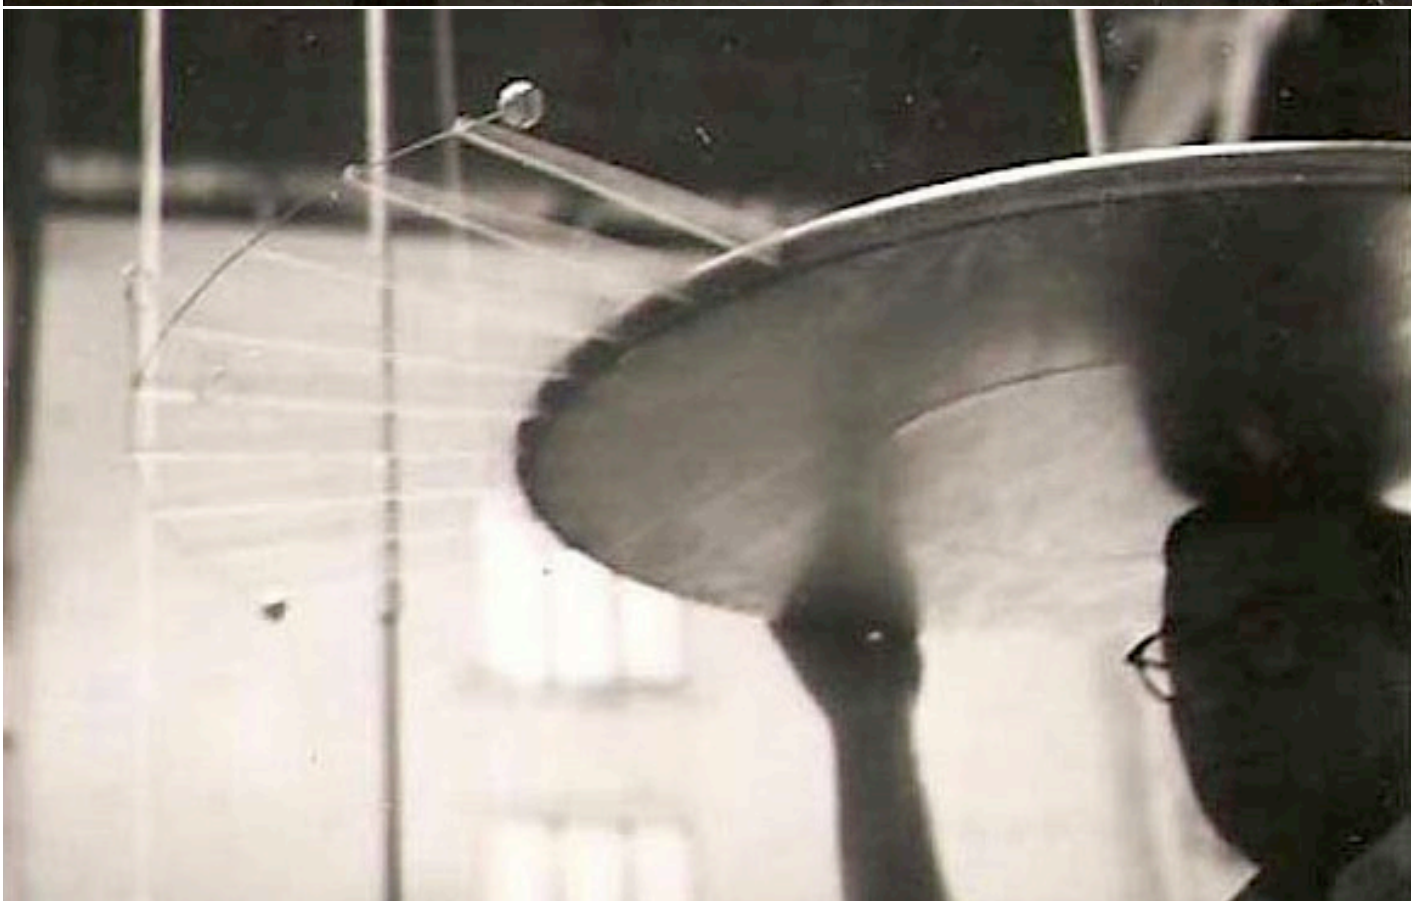
> In 1943, NRL developed monopulse radar, now the basis for all modern tracking and missile control radars. The monopulse technique was first applied to the Nike-Ajax missile system, which at the time was the nation's continental air defense system. Monopulse radar eventually led to the development of the AN/FPS-16, the first high-precision monopulse instrumentation radar. In 1958, this radar was used to guide the launchings of the first U.S. space satellites at Cape Canaveral. Monopulse radar is still the most widely used technique for military tracking radar because of its high accuracy and relative immunity to electronic countermeasures that degrade other tracking methods.[27]

Tesla's monopulse radar design applies the quadratic formula for nonlinear standing waves: [$z_{n+1} = z_n^2$] (above). The inventor had arrived at this precise mathematical expression for the nonlinear Fibonacci structure of standing waves after many decades of experimentation and contemplation on tri-frequency resonance in the Fibonnaci ratio. The Cayce readings had been very influential during the process of realization of humanity's great dream of flight, as Tesla conquered the Vedic principles of antigravity and set out to manifest the same technological wonders he had designed in a prior Atlantean incarnation.

Not only the naming of the missile system, but the critical timing of its development, along with the great technological advances of the US Naval Research Laboratory and Nazi German antigravity disk programs, were directly linked with the control and murder of Nikola Tesla. Despite the obfuscations of CIA-published disinformation campaigns concerning the Gravity Motor, the Philadelphia Experiment and Tesla's murder, the inventor's brilliance could not be entirely blotted out. The distinctive trajectory of Tesla's unique line of thinking can be traced through the full breadth of his exceptional life's work.

The crucial factor obscuring the focused activity of Cayce and Tesla in the development of resonant technologies is the deceptive media hype surrounding the identity and false physics work of Thomas Townsend Brown, conducted in secret association with Wright-Patterson Airforce Base in Dayton, Ohio.

In 1947, metal debris from the crashed spacecraft recovered near Roswell, New Mexico was immediately transported to the underground WPAFB facilities to aid in their specialized antigravity research efforts. Ongoing media manipulations of the military-industrial complex attempt to cover up their theft of the Cayce/Tesla Gravity Motor and sanitize all evidence of the secret CIA/Nazi development, manufacture and deployment of *optically invisible antigravitic surveillance drones.*



Thomas T. Brown's involvement with Project Montgolfier[28] at a French aerospace company outside Paris from 1955–56 was an effective distraction that had previously been offered to the LA Times for its clear disinformation value, while Brown never revealed his detailed knowledge concerning the Tesla Gravity Motor and his direct participation of the actual events referred to as *The Philadelphia Experiment*.

Nevertheless, the 'Biefield-Brown effect' tethered disk experiments replicated by Project Montgolfier display several design features present in the actual antigravity drone prototypes developed in secret. Published images show Thomas Brown holding one of his antigravity disk prototypes being refitted with radial elements (above) that are also clearly visible in recent photographs of the CIA drones (opposite).

The completed antigravity drones were mass-produced and first deployed in the 1990s for both domestic and international surveillance tasks. The jet-propelled high-altitude drone airplanes that have been openly publicized for the last decade comprise a cheaper, expendable drone that incorporates only marginal technology. The highly advanced antigravitic, optically invisible HHO plasma drones generally operate close to ground level, being capable of rapid flight or hovering silently overhead, and have been extensively used to monitor populations in Nazi-aligned NATO nations including France.

Many US residents in various states have photographed these Nazi/CIA antigravity drones after suddenly appearing during brief periods of malfunction of the HHO invisibility cloaking. Related disinformation was disseminated to mislead the public concerning photographs circulating online, promoting an entirely invented 'CARET Program' implicating the drones' extraterrestrial origin.[29] The CIA antigravity drones are currently manufactured by sintering metal nanopowders of varied elements. Japanese scientist Xie G. presented a similar process in 2013 for the manufacture of large-scale bulk metallic glass components:

> In the Spark Plasma Sintering (SPS) process, the pulse electric current (typically a few thousands of amperes of average electric current) directly flows through the sintered powder a volumetric heating rate resulting from the Joule effect, which is in contrast to the conductive heat transport applied in conventional sintering systems, permits a rapid increase in temperature that is able to enhance the mass transport mechanisms responsible for sintering phenomena, thus improving the consolidation rate. Furthermore the surface effects that are induced by the SPS process also play a significant role in the densification process...
>
> It has been demonstrated that the BMGs produced by the SPS process exhibited high strength which was similar to that of cast glassy alloys... [while] bulk metallic glassy composites... satisfying large-size requirements have [also] been produced.[30]

Spark plasma-sintered components of the Tesla-tech CIA antigravity surveillance drones include ring and radial elements that have been photographed above Capitola and the Santa Cruz mountains, deployed and controlled from the underground Lockheed-Martin facility in Ben Lomond Park, *running 'Space Operations' for the US Navy.* Advanced antigravity drone designs with separate ring elements have been photographed by vacationers during moments of HHO cloaking malfunction in remote areas of Michigan (above).[31]

Extensive data concerning clusters of mysterious disappearances of visitors to US National Parks have recently been brought to public attention. Media efforts to cover-up the relationship between these HHO antigravity drones and their close association with park visitor abductions and secret underground CIA bases in National Parks have been lead by government-paid disinfo artist David Paulides. Paulides' book *'411: Missing Persons'* was widely disseminated on all the fake alternative media (covert CIA operations) to implicate Bigfoot and obfuscate the reality of serial military/CIA abductions.

The existence of dozens of these secret underground military-industrial installations located in gated and arms-controlled National Parks were clearly exposed by Nazi commando Otto Skorzeny, lifelong personal bodyguard of Adolf Hitler who had confessed to the murder of Dr. Nikola Tesla. *One such underground Nazi/CIA base was directly identified as housing a multi-generational Aryan breeding experiment that essentially operated like a brothel for Nazi elite below the bedrock of Glacier National Park, Montana*.[32]

Skorzeny's revelations concerning his role in the control and murder of Tesla and the establishment of these Nazi/CIA underground bases is fully supported by the Edgar Cayce material relating to Thomas Townsend Brown. Unrecognized until the present, Cayce's many psychic readings for both Tesla and Brown reveal the *Golden Proportions* of the resonant Gravity Motor and special Atlantean manufacturing techniques for antigravity alloys that were suppressed and stolen by the Nazi military-industrial complex. The newly defined phonon-induced implosive reactions of HHO plasma reveal the connected design function of the Gravity Motor and the world's ancient pyramid network as resonant amplifiers, providing 'wireless' electrical power for a wide variety of antigravity spacecraft and drone applications.

Submerged Cities

Submerged Cities

In all parts of the world, ongoing underwater archaeology surveys being conducted on the continental shelves off the mainland coasts have yielded the spectacular remains of monumental constructions and ancient cities that challenge the imagination. The humungous scale of many of these subaquatic features of an antediluvian high civilization remain classified as National Security Secrets to this day.

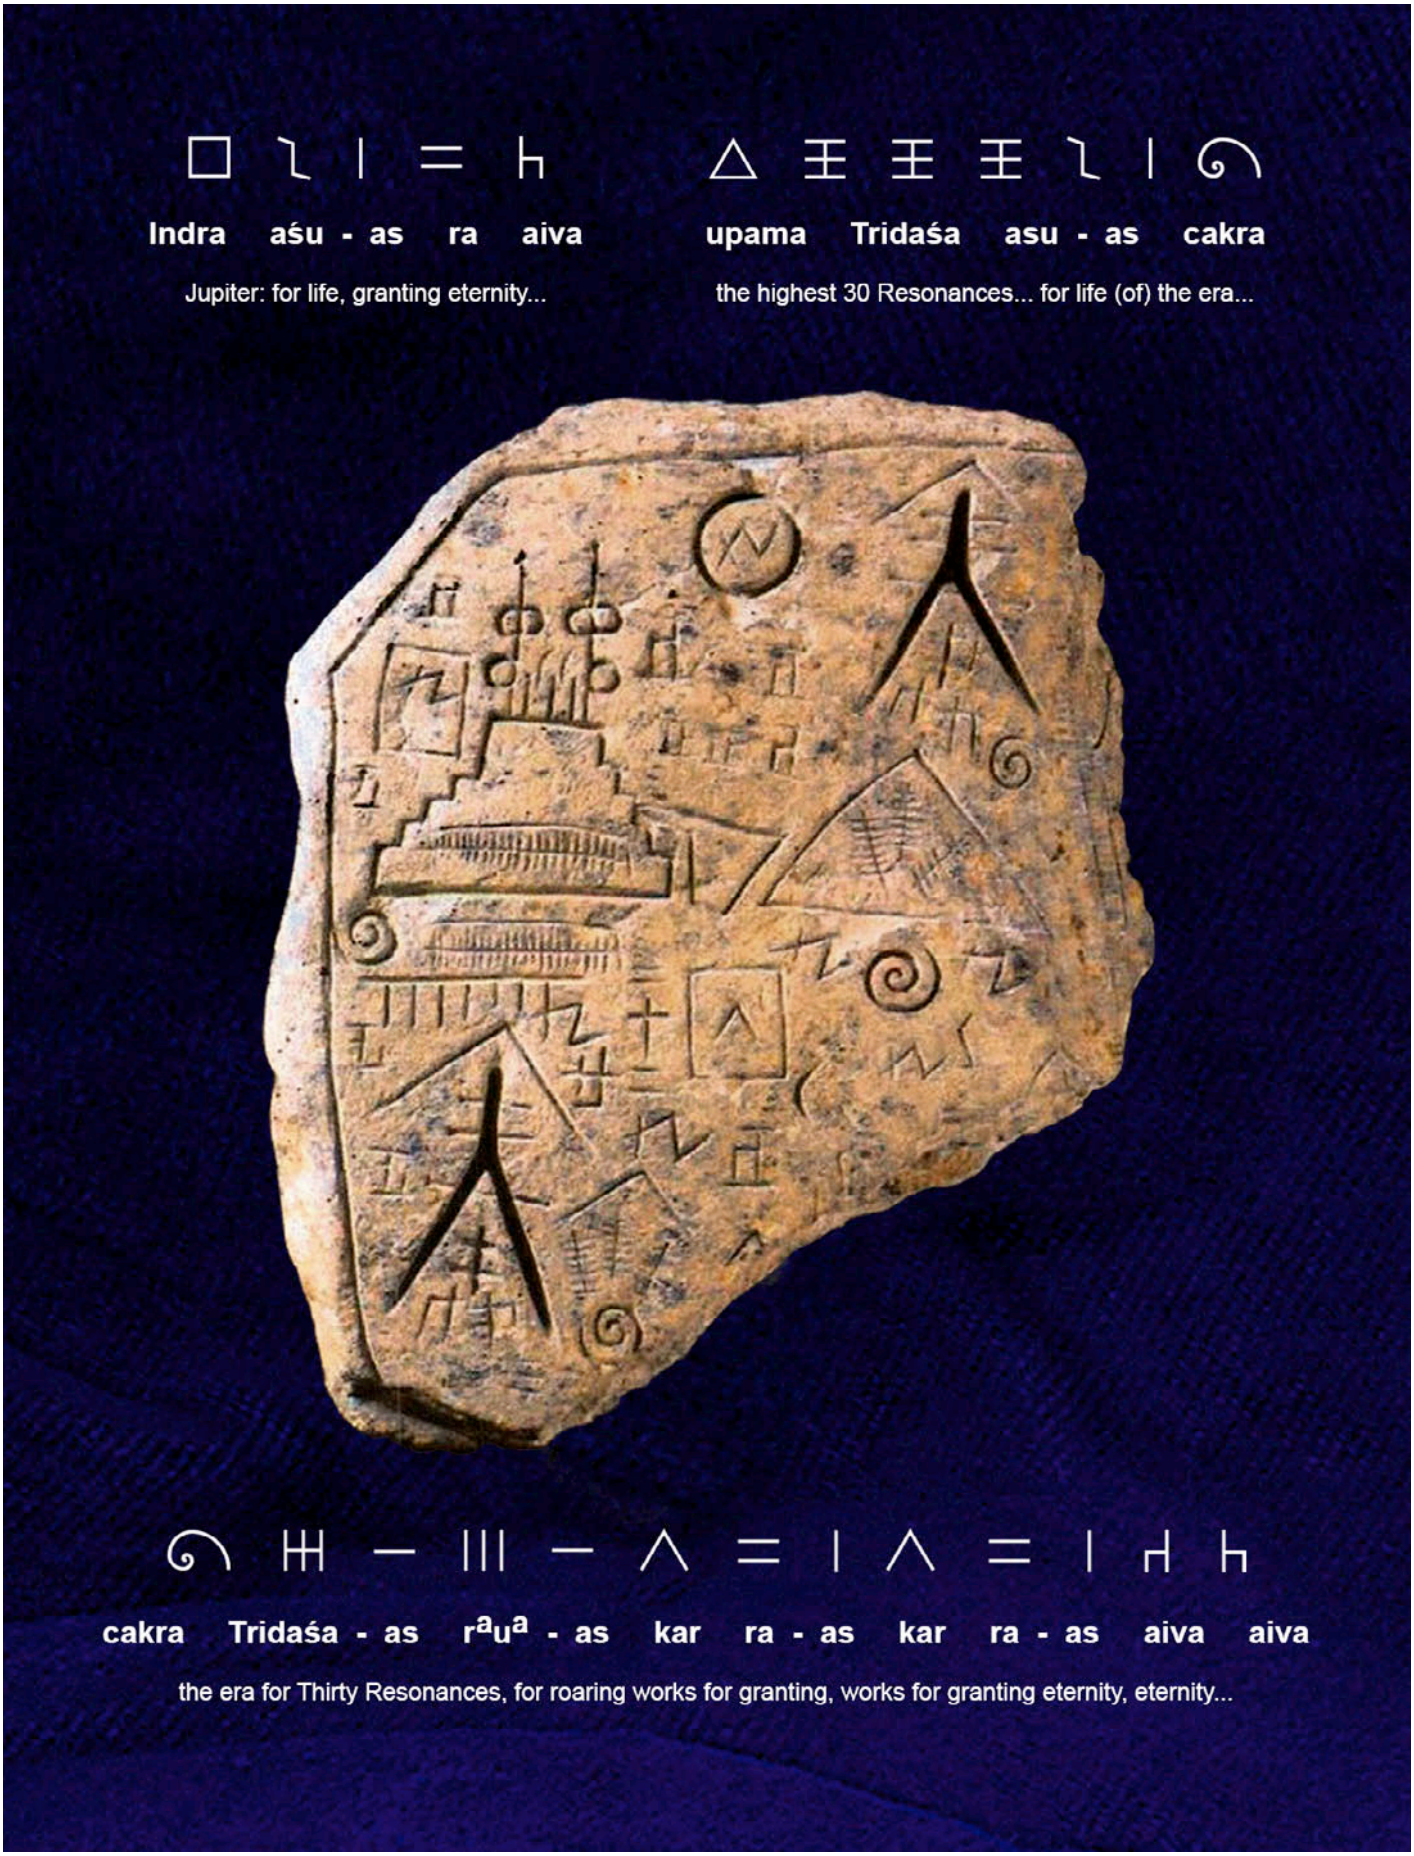
The submerged city just offshore at Yonaguni Island is perhaps the most famous sunken megalithic city for its shallow 4-25m depth and often clear visibility of the water that facilitate high-quality video and photography. Yonaguni Monument, Japan (24.26°N 123.0°E) is 5,514 miles from the Great Pyramid, a distance that comprises 22.15% of the Earth's mean circumference distance of 24,892 miles.

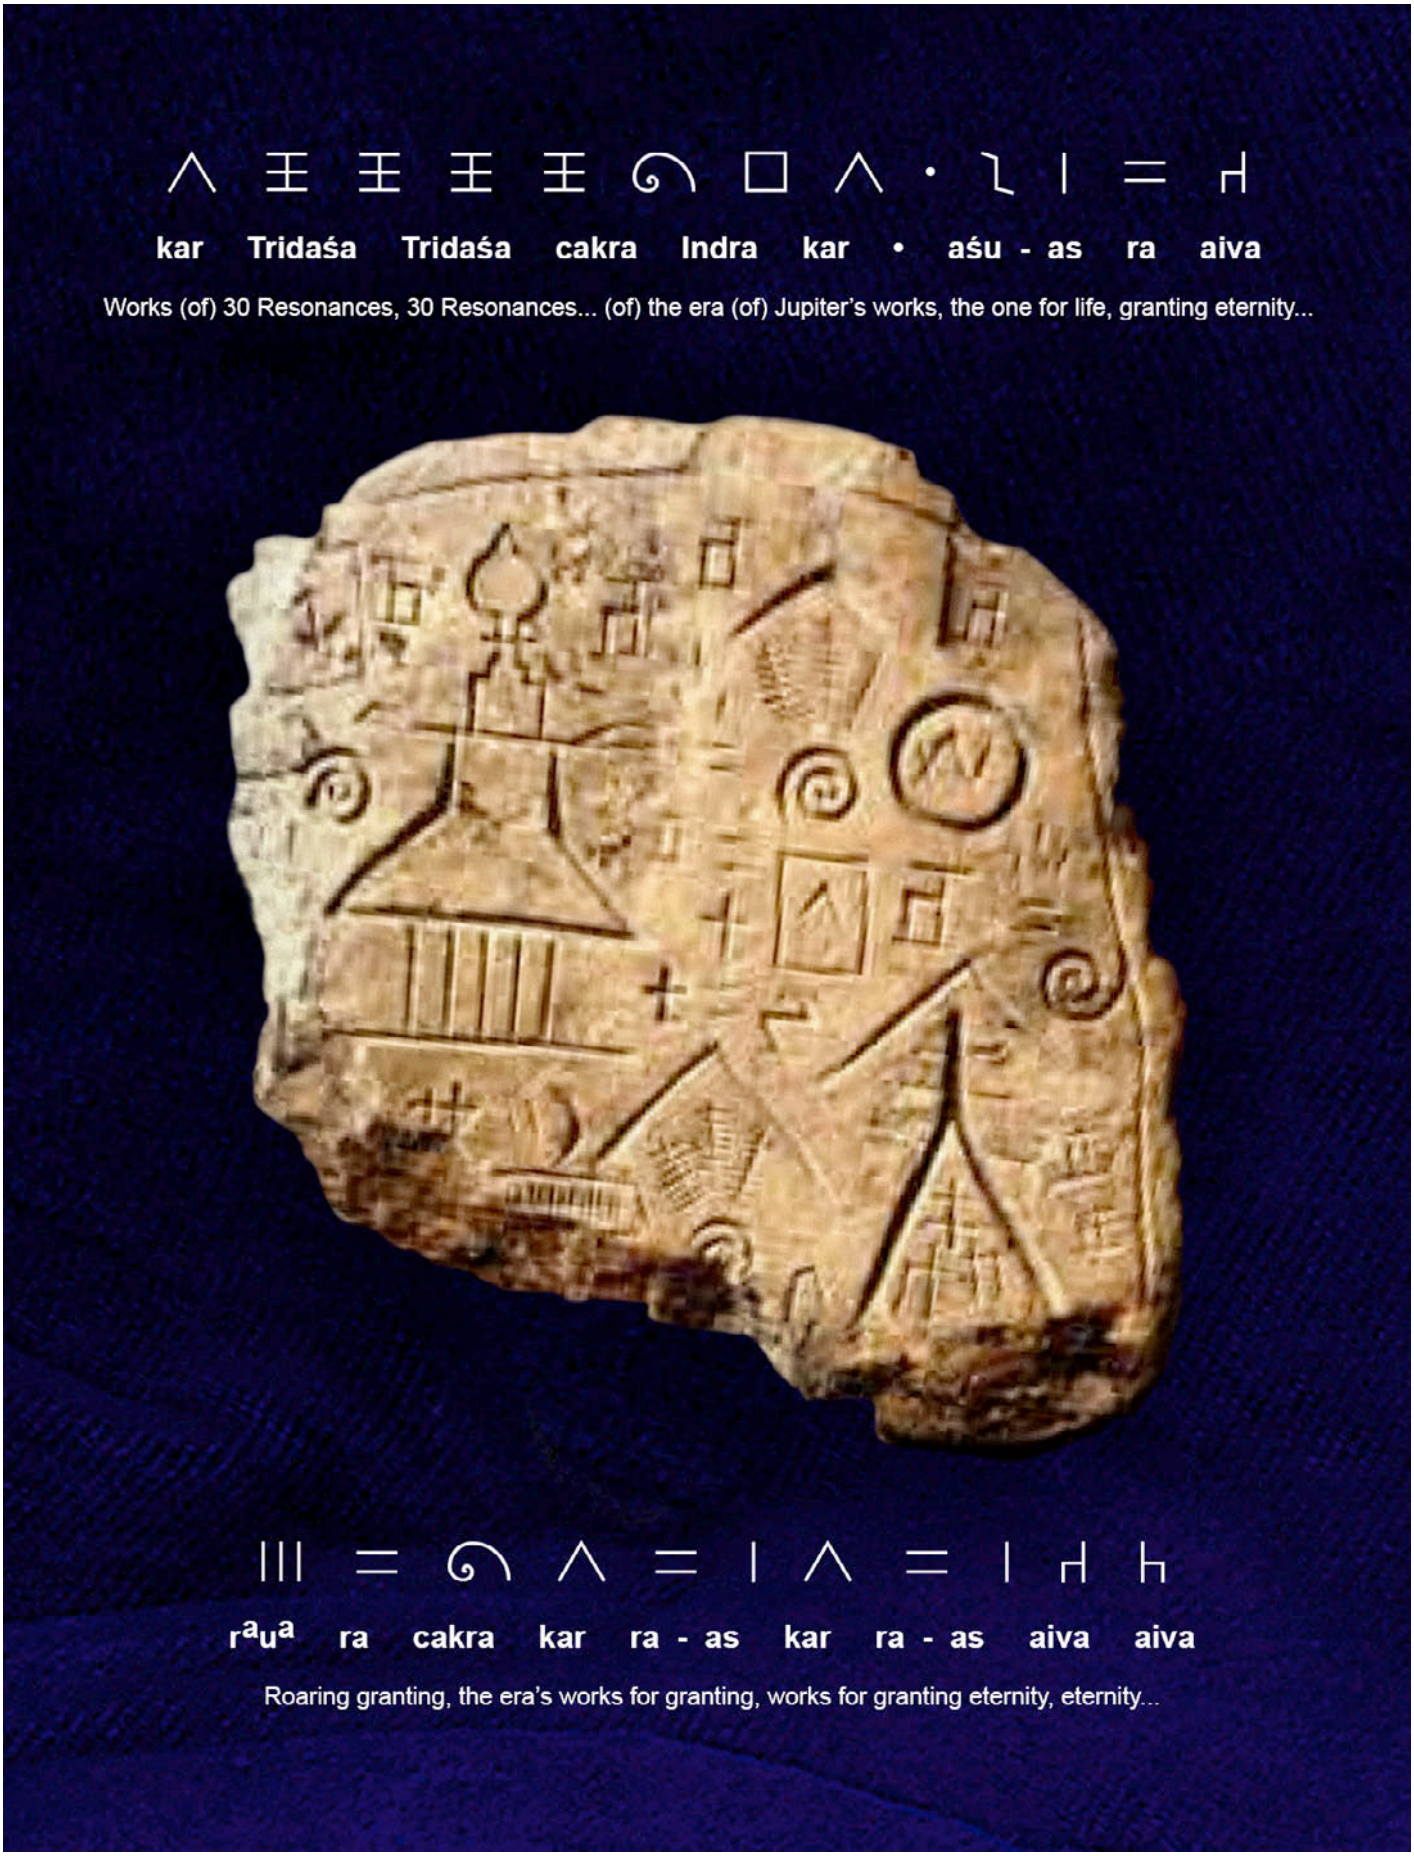
Yonaguni is also situated 1,464 miles from the megalithic temples of Angkor Wat, Cambodia (13.43°N 103.83°E), long a great circle alignment of ancient temples at the resonant 5.9% distance interval from Angkor that includes the world-renowned sacred temple sites of Bodh Gaya, India; Lhasa, Tibet and Xi'an, China, *where dozens of pyramids have been effectively censored from public awareness.* This 5.9% distance alignment from Angkor also incorporates Indonesian megalithic sites in the Bada Valley, as well as piezoelectric temples in East Java such as Dieng, Borodubur, Candi Pawon, Candi Banon, Candi Mendut, Candi Ngawen, Candi Canggal and Candi Sukuh.[1]

Precision alignments embedded in the geoposition of the Yonaguni Monument present undeniable evidence of the global networking of *all* Paleolithic pyramid and temples sites in a worldwide distribution pattern based on the quantum iterated function [$z_{n+1} = z_n^2$] encoding the spherical Fibonacci structure of infrasound standing waves that envelope the planet and ultimately sustain all life-forms.

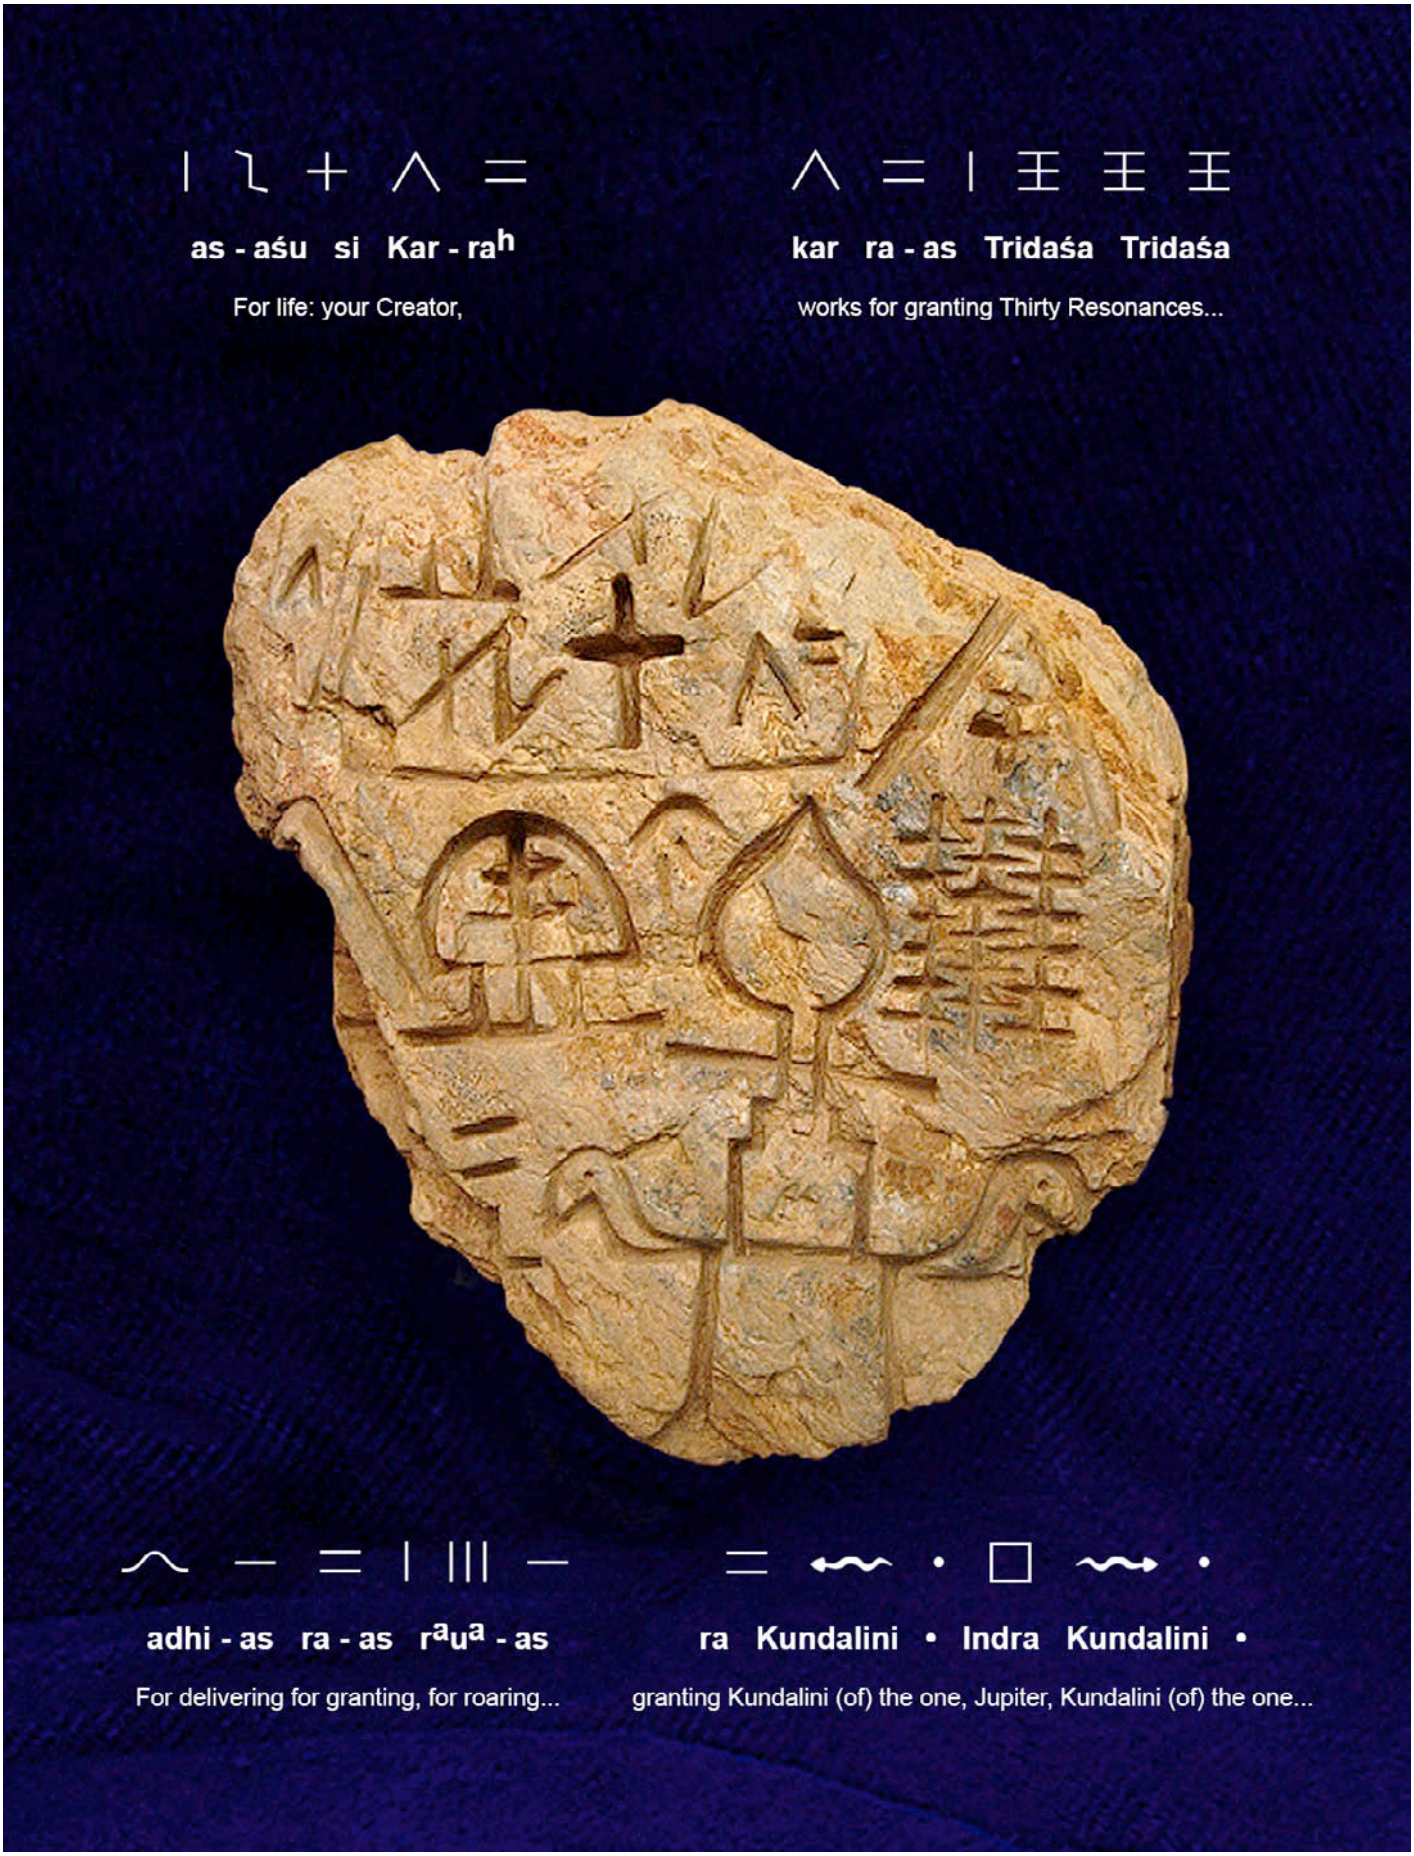
Another significant form of evidence connecting Yonaguni with many other Paleolithic sites in all parts of the world are *in situ* discoveries of stone artifacts engraved with hieroglyphs of Paleo-Sanskrit script. Having been deciphered by linguist and epigrapher K. Schildmann over a decade ago, the Paleo-Sanskrit language can be identified and translated from hieroglyphic inscriptions on stone artifacts that have been retrieved by divers investigating the Yonaguni Monument.

Paleo-Sanskrit texts collected at Yonaguni present legible glyph sets incorporated into basic ligatures, together reading: *Indra asu-as ra aiva upama Tridasa asu-as cakra cakraTridasa-as raua-as kar ra-as kar ra-as aiva aiva*, meaning "Jupiter: for life, granting eternity... the highest Thirty Resonances... for life of the era... the era for Thirty Resonances, for roaring works for granting, works for granting eternity..." (overleaf).

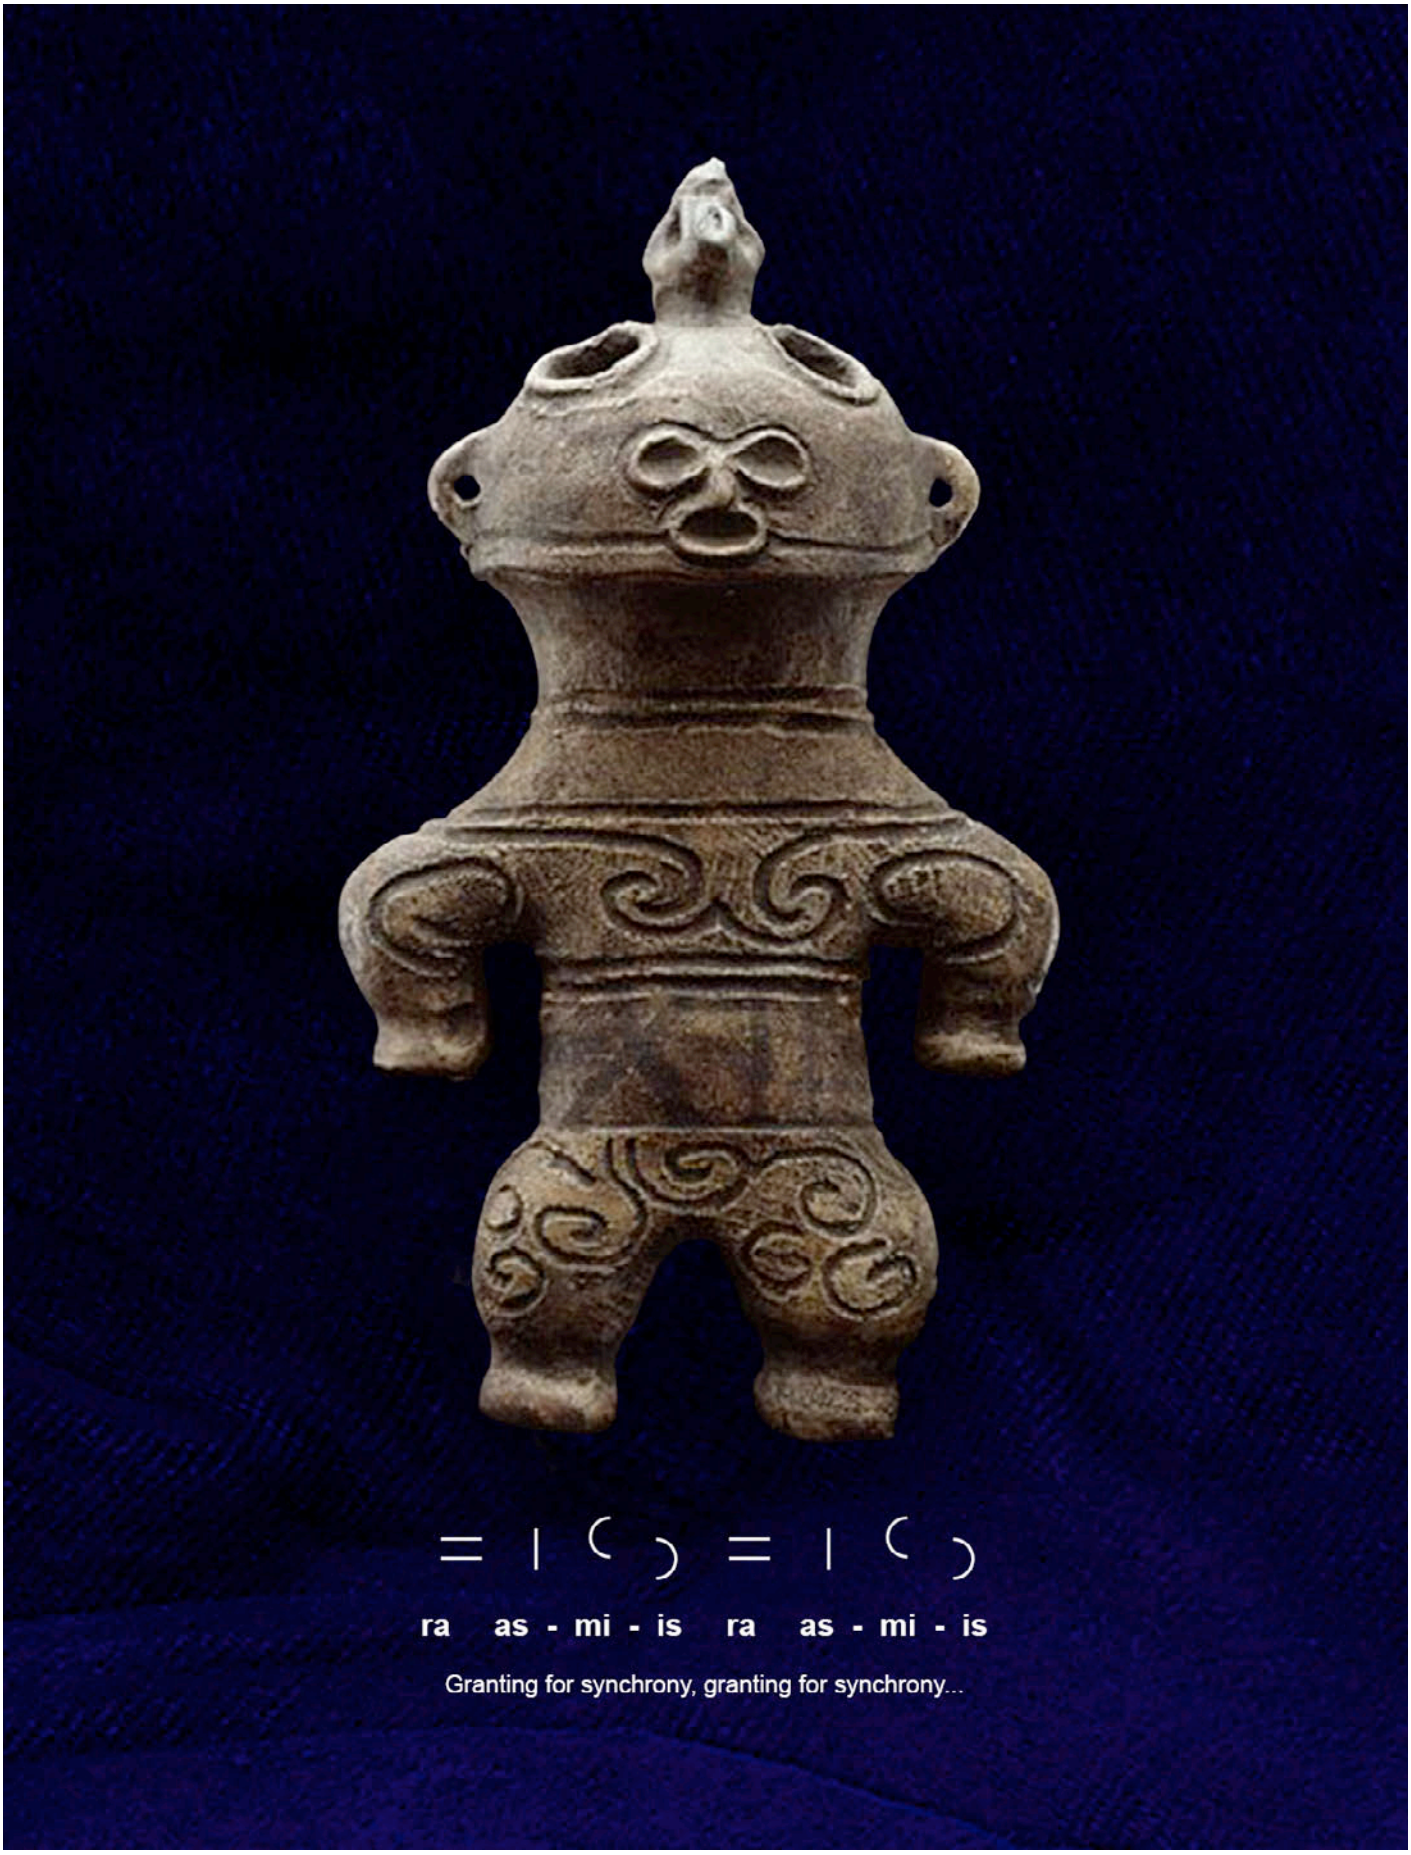




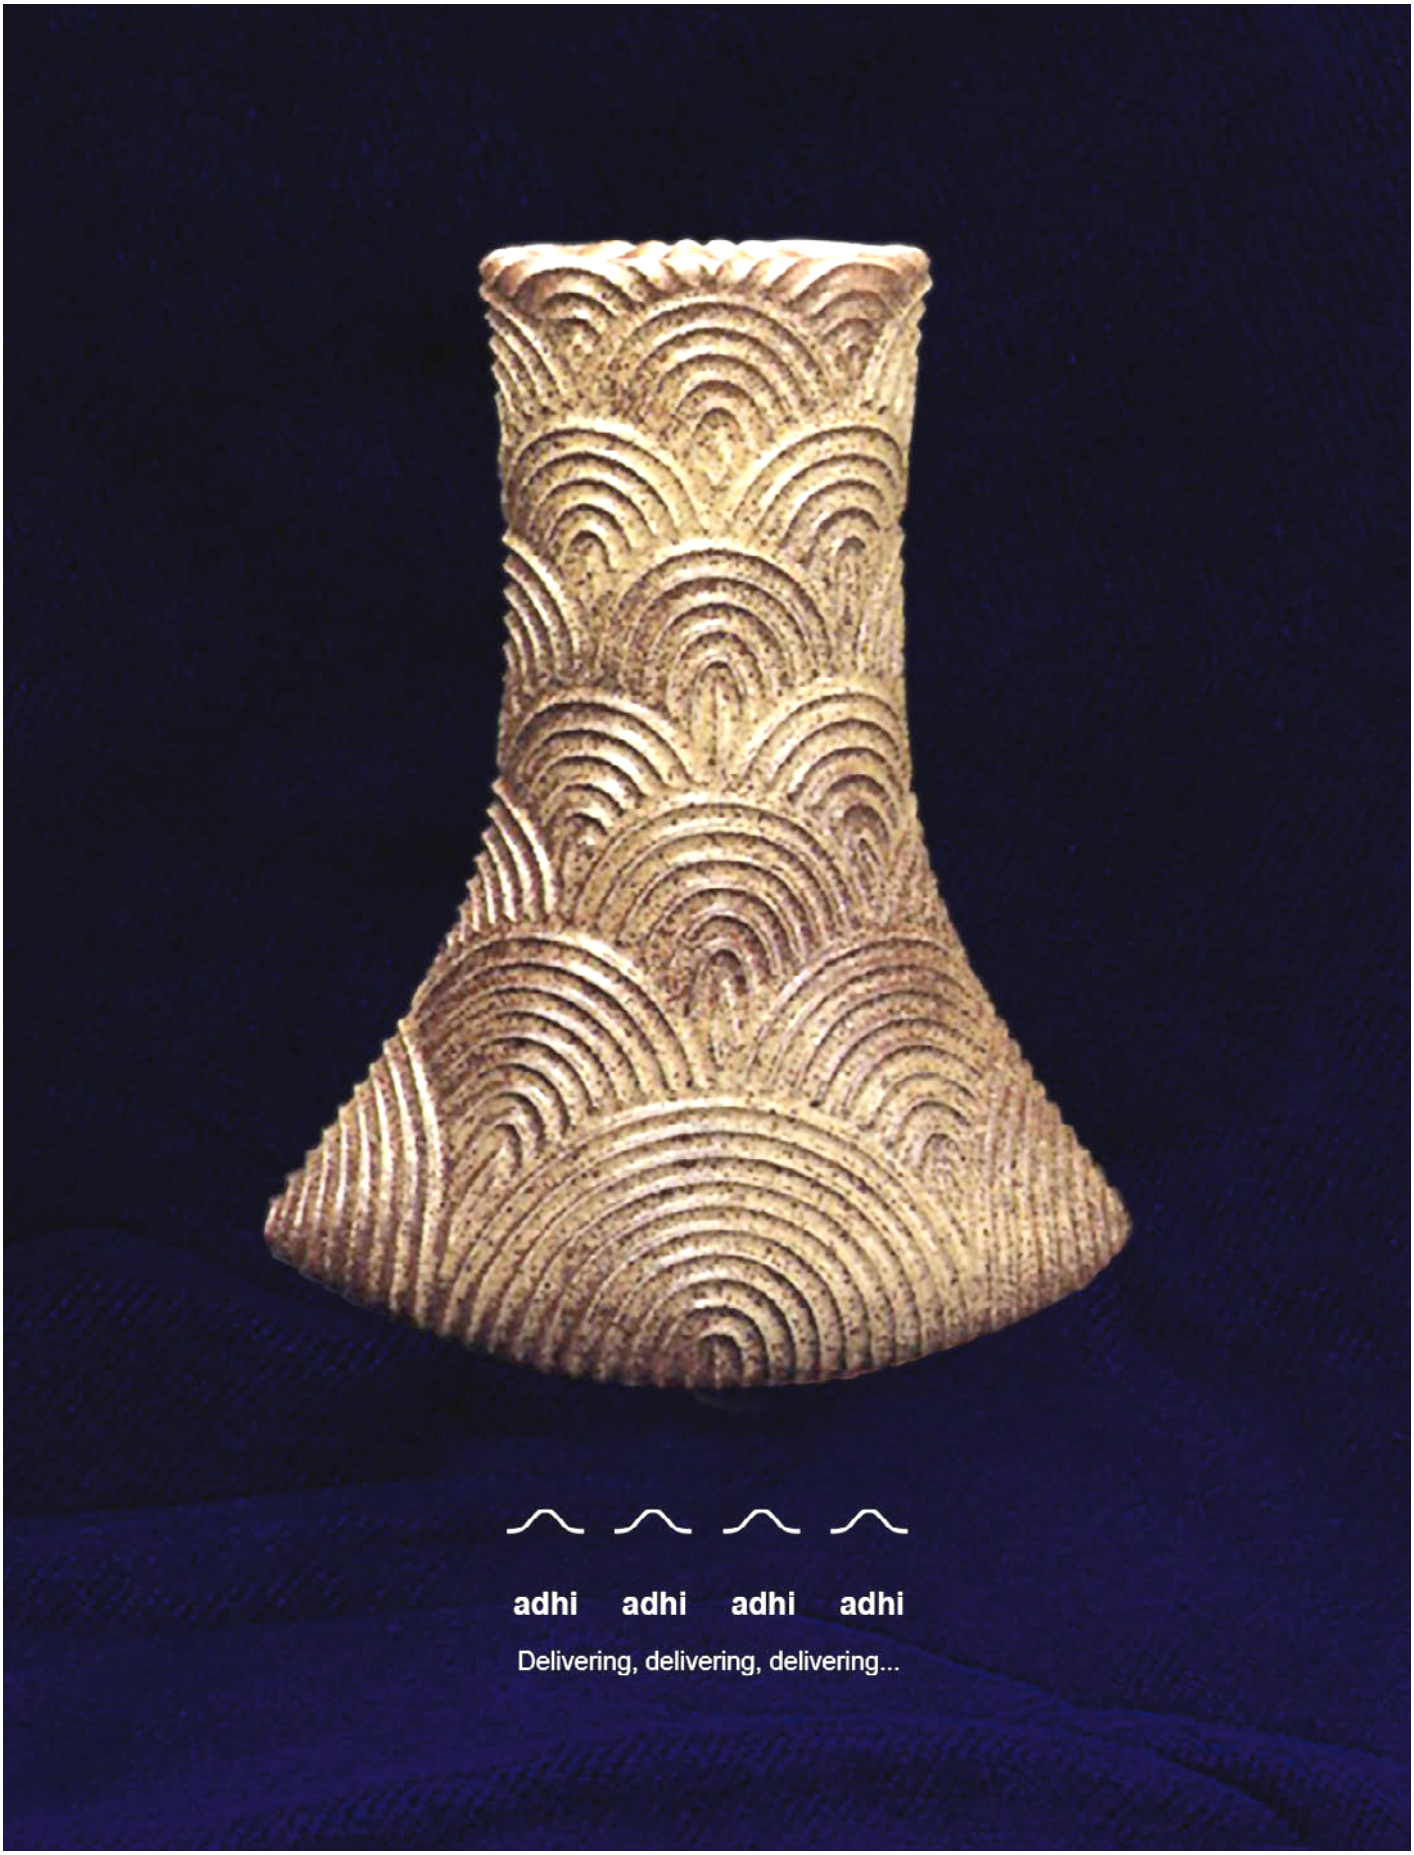
A matching tablet fragment reads: *kar Tridasa Tridasa cakra Indra kar • asu-as ra aiva* , meaning "Works (of) 30 Resonances... (of) the era (of) Jupiter's works, the one for life, granting eternity..." (p. 130). A third tablet from Yonaguni reads: *asu-as si Karrah kar ra-as Tridasa Tridasa adhi-as ra-as raua-as ra Kundalini • Indra Kundalini •* , meaning "For life: your Creator, works for granting 30 Resonances, 30 Resonances... for delivering for granting, granting Kundalini (of) the one, Jupiter, Kundalini (of) the one..." (p. 131).



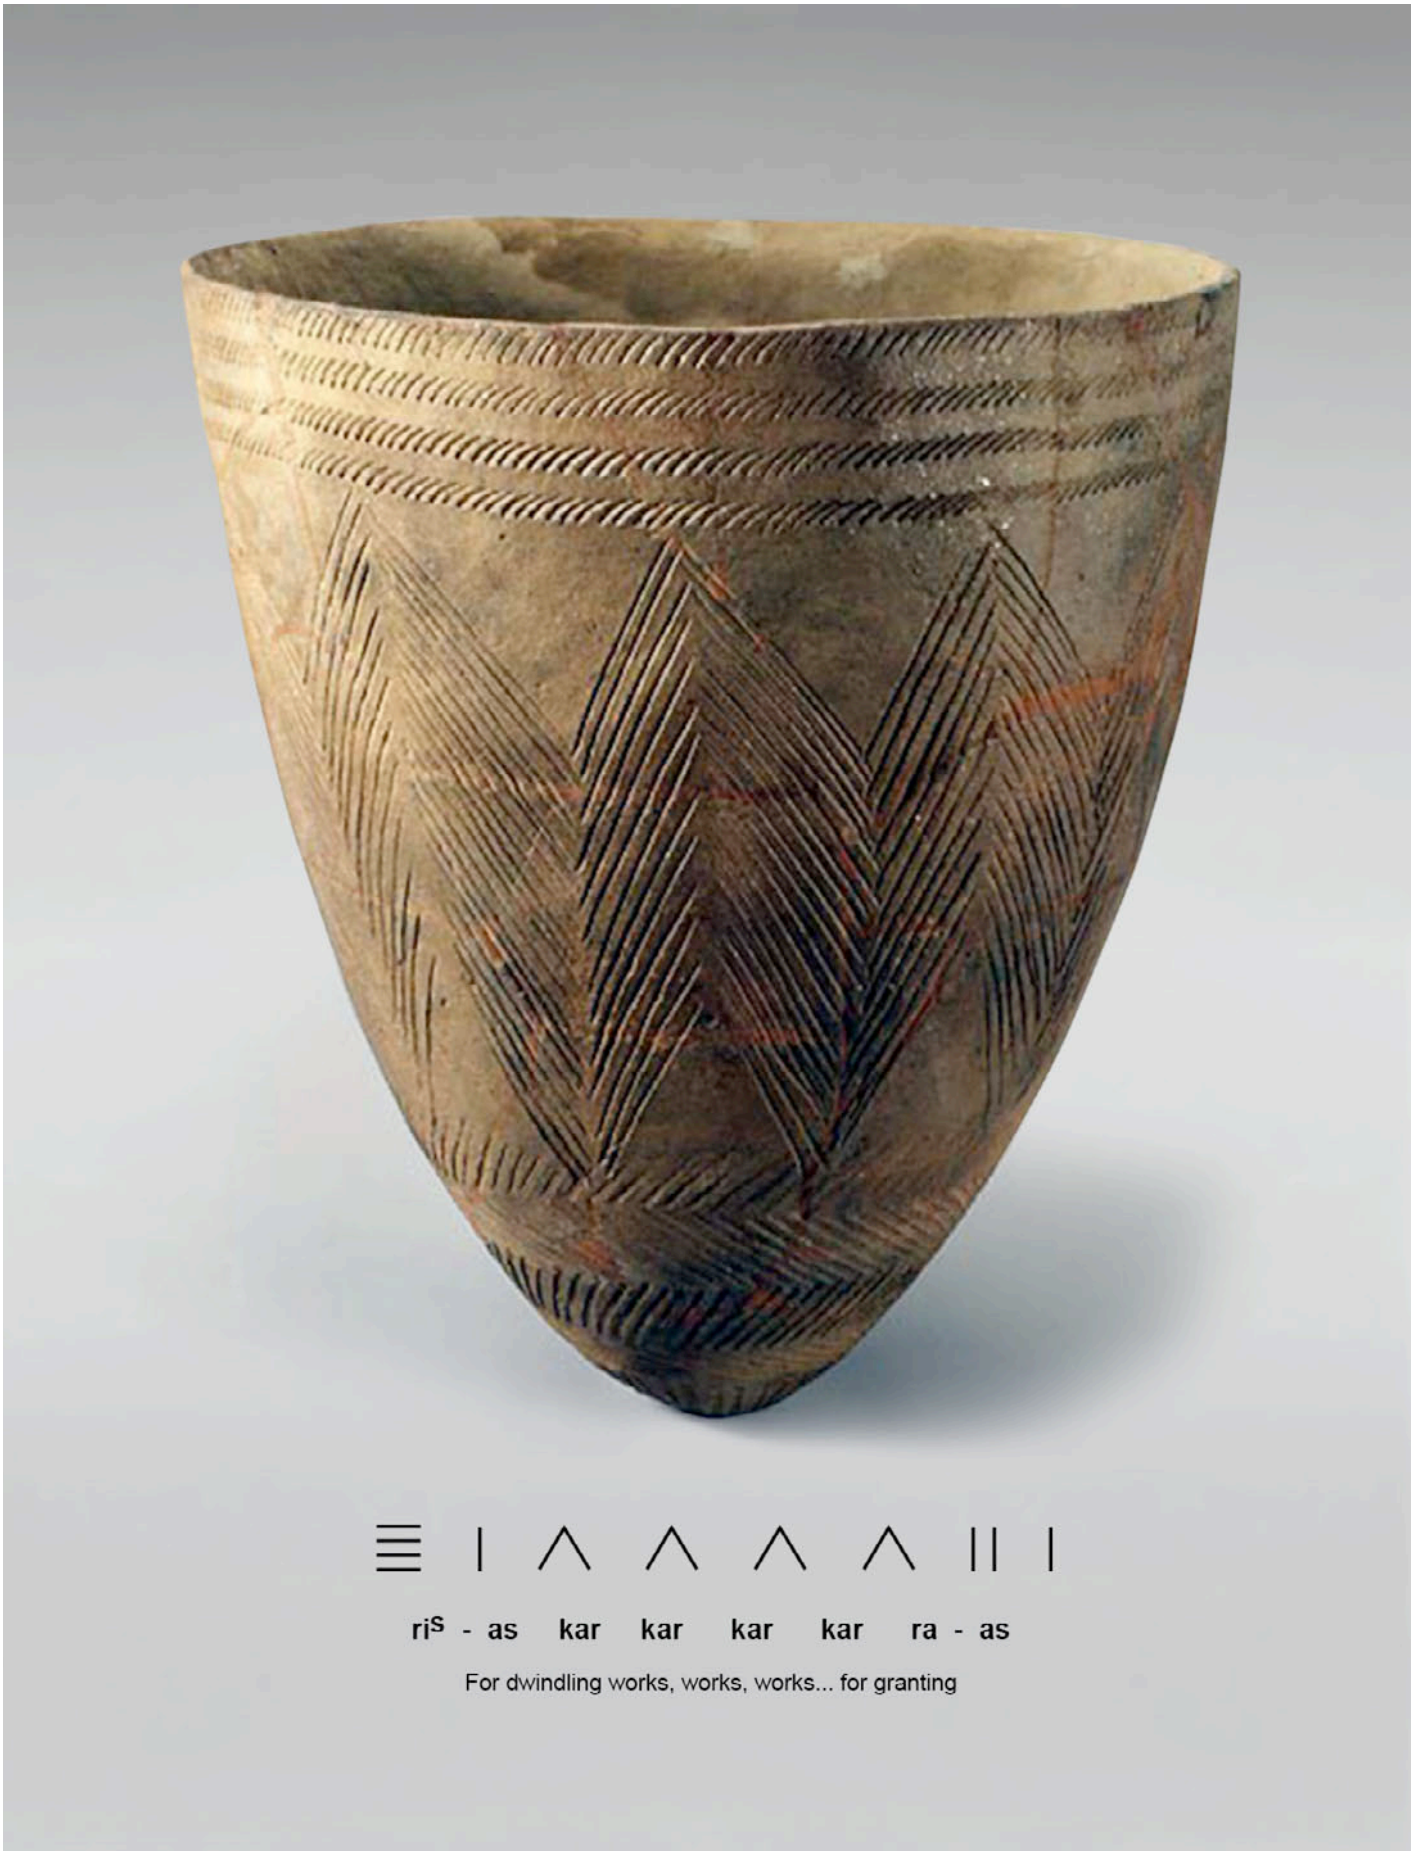
For millennia, the Jomon culture of present-day Japan and Korea built their villages *with multiple high-rise buildings supported by paired rows of ~2m wide tree trunks likely exceeding eight stories in height*, as exemplified at the later Neolithic archeological sites of Sannai-Maruyama, dated at ~5,000bp.[2]



The submerged megalithic city of Yonuguni is a Paleolithic Jomon building complex that also displays pairs of ~1m postholes. The Sanskrit Jomon builders also crafted unusual ceramic *dogu* figurines, which have the appearance of pressurized deepsea diving or spacesuits. One fine example displays incised hieroglyphs that read: *ra as-mi-is ra as-mi-is* , meaning "Granting for synchrony, granting for synchrony... " (p. 132).



A Jomon vase overtly displays the configuration of standing waves to signify a simple repeating mantra: *adhi adhi adhi* , meaning "delivering, delivering, delivering..." (p. 133). This design closely replicates glyph texts engraved on the megalithic walls of Gavrinis passage chamber in present-day Brittany, France.[3] Fragmented examples of fine Jomon pots with pointed bottoms were also excavated, with glyphs reading: *ris-as ris-as kar kar kar ra-as ra-as* , meaning "for dwindling..., works, works... for granting..." (p. 134-135).



Indra aśu - as ra aiva
Jupiter: for life, granting eternity...
upama Tridaśa asu - as cakra
the highest 30 Resonances... for life (of) the era...
cakra Tridaśa - as r^a u^a - as kar ra - as kar ra - as aiva aiva
the era for Thirty Resonances, for roaring works for granting, works for granting eternity, eternity...

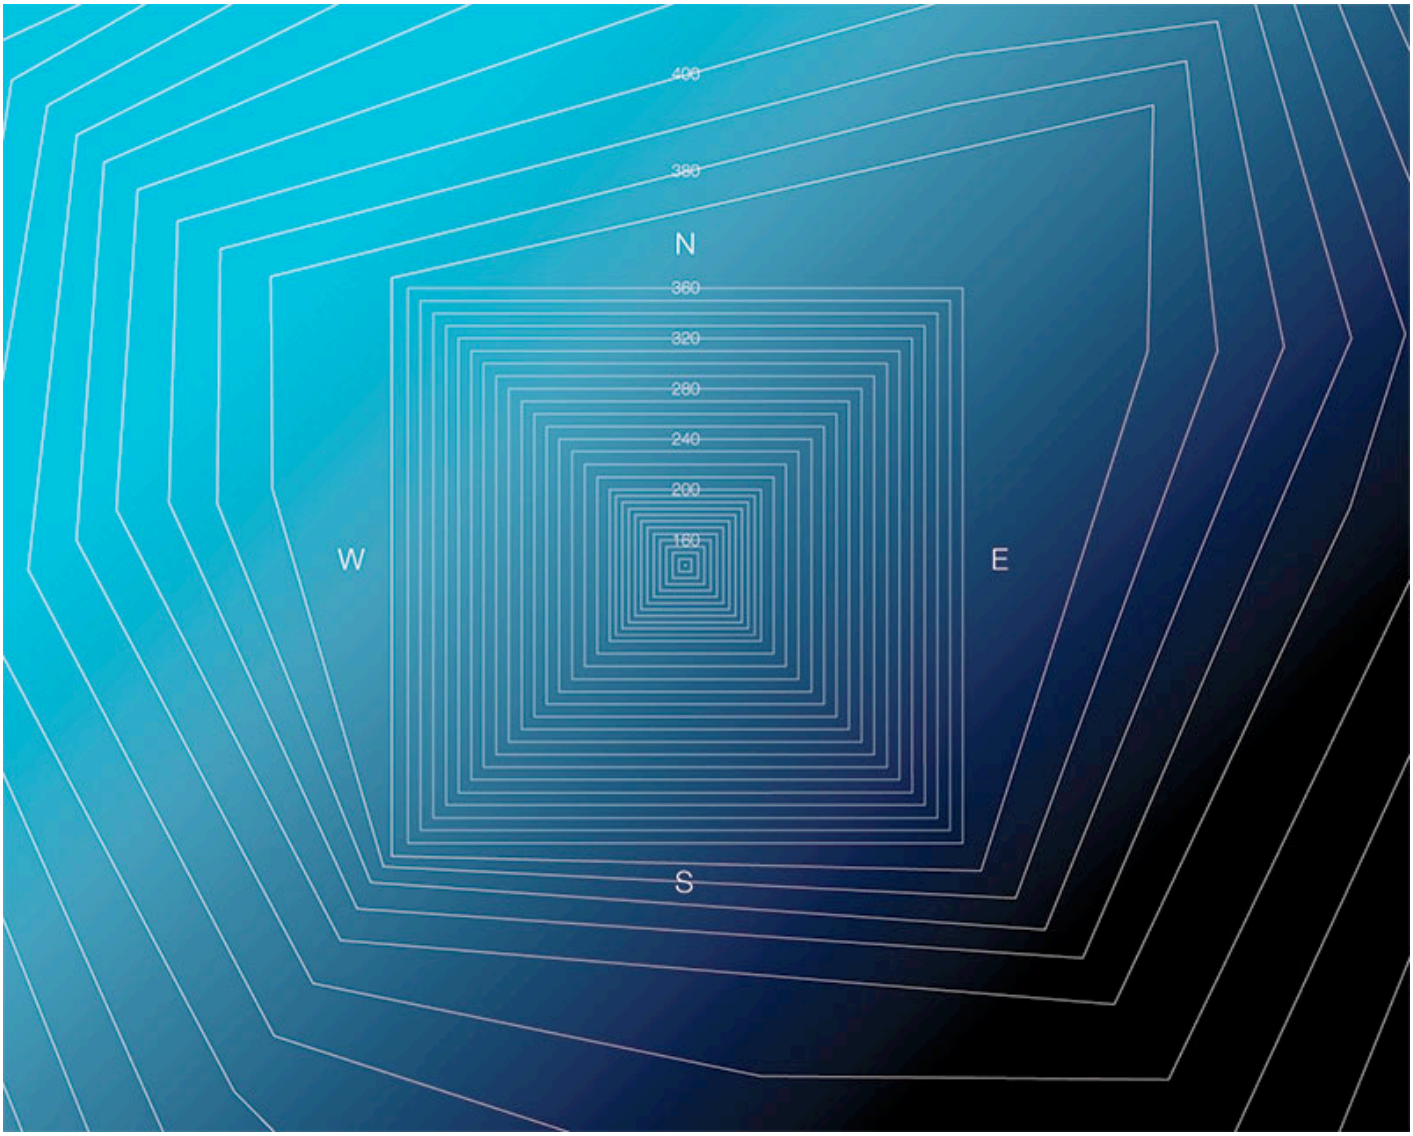
kar Tridaśa Tridaśa cakra Indra kar • aśu - as ra aiva
Works (of) 30 Resonances, 30 Resonances... (of) the era (of) Jupiter's works, the one for life, granting eternity...
raua ra cakra kar ra - as kar ra - as aiva aiva
Roaring granting, the era's works for granting, works for granting eternity, eternity...

as - aśu si Kar - ra^h
For life: your Creator,
kar ra - as Tridaśa Tridaśa
works for granting Thirty Resonances...
adhi - as ra - as r^au^a - as
For delivering for granting, for roaring...
ra Kundalini • Indra Kundalini •
granting Kundalini (of) the one, Jupiter, Kundalini (of) the one...

ra as - mi - is ra as - mi - is
Granting for synchrony, granting for synchrony...

adhi adhi adhi adhi
Delivering, delivering, delivering...

ri^{S} - as kar kar kar kar ra - as



For dwindling works, works, works... for granting

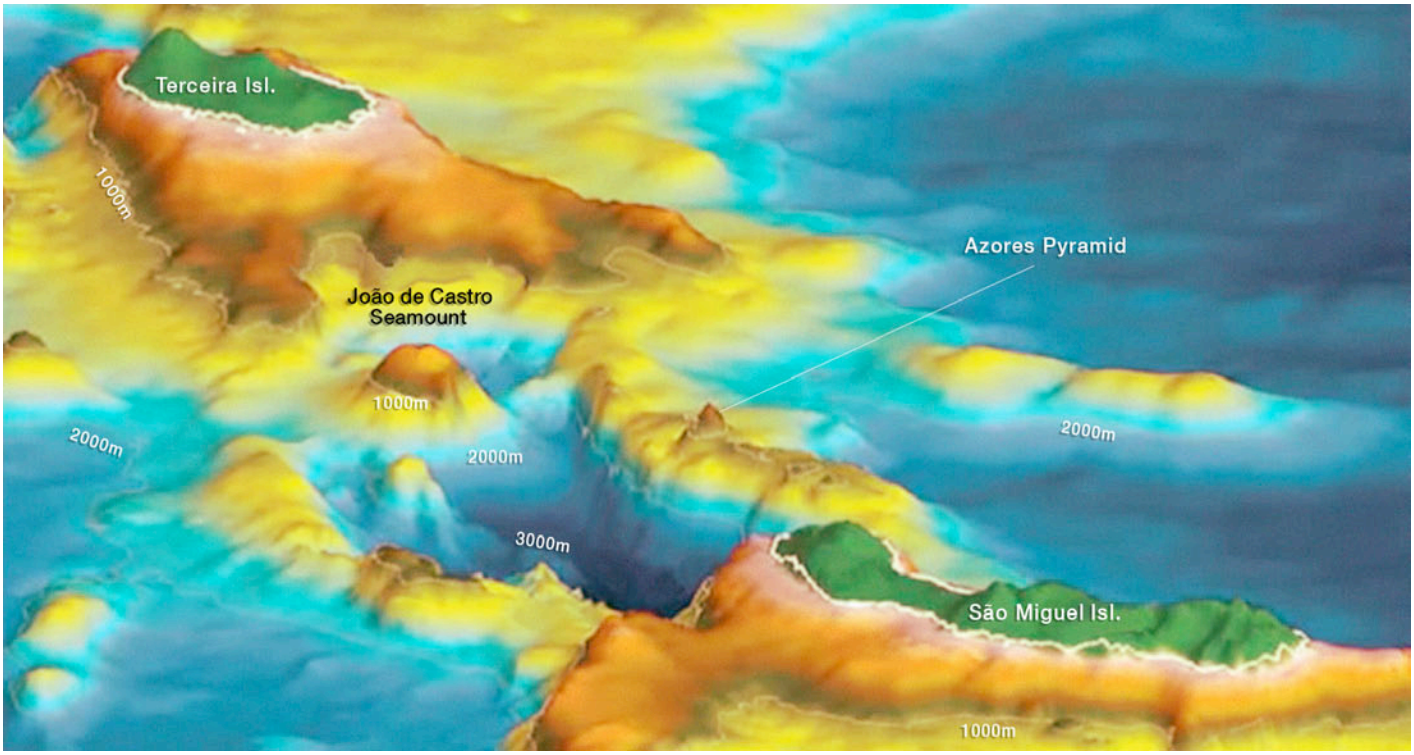
ri^{S} - as kar kar kar kar ra - as

For dwindling works, works, works... for granting

An impressive new discovery in the Azores Islands occurred in early May 2013, and was announced to worldwide media coverage on September 19th. This unusual discovery took place by sheer accident. When local yachtsman Diocleciano Silva was deep-sea fishing between São Miguel and Terceira Islands he noticed a perfectly geometric formation on his high-accuracy depth-finder device. *Silva's video of the odd sonar data reveals a large pyramid with 4 perfectly flat faces like those of the Great Pyramid.*

Height estimates for the submerged Azores pyramid provided in *every* article on the discovery claim a figure of 60m,[4] which is suspiciously inaccurate in light of the original high-resolution depth-finder data provided as evidence (composited above). Clearly, the depth-finder data displays the base of the pyramid sitting on a small level plain at 360' below sea level. The apex of the pyramid is shown at just 136' below sea level, providing for a total height of 224' (360 - 136 = 224), closer to 70m *–not 60m.*

Why has the global media machine repeatedly published this erroneous information on the exact height of this submerged pyramid, contradicting the obvious evidence presented?

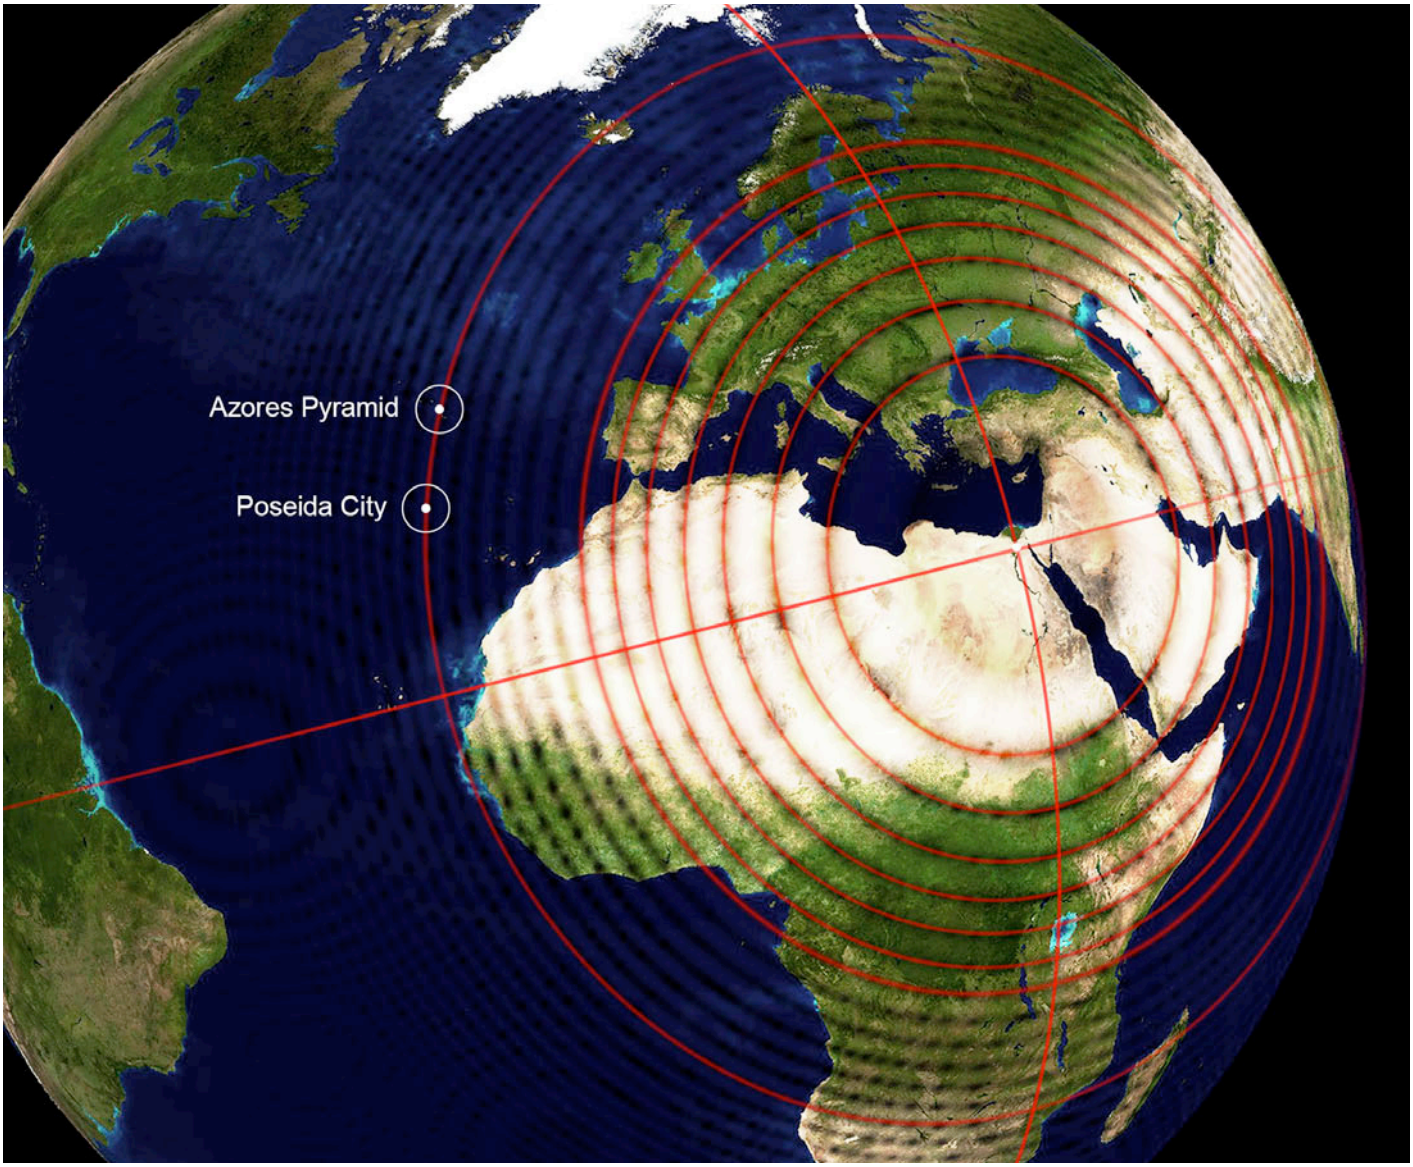


Obfuscation of the actual height of the sunken Azores pyramid is designed to hide its close relationship and psychoacoustic calibration to the Great Pyramid of Giza, Egypt. Near 74m in height, the Azores pyramid is *half the original height of the Great Pyramid, at 148m.* In addition, the Azores Pyramid is the same height as the Teotihuacan Pyramid in present-day Mexico, *and also appears to closely match the height of the newly discovered Hummingbird Pyramid in La Maná, Ecuador!*

Furthermore, the Azores Pyramid is $^{1}/_{3}$ and the Great Pyramid is $^{2}/_{3}$ the height of the Bosnian Pyramid of the Sun, at 220m. Such perfect proportional relationships displayed by ancient architectural masterworks located on various continents present stunning implications for the global networking and spacetravel capabilities of the Atlantean civilization. The World Map Stone from the La Maná pyramid, Ecuador accurately presents global coastlines with sea levels consistent with a late Pleistocene timeframe for the construction of the Azores Pyramid, La Maná pyramids, Bosnian pyramids and Gunung Padang.

The many Paleo-Sanskrit pyramids now being discovered at these new archeological sites functioned as an infrasound network displaying geopositioning and angular dimensions for harmonic resonance with the 1.45 Hz base frequency of the Great Pyramid. The Azores Pyramid was designed to resonate at a 3 Hz fundamental frequency, being the first harmonic above 1.5 Hz, while the Bosnian Pyramid of the Sun is calibrated to the 0.73 Hz subharmonic. *All of these structures were built for biorhythmic synchronization at precisely calibrated wavelengths that correspond to harmonics of planetary infrasound resonance.*

Before the cataclysmic cometary impacts of 12,890bp that initiated the Holocene warming, sea levels were several hundred feet lower than those of today. The Azores volcanic seamounts would also have formed an island chain during that remote period of the Paleolithic, yet comprised a much larger archipelago that once included a series of islands between Terceira and São Miguel Islands.

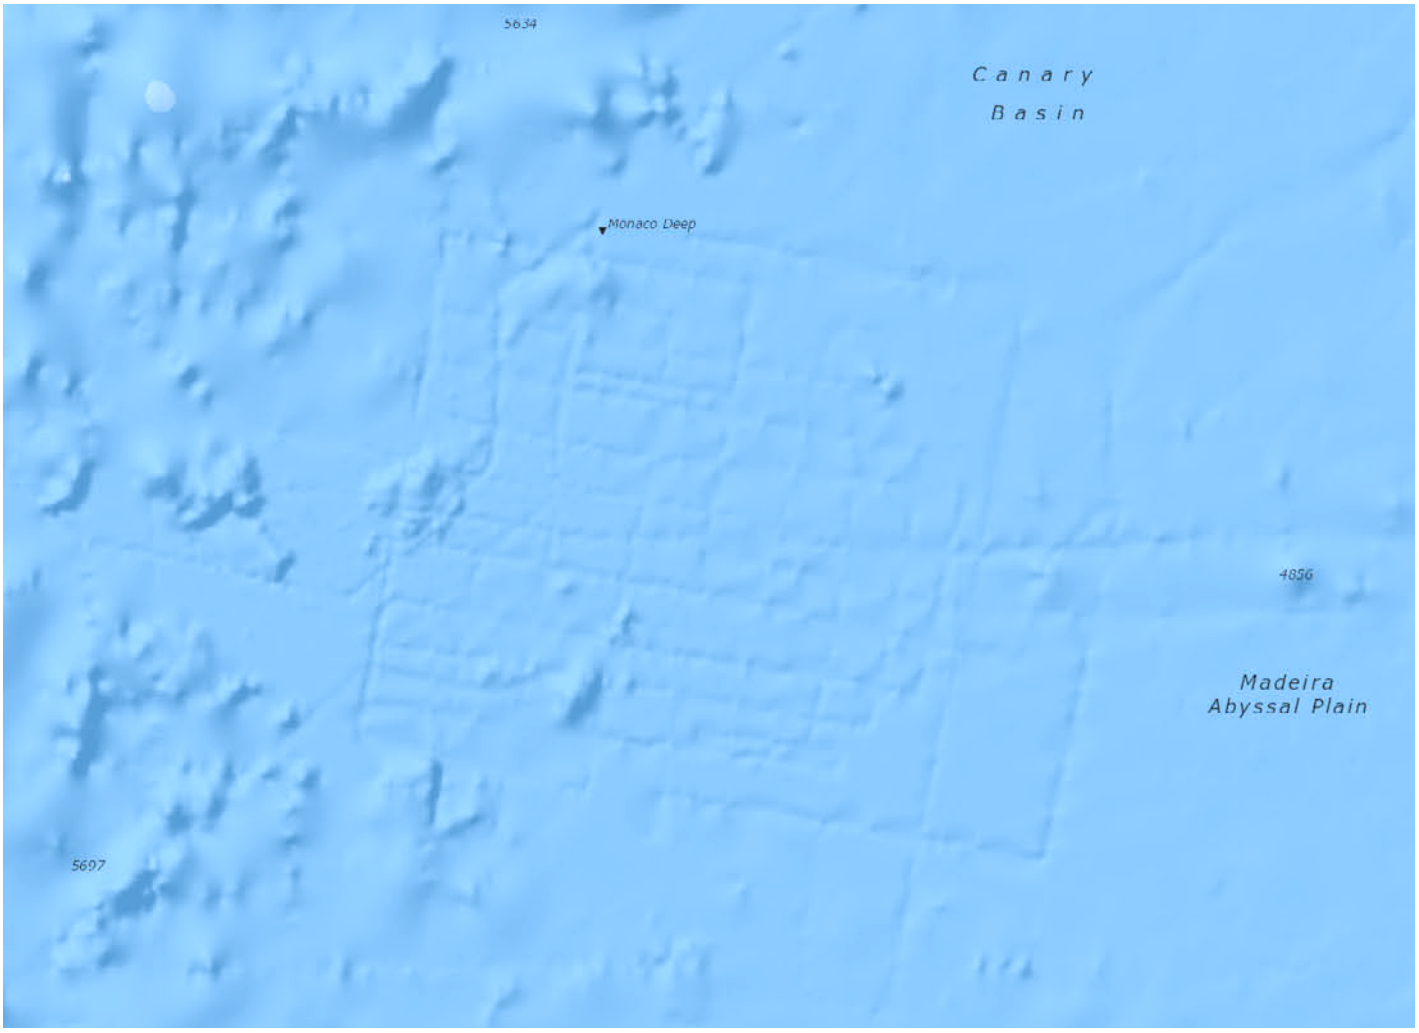


The João De Castro seamount would have formed a round island with high cliffs on the southeastern side, while another narrow island half the size of São Miguel Island was submerged with the remains of a Paleolithic city below the newly discovered pyramid dominating it's northernmost extension (below).

The submerged Azores Pyramid (38.22°N 26.21°W) is 3,284 miles from the Great Pyramid of Giza, Egypt, a distance that comprises 13.19% of the Earth's mean circumference. This great circle alignment corresponds to $^{1}/_{2}$ of Fibonacci #353 x 10^{-72} (26.49...) and passes through another major holy site that is the destination of pilgrimages made from all parts of the world by devotees of the Buddha Dharma.

Buddhism is founded upon the wisdom teachings of Siddhartha Gautama Buddha, whose original shrine[5] was recently rediscovered, over 2,550 years since his departure from this plane of existence. One of many great masters of consciousness to be honored by that name, the Buddha achieved enlightenment through intensive meditation sitting below a Sacred Fig tree in what is now called Bodh Gaya in honor of the Buddha's transcendence of *'samsara'*, the cycle of death and rebirth to which all life in the material world is bound. This special site of enlightenment also expresses a great geometric significance.

Bodh Gaya, India (24.42°N 84.58°E) is located 3,290 miles from Giza, a distance comprising 13.22% of Earth's mean circumference. This auspicious locus is situated along the same great circle alignment that defines the apex of the newly discovered sunken pyramid in the Atlantic Ocean. *Focused infrasound at these sacred distance intervals bioelectrically enhances human health and consciousness.*

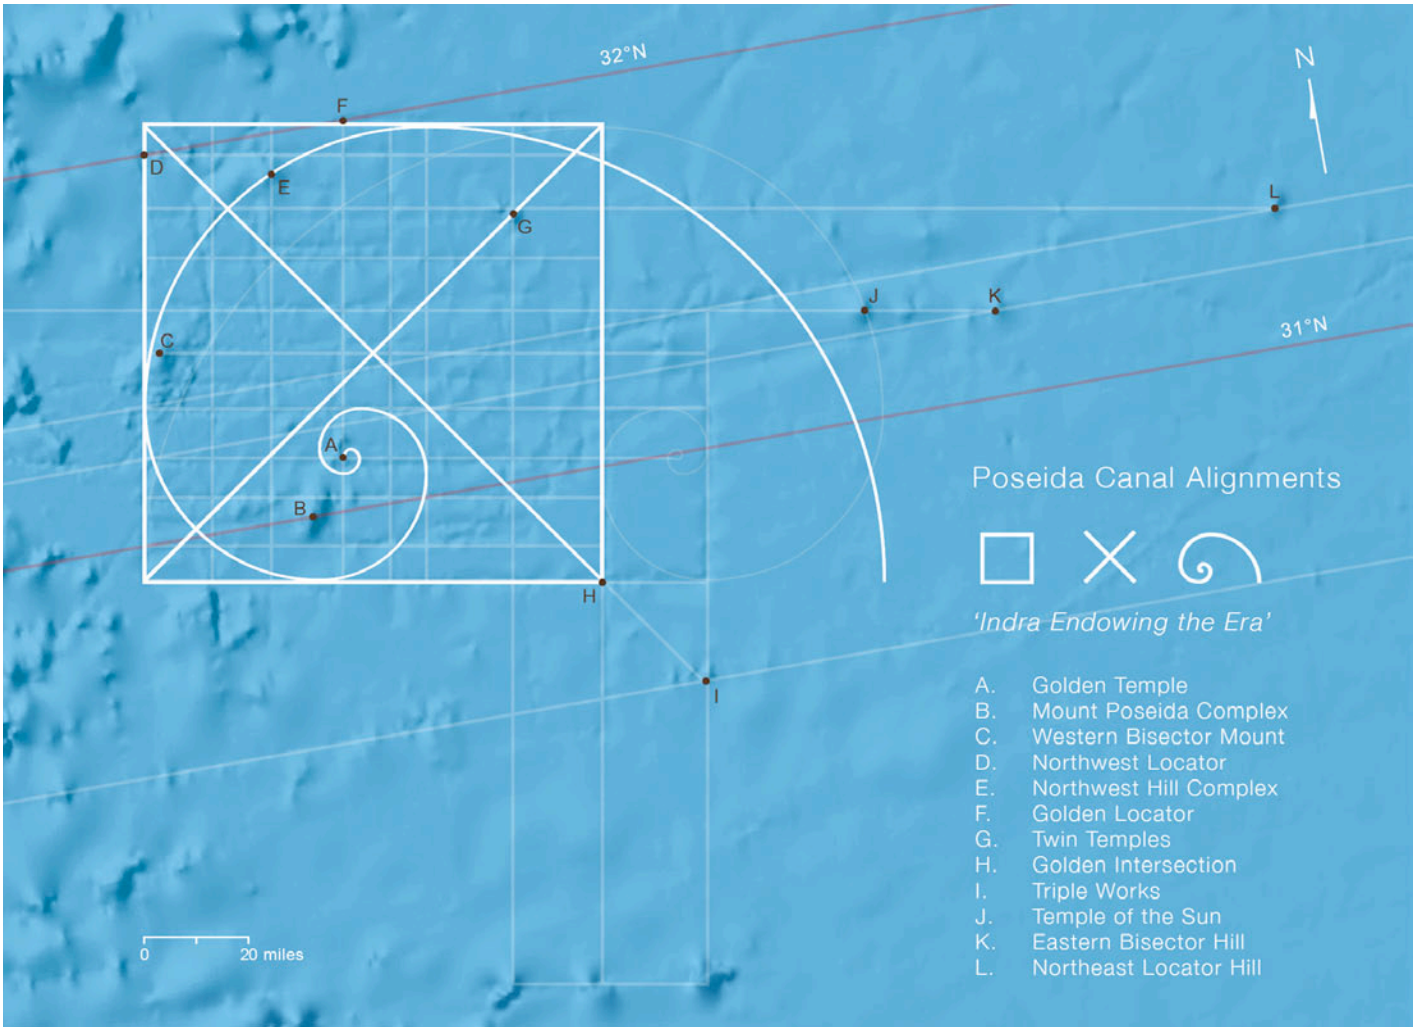


Of course, the giant pyramid in the Azores Islands –*submerged only 45m below sea level*– must have already been identified by both military sonar scans and geo-satellite surveillance several decades ago, yet a local fisherman fortuitously stumbled upon one of the most exciting sites publicized since the major discoveries in Bosnia and Indonesia. The Portuguese military claims to be undertaking investigations that will be made public, but, conversely, *continue to withhold all images and information on the site.*

The 13.2% alignment of the Azores Pyramid directly links the site with another anomalous ocean bottom formation theorized to be the giant grid pattern of a sunken city, rediscovered by British aeronautical engineer Bernie Bamford and published in 2009.[6] Bamford's disclosure accurately identified what must constitute *one of the greatest hydrological projects realized by civilization on Earth*, consisting of a gargantuan grid pattern that must have been identified by military sonar scans decades ago.

This Atlantean megacity on the Madeira abyssal plain extends from 13.0 to 13.3% of the Earth's mean circumference distance from the Great Pyramid. This geoposition conforms to the same great circle distance alignment that defines both the submerged Azores Pyramid and Bodh Gaya, India (above).

Such an ancient megacity of truly mind-boggling scale and complexity of planning defies the simplistic explanations given by media sources. A careful examination of the anomalous bathymetric data suggests this mega-structure is comprised of a huge grid-network of canals, *each about 2 miles in width*, that collected and distributed the total volume of at least four major rivers from the western hills.

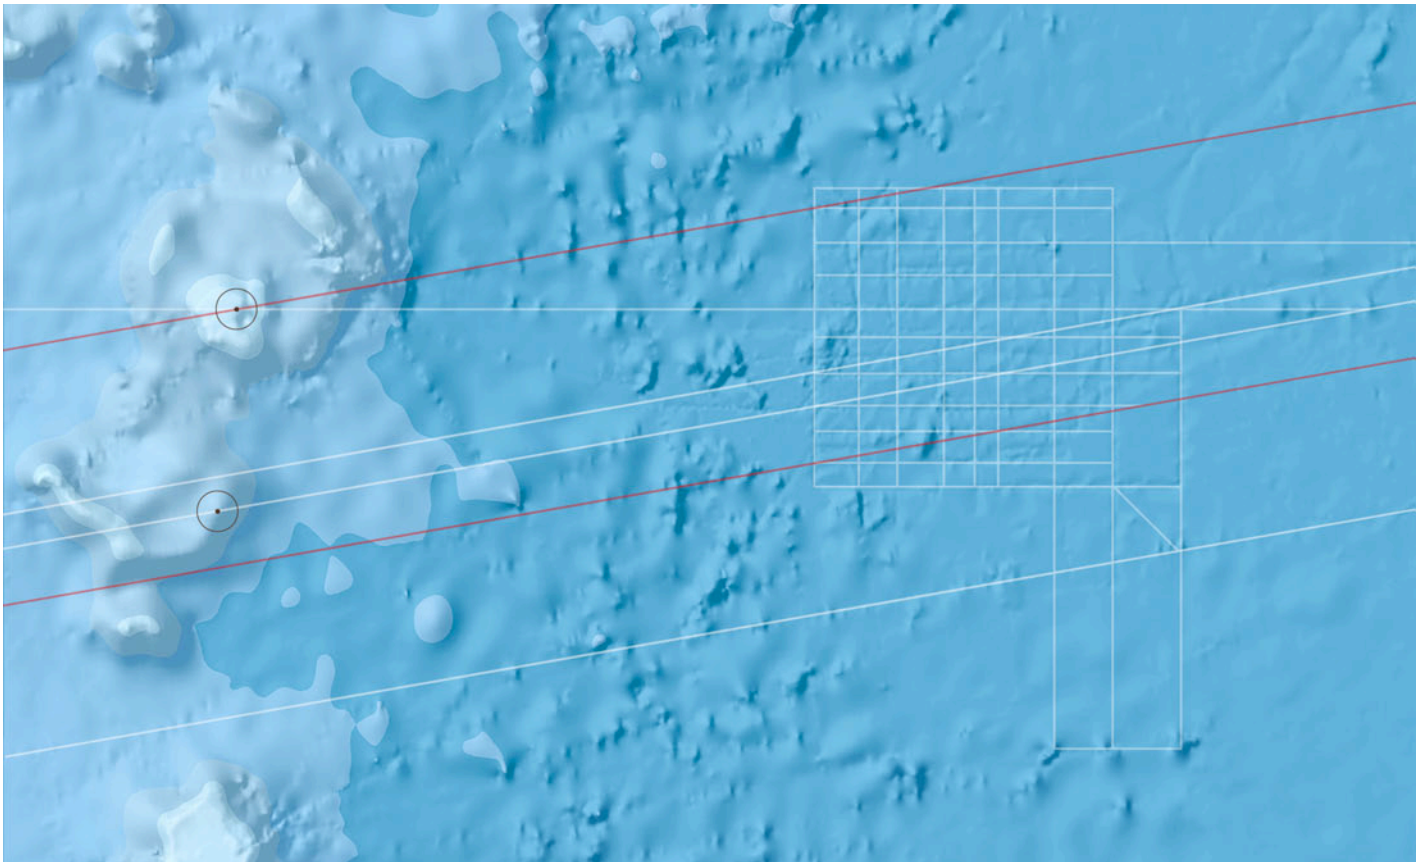


Despite loads of disinformation[7] from Google[8], bathymetry maps of the Canary Basin[9] leave no doubt that a canal-based megacity has been located nearly 3.5 miles down on the ocean floor, in the Monaco Deep (above). The silted landscape of this megacity may have been a lowland coastal flood plain of a once-thriving continent that closely corresponds to Edgar Cayce's descriptions of the comet-stricken Atlantean land of *Poseidia*, later associated in Greek mythology with the deity of the ocean depths, Poseidon.

Prior to its cataclysmic submersion 12,890 years ago, this sunken Paleolithic city appears to have been located in the southeast of the Atlantic continent, and was apparently designed around a giant Golden Rectangle of approximately 80 x 100 miles. Once enclosing hills and low mountains on a coastal flood plain, the basic shape of the canal grid is an 80 x 100 mile rectangle that encodes a language reference.

The square has been identified as the Paleo-Sanskrit glyph for the deity *Indra*, representing the giant planet Jupiter that was venerated for its amplification of 33 frequencies of planetary infrasound resonance. The pyramids' infrasonic transmissions were transduced by all electrical devices *and even spacecraft.*

A complex set of Fibonacci features embedded in the hundreds of miles of aligned canal works encode a Golden Rectangle enclosing 8,000 square miles, with an inset Golden Spiral that links many sacred temples apparently constructed atop existing mountains, reflecting a similar refaçading of the landscape witnessed in Bosnia, Indonesia and Ecuador. The Canary Basin city of Poseida was designed with canals loosely defining a grid pattern based on 20 x 20 mile blocks that together form a 4 : 5 rectangle.



The site must have been carefully planned by aerial surveillance to embed a set of distinct geographical alignments that become noticeable when the north latitude lines of 31° and 32° are overlaid. The series of significant geometric alignments and relationships follow previously observed Fibonacci patterns.[10]

A low mountain within the bounds of this Atlantean megacity is identified here as Mount Poseida, situated 3,300 miles from Giza, *comprising a great circumference distance of 13.26% that corresponds to $^{1}/_{2}$ of Fibonacci #353 x 10^{-72} (26.49...).* The perfect placement of this peak at exactly 31.00°N suggests the site may be a refaçaded mountain temple complex that represents a very promising target for investigation by deepsea ROVs. Precision alignments among these sites, marked A through K, have been identified in a preliminary mapping of the sunken city of Poseida (above), with particular names for ease of reference:

Site	Ocean Floor Feature	Geoposition	Dist. to Giza	Circ. %
A	Golden Temple	31.172°N 24.66°W	3,289 miles	13.21%
B	Mount Poseida Complex	31.00°N 24.79°W	3,300 miles	13.26%
C	Western Bisector Mount	31.463°N 24.126°W	3,254 miles	13.07%
D	Northwest Locator	32.00°N 25.10°W	3,301 miles	13.26%
E	Northwest Hill Complex	31.88°N 24.73°W	3,282 miles	13.18%
F	Golden Locator	32.00°N 24.514°W	3,268 miles	13.13%
G	Twin Temples	31.66°N 24.00°W	3,224 miles	12.95%
H	Golden Intersection	30.706°N 23.926°W	3,255 miles	13.08%
I	Triple Works	30.42°N 23.67°W	3,245 miles	13.04%
J	Temple of the Sun	31.266°N 22.98°W	3,191 miles	12.82%
K	Eastern Bisector Hill	31.20°N 22.55°W	3,167 miles	12.72%
L	Northeast Locator Hill	31.37°N 21.52°W	3,105 miles	12.47%

The Golden Rectangle's Northwest Locator is 3,301 miles from Giza, also at the resonant 13.26% distance from the Great Pyramid. *Being situated at precisely 32.00°N, the distance from the Northwest Locator to Mount Poseida at 31.00°N comprises exactly 1° of latitude.* A Golden Spiral radiating from the apex of the Golden Temple passes through the Western Bisector Mount and the Northern Hill Complex.

The design of the entire city of Poseida represents 3 Paleo-Sanskrit glyphs overlaid onto one another to give the short phrase: *Indra ta cakra* –"Jupiter endowing the era." Imitating the turning wheel *cakra* glyph, the spiral glyph variation also signifies 'the cycle, the era', used here to reference Jupiter's beneficial amplification of planetary infrasound resonance transduced by Poseida's stone temples. Even though the era of Indra's endowing ended catastrophically, Poseida's gigantic set of canal alignments now beset on the floor of the Canary Basin still convey their embedded hieroglyphic message.

This basic phrase is echoed throughout Paleo-Sanskrit texts from every continent of the antediluvian world. Exaltation of beneficial infrasonic influences from the planet Jupiter is the most prevalent subject of hieroglyphic inscriptions on stone tablets from Caria, Italy and the Illinois Cave archive.[11] One brief example of this sophisticated sentiment reads: "In accordance with the era endowing, workings of benefit are dwindling, 30 resonances initiating benefit, your works rescinding, deities diminishing the good."

Edgar Cayce had revealed the complex canal-works of Poseida were constructed as a resonant water purification system utilizing quartz and calcite crystals in the bedrock for their piezoelectric transduction of infrasound. Ultra-low frequency resonance focused by the Orion pyramids of Giza, Egypt is effectively converted into a localized electromagnetic field that once purified water flowing through the canal works, bioelectrically cleansing the bodies of barefoot initiates who made direct contact with the sacred stone.

The precise 10° offset angle of Poseida's Golden Rectangle displays perfect alignment to what was once among the highest mountain peaks on the Atlantean continent (above). Rising dramatically to a maximum height that now reaches 220' below sea level, the Irving Seamount was skillfully indicated by Poseida's offset alignment as a major sacred center located at the heart of the sunken landmass. This broad mountaintop likely hides another monumental complex of piezoelectric temples that cannot be easily discerned in the low-resolution bathymetry data now being made available to the public.

The Irving Seamount (32.00°N 28.06°W) is 3,472 miles from the Great Pyramid, comprising a great circle distance of 13.94% of Earth's mean circumference. The 14% resonant distance band passes right through the Irving Seamount, Cruiser Tablemount and other mountaintops crossing major latitude lines.

While ancient literary references to the previous global civilization of Atlantis are limited to the few well known passages of Plato's "Dialog of Timaeus and Critias", a wealth of information has also been obtained through another very surprising source: the psychic readings of trance medium Edgar Cayce. His many decades of past life readings provided for thousands of clients contain an untapped density of verifiable information that may provide a relevant context for the Canary Basin sunken city structures discovery (Reading 288-1):

[I]n the fair country of [King] Alta, or Poseidia proper, when this entity was in that force that brought the highest civilization and knowledge that has been known to the Earth's plane.

The gargantuan scale of the canal-works of the Canary Basin megacity represents an extremely high level of technological advancement that aligns closely with the abundance of detailed information given by Edgar Cayce to hundreds of individuals concerning their past lives during the Atlantean Era. One particular session in May of 1932 revealed details of the majestic canal works of the hilltop capitol city of *Poseida* that once overlooked the waters of *Parfa* (Reading 364-12):

Q: *Describe briefly one of the large cities of Atlantis at the height of its commercial and material prosperity, giving name and location.*

A: This we find in that as called Poseida, or the city that was built upon the hill that overlooked the waters of Parfa, and in the vicinity also the egress and entrance to the waters from which, through which, many of the people passed in their association with, or connection with, those of the outside walls or countries. This we find not an altogether walled city, but a portion of same built so that the waters of these rivers became as the pools about which both sacrifice and sport, and those necessities for the cleansing of body, home and all, were obtained, and these –as we find– were brought by large ducts or canals into these portions for the preservation, and yet kept constantly in motion so that it purified itself in its course; for, as we find, as is seen, water in motion over stone or those various forces in the natural forces purifies itself in twenty feet of space.

In the type of the buildings, these were much in that of tiers –one upon the other, save principally in the temples– that were about the sacred fires where these were offered, the sacrifices that were gradually builded by the people in their attempt to appease those forces in nature, and from which we find there came all those forms in the various portions of the earth in which these were carried in their necessary channels, to make for the variations in its surroundings and the conditions thereunto. In this temple, we find these of large or semi-circular columns of onyx, topaz, and inlaid with beryl, amethyst, and stones that made the variations in catching the rays of the sun. Hence a portion of same became as the sun worshippers in other portions, from which there were an egress of the peoples.

Cayce also identified the intercontinental travel and communication between various regions of a global Paleo-Sanskrit society with a single hieroglyphic language used worldwide, and a well-established global trade network with a large system of storehouses maintained in various lands (Reading 294-148):

> There were also established storehouses, that would be called banks in the present, or places of exchange, that there might be the communications with individuals in varied lands; for even in this period... was there the exchange of ideas with other lands, as of the Poseidian and Og, as well as the Pyrenean and Sicilian, and those that would now be known as Norway, China, India, Peru and American. These were not their names in that particular period, but from whence there were being gathered a portion of the recreations of the peoples; for the understandings were of one tongue! There had not been as yet the divisions of tongues in *this* particular land. This [language division] was yet only in the Atlantean or Poseidian land.
>
> With the gathering of these people and places, there began the erecting of the edifices that were to house not only the peoples, but the Temple of Sacrifice, the Temple of Beauty –that *glorified* the activities of individuals, groups or masses, who had *cleansed* themselves for service.

Bioelectrical cleansing processes employed in these temples involved drinking Soma –sacred colloidal waters enhanced with ultra-fine gold and silver nanoparticles that effectively amplify the electromagnetic fields of the human body.[12] While modern scientific investigation has clarified the physics of the ancient pyramid technologies, the life's work of Edgar Cayce provides the crucial names of leaders, locations and specific circumstances that once existed in ancient times. *The stark accuracy of Cayce's work continues to be proven by major archeological discoveries now taking place in every part of the world.*

The many known pyramid-building cultures of the Andean mountain range of Ecuador, Peru and Bolivia were preceded by the great Paleo-Sanskrit culture, and the existence of this predecessor is evident throughout those lands. Giant temples like Saqsaywaman in Cuzco, Peru are much older than previously suspected, having been built by an older civilization closely aligned with Poseidia. Psychoacoustic ceramic vessels were perfectly tuned in the thousands by every Andean culture, replicating the jaguar's purr, and the wingbeats of hummingbirds.

The psychoacoustic soundscapes of Andean ceramics can be traced back to the deeper cultural heritage of a global Paleo-Sanskrit motherculture. The psychoacoustic tuning and coherent physiological effects of Andean ceramic whistles were completely unknown during Edgar Cayce's lifetime, yet information transmitted in his readings accurately describe the ancient replication of nature's sounds (Reading 38-1):

> [I]n the land known as Poseidia, in the temple... sounds of all natures were produced upon the instruments of the day. While this peoples, as to material conditions, reached even a higher state of application of material things (hence called civilization) than even of the present day; yet the application towards material surmounted that toward the spiritual; though a form of worship was maintained through the period...

Despite the Atlantean civilization having achieved the highest level of technological advancement on Earth since the far removed Lemurian Age, Cayce's description also relates the great classism and materialism of that powerful world nation that was brought low by cometary impacts 12,890 years ago.
Astounding technical achievements of this long-lived civilization are evident in monumental constructions worldwide that enabled the *infrasonic transmission of power and audio-video data* (Reading 813-1):

> Before that we find the entity was in that called or known as the Atlantean land, during the periods when there was much turmoil and strife from the rejections by many of those laws and tenets of One; when the upheavals began that made for the egress of many from that city of the Poseidon land –or in Poseidia the entity dwelt among those where there was the storage, as it were, of the *motivative* forces in nature from the great crystals that so condensed the lights, the forms, the activities, as to guide not only the ship upon the bosom of the sea but in the air and in many of those now known conveniences for man as in the transmission of the body, as in the transmission of the voice, as in the recording of those activities in what is soon to become a practical thing in so creating the vibrations as to make for television –as it is termed in the present.

Cayce's Life Readings for inventor Nikola Tesla identified his prior incarnation in the land of Poseidia during the reign of the King Alta, before the third and final destruction of Atlantis. Readings given by Cayce in 1925 and 1934 directly linked Tesla's advanced knowledge of electromagnetism and Vedic science principles to a previous life in Poseidia as Ax-tell, of the House of Ode (Readings 487-4, -17):

> In the [incarnation] before this we find in the land of the Poseidians when the rule was in the house of Ode, and the entity then gave to that people the manner of use of the universal forces as may be applied in the way of mechanical construction in a physical plane. The entity was then known as Ode...
>
> The entity came from the Atlantean land into Egypt when there were those periods of reconstruction in the land, and from those turmoils and strifes there arose much that made for individual and group development –and the attempt of those in the experience to foster or disseminate same; those things that were good... The entity came then, in the name Ax-tell, from those forces that were in charge of the Law of the One.

Atlantean applications of the universal forces were detailed by Cayce in an unrelated 1933 reading that included technical information concerning the advanced solid-state structures employed by Atlantean engineers for the purification and rejuvenation of human bodies *by a form of fire that Tesla rediscovered as HHO plasma and effectively applied in his tri-frequency Gravity Motor invention* (Reading 440-5):

[I]t was a period when there was much that has not even been thought of as yet in the present experiences... About the firestone that was in the experience did the activities of the entity then make those applications that dealt with both the constructive and destructive forces in the period... In the center of a building, that today would be said to have been lined with non-conductive metals, or non-conductive stone –something akin to asbestos, with the combined forces of... non-conductors...

The building above the stone was oval, or a dome wherein there could be or was the rolling back, so that the activity of the stone was received from the sun's rays, or from the stars; the concentrating of the energies that emanate from bodies that are on fire themselves –with the elements that are found and that are not found in the earth's atmosphere. The concentration through the prisms or glass, as would be called in the present, was in such a manner that it acted upon the instruments that were connected with the various modes of travel, through induction methods –that made much the character of control as the remote control through radio vibrations or directions would be in the present day; though the manner of the force that was impelled from the stone acted upon the motivating forces in the crafts themselves.

There was the preparation so that when the dome was rolled back there might be little or no hindrance in the application direct to the various crafts that were to be impelled through space, whether in the radius of the visioning of the one eye, as it might be called, or whether directed under water or under other elements or through other elements.

The preparation of this stone was in the hands only of the initiates at the time, and the entity was among those that directed the influences of the [infrasonic] radiation that arose in the form of the rays that were invisible to the eye but that acted upon the stones themselves as set in the motivating forces –whether the aircraft that were lifted by the gases in the period or whether guiding the more pleasure vehicles that might pass along close to the earth, or what would be termed the crafts on the water or under the water.

These, then, were impelled by the concentrating of the rays from the stone that was centered in the middle of the power station, or power house (that would be termed in the present).

In the active forces of these the entity brought destructive forces, by the setting up –in various portions of the land –the character that was to act as producing the powers in the various forms of the people's activities in the cities, the towns, the countries surrounding same. These, not intentionally, were *tuned* too high –and brought the second period of destructive forces to the peoples in the land, and broke up the land into the isles that later became the periods when the further destructive forces were brought in the land.

Through the same form of fire the bodies of individuals were regenerated, by the burning –through the application of the rays from the stone, the influences that brought destructive forces to an animal organism. Hence the body rejuvenated itself often, and remained in that land until the eventual destruction, joining with the peoples that made for the breaking up of the land –or joining with Belial at the final destruction of the land...

As to describing the manner of construction of the stone, we find it was a large cylindrical glass (as would be termed today), cut with facets in such a manner that the capstone on top of same made for the centralizing of the power or force that concentrated between the end of the cylinder and the capstone itself.

As indicated, the records of the manners of construction of same are in three places in the earth, as it stands today: in the sunken portions of Atlantis, or Poseidia, where a portion of the temples may yet be discovered, under the slime of ages of sea water –near what is known as Bimini, off the coast of Florida. And in the temple records that were in Egypt, where the entity later acted in cooperation with others in preserving the records that came from the land where these had been kept...

Cayce's remarkable recounting of the rejuvenatory function of the piezoelectric firestone installations of the Atlantean power system presents several links to sites in other parts of the world where crucial evidence remains undiscovered to the present day. The great depth of the Madeira abyssal plain of the Canary Basin severely limits access to the Poseida canal-city sites, yet other submerged Atlantean structures are also to be found in more accessible locations.

Maritime archeology off the Florida coast has indeed uncovered the megalithic remains of an ancient Atlantean road that has been censored by decades of corporate media disinformation programming. *Just as Cayce had stated in trance, the Bahamas megalithic Bimini Road site was discovered in 1968 –an astounding 35 years after the Sleeping Prophet had made the claim. Cayce also gave the specific year of 1968 for the date when Atlantis would "rise again", although this metaphor is often misunderstood.*

Exploration dives in the vicinity of the primary Bimini Road formation have uncovered a host of other artificially constructed features below depths of 100', including hundreds of coral-encrusted megalithic building blocks, large sets of columns, fluted marble building foundations and further stretches of megalithic roadways that have been exposed from beneath the constantly shifting sandbeds (above).[13]

This closely related group of submerged Paleolithic stone construction sites has grown to include several locations near the Bimini Road, especially at Andros Island, Cay Sal Bank and the Moselle Shoals megalithic platform. Sonar scanning has also discerned a series of rectangular building foundations that apparently comprised an ancient harbor with entirely discernable breakwater formations, as well as multitudes of stone anchors and various megalithic circular structures that likely served as mooring sites.

The geoposition of Bimini also corresponds closely to the Fibonacci-ordered distribution pattern observed at all pyramids, temples and sacred sites worldwide. Bimini Road, Bahamas (25.62°N 79.31°W) is 6,454 miles from the Great Pyramid, comprising 25.93% of the mean global circumference. Focused infrasound rumbling at this resonant 26% great circle distance often perturbs residents in McCalla, Alabama[14] and Ranchlands, Alberta[15] –*and has even induced spontaneous piezoelectric fires in Homosassa, Florida*.[16]

Much of the information recorded in the Akashic field readings of Edgar Cayce concerning the sunken Atlantean lands has been confirmed by underwater scientific exploration in diverse regions of the world. The near-surface Azores Pyramid and Bimini harbor were built by the same culture who masterfully planned and executed the construction of the deeply submerged canal-city of Poseida. The sophisticated technological monuments of our ancestors lay dormant on the continental shelf, awaiting the sudden glaciation that will lower sea levels to expose their magnificence once again, *as Cayce predicted.*

The Guardians' Domain

Field research reveals the Sasquatch to be highly intelligent, primarily nocturnal omnivorous foragers possessing exceptional night vision and living in small, widely-dispersed social groups. This gigantic hominin species stands from ~7–11' in height at adulthood and presents several notable cold-adapted anatomical features; being covered by thick black, brown, auburn or beige fur with facial hair covering the cheeks and forehead, and small nasal orifices that effectively minimize heat loss to endure sub-zero temperatures. The closed nasal structure of Sasquatch also allows fine control of airflow through the nose, enabling a wide range of nasal whistles, snorts and other complex vocalizations including precise mimicry of forest animal sounds, *none of which is reproducible by the human larynx.*

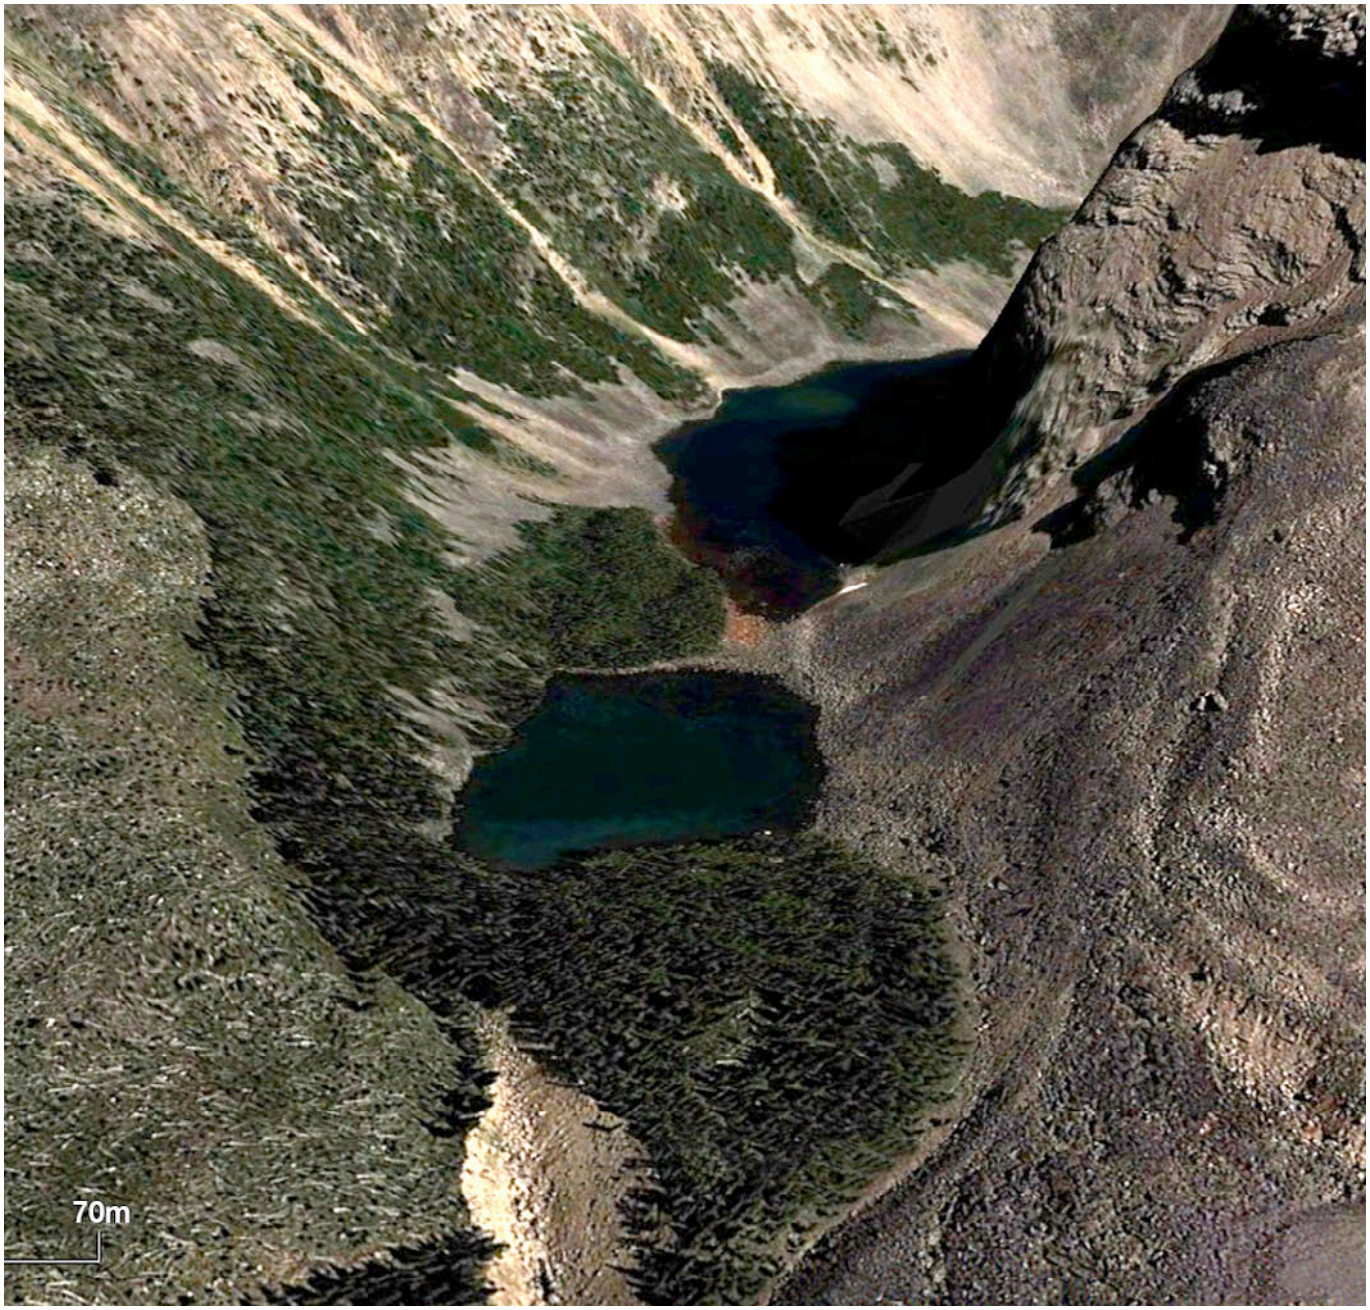
The anatomical morphology of Sasquatch displays a unique combination of human and primate features. Giant footprint casts analyzed by forensic expert J. Chilcutt identified the fine impressions of dermal ridge flow patterns characteristic of an unknown giant bipedal primate.[1] Inline tracks of 12–26" human-like footprints with 4–7' stride lengths have inspired the legendary nickname '*Bigfoot'* (above[2]).

Forensic studies of giant footprint casts from Sasquatch encounters also conducted by Dr. J. Meldrum, professor of anatomy and anthropology at Idaho State University, provide unambiguous data sets concerning the primate morphology of the Sasquatch foot,[3] revealing a flexible mid-tarsal joint that can be clearly distinguished in the Bluff Creek, California bigfoot film shot by Roger Patterson in 1967.[4] The high level of consistency of these unique features of Sasquatch locomotion constitute an essential and conclusive form of forensic evidence confirming the reality of living Sasquatch groups.

In recent years, astounding high-resolution digital photographs of the facial features of Sasquatch males and females were obtained by the Sylvanic Bigfoot research team during expeditions organized and led by Todd Standing, a Canadian outdoorsman from Alberta with extensive field experience among these elusive giant cryptids. Standing relates a decisive warning given by local Native Elders[5]:

> A highly respected Elder and personal mentor warned me many times that anyone who angers these beings will take their last breath. Based on the vast knowledge of First Nations Elders I have had the privilege of learning from, as well as my own hands-on field work, we've witnessed [that] these primates have abilities so incredible, they are often misinterpreted as supernatural...

"What would happen to you if you tranquilized a grizzly bear cub? What will you do when the mother comes back? Tranquilize her too? No, you will have to kill her, or she will kill you! Now what would you do if it was not only the mother that came back to defend the cub, but the father, the uncle, the brother [or] the whole family came back to defend it? Will you kill all of them too?"



"So, tell me how you will survive this circumstance when your adversary is more intelligent than the great bear, more strategic than the great bear, maintains high ground, throws boulders a has a hundred other advantages over the great bear? You don't need to tell me, I will tell you. Anger the master of the woods and you will take your last breath."

Despite resistance from many local indigenous hunters and trackers, Standing has been counseled by Cree, Ojibwe, Stoney and Anishinabe First Nations Elders concerning their peoples' history of interactions with what many refer to as the 'Shadow Guardians of the Mountain'. The commonly used name Sasquatch is derived from 'sésquac', a Coast Salish name meaning 'wild man'. Traditional stone and painted-wood masks of First Nations cultures present the fearsome features of Sasquatch, commonly seen among Salish, Haida, Kwakiutl and Tlingit carvings (above). Often displayed with matted wigs made with human hair, the masks portray a distinctive set of facial features, including *round, wideset eyes, a pug nose, protruding jaw and a very wide, fanged mouth.*

Local oral histories retell of paranormal events including the presence of luminous aerial objects and repeated attacks by the hairy giants in a small secluded valley called *Sylvanic*. Several fatal incidents retold in detail by indigenous wisemen reiterate the same lesson: *that anyone who attempts to kill the valley's animals or drink the valley's water will pay for those transgressions with their life.*[6]

The only way to enter the high valley without summiting the ring of peaks is through a small passage in the granite rock wall enclosure that becomes blocked by snow in deep winter, hidden above the narrow canyon entryway. Sylvanic's isolation and the Guardian's strict control of predation provides for fearlessness in the valley's animals that must be respected by all visitors who wish to survive the experience. The wisdom of the Elders denies any simple explanation for the high-altitude stone fortress, emphasizing unnatural factors that point to the *ancient engineering of this anomaly zone.*

Sylvanic Valley lies hidden on the northwest side of Storm Mountain (3,095m/10,153' summit) in remote Kootenay National Park, on the British Columbia border with Alberta's Banff National Park. The granite bowl formed by a ring of mountain peaks encloses *a pair of small, unnamed lakes.* The strategic positions of three Sasquatch lookouts, or day-watchers, repeatedly encountered by Standing during his expeditions are denoted with red dots, while a red circle marks the location of a cave within the narrow slot canyon entry pass, used for shelter by the Guardians of this secret domain (above).

The exact geoposition of this guarded valley reveals precision alignment with the other focal points of infrasound resonance forming a global network of ancient piezoelectric pyramids and megalithic sites. Sylvanic Valley (51.21°N 116.01°W) is 6,495 miles from the Great Pyramid of Giza, Egypt; a resonant distance that comprises 26.09% of the Earth's mean circumference (of 24,892 miles).

Several related sites extend along this 26.0% alignment, where recent, repeating spates of explosive booming sounds have inundated communities in nearby Ranchlands, Alberta, a Calgary suburb. To the northwest are Boom Mountain and Boom Lake, named for the localized infrasound phenomena.

The majority of pyramids and sacred sites aligned within the global infrasound network conceal rock entrances to ancient underground tunnel systems. An abundance of fatal incidents have occurred at a great many of these places that are still locally known for the many disappearances of curious visitors. The most recent lethal Sasquatch attack in a long string of similar fatalities in Sylvanic Valley occurred in late 2005 resulting in the deaths of four teenagers on an ill-advised expedition to tranquilize one of the giants. Graphic, unreleased video of the lethal attack was captured by Dan Hamilton –*the only survivor of the disastrous 3-day expedition, whose testimony has yet to be published.*

The most harrowing solo expedition reported by Todd Standing involved an altercation with one of three Sasquatch 'day-watchers' strategically posted at key vantage points in their secluded domain. Unheeded warning growls quickly escalated into roaring and physical threats of lethal force at close range. Any human intruder is easily deterred from penetrating into the Sasquatch domain by thrown boulders and tree logs that serve as an effective demonstration of the formidable strength of these giant, muscular hominins. They growl and throw stones at anyone sleeping in Sylvanic Valley.

Standing's high-resolution digital photographs and videos reveal the face and reddish-beige fur of a female Sasquatch with a long scar on her chin, peaking from behind snow-covered tree branches (above). A young adult Sasquatch male with sandy-beige fur was also videotaped during a successful October, 2010 expedition (opposite). After the 2005 attack, the remote Sylvanic research site had been disrupted by official interference and cover-up. Several hunters were then paid to use gunfire to scare off the resident Sasquatch group. Undaunted, the Sylvanic team continues their research at a separate habituation site in Montana previously developed by a local resident.

Clear audio recordings of Sasquatch knocking, vocalizations and speech were made during habituation of a small family group by Ron Morehead, Bill McDowell, and brothers Warren and Louis Johnson, at a remote camp high in California's Sierra Nevada Mountains during the deer hunting seasons from 1971–1976. Newsreporter Alan Berry was invited to audiotape and publicize their remarkable encounters.

The hunting party's first poor-quality audio of Sasquatch utterances only captured vocal aggression from the dominant male, yet subsequent recordings by Al Berry documented a growing rapport with the group of highly intelligent beings. Whistling exchanges and brief utterances from an adult female and a juvenile were interrupted by sharp commands barked by the paternal male, whom they nicknamed the *'Old Man'*. Undeniable segments of complex language can be heard in the guttural Sasquatch phrasing, followed by snarls and growls that serve to reinforce commands while curtailing complaints.

As the nocturnal encounters developed further, mutual curiosity was tamed by respectful behavioral boundaries that became well established. Distinct modes of speech began to slip out more frequently from the Sasquatch group in the presence of the men, delivered in quick succession between two adults. The pair of furry giants briefly quarreled over the hunters' offering of food scraps using clearly articulated language bursts that are virtually indistinguishable unless slowed down to half-speed.

In the final season of recordings, after the Old Man had disappeared and no longer dominated their interactions by rebuking his subordinates, new conversational offerings included raucous laughter interspersed with quite humorous mimicry of our slower form of human speech, in nearly intelligible phrases that have been comically characterized as 'samurai chatter'[7] by crypto-linguist R.S. Nelson.[8] One particularly hilarious recorded incident involved a Sasquatch male banging the camp toilet seat like an oversized door-knocker, while loudly exclaiming: "It's a knocka'!"

The notable depth of resonant frequencies produced by the Sasquatch larynx and the intensity of the projected sounds are distinctly non-human, conferring the remarkable operatic quality of their voices. A year-long acoustical analysis of the Berry audio conducted at the University of Wyoming identified 1-3 non-human speakers with estimated average vocal tract lengths of 20.2 cm, corresponding to individuals standing from 6'4" to 8'2" in height (Kirlin & Hertel, 1978).[9] The multi-frequency resonance of Sasquatch whistles are also unique, consisting of a wider range of harmonics than all human whistles, which suggests their likely origin within the nasal and sinus cavities of the giant hominins.

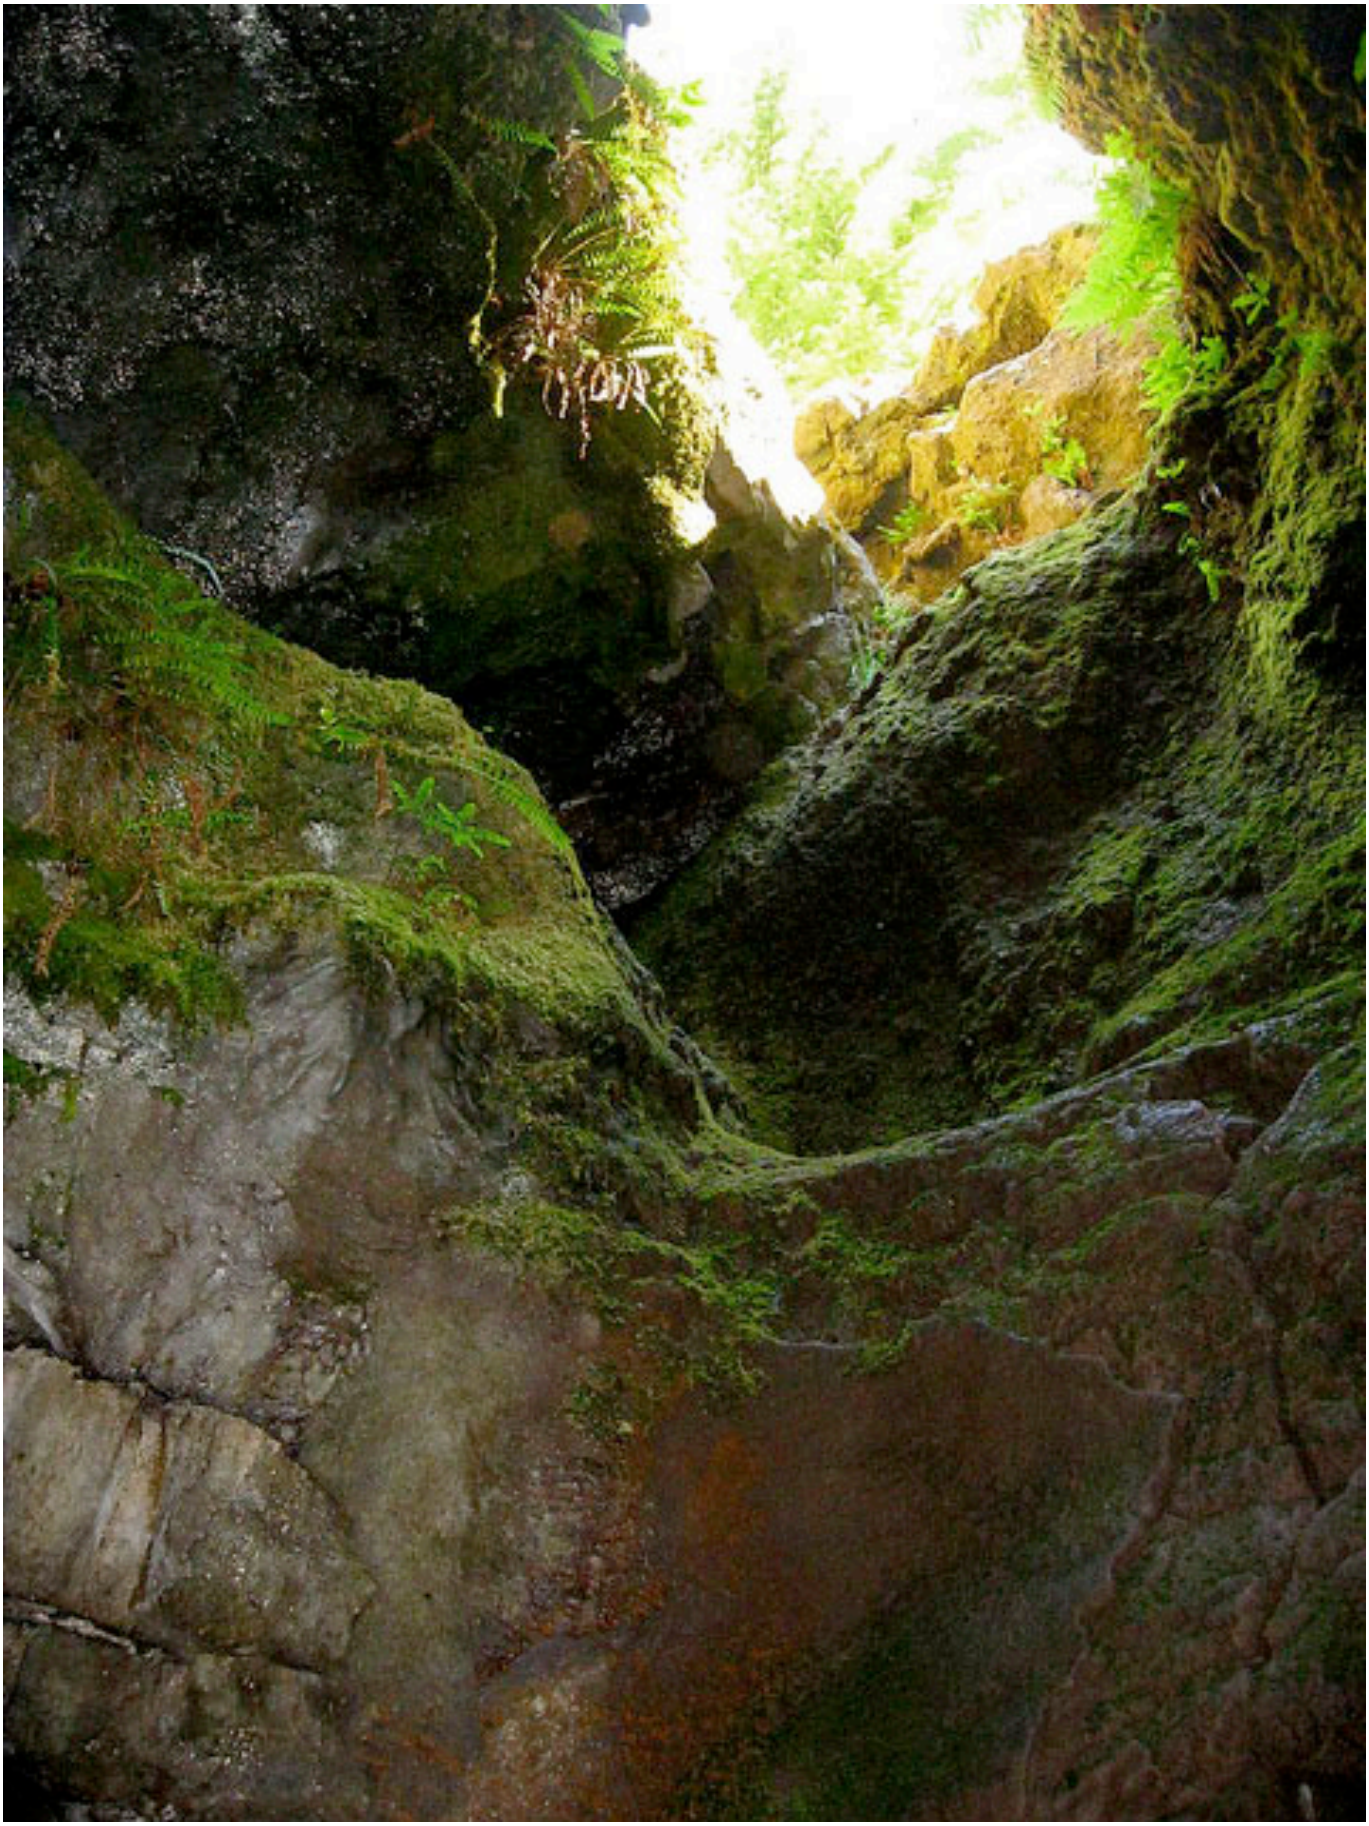
Like the growling behavior of large cats, *Sasquatch growls produce high level infrasound that can be powerfully felt at close range, causing a strong fear reaction, as does the stench of Sasquatch body odor.* In close proximity, roars are also typically used by these forest giants to confuse and stun prey animals by infrasonic bombardment during a surprise attack, or to send warnings at a distance.

Sasquatch howling and long-distance calls are commonly reported, yet indigenous Elders possess ancestral knowledge of their activities. Every Native American language has a specific name for these giant humanoid creatures; some tribes recall cannibalism and abductions of women by Sasquatch, leading most to maintain their distance from the secluded domains of the high mountain Guardians. Reflecting the explicit warnings given to Todd Standing by indigenous Elders, hunter Ron Morehead was informed by a local Miwok Elder *that Sasquatch is accompanied by small luminous objects:*

> It was years before this story was told beyond family and a small circle of friends... but more years have passed and in a world today more finely attuned to our Native Americans and the environment, perhaps these rare wilderness voices, whatever their primate origin, would want us to let them be heard. A 95-year-old Miwok, who is known among his tribal council as 'Grandpa', told me that in Yosemite Valley (above) not so long ago, but before his people were driven out, "Bigfoot was known as Oyana Ha'te, and although Oyana Ha'te traveled in the dark, he always had a lantern, or a brightness behind him."

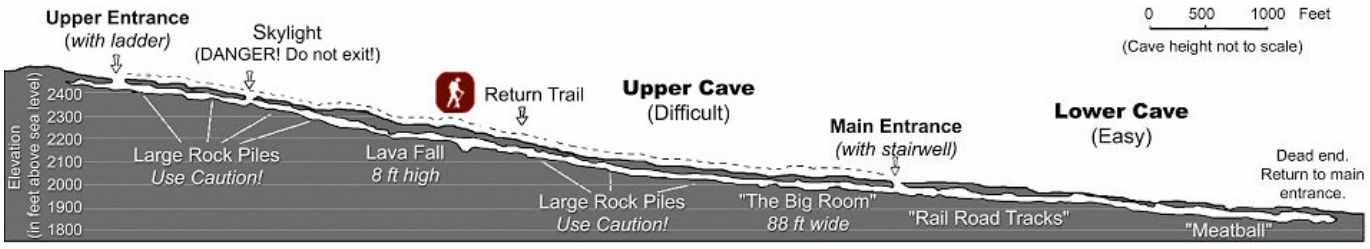
The simple words of Native Elders convey profound truths, perhaps unrecognized by Morehead, in this case clearly identifying the presence of *luminous objects that always follow these nocturnal creatures*. Ancient Miwok cultural knowledge linking Sasquatch with luminous aerial phenomena, labeled today as UFO activity, is based on regional co-habitation with the North American giants for several millennia, and eyewitness accounts from thousands of highly skilled tribal trackers perfectly attuned to the forest. *When indigenous trackers observed Sasquatch, they were also keenly aware of a trailing luminosity!*

The valley's resonant granite walls reflect infrasound standing waves focused onto the area by the Great Pyramid. Yosemite Valley, California (37.74°N 119.53°W) is 7,402 miles from Giza, Egypt, a key distance that comprises 29.74% of the Earth's mean circumference. This resonant distance is also shared by Death Valley, where small boulders are dragged in semi-levitation across Racetrack Playa;[10] Calaveras, where a spontaneous explosion recently ignited an extensive wildfire;[11] and Hidden Valley, where luminous aerial objects were seen and photographed flitting above swirled grass formations.[12]



Contemporary indigenous accounts also detail ongoing interactions with Sasquatch bands living in the rugged mountains surrounding the Columbia River gorge in northern Washington. The area is home to the Confederated Tribes of the Colville Reservation, which include the Wenatchee, Moses/Columbia, Okanogan, Entiat-Ghelan, Methow, Palus, Nez Perce, Nespelem, Colville, San Poll and Lake Bands:

> Among the various tribes comprising the Colville Confederation, Sasquatch was referred to by several different names but a common conceptual thread permeates all of their beliefs. He was always considered a human being, members of their own species... [inhabiting the forests] prior to the arrival of the white man...
>
> The Lake Band of Indians called him "Skanicum" which translates to "Stick Indian". Some Indians referred to him as "Scwe-ney-tum", derived from the original *sc'wanay'tex* meaning "stick (= woods) Indian". To the Wenatchee Indians he was known as "Choanito" or "Night People". Many believed [he] could turn into a tree.



> It is reported that a group of Indians followed Skanicum to a ravine... [as] some of the Indians went down into the ravine while others maintained vigilance from their vantage point. A complete and thorough search of the ravine yielded no sign of Skanicum, only trees, and they were certain that he could not have left the ravine...
>
> Choanito is still very active in the [Nespelem] area (above). At night lights can be seen moving along the base of a nearby mountain as a pack of them travel along, and many have been reported on Keller Butte. People are always warned to be out of the mountains before dark... The Skanicum was known to often steal dried salmon from the Indians in this area. Skanicum is known to live only in caves... willows over the door.
>
> Vince, a 30-year-old member of the Lake Band and a friend of this author, reports that as a small boy his grandfather... took him far up on Moses Mountain to see Skanicum. He was told to be very quiet and he would see them. He did see Skanicum close up and reports: "He was Huge". He knows of a cave going deep into the mountain that is reported to be a home of Skanicum. He has been inside the opening which he states is squared and smooth, appears to have been worked on with tools, and was covered with tree branches. Inside is a strong Skanicum stench. He was afraid to go further into the cave.[13]

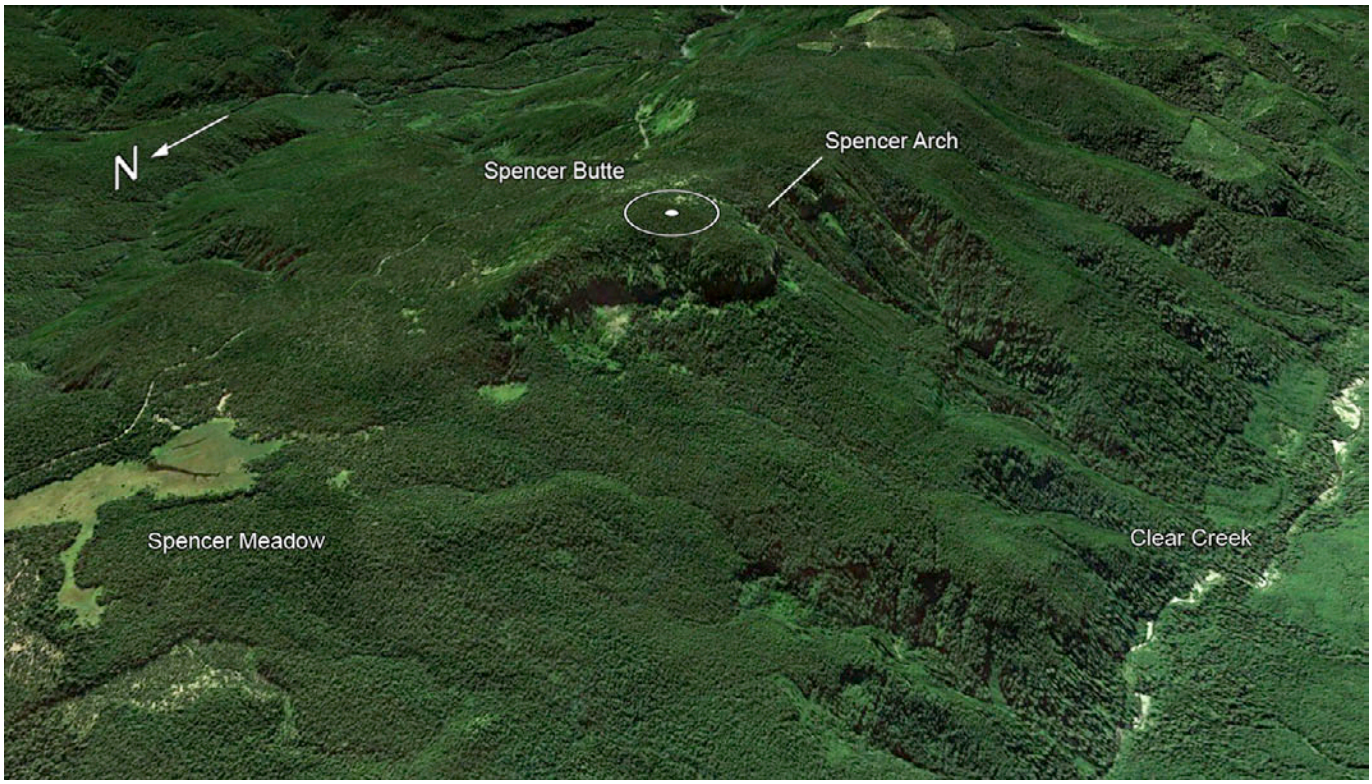
The high mountain location of this ancient, artificially hewn rock cave entrance still known to the Lake Elders, displays precise alignment within the global infrasound pyramid network. Moses Mountain, Washington (48.37°N 119.05°W) is 6,732 miles from Giza, Egypt, or 27.04% of the Earth's mean circumference distance. Directly to the southeast along this resonant distance alignment stands the impressive Keller Butte (48.07°N 118.78°W) –at exactly 6,745 miles from Giza, or 27.09%.

Rarely retold local histories of Sasquatch atrocities emerged after gold prospectors were attacked near Mount St. Helens, just southeast of Spirit Lake. Loud nighttime growling and stone-pelting escalated into violent cabin-shaking that incited a miner to shoot one of the aggressors on July 10, 1924, who fell into what is now called Ape Canyon.[14] The miners fled the area at dawn and later surmised that the giants inhabited nearby caves known to them. The site was accidentally discovered south of Mount St. Helens by a logger in 1947, whose truck fell into a sinkhole that opened into ancient lava tubes (opposite, above).[15] Named 'Ape Caves' by the loggers, exploration in 1950 uncovered a large skylight and two separate entrances spaced a mile apart along a 1.5-mile-long lava tube:

Reflecting the aggressive protection of natural habitat and resources witnessed in Sylvanic Valley, the 1924 disturbance of small-scale strip-mining operations along the Muddy River near Mount St. Helens brought immediate threats from the giant nocturnal tribe. Consistent behavioral patterns reveal that such brutal enforcement of the territorial boundaries of Sasquatch domains is incurred only when the necessary respect and avoidance of the giants is not strictly observed. The Ape Canyon attacks that took place to the east of Mount St. Helens were clearly undertaken in strategic defense of natural resources being plundered within the Guardians' forest domain.

The Oregonian of July 13 reported on the attack by giant apes, inciting the failed 'Ape Hunt of 1924'.[16] Several indigenous accounts of hairy giants, called the Seeahtik Tribe, were then published on the front page of *The Oregonian* on July 16, as collected and summarized by Jorg Totsgi of the Clallam Tribe:

> The big apes reported to have bombarded a shack of prospectors at Mount St. Helens, are recognized by Northwestern Indians as none other than the Seeahtik Tribe of Indians... Oregon and Washington Indians agree that the Seeahtik Indians are not less than seven feet tall and some have been seen that were fully eight feet in height. They have hairy bodies like a bear. This is to protect them from the cold as they live entirely in the mountains. They kill their game entirely by hypnotism. They have great supernatural powers. They also have the gift of ventriloquism, and have deceived many ordinary Indians by throwing their voices.
>
> These Indians talk, beside the bear language of the Clallam Tribe and the bird language. The writer was told by Oregon Indians during his research work among them last year that the Seeahtik Tribe can imitate any bird of the Northwest, especially the blue jay, and that they have a very keen sense of smell...
>
> The Seeahtiks... [are known to] steal... Indian Women. Sometimes an Indian Woman comes back. More often she does not, and it is even said by some Northwestern Indians that they have a strain of the Seeahtik blood in them... The Oregon Indians assert they made their home in or near Mount Rainier, while the Puget Sound Indians say they live in the heart of the wilderness at Vancouver Island, BC... Henry Napoleon of the Clallam Tribe came upon one of the members of the Seeahtik Tribe while out hunting on Vancouver Island:
>
> "I had been visiting relatives near Duncan, BC and while there I had been told many stories of the Seeahtiks by the Cowichan Tribe of British Columbia and warned by them not to go too far into the wilderness. However, in following a buck I had wounded I went in farther than I expected. It was at twilight when I came across an animal that I believed to be a big bear but as I aimed at him with my gun he looked and spoke to me in my own tongue. He was about seven feet tall and his body was very hairy. As he invited me to sit down, he told me that I had come upon him unaware and that his mind had been projected to distant relatives of his, otherwise he (Mr. Napoleon) would never have been seen."



> "He also told me that the reason they were not seen very much was because they had a strange medicine that they rubbed over their bodies so that it made them invisible and that combined with their wha-ktee-nee-sing or hypnotic powers, made them very strong Tamanaweis men. They also told me that they could talk almost any Indian language of the Northwest. The next day they led me out and just at twilight I came out of the underground trail and they accompanied me to within a mile of the Indian village I was staying at."
>
> The Seeahtik Tribe is harmless if left alone. However, if one of their members is injured or killed they generally take 12 lives for the one. This the Indians of the Northwest have learned, and even though the Seeahtik Tribe steal all their dried meat or salmon, or even steal their women, the Puget Sound Indians will not try to retaliate, for once the Clallam Tribe in righteous indignation captured a young man of the Seeahtik Tribe at Seabeck, and took him across the Hood Canal to Brinnon, where other Clallam Indians were camped.
>
> Kwainchtun, the writer's own grandfather, kept telling the Clallams to be careful of the Seeahtik's supernatural powers, but he was only laughed at. It was later told by Kwainchtun, that while they were still 20 yards from the shore the young Seeahtik made a mighty leap and immediately made for the mountains. Kwainchtun warned his people that they should move but again he was laughed at. That very night the Seeahtik Tribe came down and killed every Clallam there but Kwainchtun, who had moved his family across the canal.

The Clallam tribe's forceful abduction of a young Sasquatch male from Seabeck to Brinnon, in Puget Sound, incurred the wrath of an entire Sasquatch band, with predictably gruesome results. Their cave domain in the densely forested mountains west of Brinnon, Washington (47.70°N 123.00°W) is 6,849 miles from the Great Pyramid, or 27.51% of the Earth's mean circumference.

This resonant 27.5% distance alignment runs directly through the Puget Sound area, where repeating spates of loud infrasound booming continue to induce piezoelectric fires and explosions year after year.[17] To the southeast, this alignment extends through Washington State, passing near of a cluster of sites that have long been associated with unusual luminous aerial objects near Spirit Lake (above).

Long before the explosive 1980 eruption of Mount St. Helens covered the entire region in a thick layer of ash and debris, which still covers large portions of Spirit Lake, the area was well known among the region's indigenous tribes for a high frequency of unusual aerial sightings and many encounters with strange humanoid species. News coverage of the Ape Canyon Sasquatch attack effectively refocused the attention of white prospectors on the extensive history of encounters retold by local people.

Mining at the Vander White gold claim commenced in 1924, just 5 miles from Spencer Butte (below). High on the butte, rough outcroppings hide a large rock portal that resembles a human head facing skyward in full profile (opposite). Known as Spencer Arch (46.15°N 121.94°W),[18] this stone portal is 6,928 miles from the Great Pyramid, or 27.8%, corresponding to the resonant circle fraction of $^{5}/_{18ths}$. *As revealed in previous investigations of stone arch symbolism among ancient Atlantean pyramid-builders, such unnatural portal structures are signposts marking the entrances to tunnel systems.*[19]

The Oregonian also published a front page follow-up article by Totsgi on the following day of July 17, 1924, detailing the horrifying violence of one-sided retaliation by Sasquatch bands that was certainly intended to repress all future resistance from any local people who would attempt to prevent their overnight raids on food stores and their serial abduction of women. Among many indigenous tribes of the Spirit Lake region, Sasquatch is referred to as the Tyapish Tribe and are regarded as highly intelligent beings that must be respected for their unmatchable strength and special abilities:

> Old Indians of the upper Chehalis, the Cowlitz and the Quinault assert that Spirit Lake is a weird lake. Many strange things have happened there and many weird tales and legends abound in the region of Spirit Lake... Allen Chenois, a local Indian, told the following story to the writer regarding the Tyapish Indians:
>
> "My uncle, old man Chenois, told me once that he found a party of other Indians while out hunting some years ago and came upon a band of the Tyapish Indians during their evening meal in Baker's Slough on the Willapa Bay. The giant Tyapish seemed to be talking to the others in queer animal sounds, which my uncle could not make out. The Tyapish licked his greasy paws, then wiped them on his naked sides...
>
> In appearance they were much the same. They were tall, narrow-hipped and had crooked legs, and at the same time were deep-chested with heavy arms and enormous hands. They were covered with thick hair and had large breasts. Their heads were matted with uncut hair and black glittering eyes like the eyes of birds.

Their jaws were massive. At one side of them partly devoured lay the carcass of a deer. It was a clear starlight night and he could make them out very plainly, but they were so ferocious looking my uncle said that he did not stay very long [for fear they would notice his presence]."

Allen Chenols added that the Tyapish had not killed any Indians of the past generation that he knows of, but he had heard that former Chehalis Indians had been murdered at times by these giant Indians. They were so strong it is known they could pull a grown man's head right off.

L. Peter James of the Lummi Tribe related last year to the writer that the Seeahtik always leaves a tiny branch of the cedar tree at places they have visited or upon people whom they have killed or played a practical joke on. The Duwamish Tribe at one time related that some of their women had been stolen. The Seeahtik in a rage killed 12 of the Duwamish Tribe by ripping them in two. Mr. James' mother, who is still alive, was a witness to the tragedy. [Recalling the horrific events with disgust,] she said:

"They took our young men like toys, turning them upside down and ripping them in two like a piece of calico. Never again did the Duwamish Tribe seek revenge when their women and babies were stolen by these Snayihum or Indians of the night and brothers to the Noseless One."

The shocking massacre that occurred when dire warnings had been ignored attests to the extreme methods of Sasquatch abduction, execution and intimidation that have repeatedly scarred the collective memory of North America's indigenous tribes. References to the "Noseless One" were likely misunderstood in 1924, yet consistent contemporary descriptions of extraterrestrial visitors leave no doubt: *Native Elders identified a close relationship between the Sasquatch and beings known as the alien 'Grays', telepathic androids from the Reticulum system who co-pilot vimana plasma ships.*[20]

A great number of eyewitness accounts of aerial abductions by the android Grays include astounding descriptions of advanced technologies enabling levitation, instantaneous teleportation and invisibility – *technologies that also contribute to the extreme elusiveness of Sasquatch.* The often fatal encounters with the mountain giants reported by Native American Elders were also experienced and reported by several explorers of European descent, whose detailed testimonies were often disregarded for their bizarre aspects. One such phenomenal account was given by Edward Sturgis Ingraham (1852–1926), detailing telepathic communication with a Sasquatch deep in the steam caves of Mount Rainier:

In 1895 the well respected explorer, mountaineer, and author E.S. Ingraham returned to Mount Rainer with a companion to once again explore the crater that so fascinated him. While descending into the steam-caves of the crater Ingraham became aware of strange marks on the floor of the cave. They resembled scratches. In some places they were so profound that they looked as though there might have been a struggle or battle between two very angry creatures.

His curiosity roused, he looked about in search of other markings in other places. Ingraham noticed that close by, in the earth below him, were depressions which he thought could have come from the pawing of some flat-footed creature. As they descended lower into the cave the frequency of the scratches increased but their intensity did not follow suit. He became aware of an odd sensation as if his body had received a slight electrical charge and wondered if the same phenomena had befallen his companion. Not mentioning anything about his experience or his heightened sense of curiosity he suggested to his companion that they return to their campsite. Ingraham had decided to return to the cave later that evening, alone.

Later that evening Edward Ingraham arose and quietly slipped out to venture once more into the crater (above). His heart pounding with the anticipation of what lay ahead negated his feelings of foreboding as he made his way to the mouth of the crater and began his decent. The cold night air was soon replaced by the warmth of the steam-cave which reinvigorated his sleepy body and made his tired senses more alert. Edward pushed forward. As he stepped deeper into the darkness he noticed a faint glow that lighted his way, it seemed to beckon him into whatever fate awaited him.

He felt as if he was being guided by the influence of a force that distinctly enhanced his knowledge of this unfamiliar environment so much so that he felt confident his footsteps would not betray him. As he moved forward he reached a fork where two avenues of passage lay open before him. At this point a noise sounding like stones rolling down one of the passage ways caused his senses to jump. Quickly stepping into a recess in the wall of the cave he hid waiting to see what would happen next.

It wasn’t long before the growing sound of something rolling, something crawling, alerted Ingraham while his body tensed in fearful expectation. Then, within a few feet of Ingraham an unusual and grotesque creature tumbled into view. As Ingraham watched the still stumbling creature he noticed the form of it. It was covered with hair but appeared more human than animal-like, and the crown of the head was pointed and bristled with hair sprouting outward in all directions. He also observed the hands and feet discovering that the palms and soles were hard and calloused each with long pointed nails that seemed to shine like polished steel. He realized that while this mysterious creature’s form resembled that of a human being... it's line of descent may have been from a separate species.

As the creature began to regain it's temperament after it's rather singular appearance it began vigorously rubbing it's hands together causing by degree, an uncanny glow to gradually engulf it's entire body while the most potent centers of which appeared to be the tips of the pointed nails, the eyes, and the crown of the head. It then raised itself and, as if dancing to some imagined melody, began rapidly rubbing both feet upon the cave floor. This action seemed to rejuvenate the creature having the effect of increasing the radiance of the glow that surrounded the creature's body, while also producing a more pronounced potency at the centers of illumination.

Involuntarily Ingraham began to mimic the creature's movements and as he did so an odd feeling of fellowship fell upon him. It was at this time that Ingraham's unusual companion first noticed that he was not alone. His reaction to the presence of Ingraham was to repeat his former movements and after having done so, to extend his fingers in Ingraham's direction emitting flashing sparks of light that pulsed from the tips of his long pointed fingernails.

Ingraham was amazed as he mimicked the movements the creature had made. His similar actions seemed to produce a like effect but nowhere as powerful as that of the Old Man of the Crater. It was like magic to him! He could see a point of light slowly but brightly forming atop the crown of the unusual creature's head. He felt the top of his own head and he could feel his hair bristling upward and then as if to connect them together an arch of light appeared between them, an eerie radiant force joining them, both Ingraham and this alien being, in complete communication!

Two races otherwise unknown to each other were now afforded an opportunity to relate to each other. He did not know how but for near one hour Ingraham received impressions within his mind. Impressions of strange tales of another race, the Old Man of the Crater's race, living within the inner earth, of the customs and upheavals that changed the earth of long past and of a catastrophe that befell the earth destroying all save two and how the two adapted to the new order of things and gave birth to a new race from which he had come. Ingraham called this race the Sub-Rainians.

I did not understand how the creature sensed my doubt and disbelief but I felt a strong impression, rather a command, to follow him deep into the inner earth. When he turned to descend into the darkness I gathered my thoughts and with all my power broke free from the spell and without looking back quickly made my way upward to the surface and the safety of my campsite. [21]

The odd circumstances of Ingraham's telepathic encounter in the Rainier steam caves invites ridicule and derision, *yet his account includes several remarkable details that could not have been invented.*

The curious electrical sensation that inspired Ingraham's plan to return to the cave alone, after dark, had most likely been experienced during the explorer's previous visits, yet was not perceived or went unmentioned by his companion. Ingraham's silence on this issue suggests that he had requested his friend's presence in the crater that night for security reasons, as he wanted to return to this site alone to investigate subtle aspects of his experience that could not be easily explained to others.

The sound of a rolling stone described by the explorer is explained by many indigenous accounts of large round boulders used by Sasquatch to conceal and block cave entrances or passages, of such a great size that only the portal's giant Guardians may remove it. The crawling sounds then heard by Ingraham were made as the cave giant squeezed through the crack left by the displaced boulder, causing him to stumble out and then recover from the exertion of rolling aside the monolith.

This type of heavy stone door that rolls into place was commonly used throughout the rock-hewn underground cities of Atlantean origin, including those below the Andes mountains inherited by the Inka; in the over 200 ancient subterranean cities located below present-day Cappadocia, Turkey, including Kaymaklı and Derinkuyu (above); and in the extensive networks of rock-cut chambers that connect the many psychoacoustic limestone temples on the Mediterranean island of Malta.

The 'rejuvenative' motions described by the witness involved quickly repeated limb movements that enhance ionization and natural regeneration of the body's cells. The hand-rubbing and foot-stamping routines of the Sasquatch that marked the floor of the steam cave passage were purposefully used to enhance the piezoelectric charge of the giant's hairy body, *causing it to glow and emit sparks.*

Ionization of Rainier's piezoelectric rock and heated glacier water vapor is enhanced by infrasound standing waves focused upon the crater, providing the special conditions for HHO plasma ignition. Volcanic steam venting through the cave emitted a faint greenish glow forming an arch between them with the same eerie illumination of plasma associated with auroral formations in the high atmosphere.

For this same newly recognized purpose, giant granite and limestone basins surrounded the Great Pyramid, and were placed deep within megalithic chambers such as Gavrinis and Knowth, once used as resonators for the acoustic levitation of lightwater and its ignition as HHO plasma.[22] *The ionization motions repeated by the Rainier Sasquatch generated HHO plasma around the being's fingertips and atop its head, suggesting ancient Celtic 'riverdance' ceremonies within resonant piezoelectric chambers may have generated glowing plasma around the group of dancers!*

Longwave infrasound becomes focused onto Mount Rainier because of its geometric relationship with the giant psychoacoustic pyramids of Giza, Egypt. The steam caves of Mount Rainier, Washington (46.85°N 121.76°W) are situated 6,880 miles from the Great Pyramid at Giza, or 27.64% of the Earth's mean circumference distance, presenting clear alignment within the global array of infrasound vortices.

The Puget Sound region has become well known for repeating spates of ultra-low frequency booming and spontaneous piezoelectric fires.[23] Cave systems occupied by Sasquatch were known to Puget Sound tribes; Squalicum Mountain (or 'Skanicum') and Bigfoot Hill are both named for the giants, located near Mount Baker, Washington. Other Sasquatch encounter clusters near cavesites have also been reported in the Vancouver Island wilderness and around Pitt and Harrison Lakes. The entire region is located along an axis of infrasound standing waves running northeast through Puget Sound (above).

The geopositions of Sylvanic Valley, Moses Mountain, Keller Butte, Mount St. Helens, Spencer Butte, Mount Rainier, Squalicum Mountain, Pitt Lake and Harrison Lake present alignment within the Atlantean pyramid network for heartbeat synchronization, mental telepathy, weather-control and power generation using infrasound standing wave resonance. To this day, the pyramids' symmetries redistribute Earth's natural infrasound fields into resonant bands where bizarre aerial and subterranean phenomena converge. *Access to these hidden portals is tightly controlled by the Guardians, whose extreme evasiveness is assisted by highly advanced aerial and subterranean technologies.*

Portrait masks of Sasquatch made by the indigenous tribes of the Pacific Northwest present many subtle facial details that exactly match digital photographs of the giants' faces obtained under duress by Todd Standing in 2010. Painstaking removal of tree branches and digital reconstruction of the partially obscured face of a female Sasquatch reveals distinctive features that Native artists have so clearly described (above). The image captures their "black glittering eyes like the eyes of birds" and the great intelligence that enables their fluency in all animal and human forms of communication.

Native ancestral knowledge closely echoes thousands of modern day eyewitness accounts of bizarre encounters with strange humanoid beings, often involving luminous aerial objects. The vast majority of such incidents fail to provide forensic evidence for analysis that may verify eyewitness accounts, yet those few ironclad cases that do offer physical trace evidence deserve careful consideration.

One of the most compelling forms of physical evidence for Sasquatch interaction with local indigenous people persists in the DNA of several living descendents who are normal in appearance, yet bear the genetic vestiges of Sasquatch ancestry. In the 1890s, a young Native Spokane woman was abducted and apparently raped by a Sasquatch near Keller, for she gave birth several months after her escape:

> During her stay with Skanicum the woman became pregnant and bore a son named Patrick, who grew up on the reservation. Patrick's body structure was very different from that of other Indians as his arms were very long, reaching about to his knees. He was very short, about 5'4" tall... possessed a sloping forehead, very large lower jaw, a very large wide mouth with straight upper and lower lips, and straight protruding teeth. He was kind of stooped, or hump-backed. His ears were elongated upwards (peaked) and bent outward at the top. He had very large hands and long fingers, is described as very ugly although extremely intelligent.[24]

> [A similar incident occurred when] Mono Lake Paiute girls were out gathering berries in Paiute Meadows... [in] northern Yosemite [Valley]... Pahi-zoho had come out [from] behind a tree... He was big, reddish and hairy and she screamed... [as] he took her into the bushes and forced himself on her. She said he stunk so bad, that it was making her sick and it was extremely painful, that he didn't talk but grunted all that time... [H]e snorted and snored loudly all night long and... in the morning he completely lost his grip and she made a quick dash.
>
> Now she was safe with her people and her family, but later on she started to show signs of pregnancy... [and] had a son, a big red headed baby boy who was very hairy. The people were scared at first and some of the men wanted to kill him, but... later the people accepted him into the group for he was a good hunter and he had uncanny natural abilities of sight and smell and was very strong. He married and his children came out more normal looking, but every now and then one of his descendents comes out hairy and with red hair. Many of his descendents are now scattered in many of the Paiute tribes in California and Nevada.[25]

The long, obscure and violent history of Sasquatch abductions of indigenous women, as well as the existence of hybrid offspring from interspecies breeding, are well known to the tribal Elders of Native American cultures. Genetic study of the many living descendants of such prevalent sexual violence promises identification of recessive Sasquatch genes scattered widely among indigenous tribes.

Another interbreeding case began as *'abnauayu'* (wild man) sightings near the Adzyubzha River in Abkhazia, Georgia, and provides scientists with the skull of a giant female hominin captured in 1850 and partially domesticated. Excavations by Dr. Igor Burtsev finally recovered the anomalous skull in 1975 from a cemetery known to residents (above). *The prognathic skull displays a very flat face, with broad cheekbones and large, widely set eye orbits. The crown of the skull exhibits a slight peak.*

Burtsev's investigation of the fascinating lifestory of the Abkhazi abnauayu, named 'Zana' by her keepers ('Black' in Georgian), continues the earlier researches of A. Mashkovtsev and B. Porshnev who had ascertained the following details from much earlier interviews with elderly local eyewitnesses:

> Zana was a female a*bnauayu* who had been caught and tamed and who lived and died within the memory of a number of people still alive at the time of the research. She was buried near the village of Tkhina in the Ochamchiri District of Abkhazia in 1890. [It would be 85 years until the exhumation of Zana's skull (below).]
>
> The manner of her capture is vague. Some said it was not a chance catch [but a planned abduction]. Hunters familiar with an age-old technique tied her up, and, when she furiously fought back, hit her with cudgels, gagged her mouth with felt, and shackled her legs to a log. Probably she had already changed hands by sale when she became property of... a nobleman, Edgi Genaba, who visited the region. He took her away, still shackled and chained, to his estate in the village of Tkhina on the Mokva River, 78 kilometres from Sukhumi.

> At first Genaba lodged her in a very strong enclosure and nobody ventured in to give her food, for she acted like a wild beast. It was thrown to her. She dug herself a hole in the ground and slept in it and for the first three years she lived in this wild state, gradually becoming tamer... Her skin was... dark grey, and her whole body covered with reddish-black hair. The hair on her head was tousled and thick, hanging mane-like down her back.
>
> She could not speak, over decades that she lived with people, Zana did not learn a single Abkhaz word; she only made inarticulate sounds and mutterings, and cries when irritated. But she reacted to her name, carried out commands given by her master and was scared when he shouted at her. And this despite the fact that she was very tall, massive and broad, with huge breasts and buttocks, muscular arms and legs, and fingers that were longer and thicker than human fingers. She could splay her toes widely and move apart the big toe.
>
> From remembered descriptions given to Mashkovtsev and Porshnev, her face was terrifying; broad, with high cheekbones, flat nose, turned out nostrils, muzzle-like jaws, wide mouth with large teeth, low forehead, and eyes of a reddish tinge. But the most frightening feature was her expression which was purely animal, not human. Sometimes, she would give a spontaneous laugh, baring those big white teeth of hers. The latter were so strong that she easily cracked the hardest walnuts.

She lived for many years without showing any change: no grey hair, no falling teeth, keeping strong and fit as ever. Her athletic power was enormous. She would outrun a horse, and swim across the wild Mokva River even when it rose in violent high tide. Seemingly without effort she lifted with one hand an eighty-kilo sack of flour and carried it uphill from the water-mill to the village. She climbed trees to get fruit, and to gorge herself with grapes she would pull down a whole vine growing around the tree. She ate whatever was offered to her, including hominy and meat, with bare hands and enormous gluttony. She loved wine, and was allowed her fill, after which she would sleep for hours in a swoon-like state.

She liked to lie in a cool pool side by side with buffalos. At night she used to roam the surrounding hills. She wielded big sticks against dogs and on other perilous occasions. She had a curious obsession for playing with stones, knocking one against another and splitting them. She took swims the year round, and preferred to walk naked even in winter, tearing dresses that she was given into shreds... She was trained to perform simple domestic tasks, such as grinding grain for flour, bringing home firewood and water, or sacks to and from the water-mill, or pull her master's high boots off.

But she became the mother of human children, and this is the wondrous side of her life story, very important for the science of genetics. Zana was pregnant several times by various men, and, giving birth without assistance, she always washed the newborn child in the cold water-spring. The half-breed infants, unable to survive these ablutions, died.

So, when subsequently Zana gave birth, the villagers began taking the newborn babies away from her in good time, and reared them themselves. Four times this happened, and the children, two sons and two daughters, grew up as humans, fully-fledged and normal men and women who could talk and possessed reason. It is true that they had some strange physical and mental features, but nonetheless they were fully capable of engaging in work and social life.

The eldest son's name was Dzhanda, and the eldest daughter was Kodzhanar. The second daughter was named Gamasa, and the younger son Khwit, who died in 1954. [Khwit's skull was exhumed in 1978 (above).] All had descendants of their own, scattered across Abkhazia. There were rumours that the father of Gamasa and Khwit was in fact Edgi Genaba himself, but in the census they were put down under a different surname, and their family-name became Sabekia. It is significant that Zana was buried in the family cemetery of the Genabas, and that the two youngest children of Zana were brought up by Genaba's wife.

Mitochondrial DNA (mtDNA) sequencing of extractions from the teeth of Zana (above) and her son Khwit at New York University yielded modern human sequence consistent with haplotype H, with the exception of a single base variant.[26] *This surprising result precludes the possibility that Zana was an archaic hominin holdover from Neanderthal or Denisovan lines having gone unchanged for millennia. Zana's human mtDNA reveals that she is a half-human hybrid, and that her significantly non-human characteristics were inherited from the paternal progenitor, an unknown species of giant primate.*

For years, purported Sasquatch hairs have yielded the same result of fully human mtDNA that can only be accounted for by species hybridization. The human-hybrid hypothesis is also consistent with the fact that Zana's children were nearly indistinguishable from modern humans, *being backcrossed hybrids.* Determination of the full base sequence of Zana's nuclear DNA (nuDNA) will reveal the identity of the paternal contributor of non-human genetic sequence that gives rise to her apparent Sasquatch form.

Comparative analysis of whole Sasquatch genomes must be established by a wider survey of genetic variation among global Sasquatch populations before any pertinent hybridization dynamics may be identified. While such analyses seem far off, recent findings concerning the vestiges of human-Neanderthal interbreeding provide a new framework for comparison with the Sasquatch hybrids.

Comprehensive sequencing of the Neanderthal genome has facilitated clear distinction of Neanderthal sequence interspersed within the genomes of all non-African human populations (Noonan *et al.*, 2006; Green *et al.*, 2010), resulting from a very low interbreeding rate of ~2.5% and high rates of inviability or sterility among male human-Neanderthal hybrids according to Haldane's Law (Mason & Short, 2011).

Further studies revealed the strong reproductive isolation between Neanderthals (above) and humans despite thousands of years of co-existence in Europe (Currat *et al.*, 2011; Yang *et al.*, 2011). A study of the date of interbreeding between Neanderthals and modern humans identifies migratory gene flow <100,000 years ago as the likely scenario for the observed interspecific mating (Sankararaman *et al.*, 2012). The researchers estimate a likely interbreeding period of 47,000–65,000 years ago.

In the case of Sasquatch, a rough estimate of the hybridization period can be made according to gene mutation rates that mark phylogenic 'branching' events resulting in haplotype differentiation. *The fact that both Zana and Khwit showed only one base variation from the human reference sequence is indicative of more recent hybridization at the end of the Pleistocene, some 12,000-16,000 years ago.*

Subsequent Holocene warming was triggered by meteor impacts that destroyed the Atlantean power grid –a global network of megalithic temples and pyramids for cranial and genetic enhancement during fetal gestation by focused infrasound at the base human heartbeat frequency of 1.45 Hz.[27] *Resonant gestation practices induce cranial enhancement like those elongations exhibited by the Pharaonic lineages of the descendant Egyptian culture that dominated the use of pyramid facilities.*

While the skull size of the Sasquatch Zana is well within the human range, no determinations have been published concerning the volume of her unusual braincase, *which displays a distinct occipital enlargement that is not consistent with modern human skull morphology* (opposite). Enlargement of the occipital lobe of the Sasquatch brain most likely relates to enhanced infrasound perception, enabling long-distance vocal communication far below the threshold of human hearing.

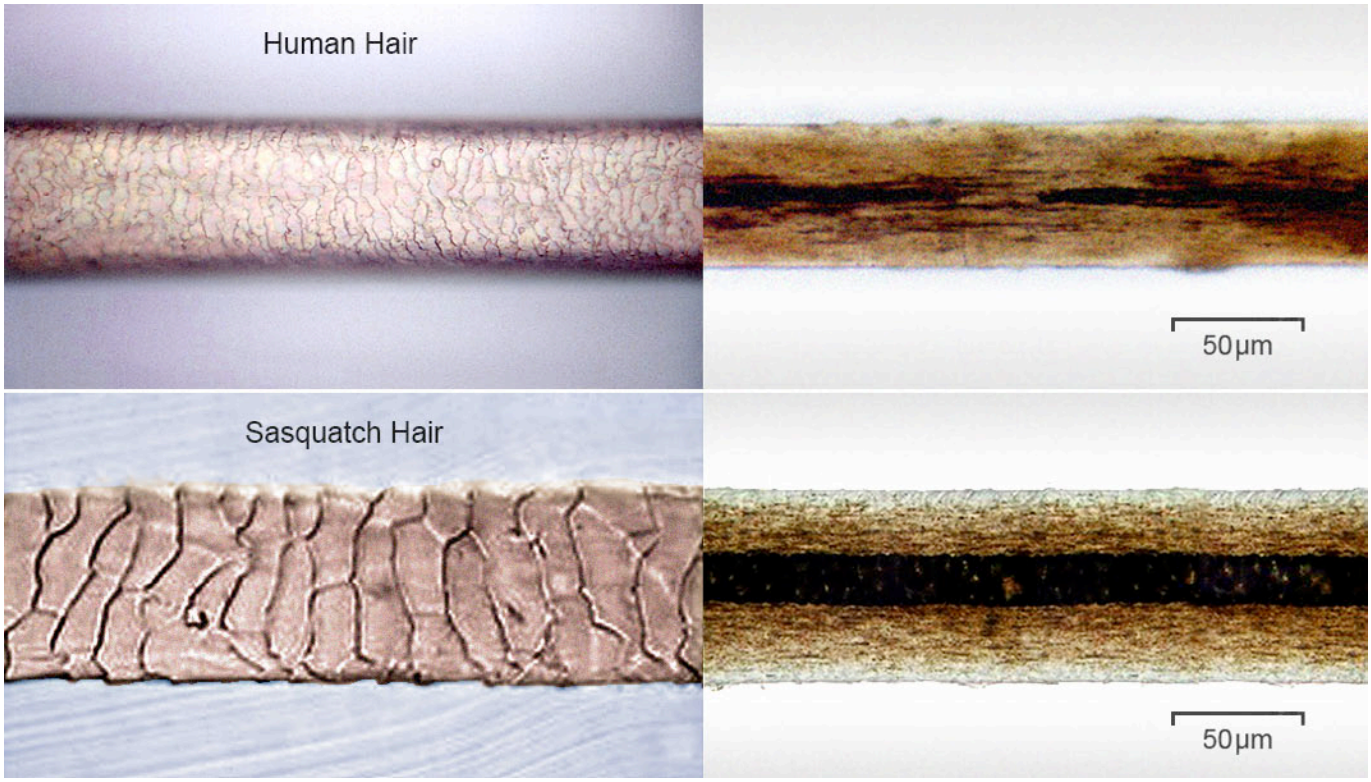
The Sasquatch Genome

The Sasquatch Genome

Obscure histories of gruesome murders and sexual violence by the elusive race of high mountain giants known as Sasquatch demands genetic study. The prevalence of psychopathic behavior among these giant hominins has been mistaken by many researchers as a natural response to inevitable territorial conflicts, having incurred deep psychological trauma among the tribes of the Pacific Northwest. At Nootka Sound, Vancouver Island, the Spanish-Mexican naturalist Jose Mariano Moziño Suárez de Figueroa described the fearsome giants in 1793:

> [Locals speak of] a *Matlog*, a resident of the mountains, who fills everyone with unspeakable dread. They describe it as having a monstrous body, covered in all manner of rigid black bristles, with a head similar to a human's but with larger, sharper and stronger fangs than a bear's, very long arms, with its fingers and toes armed with long and curved claws. Its screams alone –they say– can topple anyone... I presume that... members of the tribe received word long ago that *these entities owe their existence to demons*.[1]



Regional Native accounts of Sasquatch encounters by hunters and trackers reflect the contemporary experiences of residents of forested areas that border the giants' mountain domain throughout North America. Encroachment by western civilization has increased levels of interaction between the hairy giants and human beings, as witnessed by many incidents where Sasquatch trespassers have left hair, blood and tissue residue while stealing livestock from country farms at night.

Numerous unidentifiable hair samples have been collected from pasture fencing that show distinctly non-human, non-animal characteristics under microscopic examination (above), yet consistently yield human mitochondrial DNA (mtDNA). While this anomalous feature of Sasquatch genetics has halted many forensic investigations, nuclear DNA (nuDNA) studies reveal the giants to be a viable human-hybrid species. *For this reason, human-Sasquatch interbreeding produces viable offspring defined as backcrossed hybrids entering the human genepool at a much higher rate than one might guess.*

Toward development of a comprehensive Sasquatch genome database, multitudes of hair samples specifically linked with Sasquatch close encounters have been recovered by dedicated field research organizations including the Sylvanic collective, Erikson Project, Olympic Project, Arizona Cryptological Research Organization and the Stan Courtney Research Group. Novel hair samples have also been collected by hundreds of eyewitnesses and Sasquatch habituators. In a long-term study, Texas-based DNA Diagnostics has screened over 100 hominin hair samples by careful morphological examination, revealing several consistent features that diverge significantly from all human and animal hair types:

> A wide variety of hair shaft profiles were observed using stereomicroscopy and light microscopy (below)... with most exhibiting a stiff, wiry texture and wavy, curved appearance with rounded tapered tips, consistent with aged hairs that had not been cut. The full length of the hairs was approximately 15 cm and diameters ranged from 80 to 110 µm (human head hairs typically range from 55 to 100 µm in diameter).

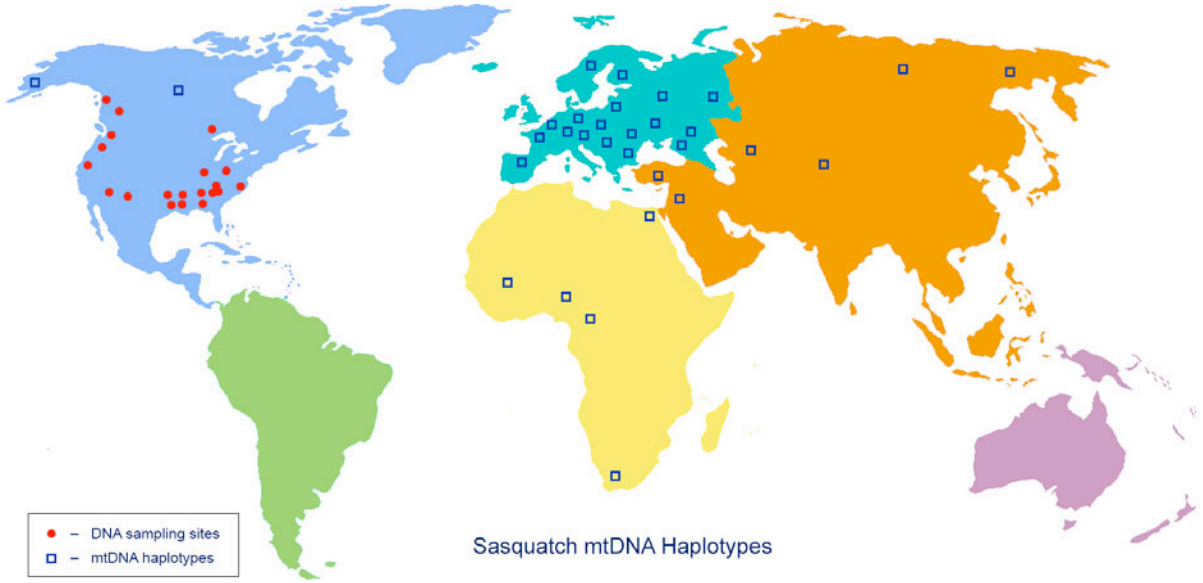
> The medulla and root were found to be the two most discriminating characteristics of the microscopic examination. Most of the novel hairs had medullary structures and diameter ratios that were clearly distinct from human hairs... Human hairs exhibit characteristic uniform imbricate scale patterns of the cuticle. Several different cuticle patterns were observed on the submitted samples. The hairs exhibited wide imbricate scale patterns proximally that transformed to close imbricate patterns distally. These patterns are distinctly non-human in appearance. Most of the submitted hairs were not microscopically consistent with any of the hairs from the reference collection of common animal hairs that included human, cat, dog, cow, horse, deer, elk, antelope, moose, sheep, fox, bear, coyote, wolf, rat, mouse, monkey, beaver, squirrel, llama and others.[2]

The primate quality of these easily-distinguished Sasquatch hairs is unmistakable, showing imbricate scale patterns and thickness that now form the basis for identification of the giant hybrid. The broad range of colors among Sasquatch hairs includes black, brown, orange, red, auburn, beige, grey and even white, while their skin color ranges from dark grey to light brown. *The most impressive sample yet analyzed is a sizable section of skin with beige fur collected from a fresh Sasquatch corpse.*

Histological examination of the fresh Sasquatch tissue sample with skin and hair were conducted by anatomic and clinical pathologist Dr. D. Toler, of Huguley Pathology Consultants, identifying fewer numbers of glands than are normally found in human skin, in addition to several follicular anomalies including follicle depth, number and clustering patterns not associated with pathological influences:

The tissue sections reviewed show sufficient preservation for adequate histologic review. The basic epidermal and dermal histological architecture and cellular constituents are intact... It seems there are some abnormalities with abortive hair shafts, various alopecias etc. where hair follicles can be grouped. However, the clustering deeper in the dermis than the level of dermis where most skin appendages usually occur is unusual and is not generally associated with hair follicle loss as is seen with alopecia. This appeared to be hair follicle addition or at least some extra follicles, clustered and deeper in the dermal region.

There were also lesser numbers of eccrine glands and even sebaceous gland/pilosebaceous gland units than you usually see in human skin. The relative number of skin appendages is somewhat dependent on which part of the body the skin comes from so that would be location specific. Some surfaces have lots of hair and others considerably more eccrine glands. It is difficult to say where the combination in these sections came from especially since the deeper dermal clustering is not usually found in human skin.[3]



Toler's histological analysis was conducted *in the blind* (without knowledge of the giant human-hybrid origin of the sample), leaving the pathologist apparently unable to reconcile major divergence from normal human skin in a great number of the tissue's structural features. Yet, the overall density, depth and clustering of hair follicles is consistent with the character of protective animal fur, having been especially climate-adapted to the sub-zero conditions of harsh North American winters.

In addition to follicular material from the multitude of non-human, non-animal, unknown primate hairs analyzed, various other biological samples including tissue, blood and saliva were selected for DNA extraction, amplification and sequencing of both mtDNA and nuDNA in an ongoing five-year study by Dr. M. Ketchum and associates at DNA Diagnostics, who have *expertly applied strict forensics protocols, supported by blind studies run in parallel at several world-class laboratories in Texas.*

Of those screened by histological examination, 30 hair samples were selected for mtDNA analysis, whereas hair samples without root material were not recommended for genetic study. The Sasquatch mtDNA analyses revealed a comprehensive set of previously unrecognized anomalies regarding the unusual global distribution pattern of maternal lineages of the giant North American hybrid. Of the 30 distinct individuals sequenced for mtDNA, 20 specimens yielded complete genomes, while 10 yielded partial mtDNA sequences that provided definitive segments enabling haplotype determinations.

Surprisingly, all 30 North American Sasquatch individuals yielded fully human mtDNA haplotypes, a majority of which predominate among Europeans, Asians and Africans, while a minority are descended from North American maternal lines. Such consistent human results have been the cause of much confusion among geneticists and Sasquatch field researchers alike, for this unique combination of human mtDNA from distinctly non-human hairs can only be explained by interspecies hybridization. This small sampling of human mtDNA contributors to the Sasquatch species represents $^{1}/_{3}$ of all known human haplogroups. *Rather than narrowing down the geographic region where hybridization occurred, such a wide distribution pattern denies any specific conclusion regarding the giants' locus of origin.*

Only 13% of mtDNA haplotypes identified (samples 11, 81, 140 and 168) showed maternal lineages in geographic proximity to their North American habitation sites, yielding Native American haplotype A6L2c, found in greatest concentration among the Inuit and Nivkh peoples; haplotype C, representative of the Evenks and Yakuts; as well as haplotype D, predominant among Aleuts. By contrast, 74% of North American Sasquatch samples sequenced thus far belong to distant human mtDNA haplogroups H and T prevalent among Europeans, and V characteristic of the Arctic Saami. The skin sample with beige fur from Northern California (sample 26) yielded haplotype H1a prevalent among the Basque of the Pyrenees mountains, while black hairs from North Texas (sample 31) yielded mtDNA sequence belonging to the oldest haplogroup, type L0d2a of the South African Khoisan people (opposite).

The breadth of diversity of human maternal haplotypes identified among the Sasquatch population follows none of the migratory gene flow patterns common to the great majority of naturally-dispersing populations, instead presenting a series of anomalies that, taken altogether, are highly indicative of a long-term global program of genetic engineering in conjunction with population management.

Such strong divergence from natural population dynamics is further compounded by the extreme rarity of specific subsets of mutations among the maternal progenitors of North American Sasquatch. Results from sequencing the hypervariable region of Sasquatch mtDNA have confounded geneticists, *in every case presenting sets of mutations at various markers that are unique among modern populations.*[4]

Notable disparities between human and Sasquatch mtDNA haplogroup T lineages support strong population isolation between terrestrial humans and the female human progenitors of the Sasquatch species. Mutations 146T, 16187C and 16189T are present among all terrestrial humans of haplogroup T, yet none of the haplotype T2 Sasquatch display those mutations. Another anomaly concerns the 73G, 152C, and 263G mutations which appear consistently among the Sasquatch T2 haplotypes sequenced from five different states (OK, TN, WA, AZ, TX), yet are absent in known human sequence belonging to haplogroup T. Instead, among known human populations mutation 73G finds expression among haplogroups X and U.[5] *Clearly human, Sasquatch mtDNA haplotypes are indeed distinctive.*

Further studies may reveal descendants bearing these same distinct sets of mutations, but our present knowledge of genetic diversity among terrestrial human populations refutes the conclusion that the giant human-hybrid Sasquatch is a product of natural species hybridization. The troglodytic lifestyle of the Sasquatch species lends support for the existence of parallel subterranean human populations.

The presence of the T2b mtDNA haplotype among the Sasquatch individuals sampled is suggestive of a relatively recent hybridization period for the Sasquatch species prior to the catastrophic events that initiated the warmer Holocene, some 12,000-14,000 years ago.[6] The cometary impacts that ended the last glacial period caused rapid changes in global weather patterns closely associated with significant glacial melt and sea level rise effectively submerging the coastlines of the glacial period by hundreds of feet, leaving behind what is known today as the 'continental shelf'. *The recurring cataclysmic loss of spiritual and material knowledge experienced by terrestrial humanity is effectively prevented by the great depth of ancient subterranean populations with advanced technological capabilities.*

The existence of these technologically advanced human and non-human populations dwelling below the Earth's surface in artificially maintained, illuminated and weather-controlled cavern systems remains largely unknown to most humans now inhabiting the planetary surface, yet the whispers of ancient indigenous wisdom are still audible, echoing within the human collective unconscious.

Ethnographers have documented ancient knowledge of subterran cities among Native American cultures, who regard such places as sacred centers where their ancestors survived multiple catastrophes during previous epochal shifts. Underground human populations also account for the distinct genetic material observed of the cave-dwelling Sasquatch maternal lines, apparently derived from *an entirely separate human population without any known living terrestrial descendents.*

The genetic divergence witnessed in the mtDNA mutations of human and Sasquatch haplogroups may relate closely with the segregation of terrestrial humanity from ancient subterran populations caused by cometary bombardment events that ended the Ice Age. These first emerging genetic studies of largely subterranean Sasquatch populations have completely surprised geneticists, however, this previously undetected species has also yielded information concerning a co-existing subterran human population whose ova were used in the advanced genetic engineering of the hybrids, perhaps involving artificial insemination of human females and mid-term fetal removal –as described among alien abduction cases.

As genetic sequencing of the North American Sasquatch population continues at a quick pace, a wider variety of samples collected from various continents will reveal genetic relationships between Sasquatch and other such cryptid species of human/primate hybrids, especially the giant Yeti of Siberia, the tiny bipedal 'Orang Pendek' of Malaysia and the man-sized 'Skunk Ape' commonly reported in the Florida everglades. Dr. Ketchum has confirmed that mtDNA sequencing of the Skunk Ape is already underway.[7]

Further DNA testing of fresh biological material from North American Sasquatch have yielded novel, repeatable results. Mitochondrial genome and specific loci sequencing of the samples was followed by forensic short tandem repeat testing, whole genome single nucleotide polymorphism bead array analysis and whole genome nuDNA sequencing. Of 30 viable DNA samples, 3 specimens collected from widely-separated regions of North America and containing large quantities of high-grade DNA were selected for next generation whole genome nuDNA analysis: fresh tissue from Northern California (sample 26, above); fresh saliva from Alabama (sample 31); and dried blood from Illinois (sample 140). *Ketchum's team report a mosaic of human and novel non-human nuDNA sequence:*

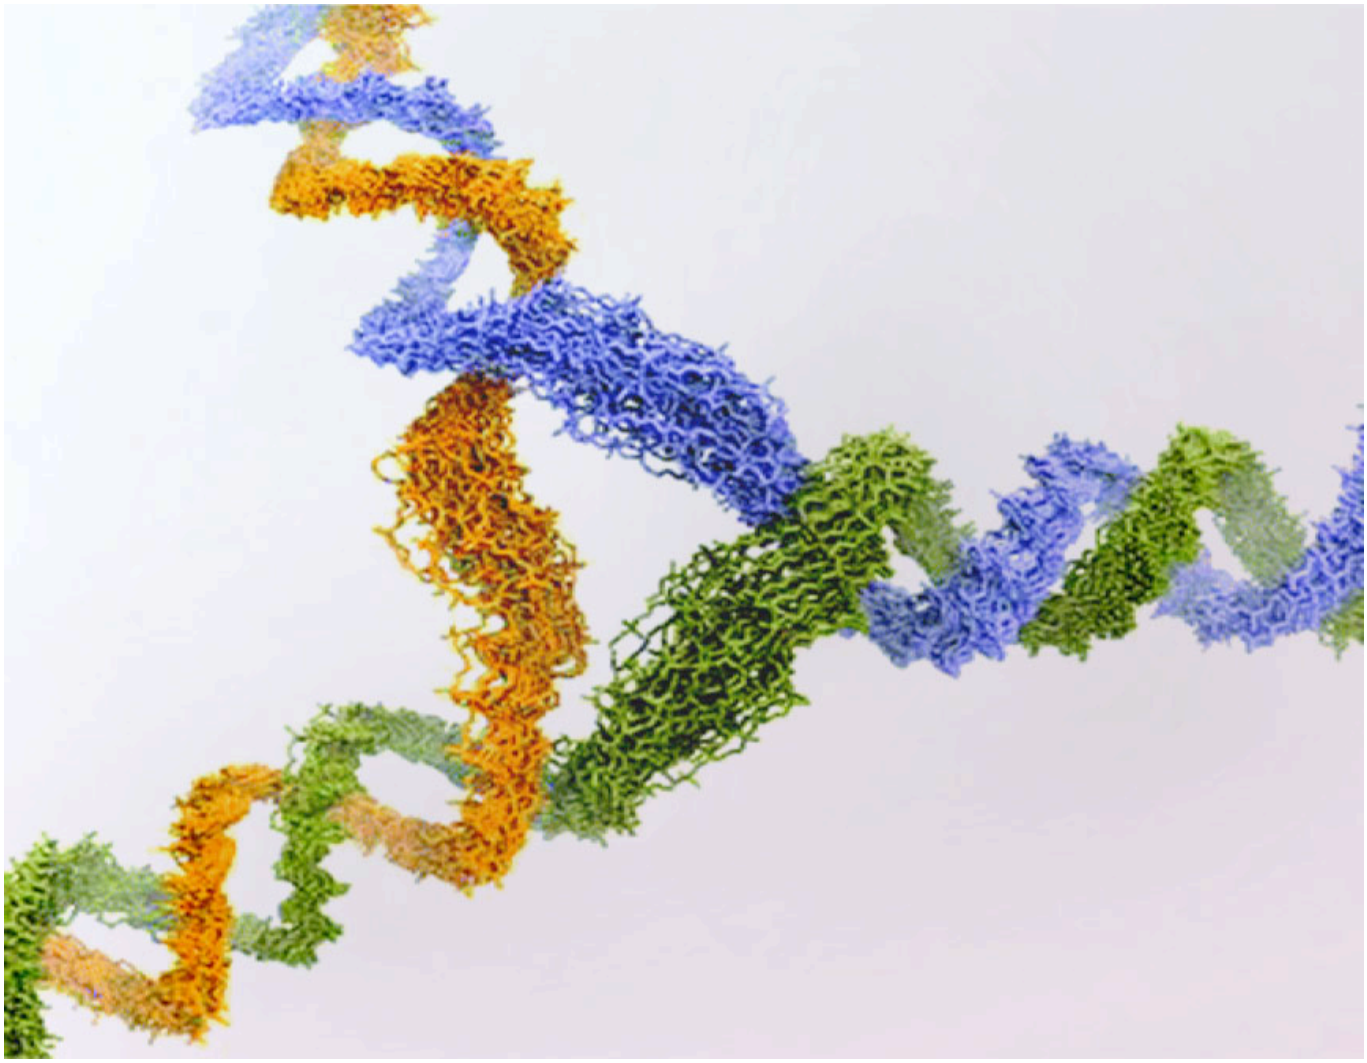
> In summary, we have extracted, analyzed and sequenced DNA from over one hundred separate samples of hair, tissue, toenail, bark scrapings, saliva and blood obtained from scores of collection sites throughout North America... Analysis of whole genome sequence and analysis of preliminary phylogeny trees from the Sasquatch indicated that the species possesses a novel mosaic pattern of nuclear DNA comprising novel sequences that are related to primates interspersed with sequences that are closely homologous to humans. These data clearly support that these hominins exist as a novel species of primate. The data further suggests that they are human hybrids originating from human females... Though preliminary analysis supports the hybridization hypothesis, ...the data conclusively proves that the Sasquatch exist as an extant hominin and are a direct maternal descendent of modern humans.

These remarkable results have surprised geneticists and been denied inclusion in Genbank, despite painstaking forensic procedures and controls applied in error prevention. Efforts to characterize the segments of novel nuclear sequences have proven even more unusual, showing homology to the oldest suborder of primates –*the prosimians*– being ancestral to the simians, which diverged into the wide variety of monkey and ape clades considered to be closely related to hominin species:

> The Sasquatch Genome Project [obtained consensus nuDNA sequences]... We sequenced three genomes and they aligned... But when we went to look at the nuclear part and started aligning it down chromosomes, we got something... very unusual. It was closely related to human, but it was not human... [–and consistently presented] something that has never been seen before. The genomes aligned with one another, meaning they came from the same species. So, here we've got three independent samples from three different parts of the country from three different submitters and they are all showing the exact same thing on genomes!
>
> [The paternal progenitor is] headed a little more towards the lemur line, oddly enough. *It is definitely not an ape.* And it's interesting that we found out that there is an extinct lemur that weighed 400-500 pounds... [with] opposable thumbs and hooded noses. It really freaked me out that we had lemur. I did not expect that! [8]

Phylogeny of Sasquatch nuDNA findings reveals the *closest known relative* of the giant prosimian paternal progenitor of Sasquatch *may be* the oversized Megaladapis (below), a giant species often referred to as the *koala lemur* for their strong anatomical similarities to the undersized Australian marsupial. Further research concerning giant lemurs of the Pleistocene period may uncover new species that present *closer* relationships with the unknown male progenitor of the Sasquatch hybrids.

The diademed sifaka is one of the largest prosimians endemic to the forests of Madagascar, known for its black, white and gold coloration, with a fringe of white fur framing its dark face (below). Despite the fact that this contemporary lemur is tiny with respect to its giant Sasquatch 'cousins', the same ruffed fringe of fur encloses the faces of several varieties of North American Sasquatch.



The reproductive limitation of size incompatibility must also be considered. An average adult human female stands 5'5" tall, whereas average adult Sasquatch males are 8-9' in height. Such a large height discrepancy suggests the giant prosimian paternal progenitor species may have reached a height of 13'. *Even if an awkward mating could somehow be accomplished, how could a human female bring a giant Sasquatch fetus to full term and safely give birth?*

By comparison with the rarity of interbreeding between Neanderthals and modern humans (hominin species of similar size and anatomy) the likelihood of a 13' male prosimian mating with a human female less than half his size seems *highly unlikely to ever have happened*. *That such a mating would occur frequently enough to establish a global population of viable hybrids with the full breadth of mtDNA variation reported by the Ketchum study appears extremely unlikely.*

The well-established veracity of sampling methods and testing procedures applied by expert forensic scientists throughout this breakthrough five-year Sasquatch DNA study remains untainted by the false media accusations and ignorant ridicule endured by Dr. Ketchum. Despite maintaining the strictest of standards and conducting extensive control studies on normal human DNA samples, *several potential DNA sequence anomalies were encountered among many of the Sasquatch samples:*

> All human control samples were successfully amplified on all loci tested. In contrast, there were unusual PCR amplification findings from DNA obtained from the unknown samples. Some of the samples appeared to produce normal amplicons that resulted in bands consistent with the human controls. Other samples displayed clear bands that appeared to be of different sizes than those expected of normal human amplicons. Yet others had more than one band. Still other samples failed to amplify at all... When the amplicons from various loci were visualized on agarose yield electrophoresis gels, the bands did not migrate consistently, but migrated at varying rates across the samples... [Under electron microscopy,] most of the DNA showed clustering of material along the length or at ends and were typical of disordered single-stranded segments. There were also [anomalies involving] frequent single-stranded gaps and single-stranded ends...[9]

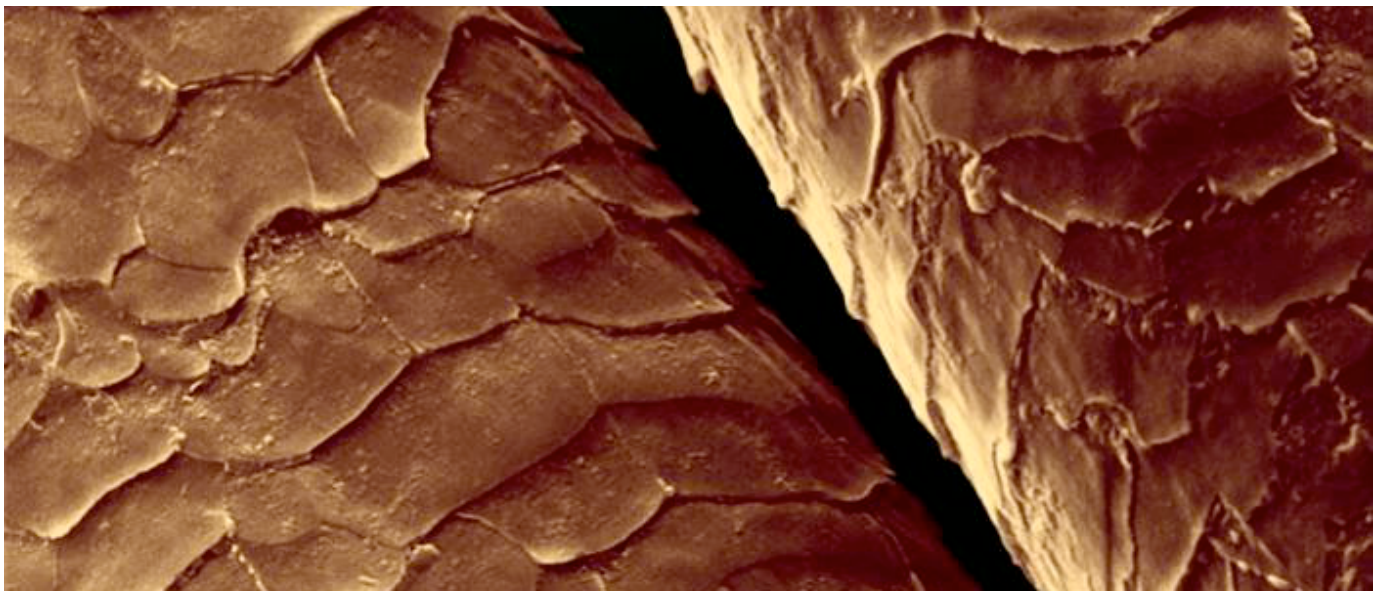
Off-ladder alleles and allelic dropout were detected during analysis of short tandem repeats (STRs). The mutations were seen in 16 separate loci when PowerPlex16 amplification was used. *X* dropout was noted in a significant number of the Sasquatch samples due to novel sequence in the homologous *X* region of the *Y* chromosome at the *amelogenin* locus. This was supported by sequencing this region and the associated novel sequences and failures to sequence at this locus. Novel sequence, failures to sequence and interspersed human sequence was also observed when *amelogenin* locus exons 1, 2, 4/5 and 8 were sequenced. The same amplification/sequencing patterns were observed at the *TAP1* locus.

In order to further explore the reasons for the widespread novel amplifications described above, DNA from Sample 26 was imaged using electron microscopy. Electron micrographs of the DNA revealed unusual double strand – single strand – double strand transitions which may have contributed to the failure to amplify during PCR. The high quantities of single stranded DNA, interspersed with double stranded DNA... may suggest substantial structural abnormalities of the DNA itself. The DNA was visualized twice by electron microscopy from aliquots of two different extractions from the same sample 26. Both of these extractions not only had yielded successful PCR amplifications previously, but were combined and utilized for whole genome nuclear sequencing at a later time. Alternatively, the abundance of single-stranded loci observed by EM could be interpreted as high numbers of replication forks or another structurally altering genomic process involving an increase in helicase activity.[10]

Comparison with genetic sequence from Genbank's over 100,000 distinct, naturally-occurring species reveals unique sequential and structural features of Sasquatch nuDNA that have never been previously observed. The Y-shaped structure of three-way DNA junctions was identified decades ago as a phase of replication involving helicase enzymes (Duckett & Lilley, 1990),[11] yet this configuration was only recently modeled (above; Sabir *et al.*, 2012)[12] and *does not normally appear after DNA is amplified.*

The full scope and significance of the anomalous Sasquatch genome cannot yet be fully grasped by Earthly geneticists, being a technological DNA product that is far in advance of our present capabilities. While not all of the histologically-screened Sasquatch samples presented migration anomalies during electrophoresis procedures, the many difficulties documented by the forensic team at DNA Diagnostics have successfully thwarted all previous laboratory investigations. However, the failure of contemporary DNA sequencing technology to process Sasquatch samples is, *in itself*, strong evidence of artificial deviation from natural genetic expression as displayed by the great variety of lifeforms on Earth.

Both the structural and sequential features of Sasquatch DNA bear the unique hallmarks of advanced genetic engineering and ongoing population management conducted over a period of many thousands of years by a presently unknown consortium, comprised of several genetically-enhanced races of extraterrestrial entities. Each of these distinct humanoid species engages in specific tasks for which they have been especially engineered. *According to Native Elders, the Sasquatch species has been artificially created and deployed as Shadow Guardians of subterranean domains.*

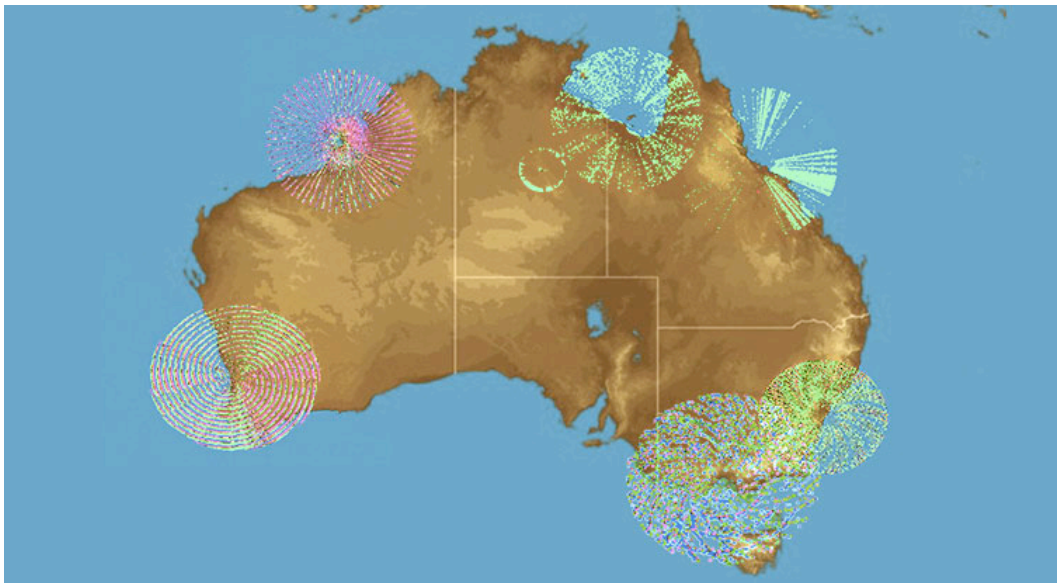


Spanish documentation in 1793 by Jose Mariano Moziño Suárez de Figueroa provided the surprisingly accurate Native account of the origin of the Sasquatch species, noting that "the [Nootka] tribe received word long ago that *these entities owe their existence to demons."* Contemporary eyewitness accounts involve interaction of Sasquatch with small, luminous aerial spheres, as well as giant aerial discs often occupied by 'demonic entities' *–giant reptilian humanoids and the diminutive Grays.*

The extensive knowledge of indigenous Elders has always been given as warnings to those who are not aware of the malevolent predatory species that stalk human beings during the dark of night. Transdimensional breaches of our terrestrial environment have left trace biological evidence in the form of novel DNA samples, which constitute definitive proof of the advanced artificial manipulation of human genetics by various extraterrestrial species occupying an extensive global network of subterranean bases populated by various human and non-human species.

The many DNA anomalies observed among the human-hybrid Sasquatch reflect similar anomalies previously encountered by researchers investigating a translucent blonde hair collected in 1992, following the extraterrestrial abduction and sexual assault of Peter Khoury in Sydney, Australia.[13]

The first-ever DNA profiling of an extraterrestrial hair sample in 1998 set a remarkable precedent for a unique combination of never-before-encountered genetic anomalies that constitute compelling evidence of advanced genetic engineering of human beings for specific functions. The blonde female 'sex-worker' that assaulted Khoury presented gene deletions conferring resistance to HIV infection *–a genetic protection mechanism that would be highly desirable for anyone committing such acts:*



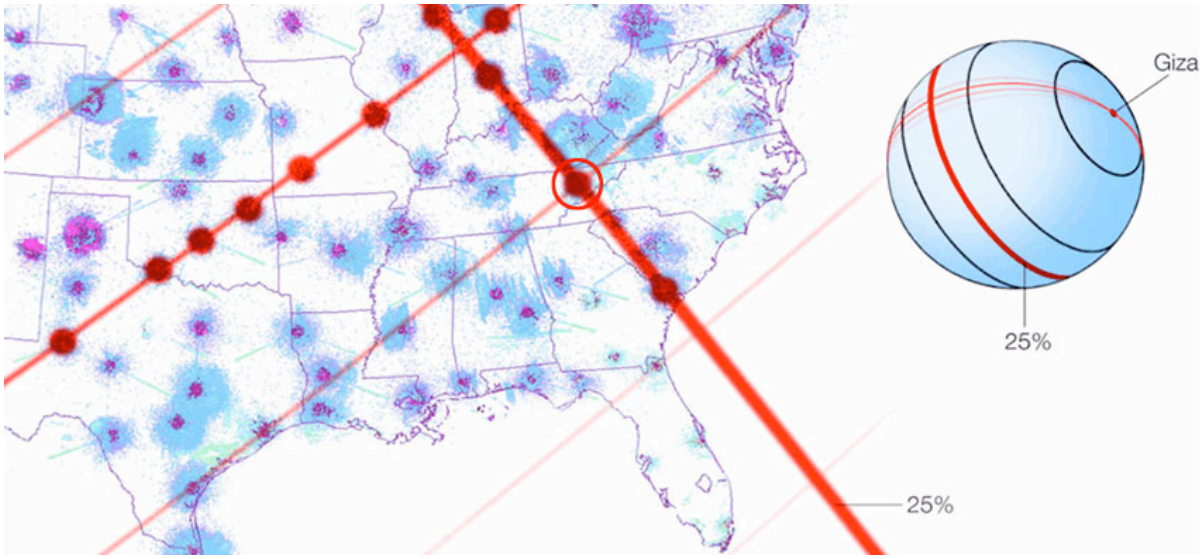
> It was not until 1996 that I heard from Peter Khoury about the hair sample that had been recovered from what may have been an alien abduction sexual assault case… By 1998, I began an investigation into the hair sample, when biochemical colleagues agreed to undertake what was the world's first PCR (polymerase chain reaction) DNA profiling of biological material implicated in an alien abduction experience. The analysis confirmed the hair came from someone who was biologically close to normal human genetics, but of an unusual racial type –a rare Chinese Mongoloid type– one of the rarest human lineages known, that lies further from the human mainstream than any other except for African pygmies and aboriginals.
>
> There was the strange anomaly of it being blonde to clear instead of black, as would be expected from the Asian type mitochondrial DNA. The study concluded, "The most probable donor of the hair must therefore be as (Khoury) claims: a tall blonde female who does not need much color in her hair or skin, as a form of protection against the sun, perhaps because she does not require it [in a protective environment]..."
>
> The original DNA work was done on the shaft of the hair. Fascinating further anomalies were found in the root of the hair. Two types of DNA were found depending on where the mitochondrial DNA testing occurs, namely confirming the rare Chinese type DNA in the hair shaft and indicating a rare possible Basque/Gaelic type DNA in the root section...

> This was very puzzling and controversial, until a 'Nature Biotechnology' paper appeared in 2000. It revealed recent findings on hair transplanting with previously incompatible hair, using advanced cloning techniques, developed in a possible cure for baldness. We seem to be seeing similar combined or "grafted" DNA in the sample recovered under controversial circumstances by Peter Khoury back in 1992.
>
> Perhaps even more controversial is that we have findings suggestive of nuclear DNA indicating possible viral resistance. The hair sample seems to show it contains 2 deleted genes for CCR5 protein and no intact gene for normal undeleted CCR5 –this CCR5 deletion factor has been implicated in AIDS resistance. To keep a very complex story somewhat uncomplicated, what seems to be suggested by the range of findings is possible evidence for advanced DNA techniques and DNA anomalies and findings, for which we are only now discovering or starting to make sense of in mainstream biotechnology. [14]

Fifteen years after this exceptional early DNA study was conducted, next generation whole genome sequencing of nuDNA from the extraterrestrial blonde hair sample has not been published. As with the hybrid Sasquatch case, fully human mtDNA results obtained from the blonde hair do not correspond to Khoury's description of the decisively non-human proportions of the face and body of the naked female who assaulted him. This obvious discrepancy was largely dismissed, yet suggests the very tall blonde is not only a product of advanced hair grafting and CCR5 genetic enhancement, *but that she is also a human-hybrid whose nuDNA contains segments of novel sequence that are extraterrestrial in origin.*

The location of Khoury's home, where the assault and subsequent hair discovery occurred, is another significant factor that has been overlooked. Sydney, Australia (33.88°S 151.21°E) is 8,962 miles from the Great Pyramid in Egypt, a distance that is 36.0% of the Earth's mean circumference. Infrasound waves focused onto the area where Khoury resides caused repeating spates of loud explosions and strong rattling of houses on August 7-8, 2007. The disturbing events were reported to local police by hundreds of area residents and followed-up with dismissive spin coverage by local news media.

The powerful infrasound rattling of August 7-8, 2007 appeared simultaneously with a gigantic Doppler radar anomaly, presenting two counter-rotating spiral features centered over Melbourne that spanned outward over 500 miles in every direction, covering a vast circular area that extends within 80 miles of Sydney (above). Melbourne (37.87°S 145.53°E) shows an exact 35.0% distance from Giza.



Similar giant circular areas of anomalous water vapor activity have also appeared on Doppler radar observations centered above the coastal city of Brisbane on February 4, 2010, and again to the north above the town of Gympie on April 2, 2010,[15] in an area made famous for the discovery of an ancient pyramid. The Gympie pyramid site has yielded many Sanskrit artifacts[16] that suggest an Atlantean origin, yet went unrecognized by authorities and was recently destroyed for a bypass road in 2009.

Further radar anomalies, similar in both shape, size and often including a single spiraling feature, were also recorded directly centered above Sydney on February 25, 2010; June 22 and November 9, 2011; and again on January 8 and May 16, 2012.[17] An extreme incident related to these anomalies occurred in Sydney on June 24, 2011, when spontaneous piezoelectric fire destroyed an unoccupied home,[18] induced by covert infrasound emissions from radar installations in resonant alignment.

The well-defined global distribution pattern of ancient pyramids and sacred sites has been employed for covert atmospheric manipulation systems within Australia's radar network, having become evident in the last several years of intensified tampering with nature's forces. *Severe weather, tornadoes and waterspout formations in Australia are being generated by increased output from this array of secretly weaponized radar systems. The same technology induced deadly tornadoes across Europe in 2012.*

The focused confluence of so-called 'paranormal' activities involving UFO sightings, human-hybrid encounters, spontaneous piezoelectric combustion and radar anomalies at exact whole number percent distances from the Great Pyramid cannot be understated. The many remarkable geometric alignments defined by these astounding patterns in space and time reveal the fundamental influence of infrasound resonance –*an almost imperceptible cosmic force that binds the dimensions.* Regional mapping of Sasquatch activity patterns in North America also supports this complex hypothesis.

The Sasquatch Genome Project confirmed the novelty of hair root samples collected in thickly forested areas of London, Putnam, Overton and Clay counties in eastern Tennessee. The indigenous Cherokee tribe once protected a sacred 4.5-acre subterranean lake now called the Lost Sea, within Craighead Caverns. The lake's pure waters are the result of filtration through piezoelectric calcite of the limestone bedrock, becoming intensely ionized by focused infrasound standing waves that converge on the area. Nearby Knoxville, Tennessee (36.01°N 83.94°W) lies exactly 6,244 miles from Giza, which comprises 25.0% of the Earth's mean circumference distance –*exactly one quarter* (circled in red, below).

Infrasound resonance in this area is responsible for earthquake-like tremors experienced in West Knoxville on May 14, 2007,[19] *which accompanied the formation of an intricate crop circle mandala in nearby Madisonville on the very same night*.[20] Another crop formation event took place on May 11, 2011,[21] *rendering the octagonal refraction pattern of calcite, the main constituent of the local bedrock.* Further along this 25.0% alignment to the northwest, infrasonic levitation of large sandstone boulders has also been documented in multiple locations in Indiana's Limon[22] and Yellowwood State Parks.[23]

Nexrad radar installations throughout the US also display an unmistakable alignment with the resonant field of focused infrasound emanating from the pyramids of Giza, Egypt (above). Driven by the artificial ultra-low frequency emissions, fine canopies of water vapor condense above the hotspots to be seen by Doppler radar. *This phenomena was discovered by Nikola Tesla in 1899 during his Colorado Springs research, published with notes and observations on standing wave resonance in 1978,* and reflected upon at the American Institute of Electrical Engineers Annual Meeting of May 18, 1917*:*

> In Colorado I succeeded one day in precipitating a dense fog. There was a mist outside, but when I turned on the current the [water vapor] cloud in the laboratory became so dense that when the hand was held only a few inches from the face it could not be seen.[24]

Colorado Springs (38.92°N 104.82°W) is located 6,861 miles from the Great Pyramid. This distance comprises 27.56% of the Earth's mean circumference, or $^{55}/_{200}$ when expressed as a fraction. Infrasonic induction of intense piezoelectric heating was measured by investigators at 800°F after a small boy suffered burns when his shoes melted on a Rockrimmon neighborhood playground on June 3, 2008.[25] *Relative geopositioning of all of these infrasound-related incidents reveals resonant distance intervals.*

In all parts of the world where ancient knowledge maintained by indigenous tribes living on their ancestral lands, *wisdom teachings handed down from the Elders denote sacred sites where vital energies are enhanced, as well as dangerous locations closely associated with death*. One such danger zone in Russia's Ural mountains has become famous for recurring mutilations (above).

The Ural mountains are well-known as a region of geomagnetic anomalies, which include an unusual mountain ridge near the Pechora River that has been the site of repeated incidents involving multiple fatalities that bear several parallels to the Sylvanic Valley attacks in British Columbia, Canada. Local indigenous Mansi Elders warn of recurring lethal attacks on the east shoulder of *Kholat Syakhl*, a Mansi name meaning 'Mountain of the Dead Men', in reference to strange deaths linked to luminous spheres that are often seen dancing above the broad mountain ridge.

In the late 1950s, the killing of a group of nine local Mansi hunters in that close vicinity was fresh in the minds of locals. Just as in the case of Sylvanic Valley, where youthful curiosity had won out over caution, retelling of the events associated with the deadly mountain inspired a group of students to investigate the area during harsh winter conditions in spite of stern warnings from local Elders. On January 23, 1959, ten students from the Ural Polytechnic Institute embarked on a three-week cross country ski expedition through the Kholat Syakhl region, led by 23-year-old Igor Dyatlov. Loaded with cameras, film rolls and journals to document the trip, a primary focus of the group is revealed by an incomplete journal entry that appears to have been their last: "Now we know the wild Snowmen exist."

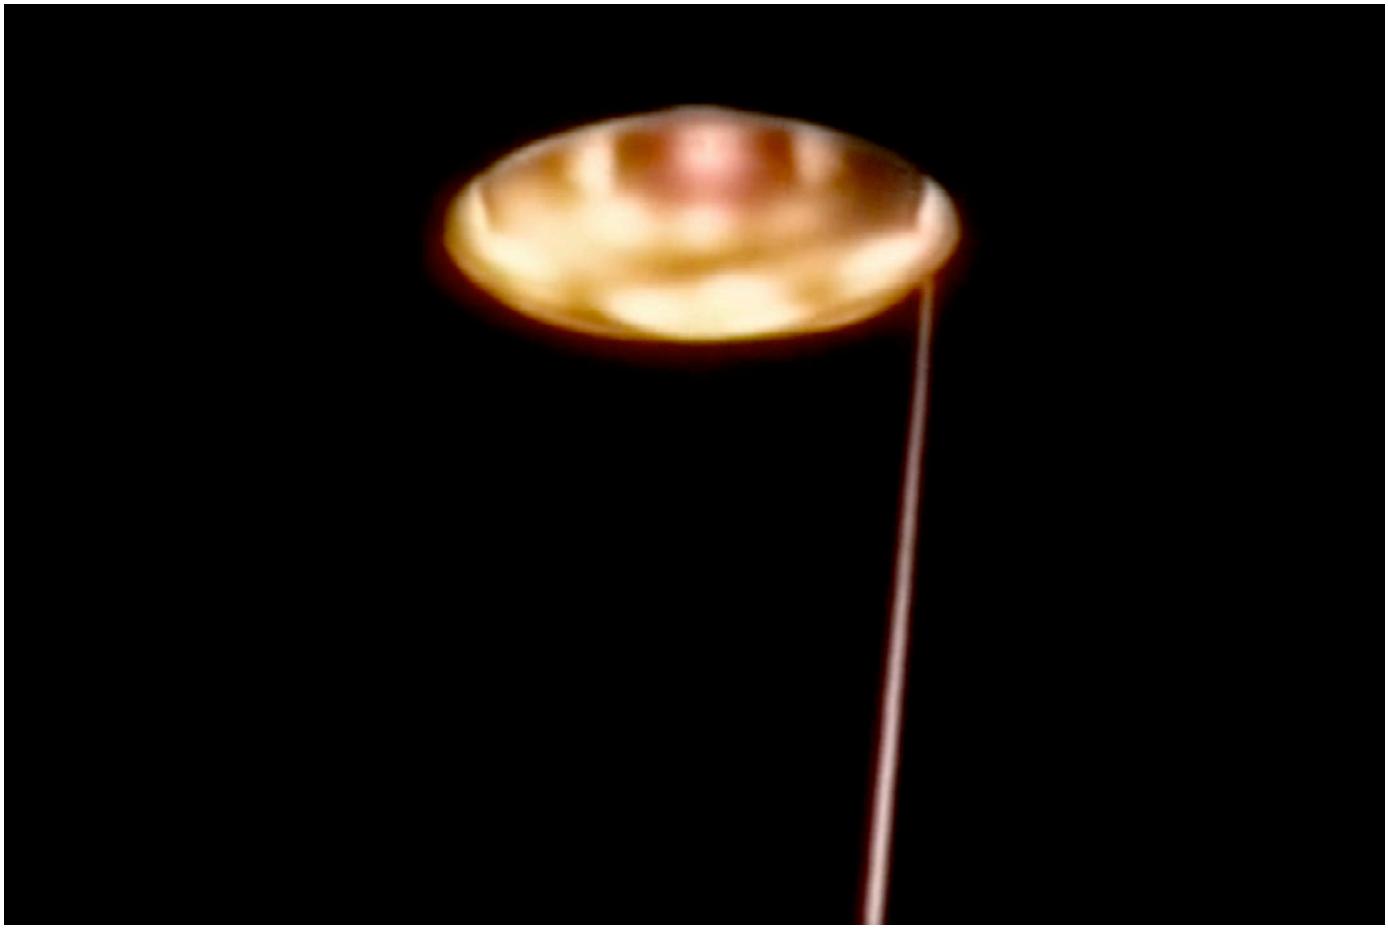
One member of the party who completed only the first portion of the trip was fortunate to have avoided the tragic incident that killed all nine remaining members of the expedition. Search parties initially only discovered their abandoned tent, yet subsequent searches recovered nine frozen bodies in conditions of great interest to the Soviet military. While much evidence was hidden and destroyed, documentary photographs of the physical remains of the group members and eyewitness testimonies offer further clues concerning advanced aerial technologies implicated in the series of disturbing deaths.[26]

The tent remains showed it had been cut with a knife *from the inside,* where most of the group's jackets, warm clothing and sleeping bags had been abandoned in panic. The frozen bodies were recovered wearing mostly underclothing, having run 500m from the tent that had been erected on the open slope (above), downhill toward the tree line where they had previously made a campfire. One of the men had sustained blunt trauma to the head and another had several broken ribs, *most likely incurred during an initial attack by the giant Yeti mentioned in the final, incomplete journal entry.*

Clear forensic evidence also suggested that although the nine victims died from hypothermia, some unknown source of high-intensity radiation was also involved. At least four of the nine recovered corpses showed radioactive contamination that had caused their visible hair loss and an orange skin discoloration, and required burial in hermetically sealed, zinc-lined coffins. In addition to radioactivity, one of the female corpses was mutilated in a very unusual manner involving bloodless electro-surgical excision of the tongue, a process that has also been implicated in livestock mutilations worldwide. Luminous aerial objects responsible for the gamma-ray exposure of the victims were witnessed by villagers nearby on the night of the attack, leading local residents to fear their common aerial presence.

Unusual rock towers standing ominously on the high ridge just above the serial murder scene (above). Kholat Syakhl (61.754°N 59.429°E) is 2,542 miles from the Great Pyramid of Giza, Egypt, a distance that comprises 10.2% of the Earth's mean circumference of 24, 892 miles. High-intensity infrasound resonance and the associated luminous aerial objects in this area are also implicated in a 1991 plane crash which took nine lives and occurred on the mountainside just two miles south of Dyatlov Pass.

Coordinated attacks by aerial plasma technologies and giant human-hybrid creatures account for other similar incidents worldwide. Clusters of Sasquatch activity that generate many eyewitness reports are apparently related to genetic engineering programs at subterran bases with hidden entrances guarded by hairy giants. Genetic evidence supports indigenous teachings that the giants are Shadow Guardians of the underground, monitored remotely from far below by HHO plasma disc probes.



The great majority of aerial traffic connected with the subterranean facility is screened from the visible range into the infrared. Disc-shaped flight vehicles are only rarely photographed in clear daylight above the mountains of British Colombia, as captured by Hannah McRoberts in 1981 (above). This fully authenticated image, obtained on color film, presents the reflective metallic surfaces of plasma ships that come and go from deep subterranean stations far below the planet's surface.

Plasma disc probes are deployed above the mountainside and apply ultra-low frequency resonance both for antigravitic propulsion and to facilitate telepathic contact between the underground command structure and the Sasquatch Shadow Guardians strategically posted at cave entrances and key vantage points. Automated emergency procedures used by the plasma discs include HHO plasma beam levitation technologies and applications that enable instantaneous teleportation.[27] An astonishing incident in Uniontown, Kentucky leaves no doubt that some kind of instantaneous teleportation event must have occurred in the milliseconds before a point-blank shotgun blast:

> On the night of 6 February 1974, at Uniontown, a woman... was sitting in her house watching television. About 10 p.m. she heard a noise coming from her porch. The house was set in an isolated and well-wooded area and she... picked up her 16-gauge shotgun... She turned on the outside light and, stepping onto the porch, found a 7-foot, hairy Bigfoot standing 6 feet from her. It raised both hands above its head and [she], assuming it was going to jump at her, reacted instantly by firing at its midriff. There was a brilliant flash like a photographer's flashbulb and the creature had disappeared, leaving no trace whatsoever.[28]

Impressive technological feats such as the blinding teleportation event described in Uniontown, involve precisely-controlled applications of HHO plasma bursts that emit high-intensity infrared and ultraviolet-A light during the moment of teleportation, in that case having been executed automatically by onboard computers monitoring the Sasquatch's activities and the nerve responses of the homeowner. Such perplexing incidents, given a broader consideration, reveal that transdimensional technologies are in control of the giant Sasquatch hybrids who conduct raids and attacks on behalf of controlling entities.

Above Tepozlan, Mexico in 1992, contactee Carlos Diaz recorded close-range video of a luminous craft emitting an HHO plasma beam used for the levitation of plant, animal and mineral samples, as well as the transport of passengers aboard the ship (above). Diaz described the plasma as 'light':

> At different opportunities during my encounters I experienced how a beam of light shot out of the craft. This beam of light has the purpose to bring insects, plants, pollen, small and bigger animals aboard the ship, and sometimes we too, my friend and I, were brought aboard by such a ray... The first time he invited me consciously to go into a ship, I saw my friend getting in first. He went through this fog-like light.[29]

Obviously, the witness lacked adequate vocabulary to describe his transdimensional experiences with HHO plasma and the associated enhancement of metabolic processes that induce cell regeneration and extend human lifespans by hundreds of years. *HHO plasma technology is also used in mutilations.*

Most cases involving high-tech human mutilations bearing similarities to the Ural mountains massacres have been effectively covered-up by law enforcement authorities in every country of the world, yet rare exceptions have been exposed. Rare public documentation of electrosurgical human mutilation include many detailed photographs of a mutilated human corpse discovered in 1994 near the Guarapiranga reservoir in São Paulo, Brazil. The weight of evidence in this disturbing homicide case implicates the aerial abduction and fatal mutilation of a middle-aged man whose remains exhibited several physical anomalies including ear, flesh, muscle and organ removal as well as circular 'hole-punch' excisions.[30]

Previous discoveries of highly radioactive corpses bearing remarkably clean, bloodless laser-surgical excisions of tissue and complete blood drainage have been reported in cases of livestock mutilations that have taken place in the general vicinity of infrasound standing wave vortices worldwide. On many occasions, carcasses of very large animals such as an 800lb bull been dropped from aerial positions above the trees, with tree branches caught between the animals legs and often leaving deep bounce-marks on the ground that explain why no blood or tracks are found around the mutilated carcass.[31]

Ranchers of northeastern Utah have suffered repeated spates of livestock mutilations that seem to cluster in a wide area surrounding one particular ranch that has apparently been the focus of a great variety of unexplained luminous aerial phenomena, often associated with encounters with fearsome extraterrestrial entities, or *'demon hoards'*. The property has become known as Skinwalker Ranch, after the Native Ute name for malevolent entities that stalk the area, recognized as cursed land by the Elders who maintain tribal memory of continually strange encounters and serial mutilations there.

Unaware of the history, the Sherman family purchased Skinwalker Ranch in 1994 and endured repeated inexplicable occurrences involving flashes of light, levitation and teleportation of objects in the house and in the skies above, *as cattle were serially mutilated, exsanguinated and dropped back into their pasture.* Aerial spheres that variably shown with a bright orange, white or blue radiance often accompanied appearances of several varieties of monstrous creatures, *including Sasquatch*, that preyed upon the cattle, horribly mutilating 14 of 80 head during the Shermans' traumatic two-year residence.[32]

One of the most unnerving attacks involved a huge dire wolf, an apparently extinct species of giant North American wolf from the Pleistocene period. The animal betrayed the appearance of a corpse being remotely-animated by an unseen aerial object, as gunfire did not evoke a response from the massive attacking wolf, whose bloodless gaping injuries reinforced its entirely unnatural presence. The following morning, footprints of the beast were followed from the scene of the cow mutilation to the spot where they vanished in the middle of an open field, as if the giant wolf had been levitated into one of the many lens-shaped plasma craft that often hover above the trees adjacent to the pasture.

A decision to sell the ranch in 1996 became imperative for the Sherman family after a lethal nighttime incident with a small, blue remotely-controlled aerial sphere that flew near ground level, actively drawing the ranchers' three dogs into the forest. Once secluded, the luminous sphere instantaneously liquefied the canines with a high-intensity plasma beam, leaving three piles of radioactive residue that went unscavenged. Having drawn unwanted public attention, Skinwalker Ranch was quickly purchased by Las Vegas millionaire Robert Bigelow, known CIA operator and owner of Bigelow Aerospace.

Using the Bigelow-established National Institute for Discovery Science (NIDS) front organization, the CIA established a comprehensive surveillance/research project and cover-up operation that only discloses marginal evidence to quell public interest. Selected events that have been made public include an ice circle formation in a shallow pond in 2002 and an interesting photograph taken on September 28, 2010 that captured three silvery discs hovering in formation behind a funnel cloud of millions of insects being sucked upward into a cloudless sky (opposite).[33]

The NIDS operation setup research stations in the centers of each of the ranch's three large fields; fenced enclosures with 10-foot-tall razor-wire adjacent to elevated watch posts housing infrared video and audio surveillance equipment (above, circled in white). Slaughterhouse blood was poured onto the ground, while bait animals and even research personnel were placed in the monitored containment sites during overnight research experiments. *Of course, results from the stake-outs have not been released.*

The complete range of extraterrestrial phenomena that regularly occur in the vicinity of the ranch keep investigators guessing as to the origin and interrelation of incidents involving all manner of monstrosities. One factor clearly unifies the events as closely related –*the location itself*. Such bizarre circumstances beg the question that has gone unanswered by prior research: *what is so special about the ranch site?*

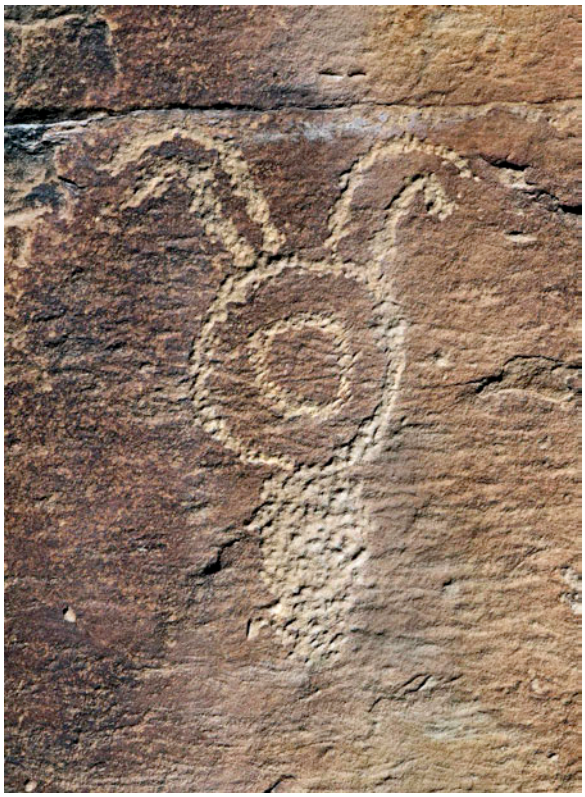
Localized infrasound is a barely perceptible force that has drawn and focused strange predatory activity into this area for thousands of years. Skinwalker Ranch, Utah (40.258°N 109.888°W) is 6,993 miles from the Great Pyramid of Giza, Egypt, a distance comprising 28.09% of the Earth's mean circumference of 24,892 miles. A global network of infrasound standing waves converges along distinct axes such as this resonant distance band at 28.0%, often perceived as low, omnidirectional rumbling at the ranch.

The ranch is located above an ancient cave system that has been artificially augmented and occupied by a malevolent consortium of extraterrestrial races that orchestrate aerial attacks. Often, Sasquatch have been deployed from aerial craft to distract and terrorize a farmhouse with horrid screams at the exact time and location where multiple mutilations were reported to local police the following morning.[34]

The silent appearance of luminous aerial objects has been closely linked with serial mutilation activities involving HHO plasma beam levitation into the craft, followed by paralyzation of prey during rapid exsanguination and excision of the rectum, reproductive organs and mammary glands. Forensic investigation of tissue anomalies in mutilated cattle conducted by Dr. J. Altshuler have reported on bloodless excisions with perfectly serrated circular or oval edges in which hemoglobin has been cooked at over 300°F without carbon traces.[35] As previously documented on scorched bedsheet samples from a plasma beam levitation case in Brazil, HHO plasma is responsible for such unusual trace evidence.[36]

In conjunction with rising planetary infrasound resonance at Native American sacred sites throughout the continent, shocking incidents involving animal mutilation have also been drastically increasing in number over the past several decades, providing strong evidence for a reinterpretation of enigmatic red ochre petroglyph murals in southeastern Utah, especially Barrier, Horseshoe and Sego Canyons.

The main mural located high on a Sego Canyon rock wall depicts what appear to be very tall beings levitating into the air towards vertical formations of large, glowing aerial spheres or disc-shaped craft hovering low in the sky (above). *Standing waves* converge on the bulbous heads of the looming figures, depicted with large, ominous circular eyes reminiscent of eyewitness descriptions of the red glowing eyes of the many large predatory extraterrestrial entities that stalk Skinwalker Ranch.

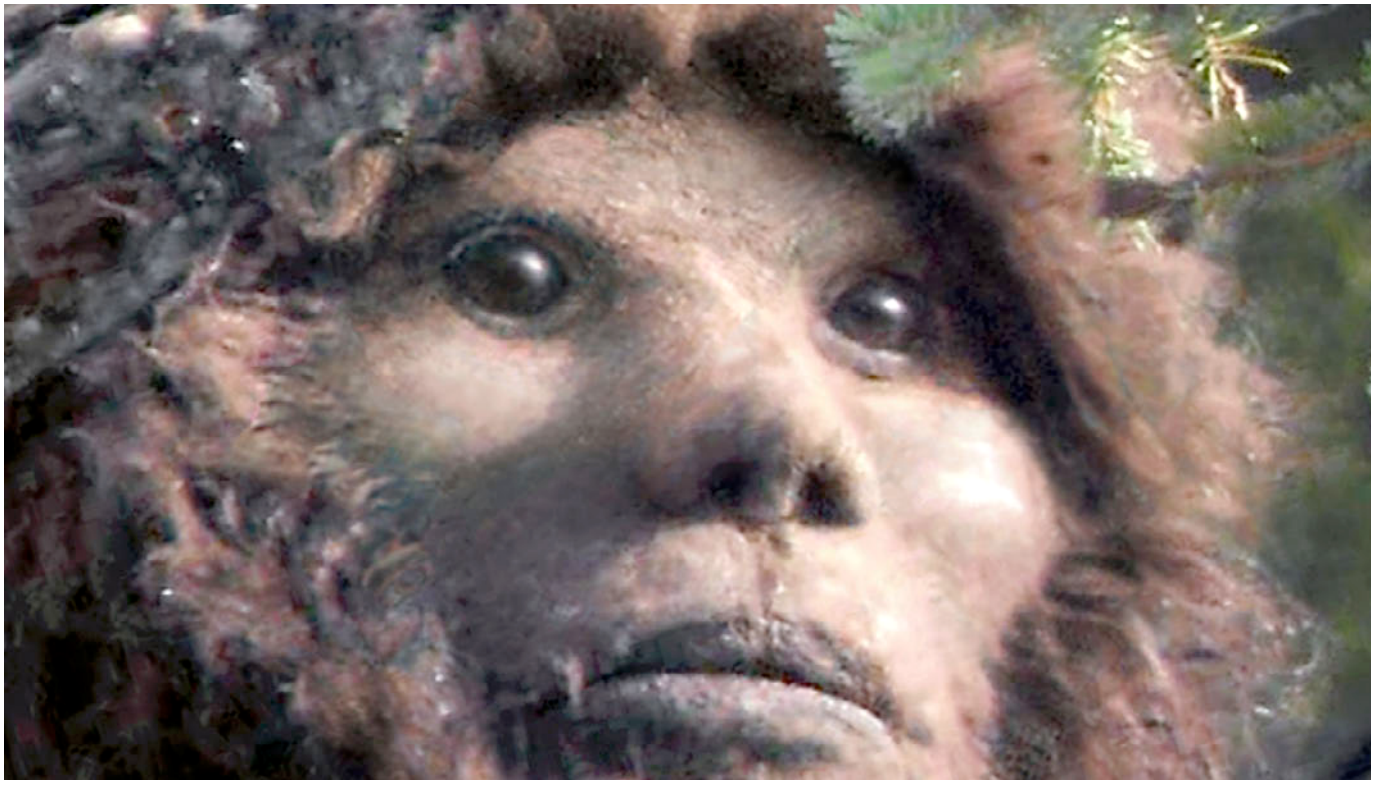


Forming a jagged cut through the barren, rocky landscape of southeastern Utah, Nine Mile Canyon contains a procession of Native American sacred sites including many rock shelters, pitted milling stones and multiple petroglyph mural sites that denote hidden caves and further underground sacred sites. *Many of the secrets of these special sites have been lost during centuries of genocide.*

One of the largest petroglyph murals in Nine Mile Canyon depict what appear to be floating humanoids with short arms, wearing large helmets surmounted by antennae (above). What's more, these antennae are connected by lines that give the appearance of an electrical arc passing between them. A serpent takes the form of a sine wave rising between the two large figures, referencing psychoacoustic influences of sacred locations where infrasound standing waves converge and resonate within canyon walls. *As commonly used among ancient cultures the world over, an undulating snake symbolizes the sacred bioelectrical capacity of DNA in all living cells to transmute the energy of the sun.*

Piezoelectric quartz crystals comprising the resonant sandstone bedrock of the region transduce the incident infrasound into an electric charge that enhances electromagnetic fields within the deep canyon. This feature of the sites were recognized by all indigenous cultures as greatly enhancing spiritual communication with the other unseen dimensions of reality, forming the basis for drumming ceremonies facilitating tri-thalamic entrainment at the fundamental 1.45Hz heartbeat frequency.[37]

The sacred rock art engravings of Nine Mile Canyon include explicit depictions of infrasound standing waves converging on concentric circles (below), relating ancient knowledge of this nearly imperceptible force that so powerfully engages Spirit within particular vortical alignments. The common modern misunderstanding that such simple geometric symbols may have conveyed any variety of meanings among past cultures is denied by the overwhelming similarity of trance-induced cultural practices from all parts of the world. The specific and repeated set of deeply-rooted transcultural associations that define these symbols is consistent throughout the world according to advanced wisdom concerning the sacred alignment of consciousness within the unified infrasound gravity field enveloping Earth.

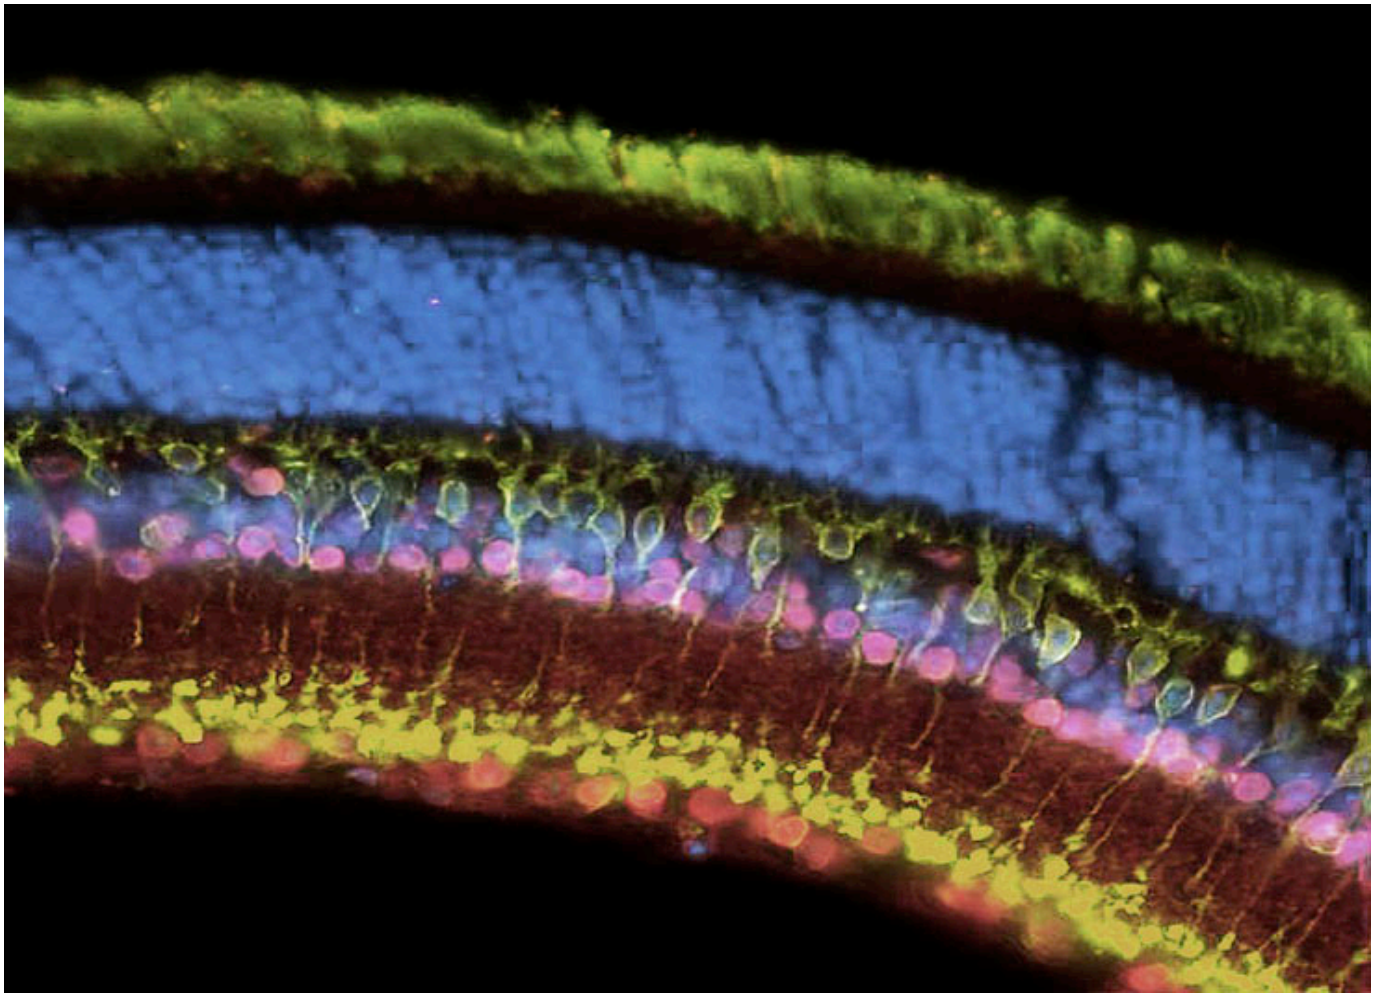


These stationary infrasound vortices provide optimal conditions for aerial ionization of the large convex hulls of transdimensional plasma craft, allowing perpetual restoration of electrical power for constant operation. Imperceptible surveillance activities by plasma probes above defensive positions leave only an infrared signature that is brightly visible to sensitive Sasquatch eyes, yet invisible to humans of the present-day. This silent and usually invisible aerial presence can emit beams of high-energy radiation.

A slew of unexplained occurrences have been witnessed by researchers in Sylvanic, BC. Their first surprise episode took place during the team's winter 2006 expedition, when a roll of color film in the photographer's camera became overexposed to a high-intensity energy beam that ruined every image. While this caused confusion for the researchers, this exact scenario has been reported on several occasions by photographers with a documented history of UFO encounters, especially Eduard Meier.

On another day hike into Sylvanic Valley in 2008, the group heard and witnessed the killing of their dog that had broken away from the group to chase a rabbit. This prohibited act was met with lethal force as a Sasquatch broke the dog's backbone with a single blow before disappearing instantaneously.

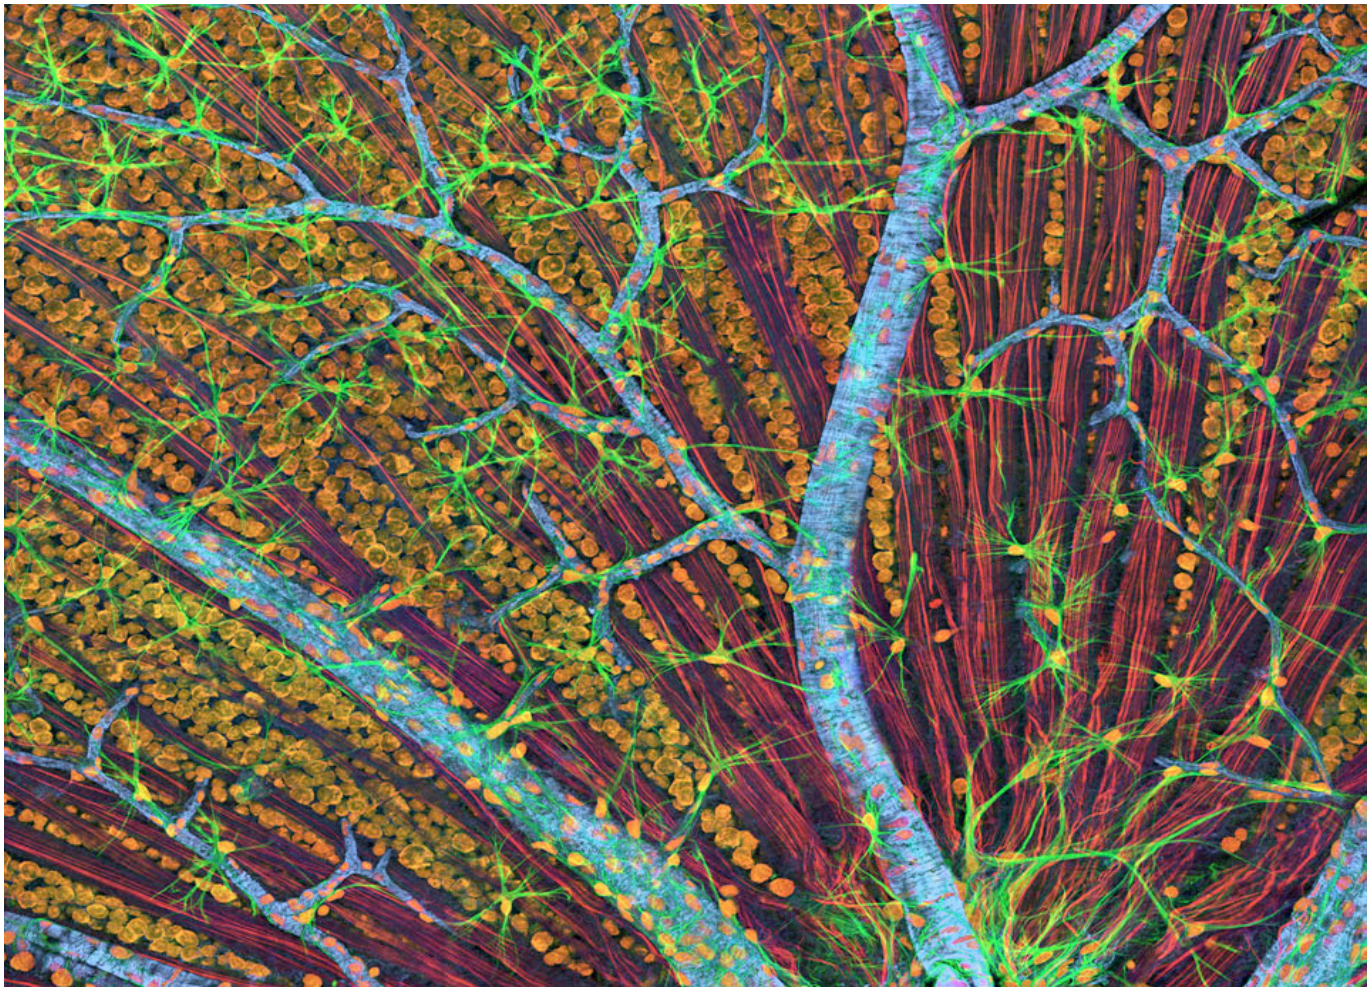
Todd Standing also recorded the strange circumstances of a winter 2007 Sasquatch encounter: *"When he sees me he drops the food and stalks around, then goes into a full sprint for about 2 km, then walks for about 300m and the tracks disappear in the middle of an open area with no trees around. We are baffled."* [38] Similar experiences have often been reported by highly-skilled Native American trackers for uncounted centuries, and witnessed more than once at Skinwalker Ranch.



An insightful series of field experiments conducted by the Sylvanic Valley research group were disclosed in the *Sylvanic Bigfoot* documentary, facilitating penetration of the valley's strategic defenses on multiple occasions that provided footage of the giants. Upon consideration of the strong likelihood of infrared sensitivity in the Sasquatch species, the Sylvanic team biologist created a large, heavy cloth blind that effectively blocked the researchers' heat signature as they entered the hidden valley. Their infrared cloak proved that daylight vision among Sasquatch sentinels relies heavily upon infrared sensing of the heat of human bodies, whereas the giants' color acuity within the light spectrum visible to humans presented a weakness that can be exploited.

These experimental field results suggest that the marginal limitations of Sasquatch daylight vision are related to photopigmentation in prosimian retinae inherited from the paternal progenitor species. While human retinae contain three types of cone photopigments, being trichromatic, visual acuity studies of diurnal lemurs in present-day Madagascar revealed dichromatic retinae that are common to the great majority of prosimian clades. The dichromatic photopigments of contemporary lemurs are limited to a short-wavelength cone pigment with peak sensitivity at 437nm, and a single class of cone in the middle to long wavelengths with peak sensitivity at 545nm (Jacobs & Deegan, 2005).[39]

In the case of nocturnal Sasquatch, the functional limits of dichromatic daylight vision account for the remarkable success of simple infrared blinding strategies developed and extensively field-tested by the Sylvanic research collective. Trichromatic vision among humans provides a subtle edge during daylight encounters with the nighttime-adapted giants, whose inability to distinguish subtleties in bright lighting conditions affords an opportunity to approach them without being seen.



During the hours of darkness when Sasquatch are most active, an especially frightening feature of the entities' eyes has been reported on many occasions *–a startling bright red illumination that can be made to slowly pulse on and off, to hypnotic effect*.[40] The retinae of all nocturnal animals possess a highly-reflective outer coating called the tapetum lucidum[41] which, among lemurs and other prosimians, consists of a microlayer of riboflavin crystals and fibers.[42] However, the complex cascade process that generates the intense red eye glow often reported during nighttime Sasquatch encounters is generated by an entirely distinct *bioelectric effect* that has escaped all prior detection.

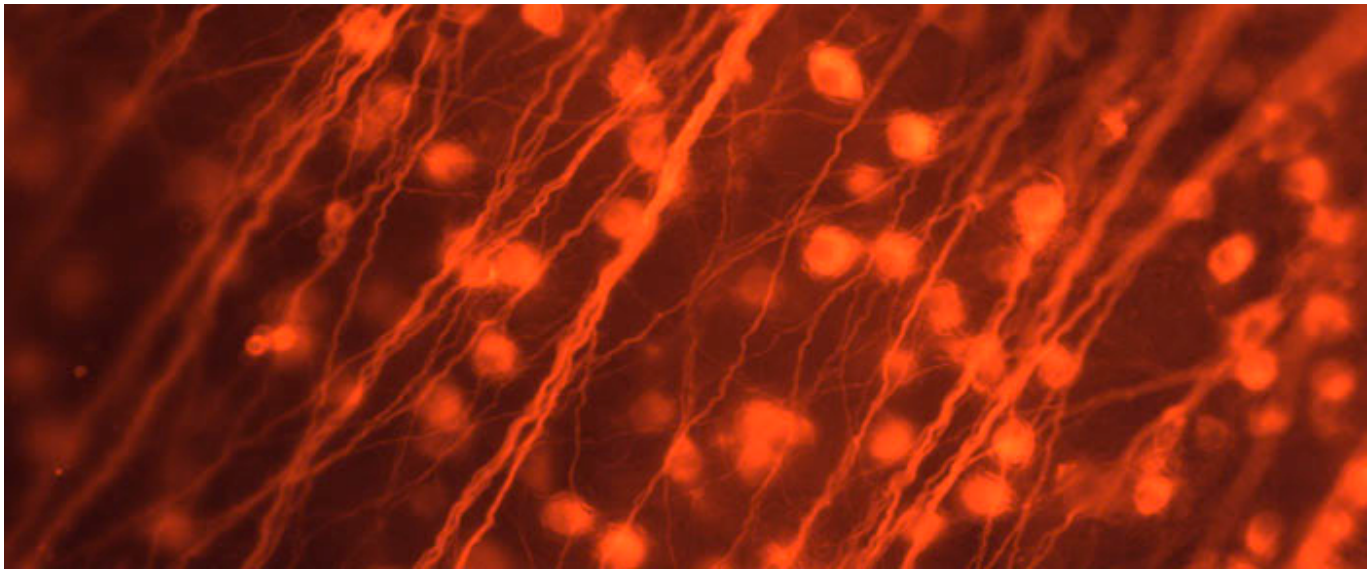
While rods and cones line the outermost layer of the mammalian eye, a separate class of microvillar photoreceptors has also been identified in the innermost ganglion layer of the retina. Approximately 1–2% of retinal ganglion cells (shown in yellow, above) possess a microvillar membrane that connects to an axon that transmits electrical impulses. This tertiary class of photoreceptors regulate reflexive responses to daylight, such as pupillary reflexes, and participate in circadian photoentrainment involving the suppression of melatonin release from the pineal gland during daylight hours.

The cascade process of light transduction into electrical impulses by photosensitive retinal ganglion cells involves the photopigment melanopsin (Hattar *et al*,[43] Berson *et al*, 2002;[44] Gomez *et al*, 2009),[45] which replicates the activity of rhodopsins in the rhabdomeric phototransduction cascade processes of invertebrate eyes (Graham *et al*, 2008).[46] Melanopsin-expressing ganglion photoreceptors transduce light via a *calcium-dependent* phospholipase C cascade triggered by guanine nucleotide-binding proteins (G_p). Researchers concluded that inositol triphosphate (IP_3) receptors in the photosensitive microvillar membranes act as Ca^{2+} ion channels, after experimental interference with these specific mechanisms resulted in direct suppression of the photocurrent (Angueyra *et al*, 2012).[47]

These conclusions were realized through study of *amphioxus*, the most basal species of chordates, revealing that the melanopsin-based signaling cascades of vertebrate eyes developed directly from rhodopsin-based rhabdomeric signaling cascades, wherein coupling of photon absorption to ion channel gating is triggered by G_p. Calcium required for phospholipase C transduction is released from the endoplasmic reticulum (ER) via IP_3-sensitive channels. Regulatory calcium stores of the ER are constantly being replenished by another previously unrecognized fundamental process involving low energy nuclear conversions induced in the circulatory system as dimensional phonon resonance interactions during the binding of monatomic metals and gases:[48]

During blood circulation... potassium atoms within erythrocytes maintain rhythmic temperature fluctuations between 37–38°C that trigger the resonant conversion reaction. Each oxygen-bound atom of potassium isotope (K^{41}) releases a single hydrogen atom during the formation of stable atoms of calcium isotope (Ca^{40}):

$$_{19}K^{41} + {}_{8}O^{16} \Rightarrow {}_{1}H^{1} + {}_{20}Ca^{40} + {}_{8}O^{16}$$



When potassium is heated to 37.8°C, oxygen atoms bound to potassium K^{41} resonate at 3,773,180 Hz matching the exact atomic diameter and corresponding phonon frequency of H^{1} at rest (20°C). Calcium is produced within the retina as potassium within erythrocytes flows into cooler capillaries of the eye, circulating through the fine mesh of blood vessels lining the backside of the retina (above). This controlled temperature drop triggers atomic reactions releasing hydrogen into the bloodstream as potassium becomes converted into stable calcium. By this previously unidentified resonant pathway, stable calcium is produced in retinal blood vessels and stored within the ER of all retinal cells.

Resonant temperature-induced nuclear reactions become enhanced under natural barefoot conditions of bioelectrification, which excite reactive oxygen species (ROS) processes that effectively increase the available induction energy for the great variety of elemental conversions constantly taking place throughout the body, including atomic recombinations of potassium into calcium in retinal capillaries.

Studies identifying biophoton emission from the human eye[49] affirm that the photocurrent transduction process constitutes a two-way pathway, whereby enhanced conditions of bioelectrification within caves or pyramid chambers generate electroluminosity within retinal ganglion cells. This reversed cascade process is driven by increased calcium production from electro-enhanced low energy nuclear reactions that become resonantly excited by positron/electron emission from decaying reaction products.

A critical threshold is surpassed as strong electrical currents are applied to the body, whereby the normal direction of photocurrent passing from retinal ganglion cells to the optic nerve is reversed, with ion cascade signals being transmitted to the microvillar membrane, inducing luminescence in retinal ganglion cells. The specific wavelengths of light emitted by the microvilli are determined by their structural characteristics, with the abundance of reported cases involving red eye glow, while a minority if cases report orange, yellow, gold and even green eye glow.

Biophotons emitted from retinal ganglion cells under electro-stimulation conditions become focused by the lens of the eye into a beam that can be seen clearly at a distance. Previously discussed eyewitness accounts of Sasquatch bioelectrification movements in the glacial steam caves below Mt. Rainier, Washington seem to demonstrate natural conditions for enhanced ionization and red eye glow.

The glowing eyes of Sasquatch reported in hundreds of sightings can now be accounted for as an artificial effect of exposure to nanopulsed HHO plasma environments maintained within the plasma ships and emitted by their plasma beam levitation systems that have been described often by various eyewitnesses in association with sightings of Grays, Sasquatch, and giant Draco reptilians in alarming incidents involving transdimensional 'high strangeness'.

In a growing number of Sasquatch encounters, eyewitnesses have reported gradual and sometimes rapid changes in the intensity of illumination of the large monstrous eyes, as if remotely-controlled on a dimmer switch.[50] Reports of red glowing eyes among multiple Sasquatch have described the glow shifting from one pair of eyes to another, suggesting that some unseen aerial object is directing an ionization beam upon the Sasquatch individuals to choreograph their unnerving retinal displays.

Recognition of the red glow of 'demonic' eyes as a signal overload reversal of the retinal ganglion photoreceptor cascade by enhanced ionization, from natural or artificial ion sources, requires the identification of essential calcium-producing resonant atomic reactions perpetually triggered in the bloodstream. Rapid ionization of the body induces an immediate and dramatic increase in the conversion rate of iron into calcium in red blood cells, effectively reversing electrical signal flow through the optic nerve, inducing the unnatural retinal ganglion glow (above).

A coherent synthesis of the multiple aspects of an extended extraterrestrial presence on our planet reveals an ancient predatory agenda that has been technologically imposed on all of Earthly humanity for tens of thousands of years by a nefarious group of extraterrestrial humanoid races including the giant hybrid Sasquatch, giant Nephilim, diminutive Grays, and their reptilian keepers. The genetic manipulation of multiple species of foreign humanoids in conjunction with management of large subterran human populations appears closely linked with the global livestock mutilation phenomena.

The role of the Sasquatch hybrids appears to be one of forced involvement in serial predatory activities orchestrated by several technologically-advanced interplanetary species. Genomic DNA sequencing confirms that the Sasquatch species is a genetically engineered human-hybrid 'sentinel' endowed with great physical strength, stamina, infrasound auditory perception and acute infrared visual perception. Several of the brutes are deployed as Shadow Guardians at hidden entrances to underground bases, often dispatched for agressive protection of natural resources in their cave's immediate vicinity.

Synthesis of ancient Native American knowledge with next generation forensic investigation offers a broader view of the artificial subterranean origin of the hybrid species and the consortium of malevolent intelligences that must have embedded themselves deep in the Earth's crust millennia ago. Continual advances in DNA processing and analysis drive our growing acknowledgement of subterran realms.

Future DNA sampling of Central and South American Sasquatch populations may support a subterran origin, for as with every other inhabited continent of the world, a long history of abductions, attacks and mutilations has also been endured in these regions. Farm communities of Entre Rios,[51] Formosa[52] and Suco,[53] Argentina have reported a major escalation in livestock mutilation activity in recent years. Many reports involving unexplained drainage of large water tanks,[54] reservoirs, ponds and pools are also increasing, with a few cases involving eyewitness accounts of siphoning by luminous aerial objects.

The cultural wealth of ancestral knowledge concerning subterranean cities and sacred sites is slowly being recovered from the most densely forested parts of the planet. The Amazon jungle has yielded special ancient megalithic sites such as San Agustin, Colombia, where many large dolmen with carved standing stones depict human-simian hybrid figures. One particularly striking representation of a male Sasquatch baring its fangs displays their distinctive broad, flat nose, heavy brow and low hairline, (above). *The hairy giant is wearing a hemispheric helmet surmounted by standing wave arcs that connect one small head to another in telepathy*. Colombian museums display gold psychoacoustic helmets of the Quimbaya and Tayrona cultures originally used within resonant pyramid chambers.

Monumental statuary of human-hybrid Sasquatch have also just recently been reported in the context of an entire lost ancient city with dozens of plazas and pyramids hidden below the jungle canopy of the Mosquito Coast of Honduras.[55] A breathtaking LiDAR survey reveals the full extent of the city that had been partly excavated, including the existence of cave entrances hidden by dense forest undergrowth. Discovery of the lost city by Theodore Morde in 1940 had been covered-up after his murder in London. The newly rediscovered White City (15.24°N 83.50°W) is 7,094 miles from the Great Pyramid of Giza, Egypt; a resonant distance that represents 28.50% of the Earth's mean circumference.

Photographs of the giant simian figures carved in the White City limestone have not been included in initial press releases, but their description clearly matches ancient megalithic statues from nearby Colombia suggesting a direct cultural relationship. The sacred waterworks of these precisely geopositioned ancient cities and cave systems were designed as piezoelectric crystalline purification systems, exemplified by the cleansing canals, baths and divining pools at San Agustin.

San Agustin, Colombia (4.84°N 73.28°W) is situated 6,912 miles from the Great Pyramid, comprising exactly 27.77% or $^{5}/_{18}$ of the Earth's mean circumference. Infrasound standing waves focused by the axis-symmetric pyramid structures are transduced by the local bedrock into an enhanced electromagnetic field that kills all pathogens in the water supply and the bathers themselves.

Enhanced ionization in stone chambers at these ancient sacred sites naturally stimulates biophoton emission from retinal ganglion cells, seen as a golden glow in the eyes of spiritual adepts who once meditated barefoot on the pyramid stones. *Ancient veneration of blood at pyramid sites takes on a renewed significance in light of the atomic reactions that induce luminosity in the retina.*

Kundalini in Ecuador

The Ultraviolet Archive

Alexander Putney

Subterranean tunnel systems below La Maná, Ecuador have yielded an extensive archive of over 300 metal, stone and ceramic artifacts that attest to the ancient worldwide Atlantean Kundalini culture, detailing a complex psychoacoustic technology linked with celestial springwaters and the Great Pyramid of Egypt. The artifacts are estimated to be perhaps over 12,000 years old, and include a boulder engraved with the contours of the continents of the globe as they were during the last glacial period, with large continental landmasses indicated in both the Atlantic and Pacific oceans that directly correspond to the legendary lost continents of Lemuria and Atlantis.

Two unusual and striking effects are demonstrated by these enigmatic Atlantean artifacts, which include a set of 13 lathe-turned stone cups, 3 mandala discs, a kundalini cobra lingam and representations of figures wearing full-body bioelectrification suits accompanied by psychoacoustic helmets. Dozens of stone masterworks show a measurable magnetism and are incised with geometric patterns inlaid with special calcite-based mortars that display a dazzling fluorescence under the influence of ultraviolet light generated by resonant HHO plasma.

Dozens of exquisite stone artifacts present intricate multicolored inlaid patterns that relate a wealth of information revealing the advanced psychoacoustic activation of the third-eye chakra by heartbeat synchronization of the pineal gland, induced through the resonance of infrasound standing waves that converge at all sacred pyramid and megalithic temple sites in a global nonlinear distribution pattern.

Among the UV fluorescent symbols are quantum maps detailing the standing wave structure of the electron and the atom, as well as the molecular structure and crystallography of calcite –the piezoelectric mineral that comprises the limestone blocks of every pyramid and is present in the human pineal gland as biomineral microcrystals.

Resonance Center

Introduction

Archaeological finds from La Maná, Ecuador include fascinating examples of high-tech kundalini instruments used to focus light, sound and electricity into the human body. Stone masterpieces display the effect of ultraviolet fluorescence of calcite crystal, found in the pineal gland: the Sanskrit *ajna* or 'third-eye' chakra. The largest worked stone is a map engraved with the continents of the glaciated Neolithic Earth prior to the Great Deluge that changed the face of our entire planet. In 1984 this large cache of over 300 artifacts was discovered by a group of gold prospectors led by engineer Dr. Elias Sotomayor, in a tunnel 30' below ground in the jungle-covered mountains of La Maná, Ecuador. Accurate dating of the entire collection of artifacts using advanced thermoluminescence techniques has not yet been accomplished, and promises to provide authentication for the ancient origin of these remarkable antediluvian masterpieces.

Archaic Sanskrit script is found on one stone piece, while the entire collection details the kundalini process in complex geometric forms, inlaid with quantum fractal maps of standing waves. The engraved script is consistent with the logographic form of Sanskrit, the mother language from which the Mayan, Sumerian and Egyptian glyphs descended. The geometric analysis given herein suggests that the La Maná artifacts encode fractal information regarding the resonant properties of calcite mineral, informing the design function of the Orion pyramids at Giza, Egypt. The La Maná site (0.95°S 79.18°W) is 7,470 miles from Giza –a distance that is *precisely 30.0%* of the Earth's mean circumference of 24,892 miles. These finds defy categorization among any known culture from South America, being very much older and exhibiting iconography consistent with Sanskrit traditions once thought to be foreign to the Andean region. The place name itself is an ancient one, likely a remnant of the prior Sanskrit inhabitants for whom the word *mana* meant 'mind' or 'mental body'. The significance of this name may become clear as the artifacts reveal their encoded psychoacoustic geometry. Most amazing are the representations of the Great Pyramid at Giza, the cobra (a snake known to exist only in southeast Asia) and an engraved global map showing the present continents of the world and other landmasses now submerged.

Plasma orbs at the sacred springs

The high vibratory characteristics of the sacred mountain of La Maná imbues its springwaters with an intense electrical vibration by resonant transfer from the piezoelectric stone of the mountain itself. During a recent visit to the sacred mountain on August 13, 2010 with several friends, we hiked to one of the many sacred springs dispersed high on the mountainside to enjoy its celestial waters. We took turns standing barefoot on the black basalt rock as we collected handfuls and cupfuls of pristine water. I briefly described the higher-dimensional beings that I very often noticed at energetic sacred sites as rapidly ascending and darting about among us (and which no one else seemed to notice).

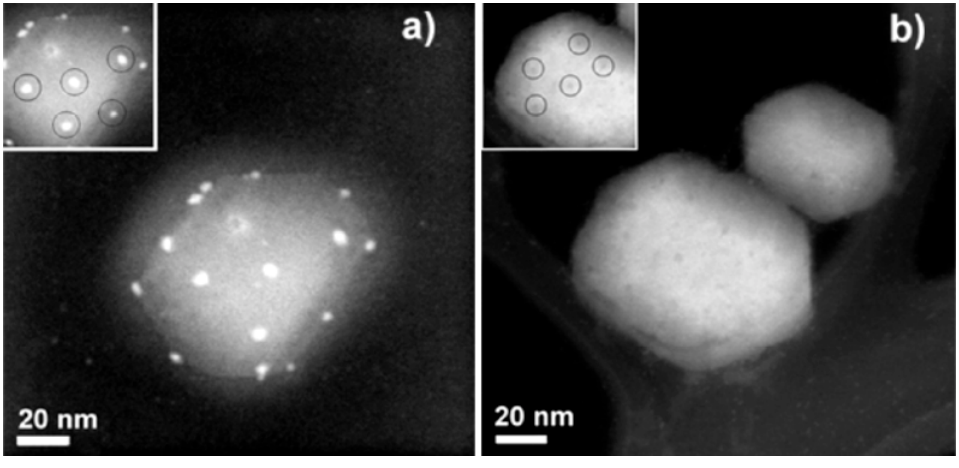
As a joyful lightness emerged inside me, I silently asked the luminous plasma orbs to share their presence with us through the camera, which I had brought for this very reason - to use digital flash photography to capture images of the rapidly flitting transparent plasma orbs. The first picture I took directly after my request is seen above, full of dozens of transparent orbs. Three very bright white plasma orbs radiating haloes of violet light are observed directly in front of the celestial water springs, and were plainly evident on the small camera display screen for all to see. *My request had been fulfilled by the luminous spheres in mere seconds!*

After showing my friends the hypnotic images on the viewscreen to make my point, I continued to record the bright flashes from my camera reflecting off the hundreds of plasma orbs that flew amongst us *and directly through us* over the next few minutes. I also continued with my explanation of the plasma orbs as pure spirit-forms that impress pure math equations into the fields as crop circles that express the same magnificent mandala structure observed of the spherical orbs themselves. Just a few months earlier I had been able to record a daylight photograph of a luminous orb at irregular crop formations in Hidden Valley, California but the images obtained at this Ecuadorian sacred site proved to be much more impressive.

One particular photograph from this series presents a large, radiant white/violet orb with very distinct sets of concentric circles distributed like petals around a nucleus (opposite), that perfectly reflect the quadratic formula [$z_{n+1} = z_n^2$] (above) that also defines standing wave patterns observed during resonant atmospheric stimulation of the Earth by intense bombardment by radiation from the 2001 solar maximum! Does increasing solar activity heighten the electrical influence of this sacred springwater, perhaps contributing to enhanced bioelectrification throughout the human body?

The electrical effect of a single drop of La Maná springwater on the skin can be instantaneously measured all over the body, and can be accurately described as 'electrum water'. Electrum is the ancient alloy comprised of gold and silver that incorporates the ductile properties of the two precious metals while being inert, without any chemical reaction to water. Electrical conductivity in the human body is usually highest in the bloodstream, as its greater salinity allows greater conductivity than the less saline cellular water. However, a body fueled exclusively by colloidal gold and silver water of optimal nanoparticle size induces an extremely enhanced electrical conductivity, replacing one of the usual roles of salt in the body. As salinity reduces the ability of a colloid to suspend the nanoparticles, the virtual elimination of salt from La Maná electrum water allows for maximum suspension. The suspended gold and silver nanoparticles are highly reflective of light and sound alike, vastly increasing the resonant characteristics of the human body.

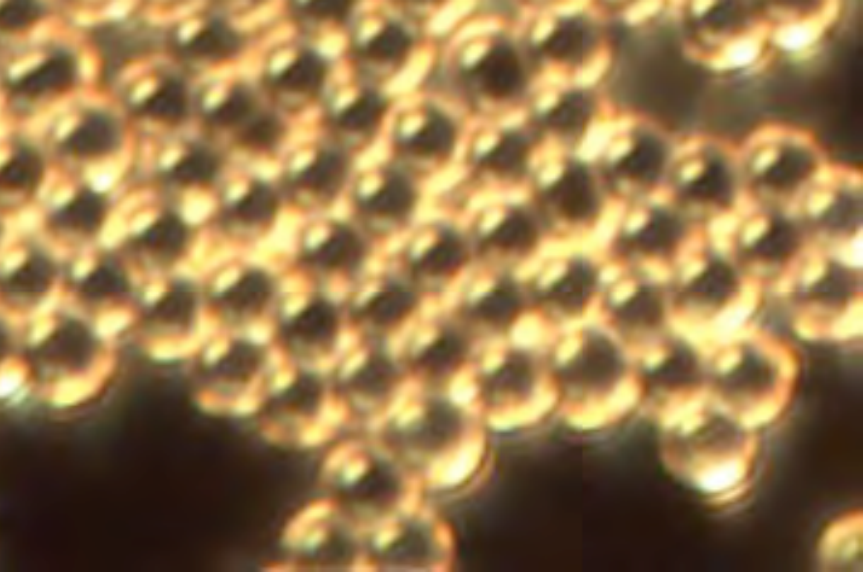
Sacred Waters of La Maná



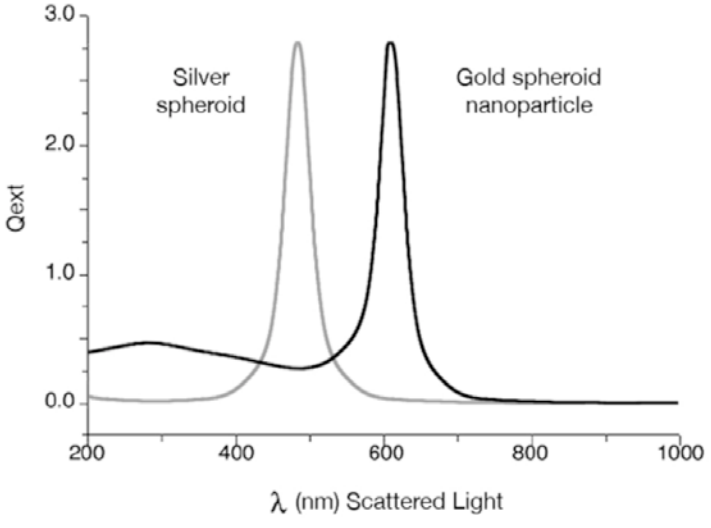
Physical/Chemical Analysis

Composition	*Units*	*La Maná*
Dissolved Solids	mg/l	33
Conductivity	µs	71
pH		6.5
Calcium	mg/l Ca ++	5.1
Magnesium	mg/l Mg ++	3.7
Sodium	mg/l Na ++	4.0
Kalium	mg/l K +	1.0
Total Alkalinity	mg/l $CaCO_3$	36.0
Chlorides	mg/l Cl -	3.0
Gold		traces +
Silver		traces +++

The sandstone chambers of La Maná, Ecuador yield sacred springwaters that flow freely from several sources, resonating with an intense energy that has been the focus of thorough international investigation. The antibacterial and ductile properties of *silver* have been well known for centuries, having been used effectively against many forms of infection including AIDS, cancer, Epstein-Barr, gonorrhea, Lyme disease, Candida, fungus, warts and parasites. Only recently has it regained widespread use in liquid colloids that maintain a positive electrical charge. High-grade colloidal silver is reported to be nontoxic, as any excess that is not needed by the body is easily eliminated, preventing the toxic accumulation of metals in tissues that can occur when low-grade colloids are ingested. The highly selective composition of the La Maná water has been documented in several laboratories around the world; its most astounding feature being spherical nanoparticles of gold and silver less than 10nm in size that are potent antibacterial and even antiviral agents. HAADF images show silver nanoparticles lethally binding to the HIV-1 virus [Elechiguerra et al, 2005]:

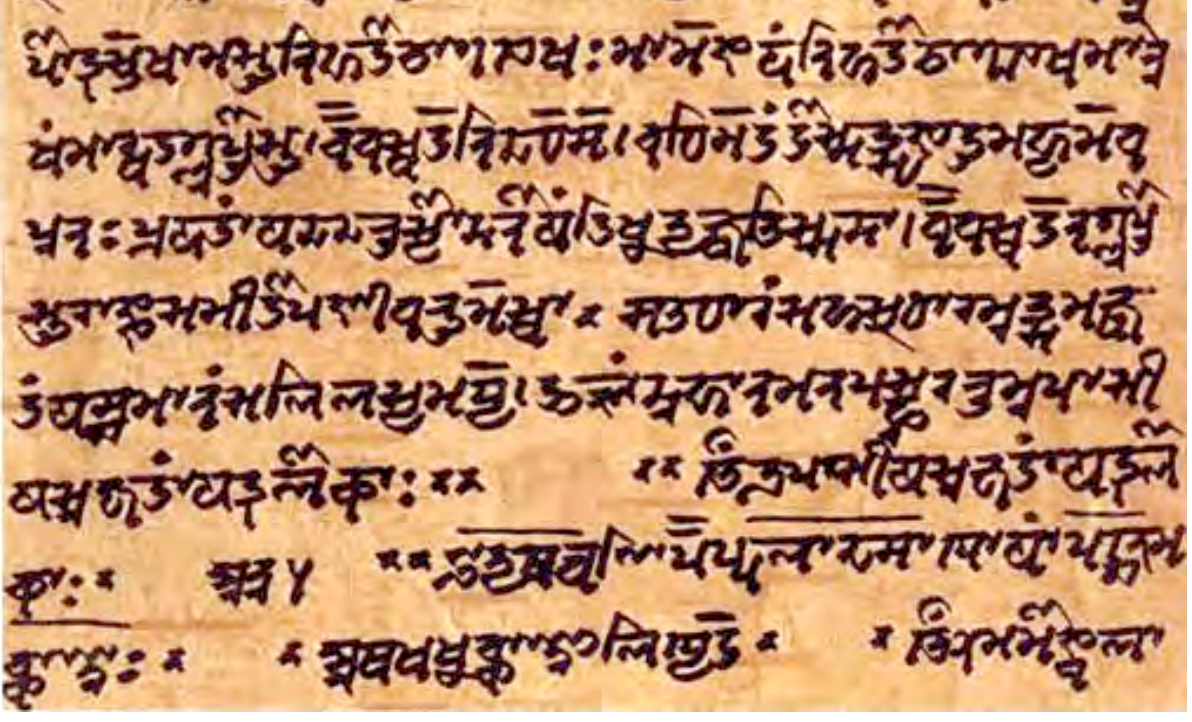


This exact size range of gold and silver nanoparticles also produce the effect of electroluminescence inside all of the cells of the body, whereby ambient electrical currents are transduced into light. Gold nanospheres transduce red light, while silver nanospheres transduce blue light that illuminates the DNA within the chromosomes located in the nucleus of each cell, inducing a profound cellular rejuvenation that affects increased longevity. The ancient kundalini masters of Ecuador left a remarkable record of their methods of bioelectrification. These profound Atlantean artworks overtly show us that drinking *the living waters from the living stone* is a key component of the kundalini process of bioenergetic enhancement achieved by purification of the human body to become an efficient acousto-electric transducer –*a temple*. Microphotography techniques using polarized light capture the rainbow effect of light scattering through the micro-crystal prisms in a frozen sample of the La Maná springwaters (overleaf). [G. Schöen]



Resonant Characteristics

Acid pH	By pharmacopoeia standards, a water to be used in the making of pharmaceuticals must have a slightly acid pH below 6.5. The subterranean source at La Maná yields water with a slightly acid pH between 5.5 and 6.0, and during the bottling process holds a pH level between 6.5 and 7.
Dissolved CO_2	The presence of CO_2 has proven digestive effects, and carbonated waters have been produced for this reason. In the case of La Maná, springs emerge from the subterranean soils with dissolved CO_2 between 250 and 300 parts per million, in the form of microbubbles.
Dissolved Solids	The World Health Organization defines good quality water as having less than 500 mg/l of total dissolved solids. Highest-quality water has a total dissolved solid content of less than 50 mg/l, being considered to have minimal mineralization. La Maná spring water has 33 mg/l, making it a water of extraordinary quality and creating a resonant environment for harmonic cellular development. The small amounts of minerals or dissolved salts are conformed almost exclusively by bicarbonates of calcium, magnesium, sodium and potassium, and by some other chloride. In reality we are dealing with a true rarity: a water that has practically no salinity.
Colloidal Gold & Silver	The quantum resonance of this rare water is allowed both by its purity and by its trace content of colloidal gold and silver. These precious metals are the constituents of the ancient sacred alloy known as electrum, allowing an extreme conductivity of 71 µs and creating an antibacterial and antiviral environment within the cells. Nanoparticle sizes of less than 10 nm allow the colloidal metals to act as a dissolved gas capable of penetrating throughout the body's cells to achieve biorhythmic resonance.



A human body fueled by sacred electrum waters undergoes of quantum shift in its electrical nature. The enhanced electrical conductivity and desalination of the body imbues the being with the resonant properties of quartz, the very concept conveyed through the crystal skull symbolically. Sacred electrum waters were the key element in the body purification processes for which the pyramids of the world were designed.

This extremely advanced scientific knowledge was passed on orally and eventually recorded textually in the volumes of the oldest books known to humanity - the Vedas of ancient India. The special preparation of foods and drinks for aerospace pilots is extensively documented in Vedic manuals, whereby electroluminescence was also generated within the human body. Modern scientists reported the electroluminescence of gold and silver nanoparticles several years ago. Nanoparticles are stimulated by electrical currents, or strong electromagnetic fields, into a high-energy state of *surface plasmon resonance*. This induced plasmon excitation produces a spectral signature unique to each element. Scientists analyzed the scattering spectra of gold and silver nanoparticles of various forms including spheroids (above). [Noguez et al, 2002, 'Light Scattering by Isolated Nanoparticles with Arbitrary Shapes']

The reflectance/absorbance of 10nm silver nanoparticles shows a large peak at 480 nm (blue/cyan), while 10nm gold nanoparticles resonate at 620 nm - red light at the transition of orange, confirming the deepest wisdom of our ancient Sanskrit traditions. The many enigmatic passages of ancient Sanskrit writings are now being understood in a new light, as Vedic scholars recently identified the Sanskrit term for electrum as 'Soma', described as *granting eternal life through the luminosity of the electrum nanoparticles consumed in both foods and drinks:*

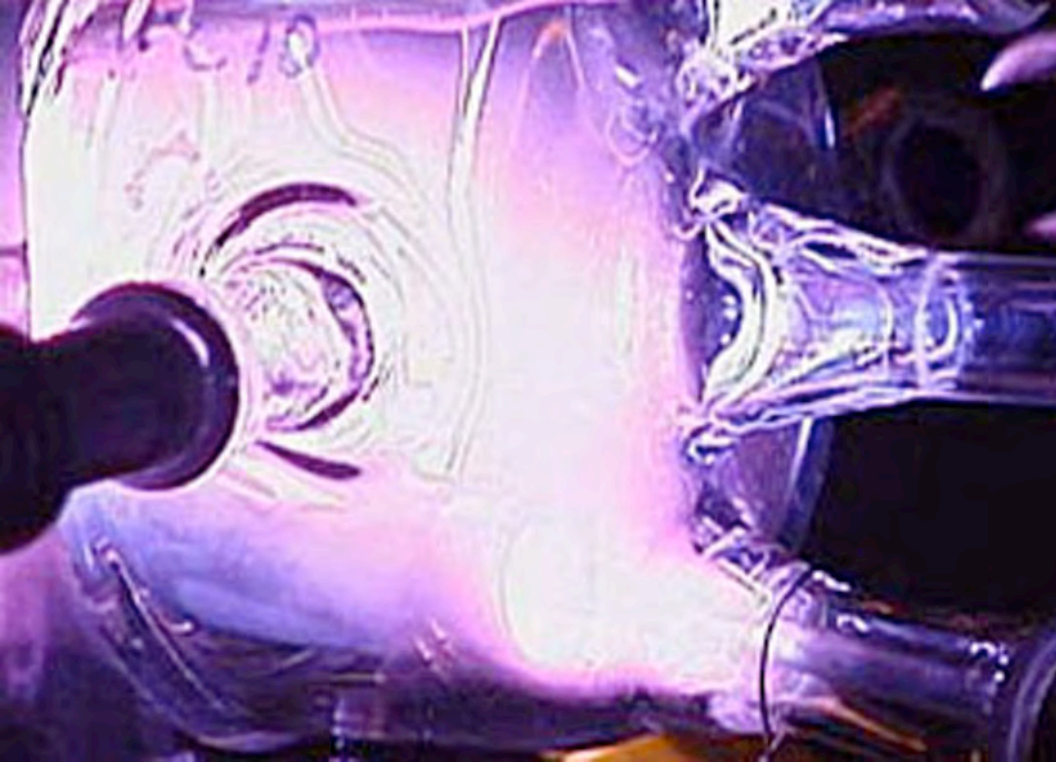
"We have drunk the Soma and become immortal. We have attained the light the gods discovered."

- (Rig Veda: VIII.48.3)

"Soma is food for the gods. Gods eat Soma."

- (Chàndogya Upanishad: V.10.4)

"One thinks to have drunk Soma ... Of him (Soma), which the bràhma¯as know, no one ever tastes."



- (Rig Veda: X.85.3; as in Atharva Veda: XIV.1.3)

"The man who supplies food hath always [his Soma] pressing stones adjusted, a wet Soma filter, well-prepared religious rites... he who hath this knowledge wins the luminous spheres." (Atharva Veda: IX.6)

Soma, Soma ma¯al, asemon, asem, electrum may perhaps denote the same substance... (which required the purificatory 'mineral waters') contained in the kaman.d.alu symbols in the icons of the yaks.a legacy. It may perhaps be the same substance said to be am°tam which was considered to be the elixir of life, of immortality. It may perhaps be the same substance referred to, in sheer poetry, as amritam àyur hira¯yam. Gold is immortality.

- [Kalyanaraman S (2004) *'Indian Alchemy: Soma in the Vedas'* Munishram Manoharlal, pp. 2-7]

Vedic hymns clearly identify the intracellular luminosity of electrum-enriched Soma foods and drinks as endowing eternal life. This special food additive is invisible and tasteless, causing so much confusion in modern scholarly interpretations, many of which misidentify the nanoparticle admixture as a mere metaphor for spiritual purity, despite the many direct references to production methods and apparati. *In fact, the Vedic texts are directly defining a 'god' as one who has 'discovered' and 'attained the light' by consuming Soma foods and drinks enriched with electrum nanoparticles! The electrum waters of La Maná were used for the generation of HHO plasma, bathing the pyramids in ultraviolet light.*

The word 'pyr-a-mid' itself is of Greek origin, based on the word 'pyros' or fire, and meaning 'fire in the middle'. Did hydrogen plasma derived from water once burn in the inner chambers of the world's pyramids? The recently rediscovered high-energy state of hydrogen has been reported by Dr. Randall Mills, who has developed the process that releases vast amounts of energy stored within the hydrogen atom itself. Mills has defined the physics underlying this novel chemical reaction derived from water as *hydrino resonant-transfer plasma* that is generated in vacuum chamber reactors now being commercially marketed for power generation by his company Blacklight Power, Inc. of New Jersey (at left, and opposite).

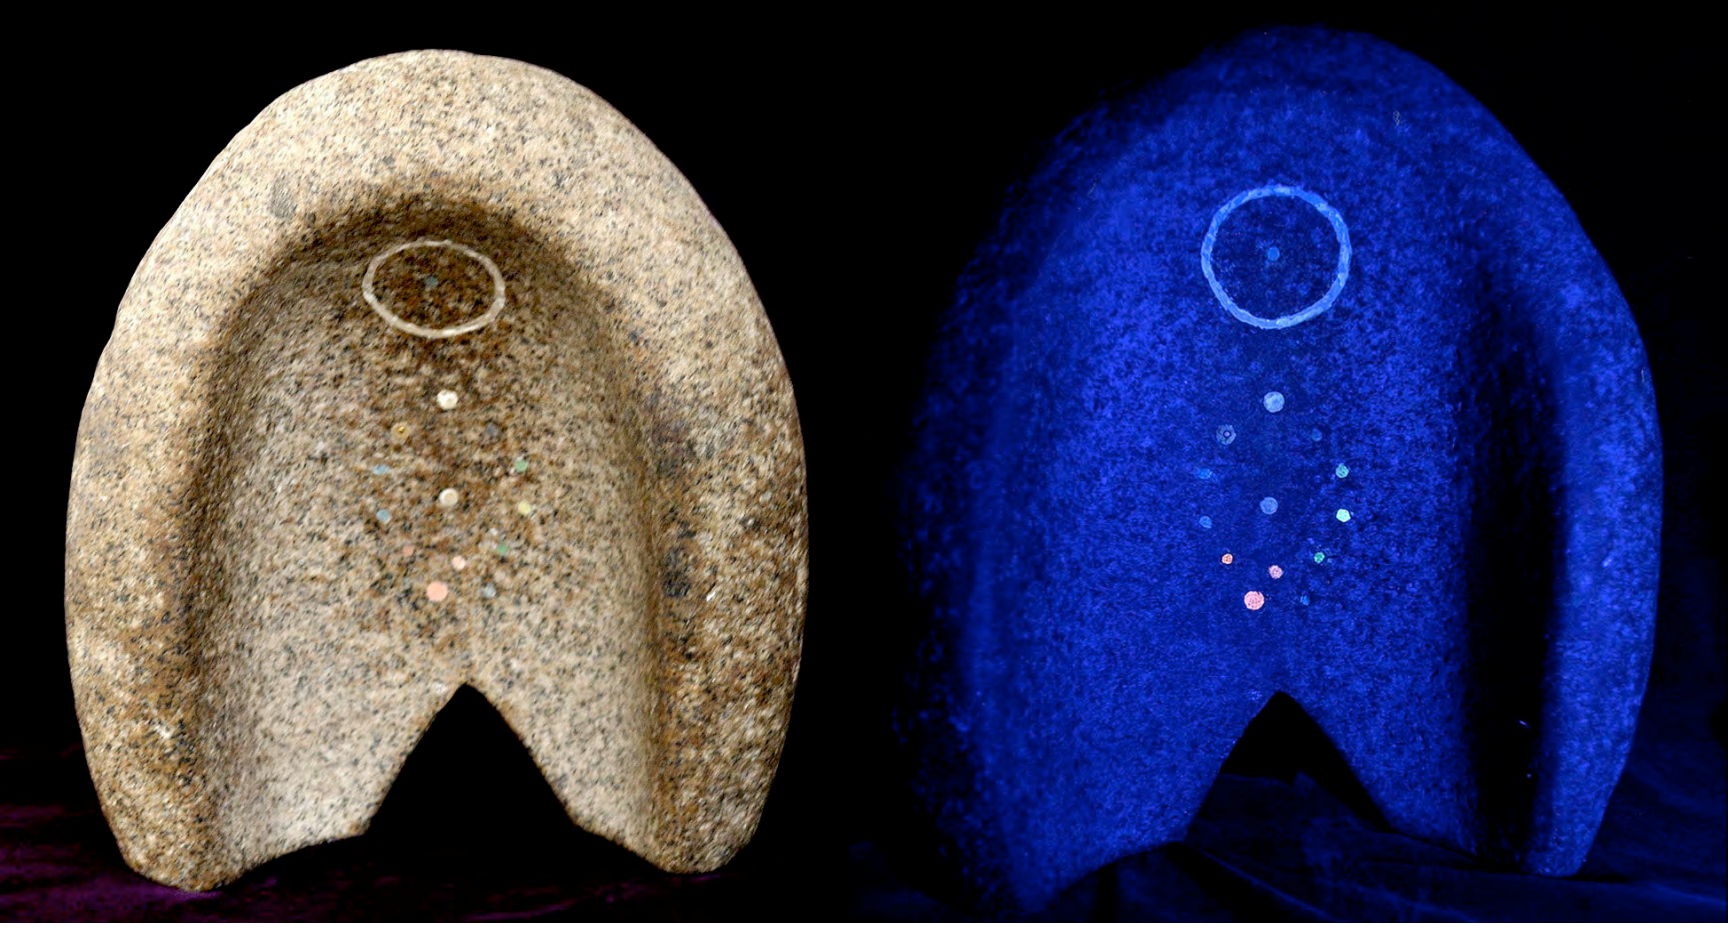
Blacklight Power researchers have defined the atomic process by which hydrino plasma forms. Hydrogen gas is produced by the electrolysis of water and is heated in a vacuum chamber with metal particles. The metals become vaporized and bombard the H atoms causing them to shrink to one-quarter normal size in a chain reaction that generates hydrino plasma. Potassium or various other elements are used to catalyze this *implosive* chemical reaction that releases vast amounts of energy in the form of ultraviolet-A and infrared light radiated by the shrinking of hydrogen atoms. This plasma reaction can occur in open air, but is more efficiently generated in a vacuum chamber.

This resonant-transfer process of hydrino plasma vastly exceeds the energy output of combustion reactions and is fueled by the most abundant element in the universe. The *explosion* principle behind the combustion reaction is reversed in the hydrino plasma reaction, based instead on the principle of *implosion*. Hydrino plasma was an essential component of the resonant energy production of the world's pyramids; having generated intense infrared and ultraviolet-A radiation within the vacuum chambers of acoustically charged piezoelectric monuments. Plasma has a resonant crystalline structure like calcite and quartz, enabling transduction of atmospheric infrasound into heat, light and strong EM fields, as especially utilized by ancient *vimana* - circular spacecraft employing acoustic levitation.

HHO plasma reactor

Vimana with HHO plasma vents

Ancient Sanskrit aerospace technology applied the *implosive* power of HHO plasma for both the propulsion and invisibility cloaking of vimana spacecraft, being commonly attributed with the astonishing capability of *complete optical invisibility at the push of a button*. Modern photographic and video evidence of this advanced ancient technology have been obtained by Edward Meier (above, 1975), recording the same noctiluminous flight machines depicted among the La Maná artifacts –*using the ultraviolet fluorescence of mineral calcite.* Intensely luminous HHO plasma beams emitted from below the vimana enable the superfluid levitation of people or objects into the spacecraft (opposite).



HHO plasma beam, UK 2003

La Maná's stone and ceramic masterworks present advanced craftsmanship, including magnetic effects and inlaid mortars that fluoresce under ultraviolet light. The artifacts defy any simple explanation, revealing the technological capabilities of ancient man to have been far in advance of that used by 'industrial' man today. The group of over 300 objects remains in Ecuador, in the private collection of German Villamar (at left), who received them as a gift from Dr. Sotomayor some years after their discovery. All of the photographs of the Villamar collection were produced by Rafael Cuesta in '02 and given to this author by German during my two-month visit to the La Maná archaeological site beginning in December '06. My initial visit to the sacred mountain above La Maná (opposite) took place in February '04, when I was able to meet Dr. Sotomayor and discuss his finds and witness demonstrations of the fluorescence and magnetic effects observed among these most intriguing masterpieces from deep below ground in central Ecuador.

Ultraviolet fluorescence effects are a well-known quality of calcite and other minerals found in natural abundance. Mineral calcite has been mixed as a mortar and inlaid into the lines incised upon the stoneworks' faces. Visible light is emitted upon exposure to longwave UV (365nm) when electrons fall back to their initial or ground states, causing some of the exciting energy to be lost as heat, resulting in a shift in the wavelength of the energy to lower energy (longer wavelength) visible light. Many minerals possess this quality, also observed upon exposure to shortwave UV (255nm). Scheelite can produce a bluish-white and willemite a bright green under shortwave UV. Fluorite emits a blue, scapolite an orange-yellow and hyalite and autunite produce a yellow-green under longwave UV.

The fluorescence spectra of certain minerals can been used as a rough indicator of the locality of the deposit in which it was formed, but is by no means reliable enough to define the origin of the materials used in creating the artifacts of La Maná. Various admixtures have apparently been used to specify the spectrum of light emitted by the various colored mortars used to achieve the inlaid designs. Manganese is likely among these mineral additives to the calcite mixture, though specific color-producing combinations have not yet been determined. Calcite may emit a large range of colors under longwave UV light including white, blue, red, orange, yellow and green, and the ancient artists at La Maná used the entire fluorescent palette in their geometric designs. This fluorescence effect has been described as quantum scattering, and has also been employed in the creation of brilliant pigments by the Mayan ceramicists of the Yucatan peninsula. The clays used by the Maya contained nanoparticles of iron and manganese that, when boiled with indigo, produces 'Maya blue' pigment (José-Yacamán et al, 1996). The metallic nanoparticles scatter light in a nonlinear, quantum fashion as the atoms in the metals vibrate near the wavelength of the re-emitted blue light. This resonance amplifies the reflected light, as it does in the fluorescent inlays from La Maná. The Maya apparently inherited many quantum techniques from the preceding Sanskrit mother culture.

Among the ceramic figures of the collection, dozens of representations of psychoacoustic helmets of various designs are presented – many with antennae-like stones fitted around their exterior. While most of the helmets depicted are made of metal, one example of which was discovered among the group of ancient Sanskrit artifacts. By far the largest and heaviest of the psychoacoustic helmets from La Maná is a smooth granite head cradle, with a triangular notch at the base to accommodate the vertebrae of the wearer as the stone's weight rests on the shoulders (as demonstrated on the opposing page). A circular inlay of calcite mineral atop the users crown chakra –representing the pineal gland synchronization of the pyramids– fluoresces blue under ultraviolet light. Below it, in the occipital region of the head cradle, a circle of multi-colored dots signifies the activation of that region of the brain by infrasonic stimulation of the piezoelectric water of the crystallized human body, which becomes transduced inside the body as *light*.

These ancient Sanskrit masterpieces employ symbols found in the natural world to convey their holistic meanings. Sacred animal spirits such as the cobra, the anaconda, the python and the dolphin reference the psychoacoustic dimension of the kundalini activation of *synesthesia*, revealing the intricate patterning on animal skins as creational formulae embedded within the very DNA of all living things.

The scarab beetle (specifically the dung beetle) was used in ancient Egyptian sacred art as a symbol for the invisible living cocoon the continually forms and renews the sphere of our planet. This ever-present force of infrasound resonance that maintains all life reveals itself in the irrepressible forms of nature through the Fibonacci proportions of all living organisms, reflecting the quantum mathematics of pure consciousness.

The enigmatic mineral luminescence of the La Maná artifacts mimics the bioluminescent displays of many native insects of these misty, low mountain forests. When disturbed in darkness, the spots of the glowing click beetle (Pyrophorus *luminosus*, at left) resemble a large pair of predatory eyes, intensifying from a dull orange to a very bright green. This noctilucent defense display closely resembles the UV fluorescent inlaid dots on many of the site's ancient Vedic artifacts (opposite). The beetle's pair of glowing dots exactly corresponds to the Archaic Sanskrit numeral *2*. The prime numeral *7* is also clearly presented in colorful inlays of the kundalini cobra lingam, showing *2* eyes above the line of the cobra's mouth, resembling the numeral *5*. Prime numbers are displayed in the many geometric forms of this stunning Atlantean archive.

Now extinct, giant terror birds like Phororhacus lived over 12,000 years ago during the Pleistocene period, and were the inspiration behind this stone carving with inlaid eyes (opposite), which was placed on the forehead during meditation to synchronize the user's brainwaves and heartbeat rhythms for telepathy.

The group of artifacts from La Maná includes several clay stamps and seals. One particular cylinder seal shows a double row of figures holding hands, bordered by waveforms (at left). The head of each figure is formed by concentric circles in reference to the telepathic pineal gland synchronization of initiates at all sacred sites worldwide within the global pattern of focal points of resonant terrestrial infrasound standing waves.

The figures' joined hands are mirrored by their feet, which electrically ground human brainwave communications. The feet display a repeating pattern of three dots, referencing the 3 Fibonacci modes of infrasound emitted by the 3 pyramids of Giza, Egypt, themselves representing the star constellation of Orion's Belt. The many carefully engraved figures encircling this cylinder seal display the same sacred symbolism that is serially repeated throughout the entire La Maná collection, identifying the exact psychoacoustic conditions present at the site of the sacred waters as an integral component of their great efficacy.

A circular jade disc fits comfortably in the palm of the hand, as used in meditation *(*opposite), and maintains a magnetic field that repels any magnet hung over its center, *causing a perpetual rotation of the magnetic pendulum.* One of just three exquisite mandala discs, the set displays luminous multicolored inlays encoding the transcendental consciousness that is *only attainable by barefoot initiates using the sacred waters at these ancient biorhythmic synchronization sites, restoring an awareness of our global Ayurvedic heritage.*

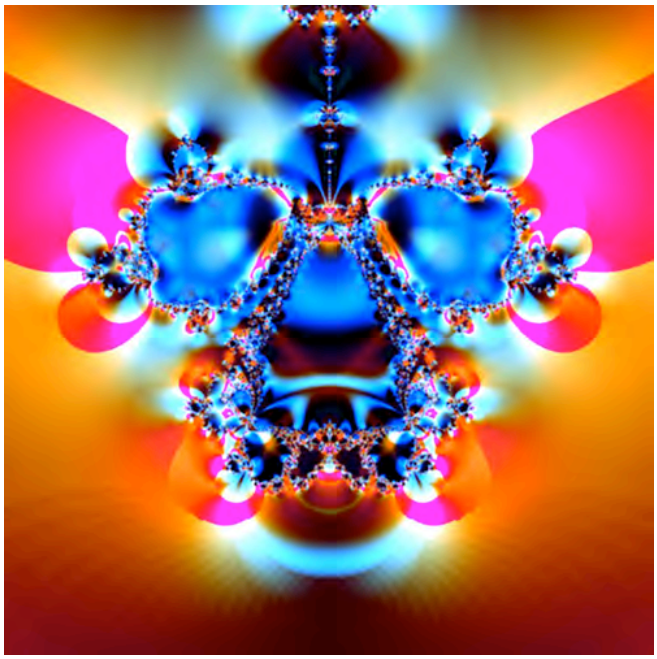
"Soma is food for the gods." ~ Chàndogya Upanishad

"We have drunk the Soma and become immortal. We have attained the light the gods discovered… One thinks to have drunk Soma… Of him… no one ever tastes." ~ Rig Veda

"The man who supplies food hath always [Soma] pressing stones adjusted, a wet Soma filter… he who hath this knowledge wins the luminous spheres." ~ Atharva Veda



What is this ethereal *Soma* that is the subject of so many ancient Vedic hymns? Soma is *electrum*, a special food and beverage additive consisting of gold and silver nanoparticles that are tasteless, invisible, and electroluminescent *~gold nanospheres emit red light, while silver nanospheres emit blue light*. Vedic wisdom clearly identifies the intracellular luminosity of electrum-enriched Soma waters and foods as endowing eternal life, directly defining a 'god' as one who 'discovered' and 'attained the light' by consuming electroluminescent gold and silver nanoparticles!

The partaking of electrum-enriched foods and beverages formed an integral rite of sacred initiation practices at all the ancient pyramids, temples and sacred sites at resonance. Identified in the Bible as *showbread* or *manna bread*, it was not made by a common baker, but by the goldsmith, to preserve the initiate from being burned in the tabernacle.

Maya wisdom prepares initiates at their sacred sites using the golden waters of Tláloc to crystallize and reawaken human consciousness, reflecting the highest wisdom of visitors from the stars as recorded by Maya ancestors in ancient times. Many renewed contacts taken up with individuals on various continents over the last several decades attest to the transdimensional use of lightwater with silver and gold nanoparticles in the ignition of HHO plasma for enhancement of consciousness and longevity through cellular regeneration processes enabling vastly extended lifespans of hundreds of years. The secrets of transdimensional travel have been revealed by extraterrestrial teachers from various confederations of peaceful planetary systems, including advanced applications of standing wave resonance for the resonant atomic transmutation processing of metals for spaceflight vehicles.

Concise explanations were given concerning the magnetic reversal of our entire solar system on December 22, 2012, and provide the timeline of specific intersecting events involving the Galactic Plane crossing, the intense blast wave of the Betelgeuse supernova and the incandescence of a Red Dwarf star at the edge of our solar system. The messages of visitors from the depths of the cosmos resonate clearly with the wisdom offerings of the indigenous Elders of Earth, preparing humanity for ascension in the resonant pulsations of worldwide aurora known as the Red Dawn, when the bleeding sky heralds the emergence of the Fifth World.

© 2010 Alexander R. Putney

For all of the radiant beings who guide humanity
toward the creation of a lasting peace on Earth,
with her transformation into a heavenly planet
under the purifying red light of the solar twins.

Having no one to influence my outlook,
I display my primordial nature and adopt the style of a youthful prince.
This is due to the only father guru.

I am busy working for others.
Prajna, penetrating all obstacles, has made the prince old and wise, fearing no one.
Dancing in space, clad in clouds, eating the sun and holding the moon,
the stars are my retinue.

The naked child is beautiful and dignified.
The red flower blooms in the sky. It is ironic to see the formless dancer,
dancing to the trumpet without a trumpeter.

At the palace of red ruby, listening to the utterance of the seed syllable,
it is joyful to watch the dance of illusion,
the seductive maidens of phenomena.

The warrior without a sword, riding on a rainbow,
hears the limitless laughter of transcendent joy,
the poisonous snake becomes amrita.

Drinking fire, wearing water,
holding the mace of the wind, breathing earth,
I am the lord of the three worlds.

Unusual atmospheric events taking place above the surface of the Earth are unmistakable signs that our planet is rapidly ascending into a new, high-resonance quantum state in synchrony with changes witnessed on the sun. Distinct geometric patterning defining the nonlinear distribution of sunspots is retraced by atmospheric excitations of plasma into the concentric arcs of resonant standing waves within the solar corona. Solar plasma formations during coronal mass ejections display perpendicular rows of luminous plasma plumes (opposite) that are also observed of Earth's noctilucent aurora (above).

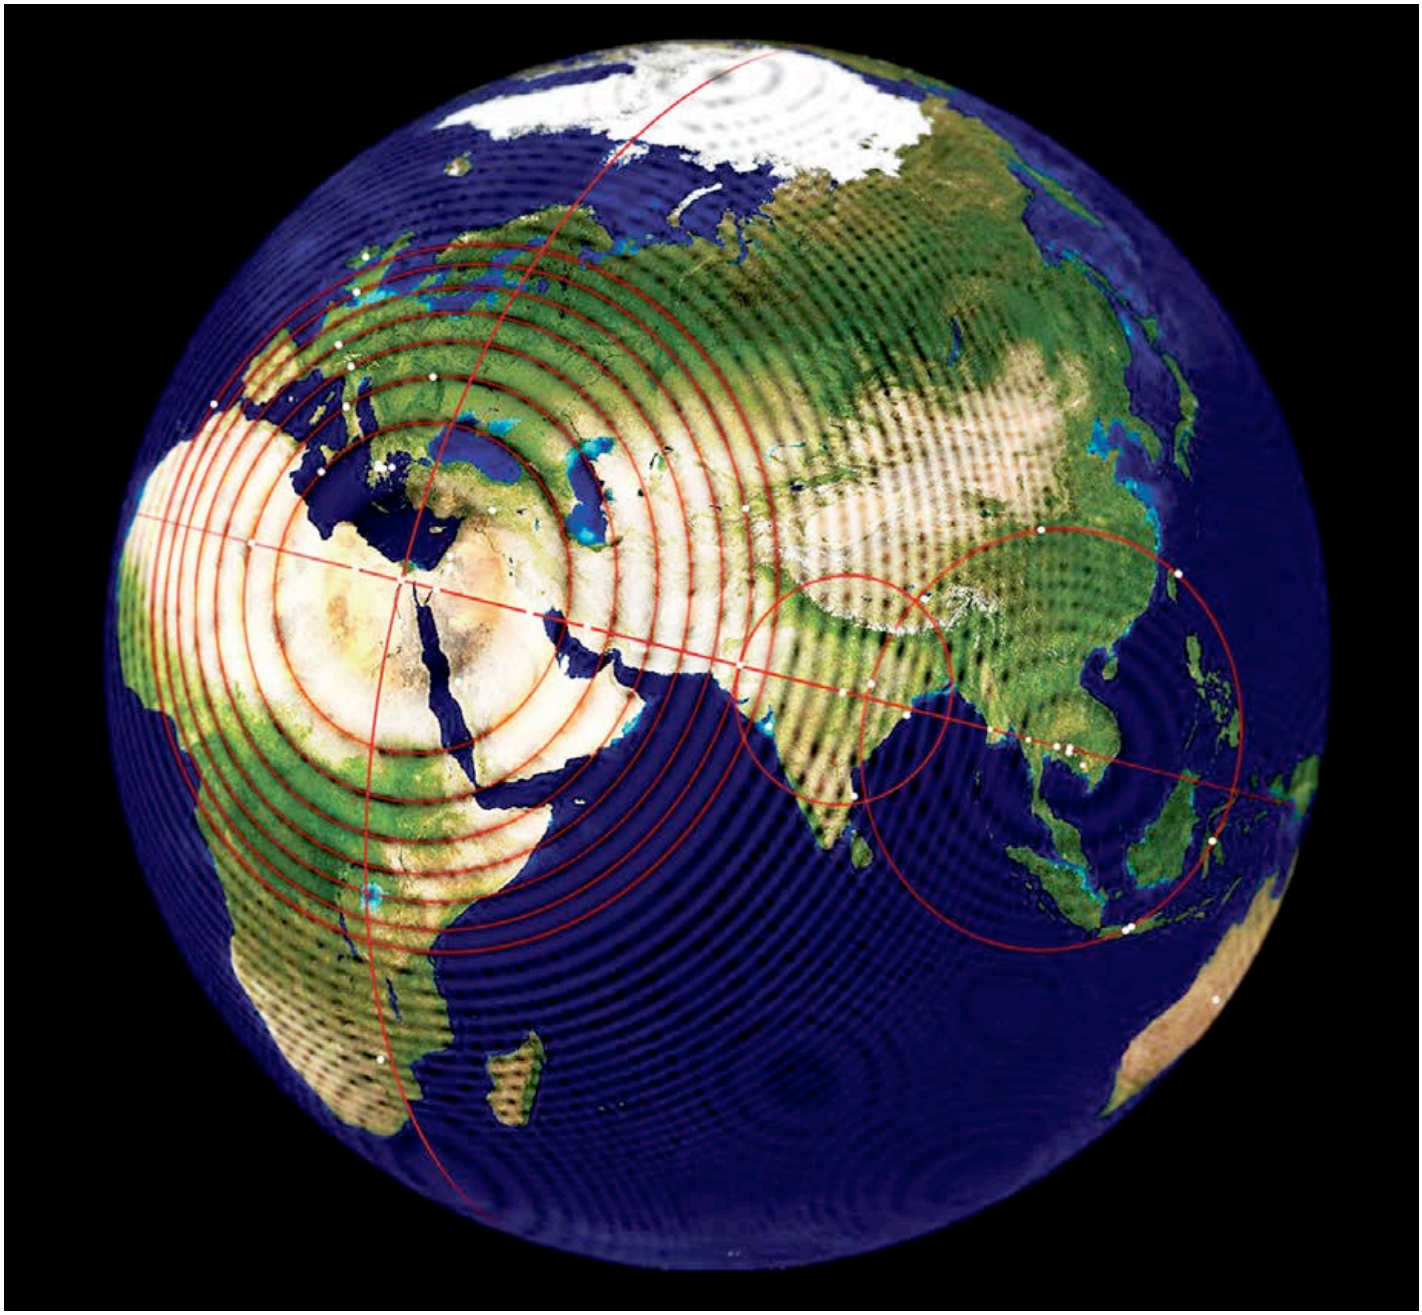
Auroral plumes were photographed and videotaped in the high atmosphere above Xiamen, China on July 12, 2010 as uneven rows of vertical plasma beams shone brightly during the night hours.[1] Perhaps the most striking examples of aerial plasma formations have been recorded near ground level in Longview, Texas by motion-activated game-trail cameras on the night of September 9-10, 2009.[2] The auspicious calendar date of this plasma flare event –9/9/9– suggests that heightened Earth resonance and solar activity may be directly linked with synchronized meditation by large masses of human beings, as once achieved by the pyramid-building cultures of the world, whose resonant temple stones still hum today.

Sacred geometric knowledge of the focal points of Earth resonance remains perfectly preserved in the pyramidal monuments of the world, both in their respective structural configurations and their relative geopositions, encoding the golden proportion as a precise spherical formula [$z_{n+1} = z_n^2$]. All of the world's stone temples and sacred sites find exquisite alignment within this global psychoacoustic resonance network organized by the geometric distribution of nonlinear infrasound standing waves (above).[3] This transcendental quadratic formula has been encoded in the sacred geometric configuration of the Sanskrit mandala *–a square within a circle–* and preserved throughout ancient sacred artworks the world over.

This spherical mandala code lies carefully nested, in perfect order, in the locks of the Buddha's hair and the circular pattern of the radiant aura surrounding his golden head (opposite). The hemispheric design of the topknot bun at the crown chakra displays octopolar symmetry with sets of concentric circles arranged in radial rows of 4, 8 and 16. The extremely long earlobes often seen in representations of the Buddha reflect an odd Sanskrit cultural association with transcendent wisdom and the great attainment of yogis to become transdimensional beings, at one with Creation.

The identification of spiritual attainment with gold has been passed down since time immemorial, and the latest findings of the biophysical sciences provide access to deeper layers of meaning within these ever-present cultural concepts. Gold, like silver, is not reactive with water and so does not break down by oxidation, but maintains a pure state –just as the consciousness of a fully self-aware human being is crystallized and purified to achieve the highest state of perfection attainable.

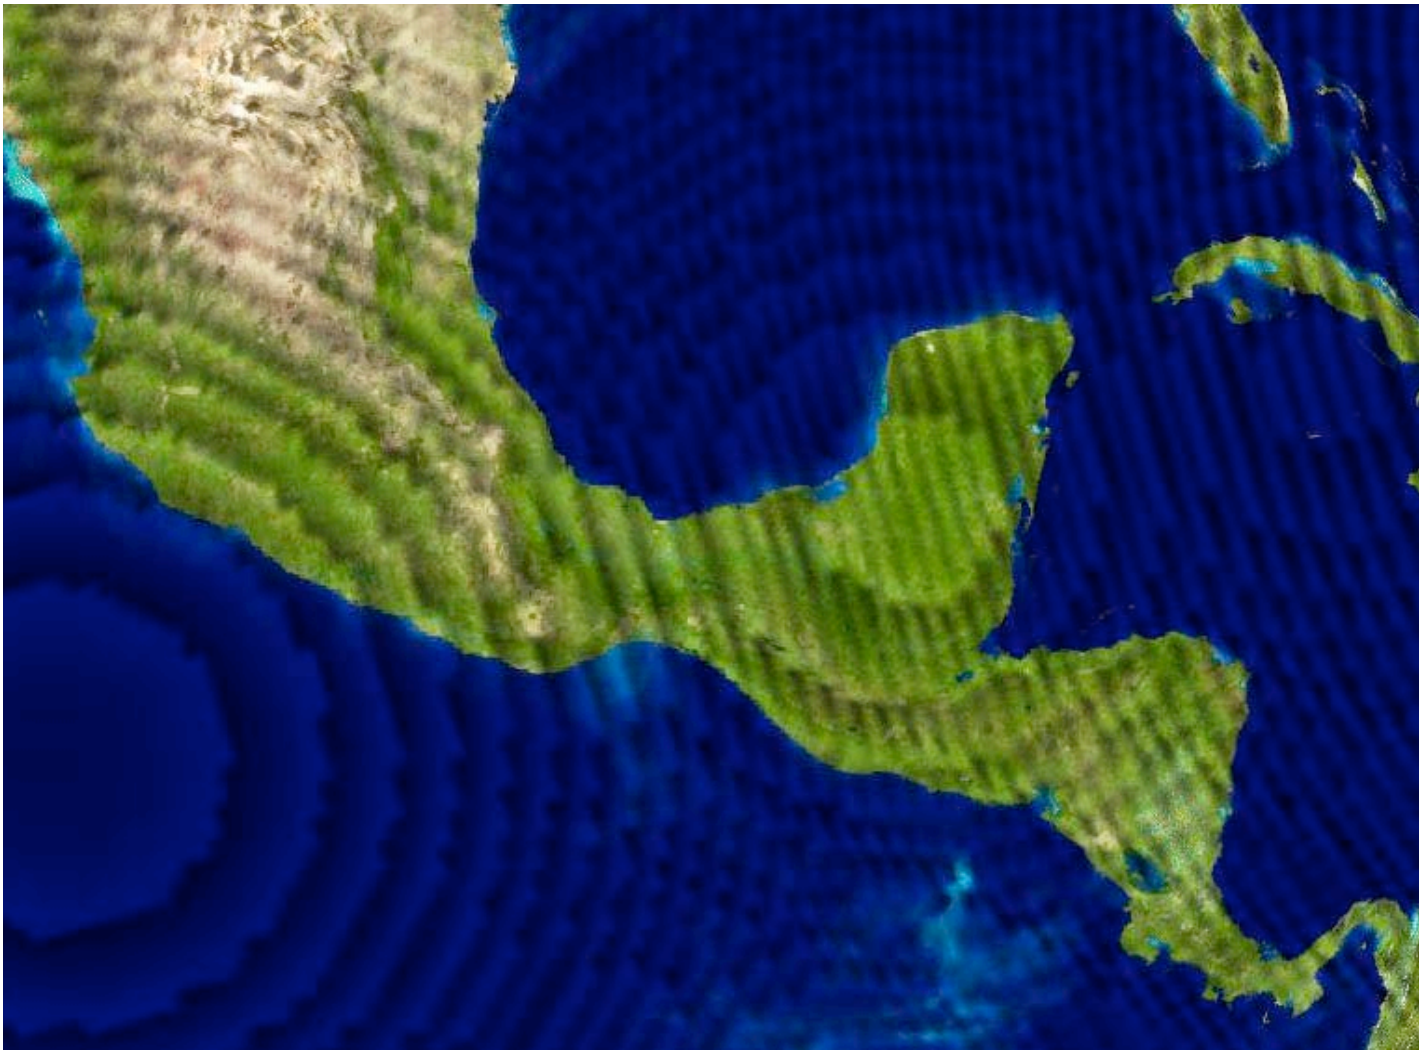
Sacred mountains are identified by indigenous cultures for the alignment of their peaks with convergence points of infrasound resonance, while great masters of consciousness are known to reside on such sacred peaks. Among the Himalayan spiritual traditions of India and Nepal, the mystical figure Mahavatar Babaji is closely associated with a cavesite retreat within sacred Mt. Kailash. Other poignant examples include the Indian adept Sri Ramana, who practiced a barefoot yogic lifestyle atop sacred Mt. Arunachala thriving on the accumulated spiritual energy for most of his life,



This resonant bioenergetic phenomenon is well cited among ancient wisdom traditions as an attainment of spiritual and physical purity, as the water of the adept's body itself becomes crystallized by the deep delta wave beating that reigns over the enlightened consciousness. Such resonant bodies never desiccate atop sacred mountain peaks, or inside pyramid chambers, but become mummified in the preservative infrasound-enhanced electromagnetic environment as the piezoelectric crystalline water, bones and tissues are continually sterilized by mild electrical currents that neutralize all pathogens.[4] This post-mortem effect was reported of spiritual adept Simeon Toko, who died in Luanda, Angola, yet his lifeless body was observed by respectful masses for many days without any sign of putrefaction.[5]

The three main pyramids that dominate the Giza plateau were created as a symbolic representation of the three belt stars of the Orion constellation, so designed to transduce the diverse ambient energies of both solar and geomagnetic storms into a precisely ordered tri-frequency resonance. Any three acoustic frequencies in Fibonacci ratio generate the full set of nonlinear standing waves that couple energy from Earth's base Schumann Resonance frequencies (near the human heartbeat at rest) into the higher harmonics,[6] which then become audible to the human ear as a deep pulsation –the cosmic Om.

Infrasound standing waves stimulated by 1.45 Hz heartbeat booming within the Great Pyramid ignite the very water vapor surrounding the pyramids in arcs of HHO plasma that is generated as water molecules are torn apart and ionized. Gold and silver nanoparticles were a key component of the high purity water that once rose as vapor through the pyramid's ascending passages, to enhance the ignition process of HHO plasma within the stone chambers and into the surrounding atmosphere. This biocompatible form of gold (thus 'organic') was consumed by all initiates within the pyramids, and reveals the deeper significance of the star constellation name 'Orion' –*which literally means 'gold ion'! Ionized nanoparticles of gold and silver are electroluminescent, illuminating the DNA of all initiates within the pyramids:*



> Through this initiation they will be able to see the luminosity of the Great Spirit. When this spiritual initiation is completed in the house of Hunab K'u in heaven, the spirit of each initiate will be illumined. Then, it will return to Earth to awaken the body and take it to the pyramids. Chichen Itza, Uxmal, K'aba, Etznah, Palenque, all of these sacred Mayan centers have a specific function in every part of the body to awaken the 7 powers contained in it.
>
> Only through the solar initiation can the sleeping body of mankind be awakened. The reincarnated teachers of the new age of Aquarius implore for the sacred human race to awaken, so that in this way it can fulfill its sacred destiny, which is to be the true sons and daughters of the cosmic light. The time of knowledge approaches, the light in the center of the pyramidal house of Hunab K'u will flash like lighting that will pierce through the shadows that envelop the human race. Let us prepare to receive the light of knowledge that comes from Hunab K'u and transcend into the memory of the creator and become beings of eternal luminosity.[7]

.

The electroluminosity of nano-gold and -silver within the body vastly increases cellular longevity and the lifespans of all initiates accordingly, as well as providing the quintessential biorhythmic environment for meditation, telepathic communication and Astral projection. The vast multitudes of piezoelectric stone temples found throughout the entire world find precise placement within the infrasound distribution pattern expressed by the sacred formula known to mathematicians today as four-dimensional equation [$z_{n+1} = z_n^2$], as a spherical rendering expressed from the apex of the Great Pyramid of Giza, Egypt (above, with major sacred temple sites denoted in white).

The Sanskrit origin of the world's ancient pyramid traditions has been linguistically identified by modern epigrapher Dr. Kurt Schildmann,[8] yet the living culture of the Maya people of Central America remains a most direct modern link to the Vedic knowledge of the deep past, as one of several descendant language forms. The powerful words of the ancient Sanskrit pyramid-builders still resonate within the sacred temple stones today, as a clue to their longstanding and divine purpose that is intimately linked with the conscious Spirit of all the human beings of Earth. The ancient astronomical and mathematical wisdom is preserved in Maya scriptures and oral traditions, *in conscious mastery of galactic temporal cycles:*

Man does not will when he wars, loves, reaps; it is the rhythms of the great gods, the planets, that act over him and make him do. When he comprehends that by himself he can do nothing, then he can learn to serve the gods; so, he must become conscious of the rhythm of the gods.

The calendar that governs the life of man, the Tonalpohualli, is based on the rites of the planets that turn closest to the Earth: Paynal, Mercury; Quetzalcóatl, Venus; and Huitzilopochtli, Mars...

After 657 Tonalpohualli (468 solar years) the cycles of the minor planets and the cycles of the Sun end together. Tonatiuh, Quetzalcóatl, Huitzilopochtli, and Paynal shine again at the same time in the same form. This is an age, the duration of the life of a culture.

Chalchiuhtlicue, Goddess of Terrestrial Waters, of that which flows, runs, surges, forward and down, arriving always at profounder levels. Chalchiuhtlicue swells the fruits and flowers only so that they may drop.

Chalchiuhtlicue fills the gourd of pulque so that man may forget. Chalchiuhtlicue, current that descends in the course of rivers, current that flows in the course of time, making men's wastes and the implements of war inert and taking them to their inevitable end.

Tláloc, God of Celestial Water, god of the vapor that rises, from the earth warmed by the sun after the rains, god of the mist that ascends from the valleys at dawn, god of the water that returns to its source in the clouds that swim over the highest peaks, god of the humid incense from which rise the copal prayers and the prayers of sacrifice.

Tláloc is the return of vapor that strains to rise, is the return of time that strains to remember… Tláloc, God of the Fight Against the Current, with whose aid the hero battles against the torrent toward his own origin and beginning, towards the wings of his soul, the wings that Tláloc hides in the hero's past.

Quetzalcóatl, the Plumed Serpent, moves between gods and men, because Quetzalcóatl is God who permeates man and is the man that achieves God. The Plumed Serpent is born when that which slithers over the Earth grows wings to be elevated to Heaven. Quetzalcóatl is a superior man, the inner circle of humanity, the link between gods and men. All men are made of earth, air, water, and fire... But in their hearts and in their semen, each man has his own coatl, his own serpent, the energy of Tonatiuh, the power of the sun itself. And in this serpent sleeps consciousness, in this serpent is hidden his divinity. From this serpent his wings will grow.

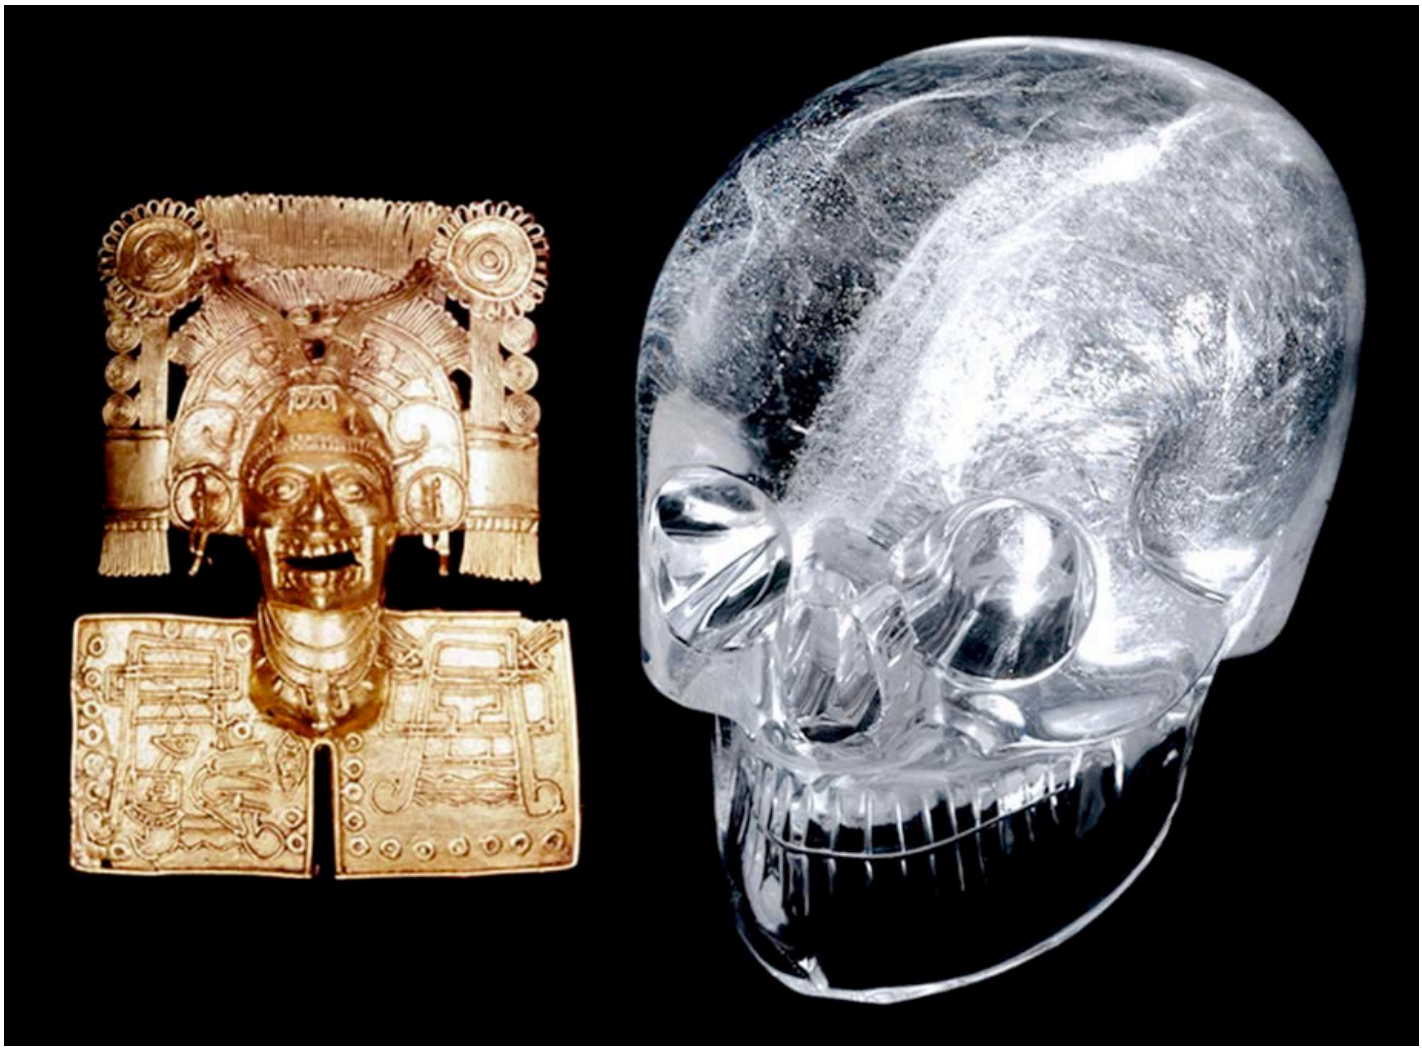
There is an occult energy in the heart that comes from Tonatiuh, the Sun, and if man releases it, returning it consciously to the sun, he becomes immortal. But to liberate this energy, sacrifice is necessary. Man must sacrifice the desires and habits that he adores, sacrifice them in himself, and turn the knife against the enemy that he carries within himself, that keeps his heart a prisoner.

In recent times men still remembered these words, but they have now forgotten their significance. They have made enemies of other men to sacrifice them and take out their hearts, believing such offerings would propitiate Tonatiuh. Such is their degeneration, such is their superstition. When fear unites with knowledge, terrible things are done. It is the self within ourselves that we have to sacrifice. It is our own heart that has to be torn out of the false being and offered to the light. May Xiuhtecuhtli, Lord of Fire, burn my false being. May Itzli, Obsidian Knife, liberate my heart.

What is the blood that connects stones with soul, men with suns? It is the universal unity, the one creative principle crystallizing into myriad forms, and when liberated by sacrifice it returns to unity. Because to sacrifice is to act consciously, to sacrifice that which will be taken away is to deny the destiny that takes it.

Defraud Death by sacrificing Life; because from the hand of the Goddess of Sacrifice that holds the obsidian blade sprouts the germ of Life to come. To sow life in the fires of sacrifice: Are the flames rising on the Hill of the Star, toward Cauhlacan? Or is it my own heart that is afire?

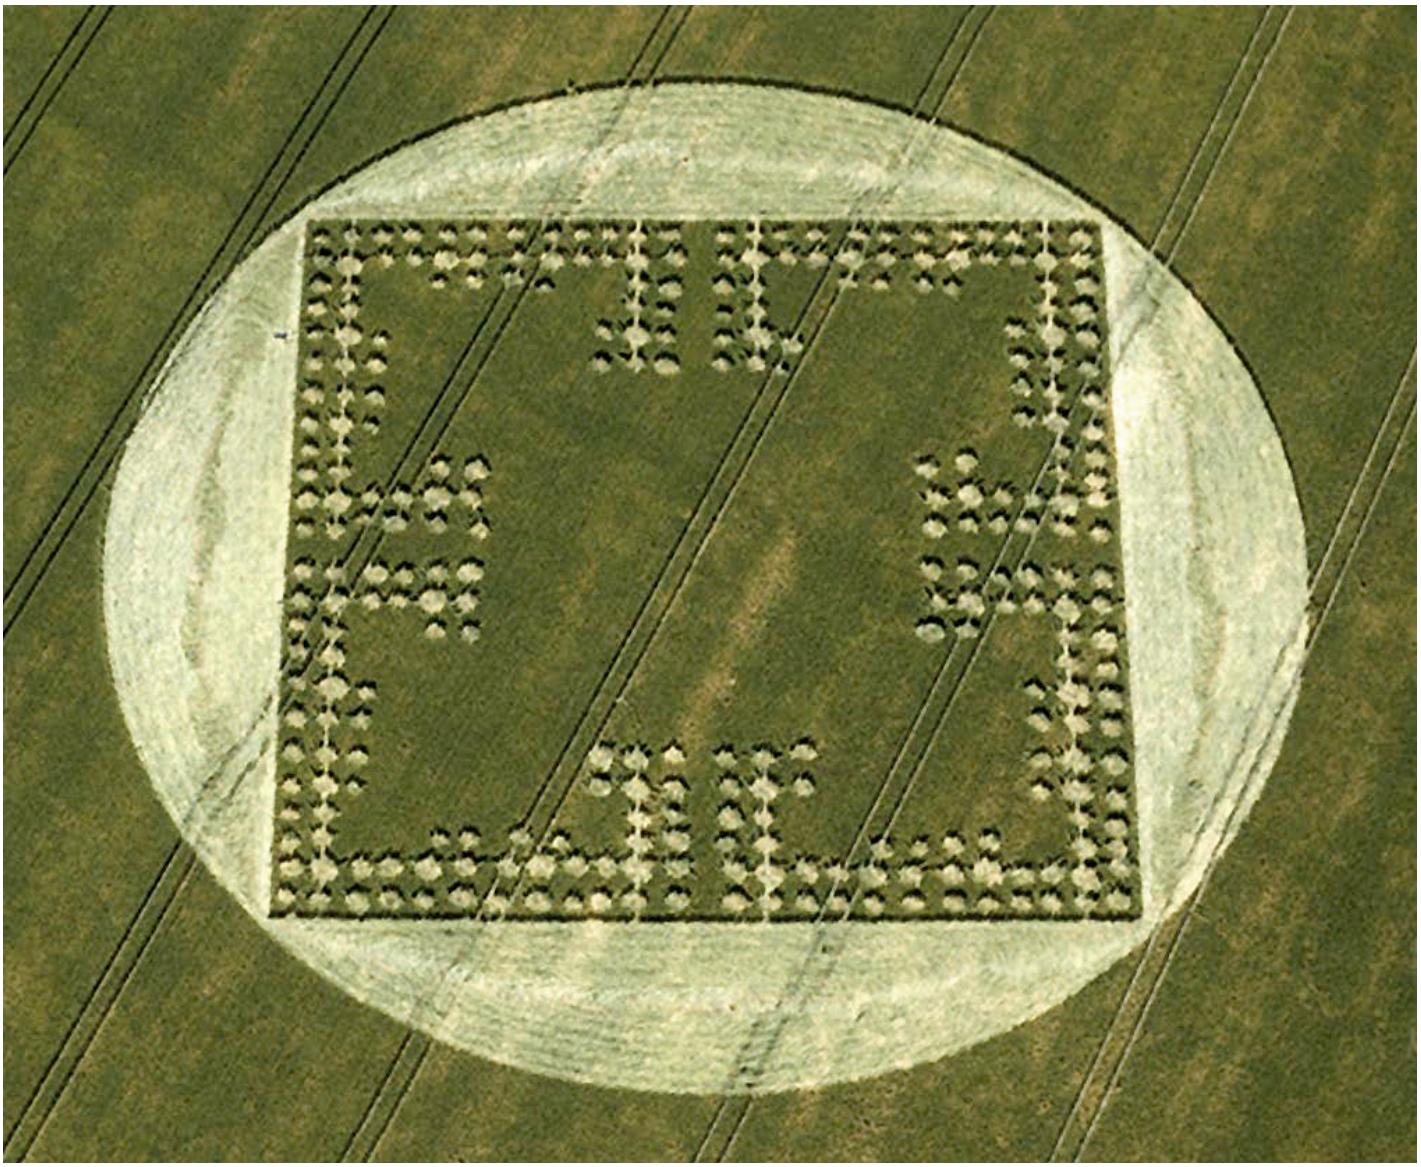
> The cycle of years is past - the waiting ended. Come - reunite, pilgrims, for the sky is in flames! From Xochicalco to Teotíhuacan the red spreads one step, another step, and another, only twelve short steps from the cave of the womb to the final conflagration… The flames rage in consummation- Rise, oh flames! What light, what heat! What great holocaust! The smoke ascends and spirals... Obscurity disappears as the flames rise to Tonatiuh, the purest light.



Profound mathematical knowledge of the rhythms of the inner planets and their specific effect on the patterns of the collective consciousness of the human beings of Earth is followed by an explanation of the attributes of different kinds of water. Sacred waters are identified with memory, wisdom, ascension and prayer and are known to science as water molecules exclusively comprised of the lightest form of hydrogen – *protium*. The lower forms of water contain heavy hydrogen isotopes – *deuterium and tritium* (with 2 and 3 neutrons, respectively), and are associated with forgetfulness, degeneration and entropy.

The Maya understand the inner power of human consciousness as a function of DNA, the coiled 'coatl' serpent within every living cell, to be mastered through meditation, spiritual development and emotional control of brainwave and DNA states. DNA electrification is overtly expressed in the straight, double ladders depicted on a large copper/gold plate from the Crespi collection from Cuenca, Ecuador, with double-headed serpents representing electrical currents moving along nanoparticles chains (opposite).

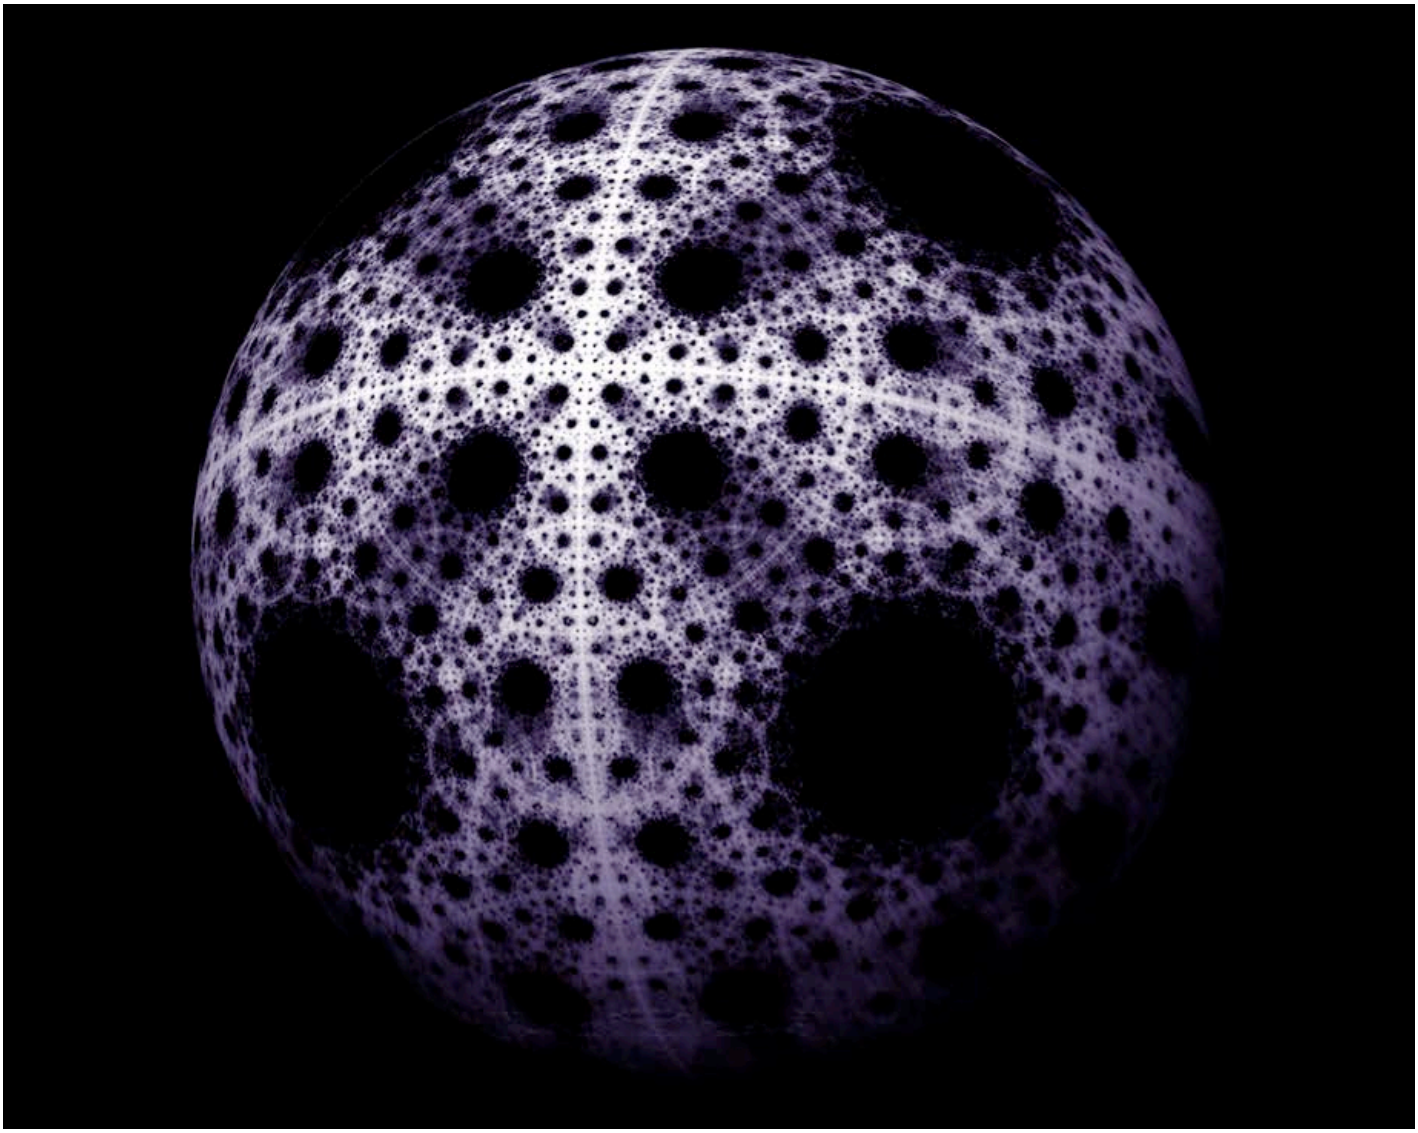
The prophecy of the Red Sky is related by Maya texts as an ignition of the pyramids and the very sky itself in flames! Atmospheric HHO plasma plumes and red atmospheric aurora are depicted in the Teotihuacan Tree of Life mural (above), the blood red sky encompassing the entire background of the scene, dominated by a giant tree-like form comprised of luminous pink and green plumes. Along the length of the spiraling 'branches' of this sacred tree are numerous concentric circles, as a well as spiders and butterflies – symbols for the transformative effects of the living waters of Tláloc.



The concept of defrauding death by self-sacrifice through the overcoming of human instincts, karmic attachments and desires as symbolized by the laughing skull. Fear of death and the unknown is transcended in the eternal light of knowledge, thus 'making death an ally.' The laughing skull symbolism is preserved in ancient Tayrona gold masterpieces from Colombia, often presented with linear alignments of concentric circles (below, left). Three spirals are another commonly used symbolism representing the three frequencies of sound that stimulate psychoacoustic resonance within the temple chambers.

The crystal skull is another cross-cultural symbol closely linked with the transformative concept of crystallization of the water within the human body, referencing the piezoelectric property of quartz and the piezoelectric potential of the crystallized human being. The advanced bioelectrical metabolism of superior man is achieved through the death of individual desires and karmic attachments, to become spiritually reborn as Quetzalcóatl in the pyramidal House of Hunab K'u, the Universal Creator:

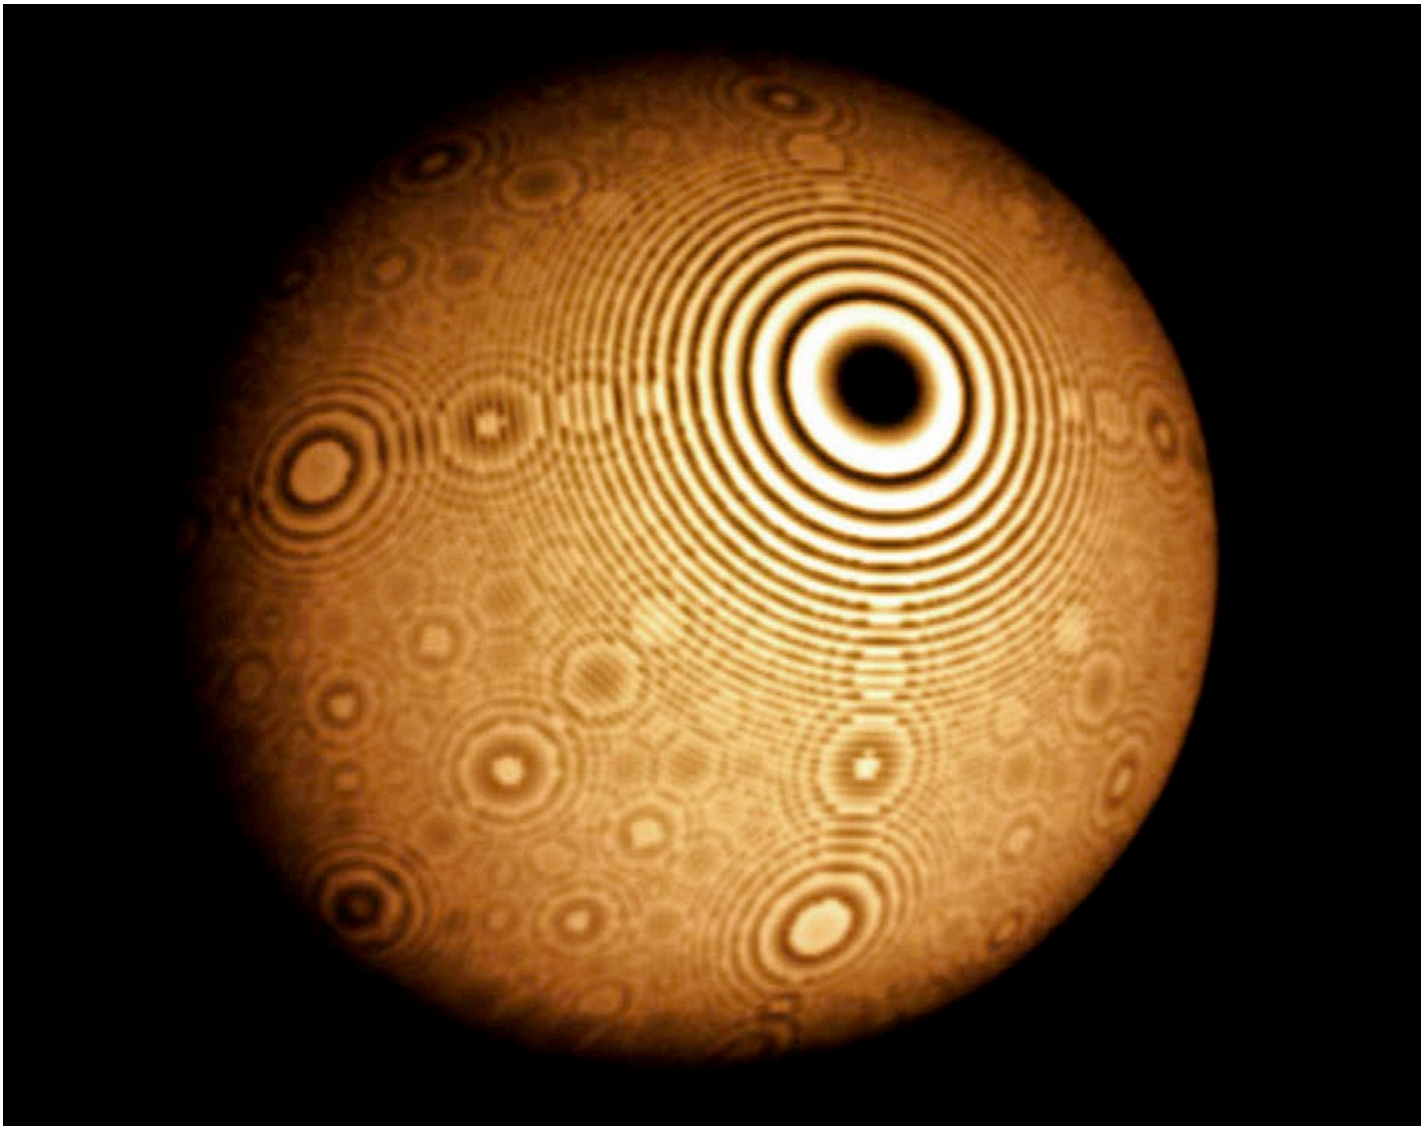
> The mysteries of the sacred Crystal Skulls have been recorded in the depths of time. That means that it is almost impossible for the human beings to understand them. This is the reason why thousands of people around the world feel restless; they want to know why the ancient peoples made these skulls… The Crystal Skull and the human being make up a single unit, but the main difference between them is that the skull has more memory than us [human beings].
>
> When all the crystal skulls of the world get together, it will be an important moment for the human beings because the memory that has been stored in these skulls will teach us how to recall our past lives. Currently, the modern human being does not know how to remember; and due to this, he does not know where he comes from or where he is going. And he does not know about his future either because he cannot remember where he came from or where he lived his past lives exactly...



There are some impressive geometric shapes that have been appearing in the fields of the European country of England, but the most impressive is the one that appeared on July 16th, 1999 in Windmill Hill, Avebury Trusloe, Wiltshire County [presented above]... As it can be seen, it is a large circle with a square in its center. Besides, the square has 328 small circles distributed symmetrically in its interior… The information below was published in the magazine "Crop Circles" where Judith Moore and Barbara Lamb wrote the following: “This 'Crop Circle' is the DNA chip that will evolve our mathematical capacity. Each one of these circles in an infinite fractal crystalline code, and each crystalline aspect is a fractal universe. This evolved system is the next step for mathematics on Earth. When this particular glyph becomes of collective knowledge, current mathematics will seem obsolete or primitive, like the difference between a stone axe and the laser.”

Qiuayon soen tra soen nas tra ka mix na ke te son tra laixwa mei ix nika. This is the ancient mantra for the activation of this process. In ancient history there were bearers of both the Mayan and Egyptian tradition that prepared the planetary essence to receive this evolutional leap. The crystalline codes were implanted in sacred sites and will be reactivated by those of you who bear the appropriate DNA codes to complete those ancient formulas and receive the mathematical formulas created in the collective mind. Those who will be part of this cosmic mission have already been reincarnated to activate this process…

The geometric writing exists, but the human being in general still cannot understand it. In ancient times the peoples mastered it; for example, the Mayans could understand it and they applied this knowledge on the planning of their constructions when they built their ceremonial centers and they also applied it on their architecture. They knew that energy moves in geometric shapes using its perfect proportions.



The Greeks knew that geometry was important to understand the mysteries of life, but it was the Mayans the first ones to include it in their culture to live it everyday. The Christians speak of God, but they do not relate him to the geometric shapes. In the Mayan culture God and science are related to the geometric shapes; for example, the circle and the square are the symbol of Hunab K'u who is the Mayan God. The circle represents the movement and the square the measurement. 'The Giver of Movement and Measurement' can be found in these two crisscrossed geometric shapes; this is for the Mayas the Universal Creator...

On the initiatic work of magnetic activation we will carry out with the Crystal Skulls in the Mayan temples we will use this same geometric shapes that appeared in England. In this occasion, all the initiates and teachers will experience these geometric shapes applied to the construction of the Mayan temples, but we will also have to live them cosmically. If we observe the map that we will be using in this initiation, we will realize that the ceremonial centers of the ancient Mayas were based on a geometric planning viewed from the space just as it can be appreciated...

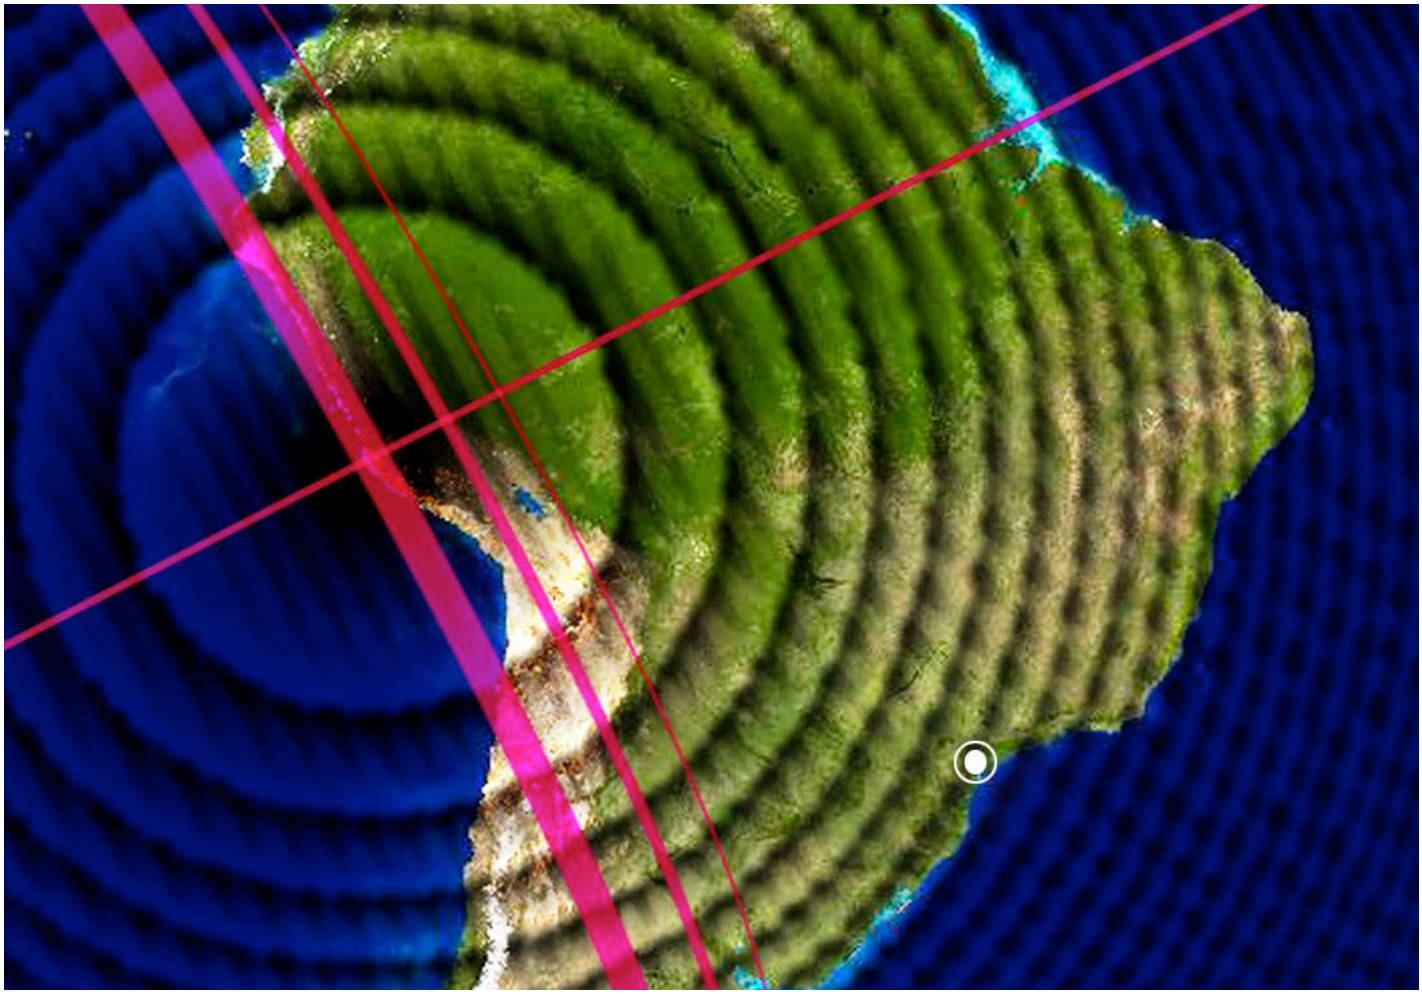
This map shows us that the Mayas built their ceremonial centers using the macro-geometry. We the initiates will use the micro-geometry when we perform our rituals to later connect it with the macro-geometry. Well, then, who will help us to expand this energy in order to achieve the activation of the pyramids? Well, that will be the role of the sacred crystal skulls because science has proved that quartz is able to expand energy much more quickly than human beings… Let me tell you that this time the flowing energy will be used only for the human beings' benefit. As we previously said, the crystal skull and the human being form a single unit. When we work with this energy in the Mayan pyramids, then they will be activated and this energy will travel to the 8,000 ceremonial Mayan centers distributed in all the countries of the Mayan world to later continue its flow toward the other temples spread in the rest of the world...

The Crystal Skulls will work on the magnetic activation of the pyramids and in a natural way they will make several radiations of the cosmos to come to us. These radiations will concentrate on the axis of all and each one of the pyramids and of course in their center, too. The pyramids are huge accumulators of electromagnetic energy that will be activated by the crystal skulls together with the initiates and teachers in the Mayan temples in order to seek the human benefit. It is also important to send this energy already activated to the center of each human being skull so that he can raise his consciousness.

As a conclusion, we will quote an important fact related to the pyramids. It is worth mentioning here the scientific theory that talks about the atomic excitation that takes place in the Sun, the stars and the cosmic space… that is able to penetrate all the existent things. Well, when this cosmic excitation penetrates into the pyramidal constructions, it gets organized and forms perfect geometric figures, giving birth in this to the cosmic geometric writing… We will do this work together in benefit of the natural laws, our Mother Earth, and all the human beings. It will also help us to start a communication with our cosmic family. This initiatic work will open the gate of the New Itza Age and the future generations will have a better world to live in, a world with a new consciousness achieved through this magnetic cosmic activation.[9]

The force of cosmic infrasound so penetrates all matter and becomes focused by giant crystalline pyramids on Earth's surface, into a nonlinear distribution pattern exactly encoded by the spherical resonance formula [$z_{n+1} = z_n^2$] (above). Standing auroral beams and atmospheric flashes are being caused by localized surges of terrestrial infrasound at nodal convergence points, irradiating water vapor to induce the dissociation of water molecules and the rapid formation of HHO plasma. The implosion of hydrogen atoms releases intense ultraviolet-A and infrared light that becomes visible during brief periods.

An intensely luminous HHO plasma canopy envelops the Giza pyramids when operating at high resonance, radiating giant acoustic plasma beams that arc from the four faces of each pyramid, with looping flares connecting one pyramid to another just as solar flares arc from one sunspot to another. This dramatic luminous interaction of the pyramids with stimulated atmospheric plasma activity is exactly described by the Pyramid Texts of Saqarra, Egypt (below), only now comprehensible to plasma physicists as intense emissions of UV-A and IR light from resonant HHO plasma and amplified by the gleaming UV fluorescent limestone's of pyramids all over the world:



> House bright and dark of Heaven and Earth, for the [solar] ships put together; Great Pyramid, House of the gods with pointed peak; for Heaven-to-Earth it is greatly equipped. House whose interior glows with a reddish light of Heaven, pulsating a beam which reaches far and wide; its awesomeness touches the flesh… House of Eternity; its foundations are stones, the water; its great circumference is set in the clay.[10]

Calcite is an ultraviolet fluorescent material that was used extensively in the construction of all of the pyramids of the world. The ancient Vedic accounts of antigravitic vimana, or solar ships, include recipes for electroluminescent metal alloys which display the same molecular properties as the pyramid stones, as well as showing the same octagonal axis-symmetric geometry. If antigravitic effects were once achieved in the pyramids for application to the human body and consciousness, what is the range of extra-low-frequency sound biocompatibility? The heartbeat - at 1.45 Hz wavelength of 765 feet - informs the base length of the Great Pyramid of Egypt. The word 'pyr-a-mid' itself is of Greek origin, based on the word 'pyros' or fire and meaning 'fire in the middle'. Were biocompatible plasmas once burning in the pyramids' inner chambers?

The recently rediscovered high-energy state of hydrogen has been reported by Dr. Randall Mills, who has developed the process which releases vast amounts of energy stored within the hydrogen atom itself. Mills has defined the physics underlying this novel chemical reaction derived from water as hydrino resonant-transfer plasmas, which are now being commercially marketed for power generation by his company Blacklight Power, Inc. A very similar application of this novel reaction has been developed by Denny Klein, called HHO gas, and is now available as a plasma torch capable of sublimating any material. Both of these hydrogen-based plasma reactions produce intense infrared and ultravoilet light. Interestingly, the bandwidth of UV radiation produced is restricted to UV-A, which is beneficial to the human body, while the destructive UV-B and UV-C wavelengths are not observed.

The technical process by which HHO plasmas are formed has been defined by the Blacklight Power researchers. It involves the breaking of the molecular bonds of water by vaporized metal nanoparticles, producing a highly kinetic vapor composed of individual hydrogen and oxygen atoms. This reaction cannot occur in the presence of air, therefore a vacuum chamber is required. Once the HHO vapor fills the chamber, it is then electrified to become HHO plasma releasing energy as the H atoms shrink to one-quarter normal size.

These contemporary scientific breakthroughs shed light on the unusual experiences recounted (in Search Magazine, March 1960) by American ex-patriot Dr. Raymond Bernard in Joinville, a coastal city in the Brazilian State of Santa Catarina (above). A very strange series of extraterrestrial contacts began while Dr. Bernard was organizing and living amongst a community of vegetarians outside of the city. The calls of a booming voice from a nearby mountaintop prompted a member of Bernard's camp to investigate the location of their origin. Eventually finding only a well-like circular shaft, measured by jungle vines to be about 300' in depth, the investigator returned equipped with ample rope to descend to its bottom:

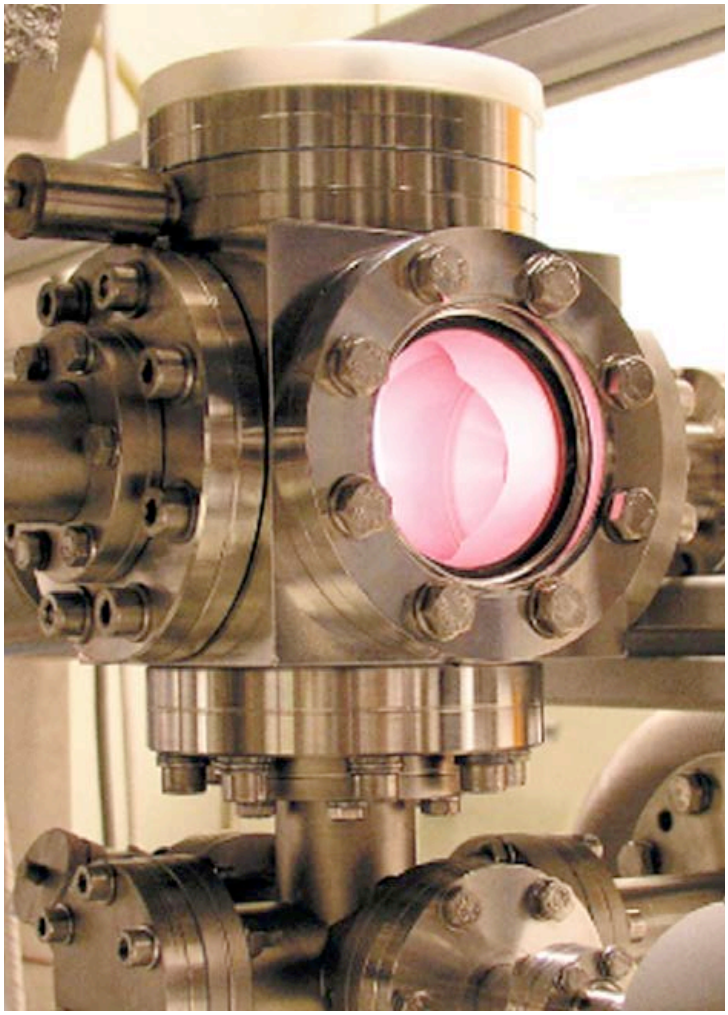
> When I came to the bottom I entered a tunnel, which I traversed for a distance of 2,000 meters. I then saw with my flashlight a door of stone. While I was watching the door, it suddenly opened and I saw a very tall man with a metallic uniform, who spoke with a powerful voice and said that this was the first time that anyone ever had the courage to enter this tunnel. I first was frightened at the powerful voice of the man and wanted to run, but he called me and told me not to be afraid, as he was a very peaceful person who never did harm to any living being. So I asked him who he was to live in this cavern.
>
> He said, "I am an Atlantean-Inca, the guardian of this door."
>
> He asked me what I was looking for. I told him I was looking for my race, because I too am an Inca. He seemed to be very pleased to hear this. I told him I would like to visit his city, and that I had an American friend, and a wife that would like to go there too, with my children...
>
> On this second visit to the Atlantean he delivered a lecture on radioactivity and its danger. He said that radioactive dust in the air is causing surface dwellers to age very rapidly because it accumulated in the pores of the skin and stops skin respiration. He said the pores of the skin have a constant alternate contraction and expansion and serve to take in air and expel foreign matter. In an atmosphere of radioactive dust metals, there substances clog up the pores and interfere with their vital functions of respiration and excretion. This causes disease and early death.

The Atlantean called me to come near a transparent screen to make an exchange of blood to make sure I will preserve the secret of the whereabouts of this tunnel, so that I do not reveal it to an unworthy person. When I was near the curved plastic screen, another curved plastic screen suddenly appeared from each side of the door and encompassed me, so that I found myself inside the two curved plastic screens. Then it seemed that all air was pumped out, leaving a vacuum in the space where I was between the plastic screens. Then other air entered, which seemed lighter and purer, which made me feel more healthful and stronger. Then the inside plastic door opened, and he put inside a man-sized capsule of this transparent substance which he held by handles on both sides of it, and told me to go inside the open door. After I was inside, the door automatically closed. Now the second plastic door opened and the Atlantean took hold of the handles on each side of the capsule and carried me to the other side of the inside plastic screen whose door automatically opened and shut...

He told me not to bring here any unworthy person, because he would know it in advance. I asked how. He said that with this apparatus, which he called an "electrovisor," he could behold whatever was occurring in any part of the world. If any unworthy person comes near the mountain and tries to get to the tunnel opening, certain rays confuse the person's mind, so that he is unable to continue the trip and will go off in a wrong direction.

I had some bread in a pocket. He told me not to eat the bread. He put a white pill in my hand (which was projected outside the capsule all the time), and told me this pill had the taste of many fruits. Then I withdrew my hand and the plastic material through which it projected closed. After he gave me the pill he carried the capsule with me inside to the space between the two plastic screens, as the door of the inside screen opened to admit the capsule and then automatically shut. Then the door of the capsule opened. I left the capsule, and then the door of the outside plastic screen opened and I left.

When newcomers enter, they first enter the capsule, and the Atlantean carries them to a Decontamination Chamber (the Atlantean told me). The door of the capsule opens, the person leaves the capsule, takes off his clothing, then the chamber becomes filled with vapor, which draws forth radioactive poisons from his body. The person dresses with other clothing there ready for him, then enters an "electrical apparatus," which carries him [towards] the center of the earth. I should mention that during my visits, before the door opened I heard a peculiar humming sound, which was of the apparatus with which the Atlantean came up from below, which became louder and louder as the apparatus came near, and when it came to a stop the noise stopped and the doors automatically opened.

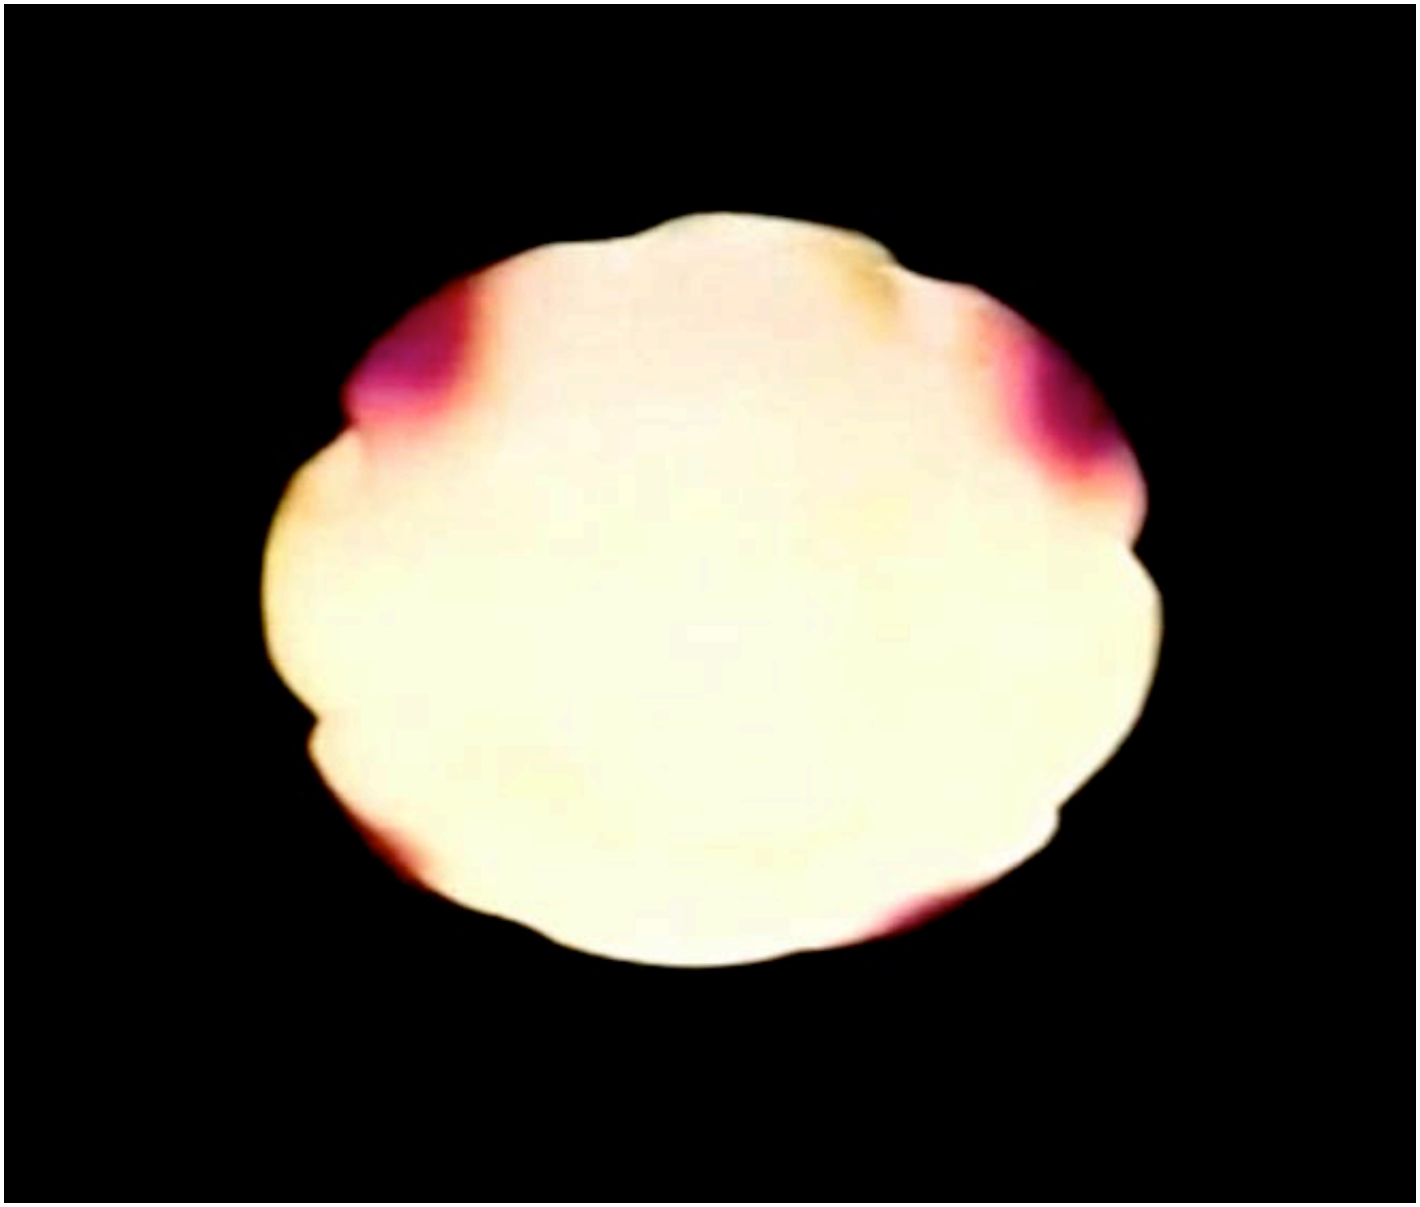


> I should also mention that when a flying saucer came near my house on Saturday, June 13, 1959, in the afternoon and night, it gave off an identical hum as this subterranean apparatus, which makes me think they are both operated by the same mechanism and that the flying saucer was an apparatus of those same subterranean Atlantean's and did not come from another planet. The flying saucer came describing a spiral which descended on top of a hill about 2000 meters from my house, and then rose in a spiral manner, with a tail of light behind it. It came in the night, had a round shape and a silver color. I believe it was sent by subterranean Atlantean's , who knew where I lived and came especially near my house.[11]

These details related by Bernard are all the more remarkable when one considers their timeframe, prior to 1960! The accounts of a peculiar loud humming that accompanied both the subterranean elevator and the vimana 'flying saucer' are now known to be ultra-low frequency soundwaves used for antigravitic control. The Atlantean's brief mention of technological remote viewing and rays that would confuse any visitor with negative intensions are also applications of ultra-low frequency waves being developed by today's scientists. Blood sampling for DNA study in the screening of visitors is also logical, as modern researchers have now been able to show a genetic predisposition to psychopathic behaviour.

Likewise, the lesson given by the Atlantean on radioactive dust metals in the atmosphere is confirmed by the ancient evidence of nuclear blasts in the archaeological record, as well as by modern indiscriminate use of depleted uranium (DU) weaponry. Modern medicine has also recently developed the process called electroporation that was described to Bernard prior to 1960 as a natural cellular function that has become blocked by atmospheric conditions. The detailed account of decontamination processes involving electroporation is extremely scientifically accurate, as informed by newly developed heat-resistant piezoelectric plastics such as PVDF (polyvinylidene fluoride) that form the vacuum chamber into which HHO gas is flooded before becoming an electrified plasma.

Further investigations of the unique properties of superfluid plasmas have been conducted by a group at the Massachussetts Institute of Technology led by Dr. Ketterle. The group's experiments have defined the parameters necessary for the creation of superfluid plasma beams. An infrared light ray is used as a pathway that is then surrounded by a strong encircling electromagnetic field. These conditions efficiently contain the plasma when released into the IR beam. They have found that a pair of rotating green lasers within the IR beam induces the frictionless rotation of the superfluid plasma, which subsequently forms an array of hexagonal vortices that maintain the crystalline structure of the ionized gas.



Ketterle's experimental results have apparently replicated the 'ultraviolet fog beams' related in the vast majority of extraterrestrial encounters. Physical transport via levitation in ultraviolet beams have been reported for decades, including riveting descriptions of the intense sensations of heat and light that accompany the events. The consistency of the contemporary eyewitness accounts of these advanced plasma technologies is astounding, and when analyzed in the context of the latest human technological developments one finds a profound synchronicity. Twenty-first century science has completed both the mathematical and experimental groundwork enabling a new comprehension of high-energy realms beyond common human experience.

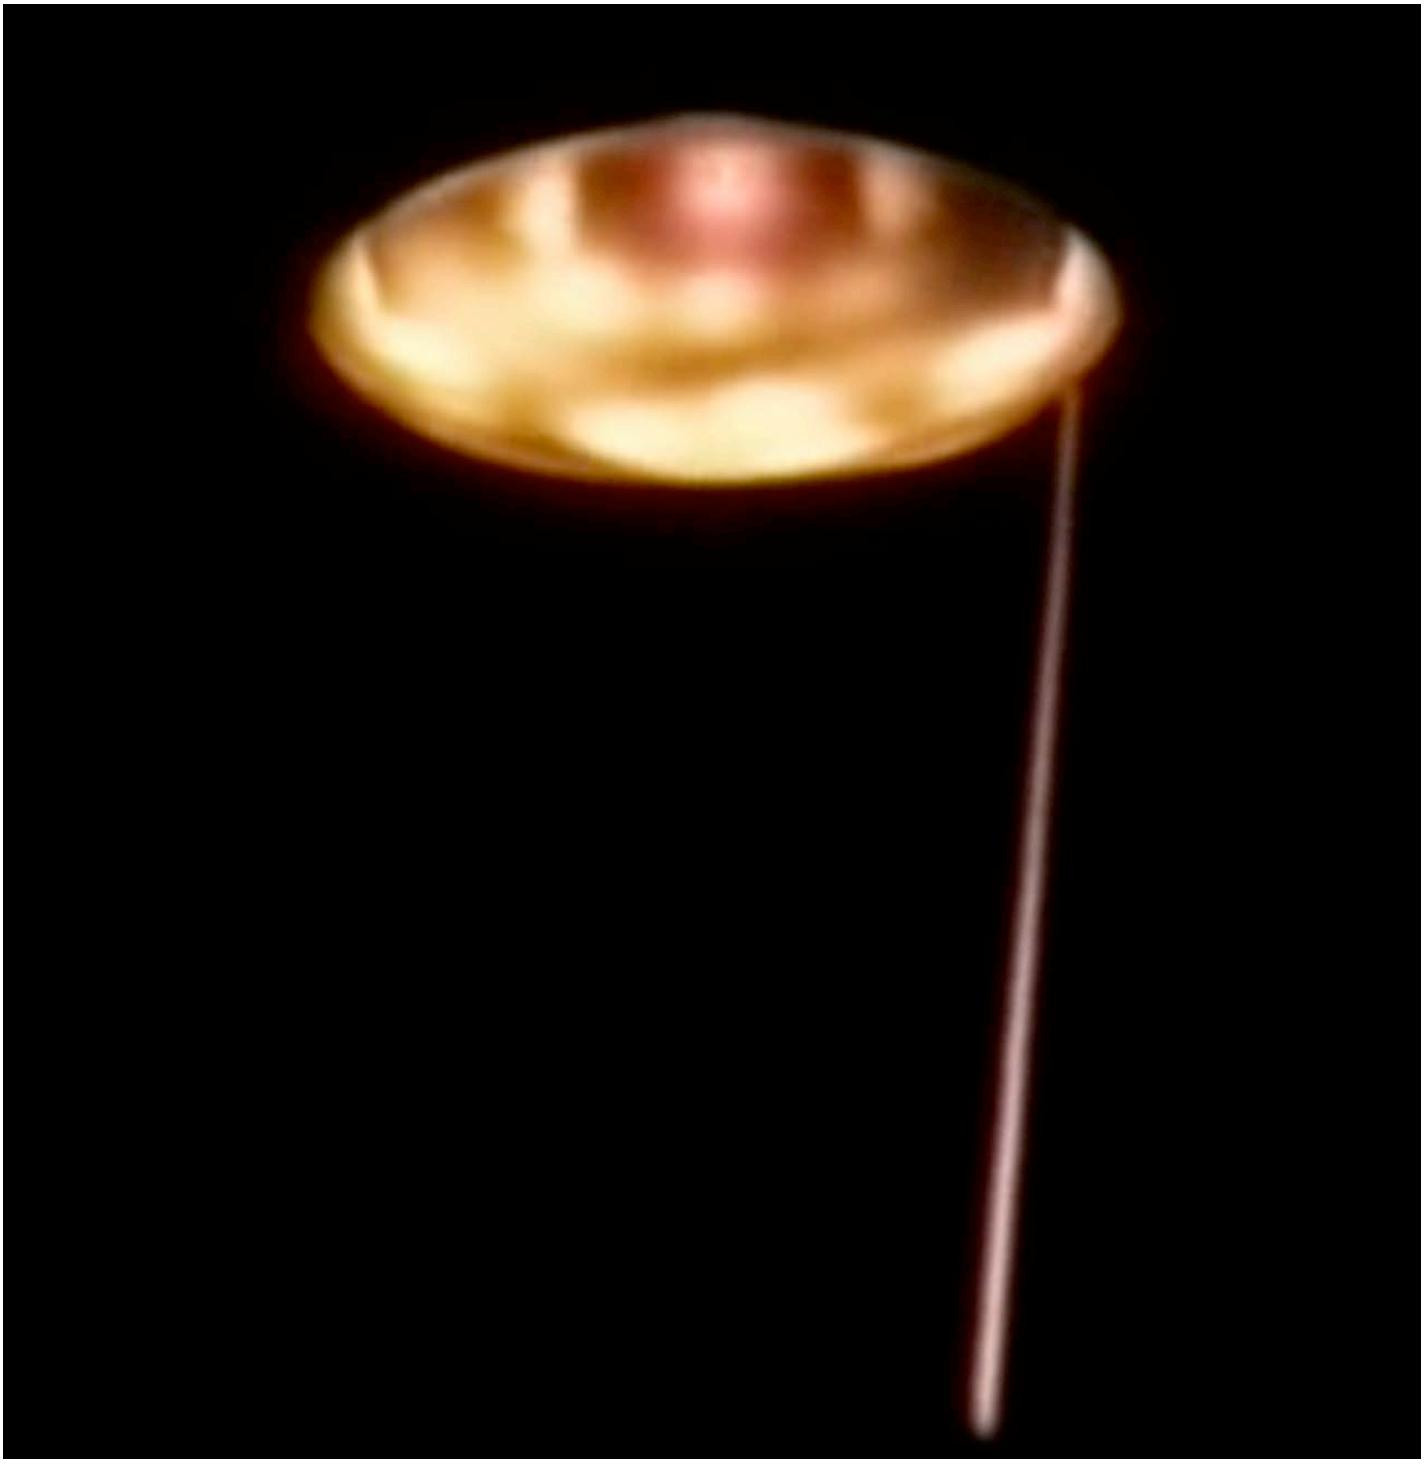
Plasma is the fourth state of matter, with the highest energy and lowest density, followed by gas, liquid and solid states. The ignition of fire is a commonly witnessed event where gas becomes ionized to form plasma. The realm of human beings is a gas-filled resonating atmosphere in which we experience a three-dimensional world. A four-dimensional extraterrestrial realm of resonant plasmas passes through and beyond the human reality, apparently inhabited by electroluminous paraphysical beings.

While still higher realms of aphysical consciousness - thought at large - must exist, all human contact with this realm necessarily occurs via thought, dream, intuition, meditation or channeling. The channeled Cassiopaea contacts of Laura Knight-Jadczyk provide a very broad frame of reference and apt terminology which we will apply here in our discussion of the relationship of the gas and plasma realms –as 'third-density' and 'fourth-density' environments. Matter brought into the high-energy plasma environment decreases in density thus allowing molecular interpenetration. Evidence of the hyperdimensional interpenetration of matter have been found in the debris of tornadoes. One such anomaly has been described more than once - a windowframe with a wood plank passing right through its unbroken pane of glass.

Superconducting plasma aerial vehicles achieve frictionless passage through air, water or stone as there is no displacement of matter, allowing velocities and maneuverablity impossible for objects in third-density. The wave motion of acoustic propagation that is created in a third-density atmosphere of air is not present in fourth-density plasmas, which lack the temperature differentials that bend sound into waveforms. The fourth-density environment creates a coherent energy transfer, inducing unified telepathic consciousness without any information loss as minds are electromagnetically coupled in group synchrony.

The biocompatability of HHO plasmas accurately described in Bernard's account is quite similar to later reports of extraterrestrial encounters from other parts of the world. Michael Hesemann's breathtaking documentary film 'Ships of Light: The Carlos Diaz UFO Experience' presents overwhelming video and photographic evidence of fourth-density technology. Diaz vividly describes the initial sensation of heart throbbing at 1.45 Hz entrainment that precedes his extraterrestrial contacts. This powerful infrasound effect can now be understood as part of the propulsion system of the fourth-density craft, suggesting its invisible presence is maintained nearby before Carlos becomes aware of it. The craft then makes a luminous and visually dramatic appearance only when he has mentally prepared himself for the contact:

Q: In what form do the contacts happen?



There is a very special sensation concentrated in the solar plexus of my body – a sensation like when one is strongly in love. This sensation sometimes wakes me up at night, and I know that I am going to have an encounter with them. What I enjoy about the experiences I have had is that the communication I have with them is just as we are having at this moment.

Q: So it's an absolutely physical contact? You can touch them?

Yes, I can touch them... and at times they present a body of light...

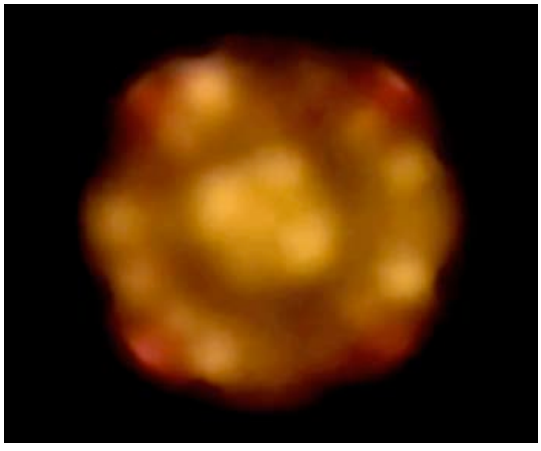
Sometimes these ships appear at a great altitude, coming down slowly to hover eventually over the ground at an altitude of one and a half feet. When it is still at a high altitude the movements of the ship are very unstable, but when it hovers over the ground it is completely static. But it also happens that the ship suddenly appears right on the spot. For me, it is a kind of magic. They come directly out of the light slowly, part for part. Their body emerges out of the wall of light...

Their craft use the natural energy belts of the planet. Sometimes they enter into the belts, letting themselves flow with the energy. If they want to maintain one position they must act against the flow of the energy belts, causing the erratic movements of the craft. Once they are in the natural energy flow they travel at high speeds...

At different opportunities during my encounters I experienced how a beam of light shot out of the craft. This beam of light has the purpose to bring insects, plants, pollen, small and bigger animals aboard the ship, and sometimes we too, my friend and I, were brought aboard by such a ray. This beam directly forms and emerges from the ship, and consists of the same light or energy of the ship itself.

The first time he invited me consciously to go into a ship, I saw my friend getting in first. He went through this fog-like light. When more than half of his body was inside of the light his body got sucked into the object. So, what I did first is that I put one hand into the light to feel, and to my surprise it went through the light and inside I felt a nice temperature. When I took my hand out I was relieved to see it was in one piece, so that gave me the confidence to walk in, and when I had my body halfway inside the object I was sucked into it too. But once you are into it there is nothing you can see. You just see yellow light all over. You don't feel your toes. You don't feel the floor, but the sensation is very peculiar, because you feel very peaceful, with a lot of love within you.

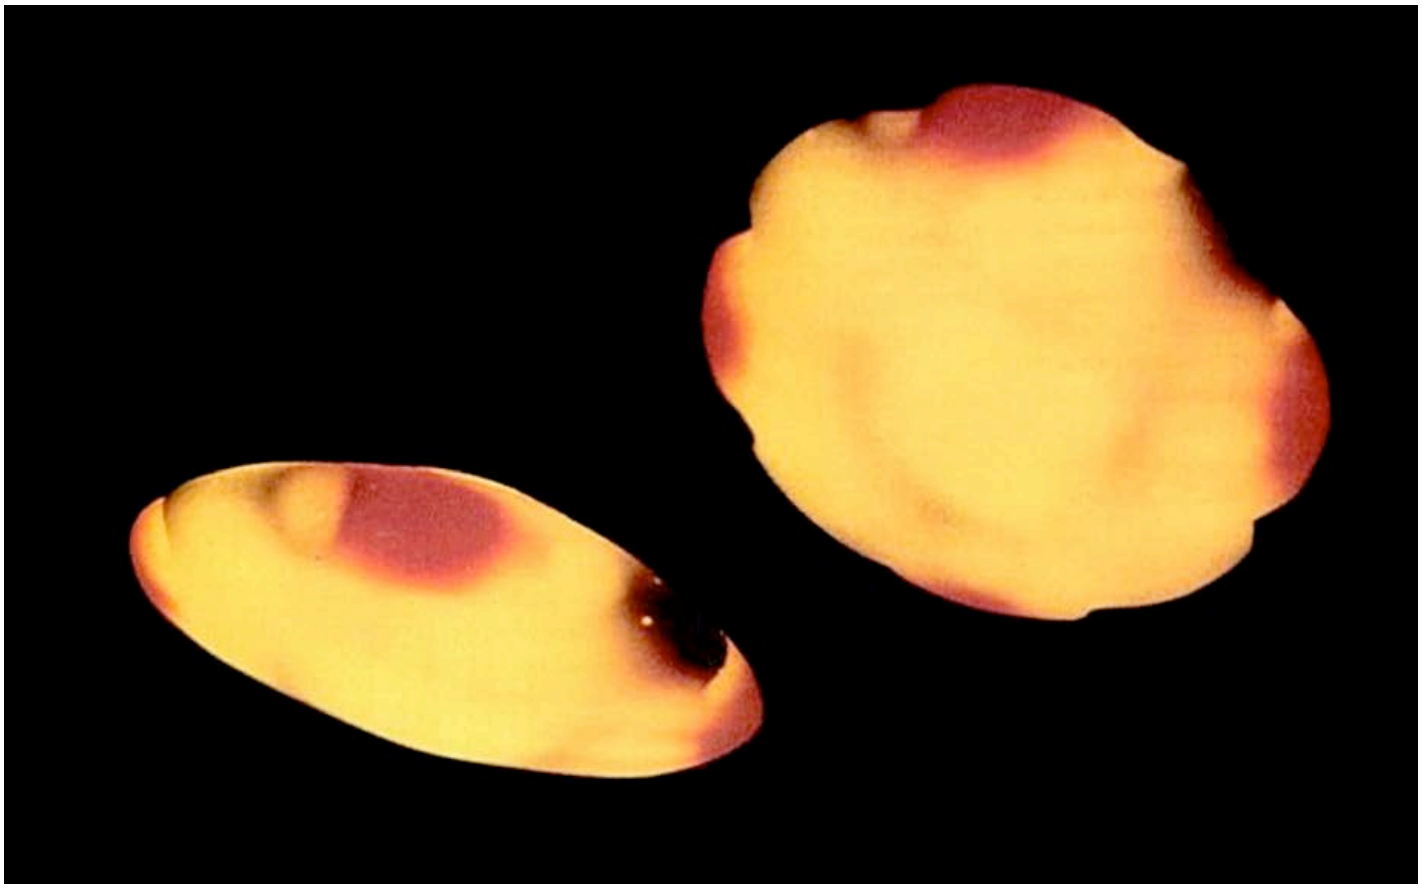
Once when I came out of the yellow light I realized I was not at the same place, but in a cave. It had stalactites and stalagmites, and between them I saw several sculptures and ornaments which were of the art of the Maya culture. This big cave was the place where the ship hovered and there was a kind of path we walked through and we came to another cave, and I saw there many people who were very kind to me and greeted me... But the particular thing about this cave was that there were seven egg-like spheres of yellow light. After we got to this place my friend stuck his hand into one of the eggs and took out a small ball of light, also yellow, and said that this little ball could project a ray that would touch my seventh vertebrae or at the middle of the spine and it would take all of the information in my neurons.



Once I was there in this place he invited me to go into one of those spheres or eggs of light. When I did so, I realized that all the yellow color changed, and it was not yellow anymore, but was a scene of a forest from the air. It was like as if I was flying. And then I saw on each of my sides a wing – the wing of an eagle, and I realized what I was looking at was the information from an eagle, his memories, that they had stored into this egg of light.

Once... my good friend Jaime Maussan asked me to ask them where they come from. So when I was with one of them the next time, we were walking near Mextitla, I asked him ‘Where are you from?’, and he smiled and said, ‘Look Carlos, I can give you the name of any star, any constellation, any galaxy, but what would this tell you? As far as you have gotten is your moon, so it makes no sense if I tell you where we come from since you can’t go there and verify. For me, this answer was enough even though when I was with them I once heard them to mention a star named Maya, and when I looked into an astronomy book that there is in the constellation of the Pleiades a star named Maya. Maybe this is where they come from but I really don’t know...

After entering these spheres or eggs of light, I understood that they store a great wealth of information in them, not just about human beings, but about all forms, all manifestations of life. They don't only store images, they also store senses. When you are there you feel like an eagle, like a bird – I felt joy, I felt fear – and I have seen many types of environments; the sea, the ice, jungles. What I have learned from this is that every living thing is important for this wonderful planet.



They also offered to show me what they stored about the past of my own life but I didn't want to know, because what I want to do is go forward, and to try to act with all the things I have learned to live this experience. I had experienced that there is a wonderful interaction between all living things, but this interaction went out of control. Every individual, every species is an important part of this interaction. This is the reason why I want to share all of this with the whole world – to invite the people to act in order to save the Earth – to make it a true paradise for all living creatures, and to inherit our future generations a living planet.[12]

Profound experiences shared with Carlos through advanced transdimensional consciousness technologies have inspired a deepening understanding of the interdependence and unity of all life in the cosmos, and the urgency of the need to preserve the living systems of our mother Earth. The organic, jellyfish-like appearance of the plasma ships photographed by Diaz reflects a natural beauty by imitating the rhythmic bioluminescence of bacterial colonies symbiotically living within deep ocean creatures, which become stimulated to generate the brightly pulsating spotted displays of squid (above). Carlos Diaz's astonishing video footage of plasma beam technology has confounded the experts, including digital video and photo analyst Jim Dilettoso of Village Labs in Tempe, Arizona:

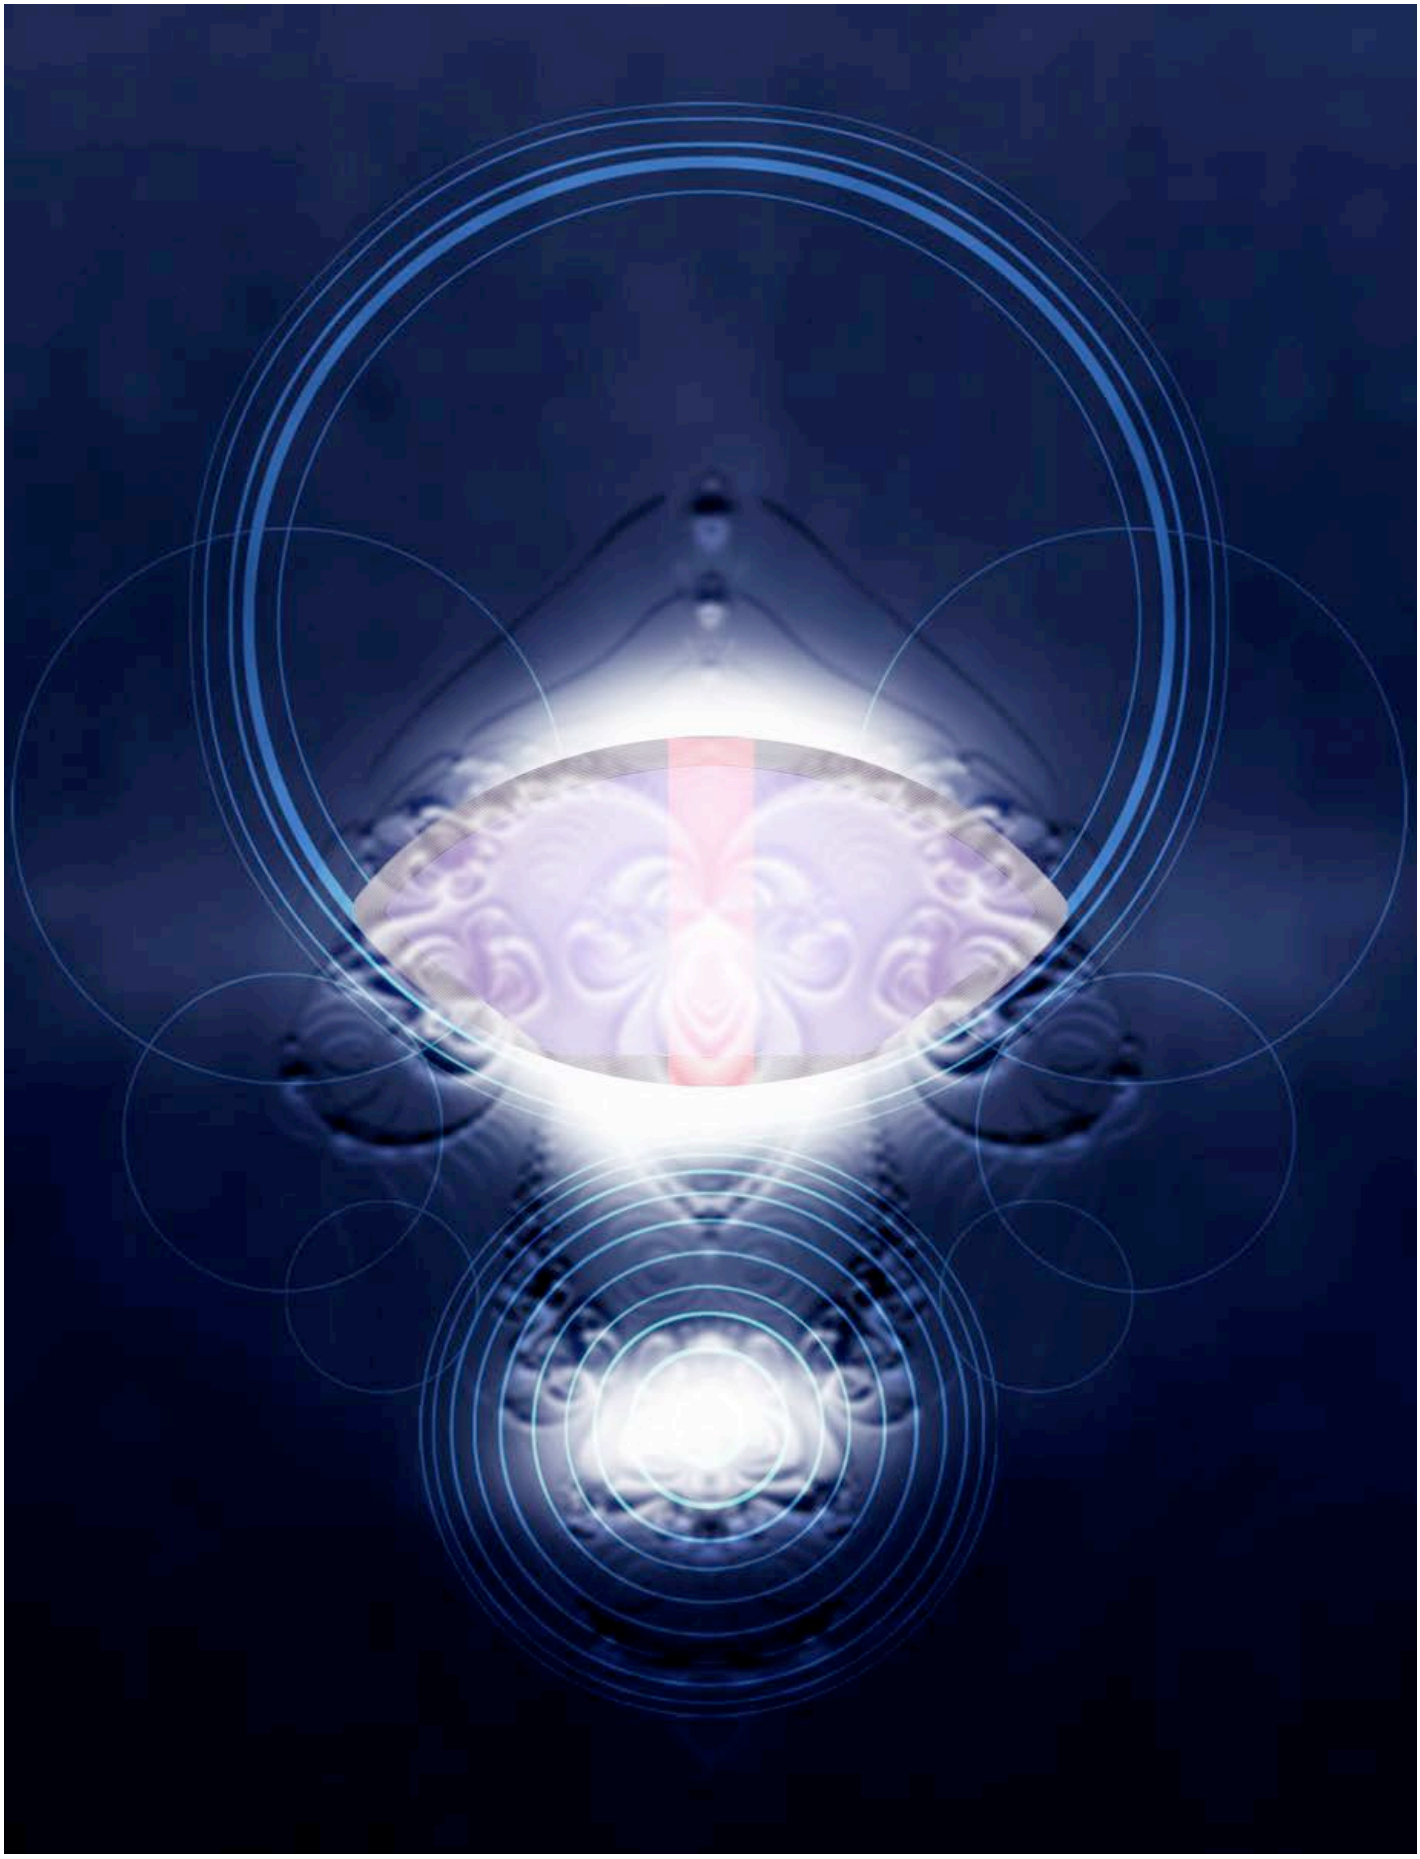
> The ray of light that comes down, when we look at it frame by frame, the light of the ray... [is] darker the top than it is at the bottom... and it goes off the same way. At each incident when the light goes on... the variance is between one frame, a thirtieth if a second. Well if [the ray] was [propagated] at the speed of light, we wouldn't even see it in a frame. It would be off and then on... which is curious. So, I'm still trying to understand it.

The false assumption that the ray is a simple beam of light has caused great confusion, as the intensity of the beam increases from top to bottom over the period of three video frames or one tenth of a second. The same three-frame shift in intensity from top to bottom is also noted when the beam recedes. The constant of the speed of light denies the possibility of a single source of emanation, suggesting that the beam is an emission of plasma. This notion is corroborated by the recent experimental results of Ketterle's MIT group, from which we can infer that the beam is initiated as a faint ray of infrared light subsequently flooded by HHO plasma in one tenth of a second. Knowledge of the properties of plasma beams and the effect of acoustic levitation by use of standing waves informs the authenticity of the images, as for Dr. August Meessen, Professor of physics at the Catholic University of Louvain, Belgium:

> As far as I see there are no objections against [the Diaz documentary photographs and videos], because if it is true it is very interesting for me as a confirmation of the theory where one expected results of this type... I developed a theory for the propulsion of classical objects... [which are] axis-symmetric objects... How do they produce electromagnetic waves which surround the object? ...One of the predictions of the [Unified Field] theory... [is] that they should be able to create *standing waves with certain modes where at certain regularly distributed places you have a higher intensity, thus you could eventually ionize differently.* If the theory is correct you could expect that somewhere observations like [those of Carlos Diaz] should appear.

Dr. Meessen accurately identifies the aerial activity over Tepotzlan, Mexico as involving ionizing spacecraft that restore energy by absorption of terrestrial infrasound standing waves that converge on the area, as described to Carlos as 'energy belts' by the extraterrestrials in contact with Carlos Diaz. Meessen has arrived at the same conclusions concerning standing waves as had Nikola Tesla, the original discoverer of the fascinating acoustic phenomenon, and have been applied by this author as spherical infrasound resonance maps of the Earth, flowering from the Giza Prime Meridian:

> The discovery of the stationary terrestrial waves... [indicates] that, despite its vast extent, the entire planet can be thrown into resonant vibration like a little tuning fork; that electrical oscillations suited to its physical properties and dimensions pass through it unimpeded, in strict obedience to a simple mathematical law...[13]
>
> [T]he Earth responds to a great number of vibrations and can be resonantly excited just like a wire of limited dimensions. When this takes place there are formed on its surface *stationary parallel circles of equal electrical activity*, which can be revealed by properly attuned [infrasound] instruments… Then *the crests and hollows of the stationary waves would be in parallel [or concentric] circles [enveloping the entire planet]*…[14]

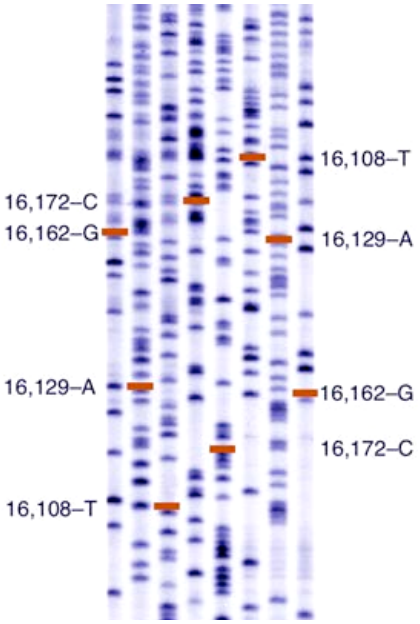


Tesla's most profound discoveries in those last several months of the 19th century would go unpublished for almost 80 years, yet find direct relevance to the advancements of resonant technologies of the 21st century and beyond. The concise explanations of Nikola Tesla provide insight into the technological aspect of fourth-density experiences reported by extraterrestrial contactees and abductees alike. The enveloping brilliance of violet, yellow or golden light –combined with an intense sensation of the warmth of Eternal Love– are among the transdimensional experiences that leave many at a loss for words.

Many unmistakable aspects of advanced bioelectrical bodily purification processes using HHO plasma have been well documented. Closely echoing Bernard's 1960 report, Diaz also underwent plasma decontamination and was given fruit concentrate pills to ingest instead of the normal third-density metabolism based on the digestion of organic material.

The impeccable and extensive video and photographic evidence presented by Diaz documents the fourth-density conditions of intense light and heat of HHO plasma within the beam transport and in the plasma ship itself (opposite). This remarkable enhancement of the luminosity of the atmospheric conditions reflects the atmospheric environment present on the homeworlds of those space-travelers, affecting DNA enhancements not present in the terrestrial human populations of Earth. DNA evidence of this kind was actually obtained by Australian Peter Khoury, who has collected and preserved a single translucent hair from one of his several disturbing extraterrestrial encounters investigated by Bill Chalker:

> It was not until 1996 that I heard from Peter Khoury about the hair sample that had been recovered from what may have been an alien abduction sexual assault case… By 1998, I began an investigation into the hair sample, when biochemical colleagues agreed to undertake what was the world's first PCR (polymerase chain reaction) DNA profiling of biological material implicated in an alien abduction experience. The analysis confirmed the hair came from someone who was biologically close to normal human genetics, but of an unusual racial type - a rare Chinese Mongoloid type - one of the rarest human lineages known, that lies further from the human mainstream than any other except for African pygmies and aboriginals.



There was the strange anomaly of it being blonde to clear instead of black, as would be expected from the Asian type mitochondrial DNA. The study concluded, "The most probable donor of the hair must therefore be as (Khoury) claims: a tall blonde female who does not need much color in her hair or skin, as a form of protection against the sun, perhaps because she does not require it [in a luminous fourth-density environment]..."

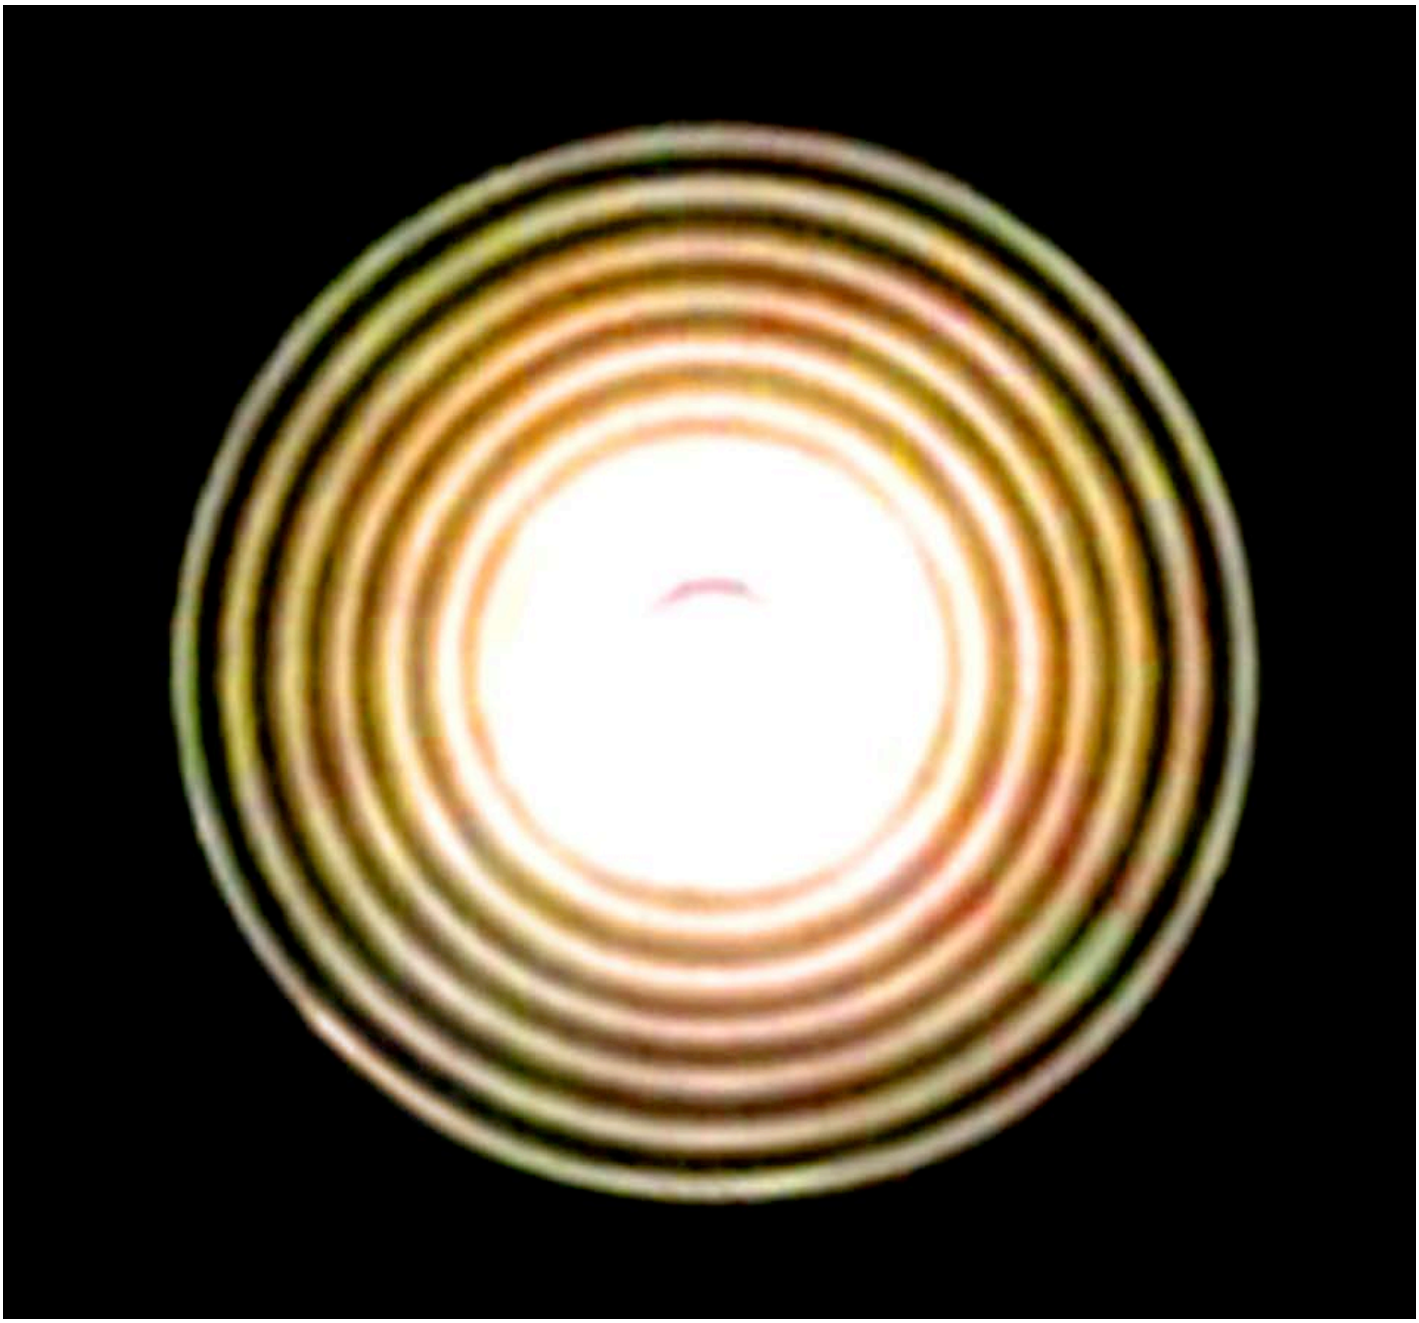
The original DNA work was done on the shaft of the hair. Fascinating further anomalies were found in the root of the hair. Two types of DNA were found depending on where the mitochondrial DNA testing occurs, namely confirming the rare Chinese type DNA in the hair shaft and indicating a rare possible Basque/Gaelic type DNA in the root section... [The female's appearance is illustrated below, based on Khoury's detailed descriptions.]

This was very puzzling and controversial, until a 'Nature Biotechnology' paper appeared in 2000. It revealed recent findings on hair transplanting with previously incompatible hair, using advanced cloning techniques, developed in a possible cure for baldness. We seem to be seeing similar combined or "grafted" DNA in the sample recovered under controversial circumstances by Peter Khoury back in 1992.

Perhaps even more controversial is that we have findings suggestive of nuclear DNA indicating possible viral resistance. The hair sample seems to show it contains 2 deleted genes for CCR5 protein and no intact gene for normal undeleted CCR5 - this CCR5 deletion factor has been implicated in AIDs resistance. To keep a very complex story somewhat uncomplicated, what seems to be suggested by the range of findings is possible evidence for advanced DNA techniques and DNA anomalies and findings, for which we are only now discovering or starting to make sense of in mainstream biotechnology.

While the unusual experiences of Bernard and Diaz were of a very positive nature, the sexual assault case of Khoury is by contrast quite negative. Yet in all of these cases the powerful emotive interaction between the extraterrestrials and the contactees is obvious, as one might expect of primarily telepathic beings. Diaz provides extensive video and photographic evidence that support his experiences, while Oliveira and Khoury have collected the most convincing physical evidence of HHO plasmas and an extraterrestrial DNA sample.

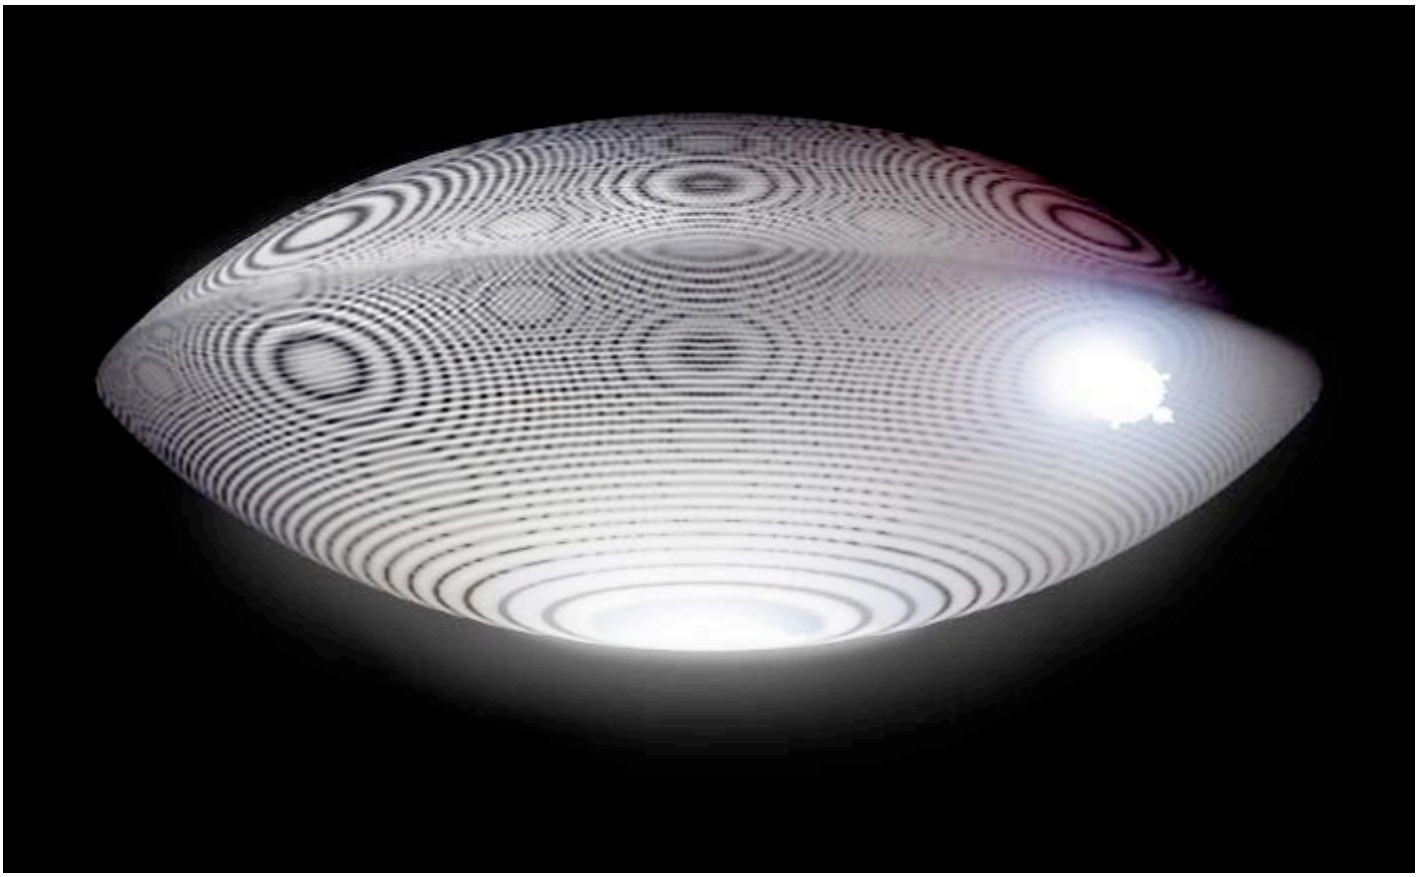
When compared and contrasted, their corroborated accounts and evidence of hyperdimensional transport compellingly point to a single, remarkable conclusion: that technologically advanced Sanskrit cultures of the deep human past have not perished, but have in fact transcended our toxic third-density realm to achieve vastly extended lifespans in fourth-density plasma environments developed in subterranean chambers and flying vimana discs. The stark synchronicity of evidence from these extraterrestrial contacts with the emerging human technologies of acoustic levitation, HHO plasma, electroluminescent metals and piezoelectric plastics informs a broadened perspective. By synthesizing these scientifically described and extraterrestrially demonstrated technologies, humanity is at the threshold of a hyperdimensional transition to the unified consciousness of the fourth-density realm.



Advanced HHO plasma technology will soon significantly expand the consciousness and extend the lifespan of human beings living on Earth's surface, thus closing the circle of time to reunite with our advanced ancient ancestors concurrently dwelling in fourth-density. The ascension of human consciousness by self-sacrifice in HHO plasma chambers within the sacred pyramids endows telepathic communication and direct thought contact with fourth-density spacecraft in Earth's atmosphere. Fleets of plasma ships have been videotaped at high-altitudes over the vicinity of Mexico City in various large formations, including *long chains of ships that appear like floating helical DNA strands* (below).

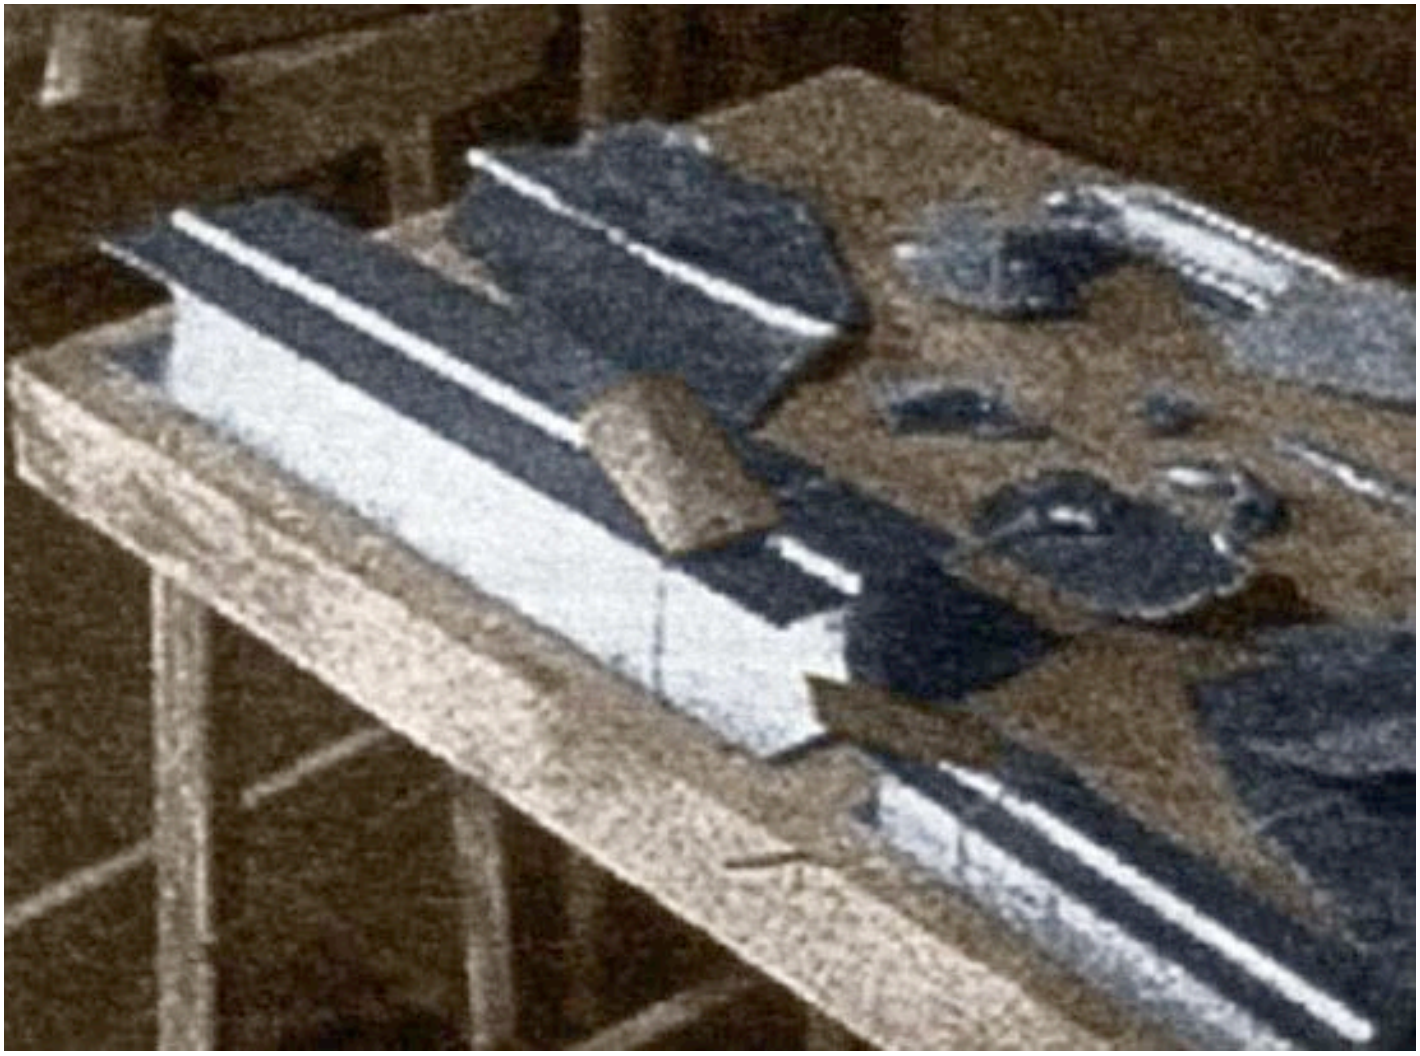
Such odd and spectacular plasma ship formations are orchestrated to reawaken human curiosity and announce the presence of higher dimensional realities, while most fourth-density spacecraft pass through Earth's atmosphere without being perceived by terrestrial humans. Highly developed subterranean bases and cities have been in use for millennia by extraterrestrial colonies living deep below the Earth's surface:

> Two scientists affiliated to the Fundación Instituto Biofísico de Investigaciones (FICI) headquartered in La Matanza… claimed having picked up radioactive signatures, microwaves, levels of electricity and oscillations originating from the depths of the earth.
>
> Omar Hesse and Jorge Millstein surveyed the mountains surrounding Cachi last week -- 157 km from the capital and 2,280 meters above sea level. After applying a Russian tester in the vicinity of the Nevado de Cachi, they concluded that the signals are not natural in origin, and rather originate by machinery operated by intelligent beings… "The oscillations clearly indicate that kilometers beneath the surface there is activity: alternating electrical waves, which means a power source," said Hesse. "This could mean engines," he added.[15]



The constantly maintained acoustic signals of deep subterranean cities present convincing evidence that such highly advanced facilities are powered by infrasound standing wave resonance, in alignment with the pyramids on the Earth's surface above. The fourth-density experiences of Carlos Diaz involved visits to augmented natural caverns below the Tepotzlan, Mexico area (not far from the Nevado de Cachi site) that contained ancient statuary like that of the Maya tradition, as well as seven yellow luminous plasma eggs composed of the same HHO plasma that also surrounds the spacecraft as a radiant red aura.

Transit to and from these deep underground cities is achieved by transdimensional passage directly through the bedrock by retuning the atomic frequency of the entire ship, its interior HHO plasma atmosphere and crew to safely interpenetrate the material realm. The transdimensional ships' generate thin veils of HHO plasma surrounding the vessel that can instantaneously shift the frequency of all emitted light into the infrared range for invisibility cloaking, or be tuned to generate visible light of any desired frequency. Security camera video from Turkey in 2006 obtained detailed close-up images of the underside of a large lens-shaped plasma craft, revealing 7 luminous concentric rings surrounding one central HHO plasma beam emitter (above).

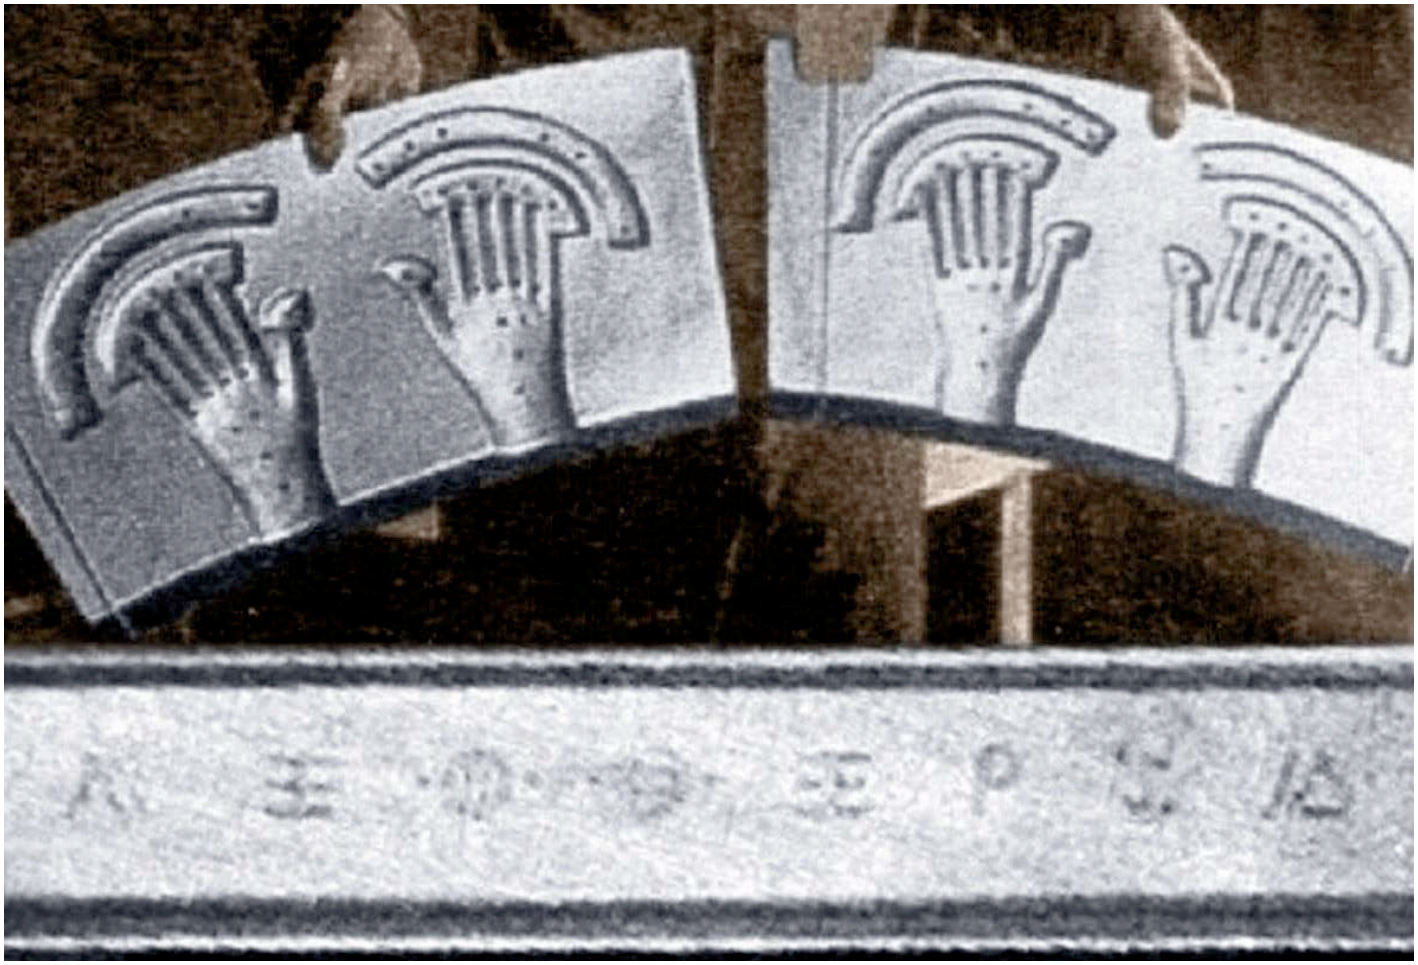


This same configuration of 7 luminescent concentric circles reflects the nonlinear quadratic formula [$z_{n+1} = z_n^2$], as precisely encoded in a complex set of ancient Sanskrit stone artifacts from La Maná, Ecuador (pg. 197). The Sanskrit artifacts from La Maná fluoresce under ultraviolet light, as absorbed UV radiation is converted into reemitted light of visible wavelengths – a process that is also generated within the electroluminescent crystalline metals of transdimensional plasma spacecraft.

Complex metal alloys synthesized for acoustic levitation using cosmic infrasound standing waves convert the strong electromagnetic fields of the ships' internal HHO plasma chambers into reemitted visible light from the external surfaces, tuned as desired for various aerial displays or using infrared radiations outside of the visible spectrum of the vast majority of terrestrial humans beings. The enigmatic experiences reported by hundreds of thousands of eyewitnesses of extraterrestrial spacecraft transiting Earth's skies are now explicable in scientific terms, as nonlinear effects of quantum resonance.

Primary identification of the optimal material properties for antigravity alloys have been experimentally tested and reported by more than one group. The axis-symmetric shape of the object to be levitated, as well as its resonant crystalline material composition, endows antigravitic properties that act to transduce incident radiation into resonant standing waves encircling the object. Fran De Aquino, physicist at Maranhao State University in S. Luis, Brazil, has mathematically modeled antigravitic effects observed in the extra-low frequency acoustic levitation of electroluminescent objects:

> According to the weak form of Einstein's general relativity equivalence principle, the gravitational and inertial masses are equivalent... [To the contrary,] we have shown that the gravitational mass and the inertial mass are correlated by an adimensional factor, which depends on the incident radiation upon the particle. It was shown that only in the absence of electromagnetic radiation this factor becomes equal to 1 and that... it can be reduced, nullified or made negative by means of extra-low frequency (ELF) radiation.
>
> We have studied the possibility to control the gravity on luminescent materials and have concluded that electroluminescent materials with high refractive indices are a new and efficient solution for gravity control technology.[16]



The refraction of acoustic energy within the parallel faces of the alloy's crystalline lattice allows resonant energy storing as standing waves form within the electrified metals, thereby generating coherent light from its highly reflective surfaces and reducing its mass to become totally weightless. During investigation of photographic evidence produced in the Carlos Diaz case, analyst Jim Dilettoso identified the unusual properties of light emitted by electroluminous alloys as *"coherent light – like a laser"*.[17]

Various metal alloys manufactured for diamagnetic antigravity propulsion systems (having two opposing rotating magnetic fields) produce the effects of electroluminescence from highly reflective surfaces, as well as photo-absorption from completely black surfaces. By applying ancient metallurgical knowledge preserved in Vedic hymns, Dr. C.S.R. Prabhu has reproduced metal alloys with formulations that are completely unknown to modern science, such as one referred to in Sanskrit as Tamogarbha Loha:

> Tamogarbha Loha: Already produced in the laboratory, light in weight, black in color, found to be resistant to acids. Displayed high level of absorption for laser light... used in 'Tamo Yantra'… for the purposes of absorption of light escaping from a photochemical reaction... generating 'darkness'...[18]

The Atlantean Sanskrit origin of vimana spacecraft *seen throughout Earth's skies today* is revealed by crashed aerial discs collected by military forces in many parts of the world. The most famous incident of this kind occurred on July 2, 1947 –allegedly near Roswell, New Mexico. Leaked US military documentary photographs and films of the New Mexico disc crash wreckage[19] include dwarf humanoid corpses with *large eyes, grey skin and six fingers*, as well as fragments of highly reflective metal alloys imprinted with small six-fingered hand consoles and hieroglyphic Archaic Sanskrit inscriptions. Dr. Schildmann's epigraphic decipherment reveals the meaning of a fragmentary text from an I-beam:

kar-as tridaśa yoni śani tridaśa ku-p$^{a}{}_{i}{}^{a}$ as-upama

"workings of 30 resonances, female and male, 30 resonances whereby approaching the highest"

The New Mexico I-beam text directly confirms the Sanskrit origin of the pyramids and 'UFO' phenomena. Four very unusual removable metal panels were also documented among the pieces of Roswell crash wreckage, formed with what appear to be inset hand consoles for conjoined control of the plasma ship. One of the panels was damaged. Like portable biocomputers for each crewmember of the ship, each panel is individually tuned to the biorhythmic signature of each pilot, precluding use by others.

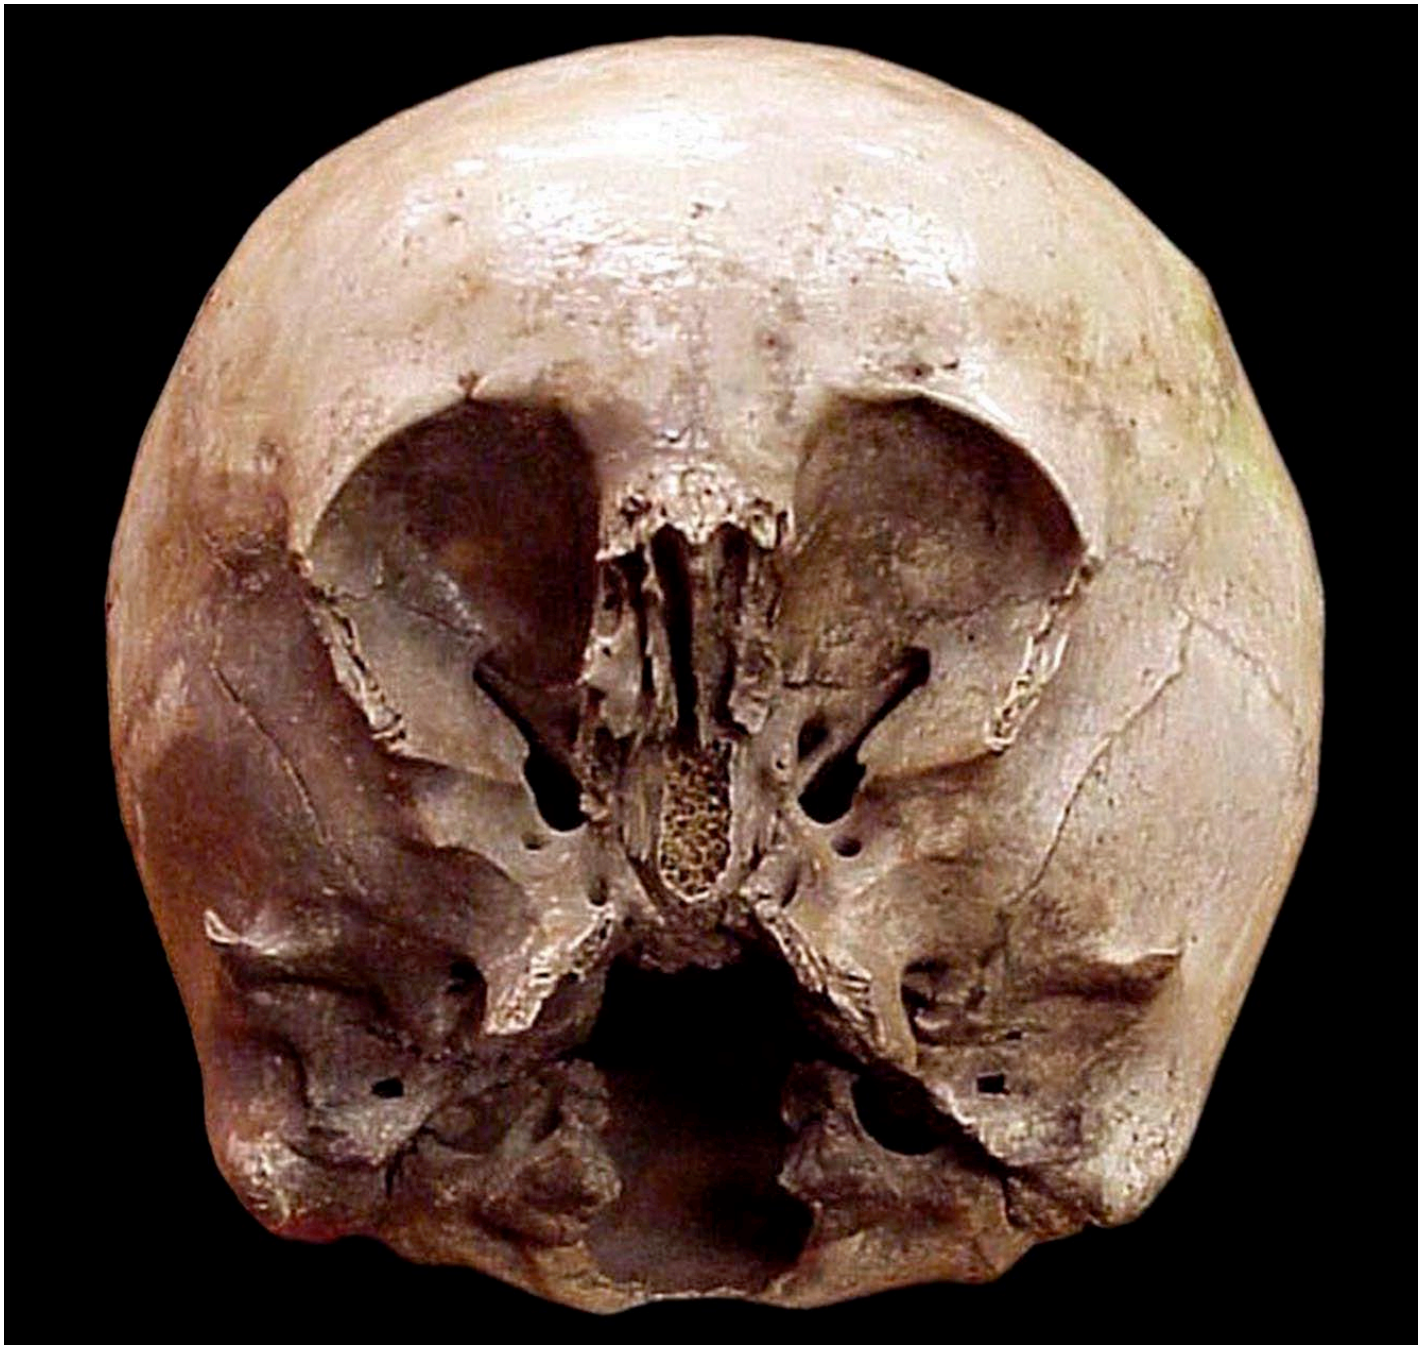
The panels' cast metal forms accommodate two small, six-fingered hands, with nodal sensors distributed at geometric points on the contact consoles and along a radial groove extending just beyond the span of the fingers. The configuration of the consoles exactly match the anatomy of the Roswell autopsy documentary video leaked anonymously to Ray Santilli and published in May of 1995, corroborating their close association and authenticity. While abductees call these beings 'the grays', they have been identified as bioengineered androids of a dwarf race from the planet known as Zeta Reticuli, of the Reticulum star system, during informative contacts with a Swiss farmer named Eduard Meier on November 3, 1975, and further clarified in tantalizing detail over 11 years later, on February 28, 1987:

> Their size varies between 126 and 163 centimeters… They originate in the planet and star system Zeta Reticuli,… a median distance of 37 light years away from the Earth. Their spaceships are similar to our beamships, and extremely well equipped, and are very able for space-traveling. The atmosphere of their homeworld is very similar to the Earth atmosphere, thus they can breathe here without great difficulty. They wear close-fitted filter-dress, which offers protection for them in some ways.[20]

The Roswell Case is a reality because the UFO crash actually took place there, but this is denied up to the present day and will continue to be denied in the distant future by the American military and Secret Services, as well as by all government agencies, namely with flimsy, changing, stupid, and ridiculous excuses that will only surely testify to the fact that everything actually happened. With the crashed object, it concerned a beamship from the Reticulum systems. The crew did not consist of natural human life forms but of human androids of a bioorganic nature, which means that they were artificial human androids, which the US-Army also got a hold of, some living and some dead, and these were secretly kept in secret stations [for autopsy, above, opposite[21]].

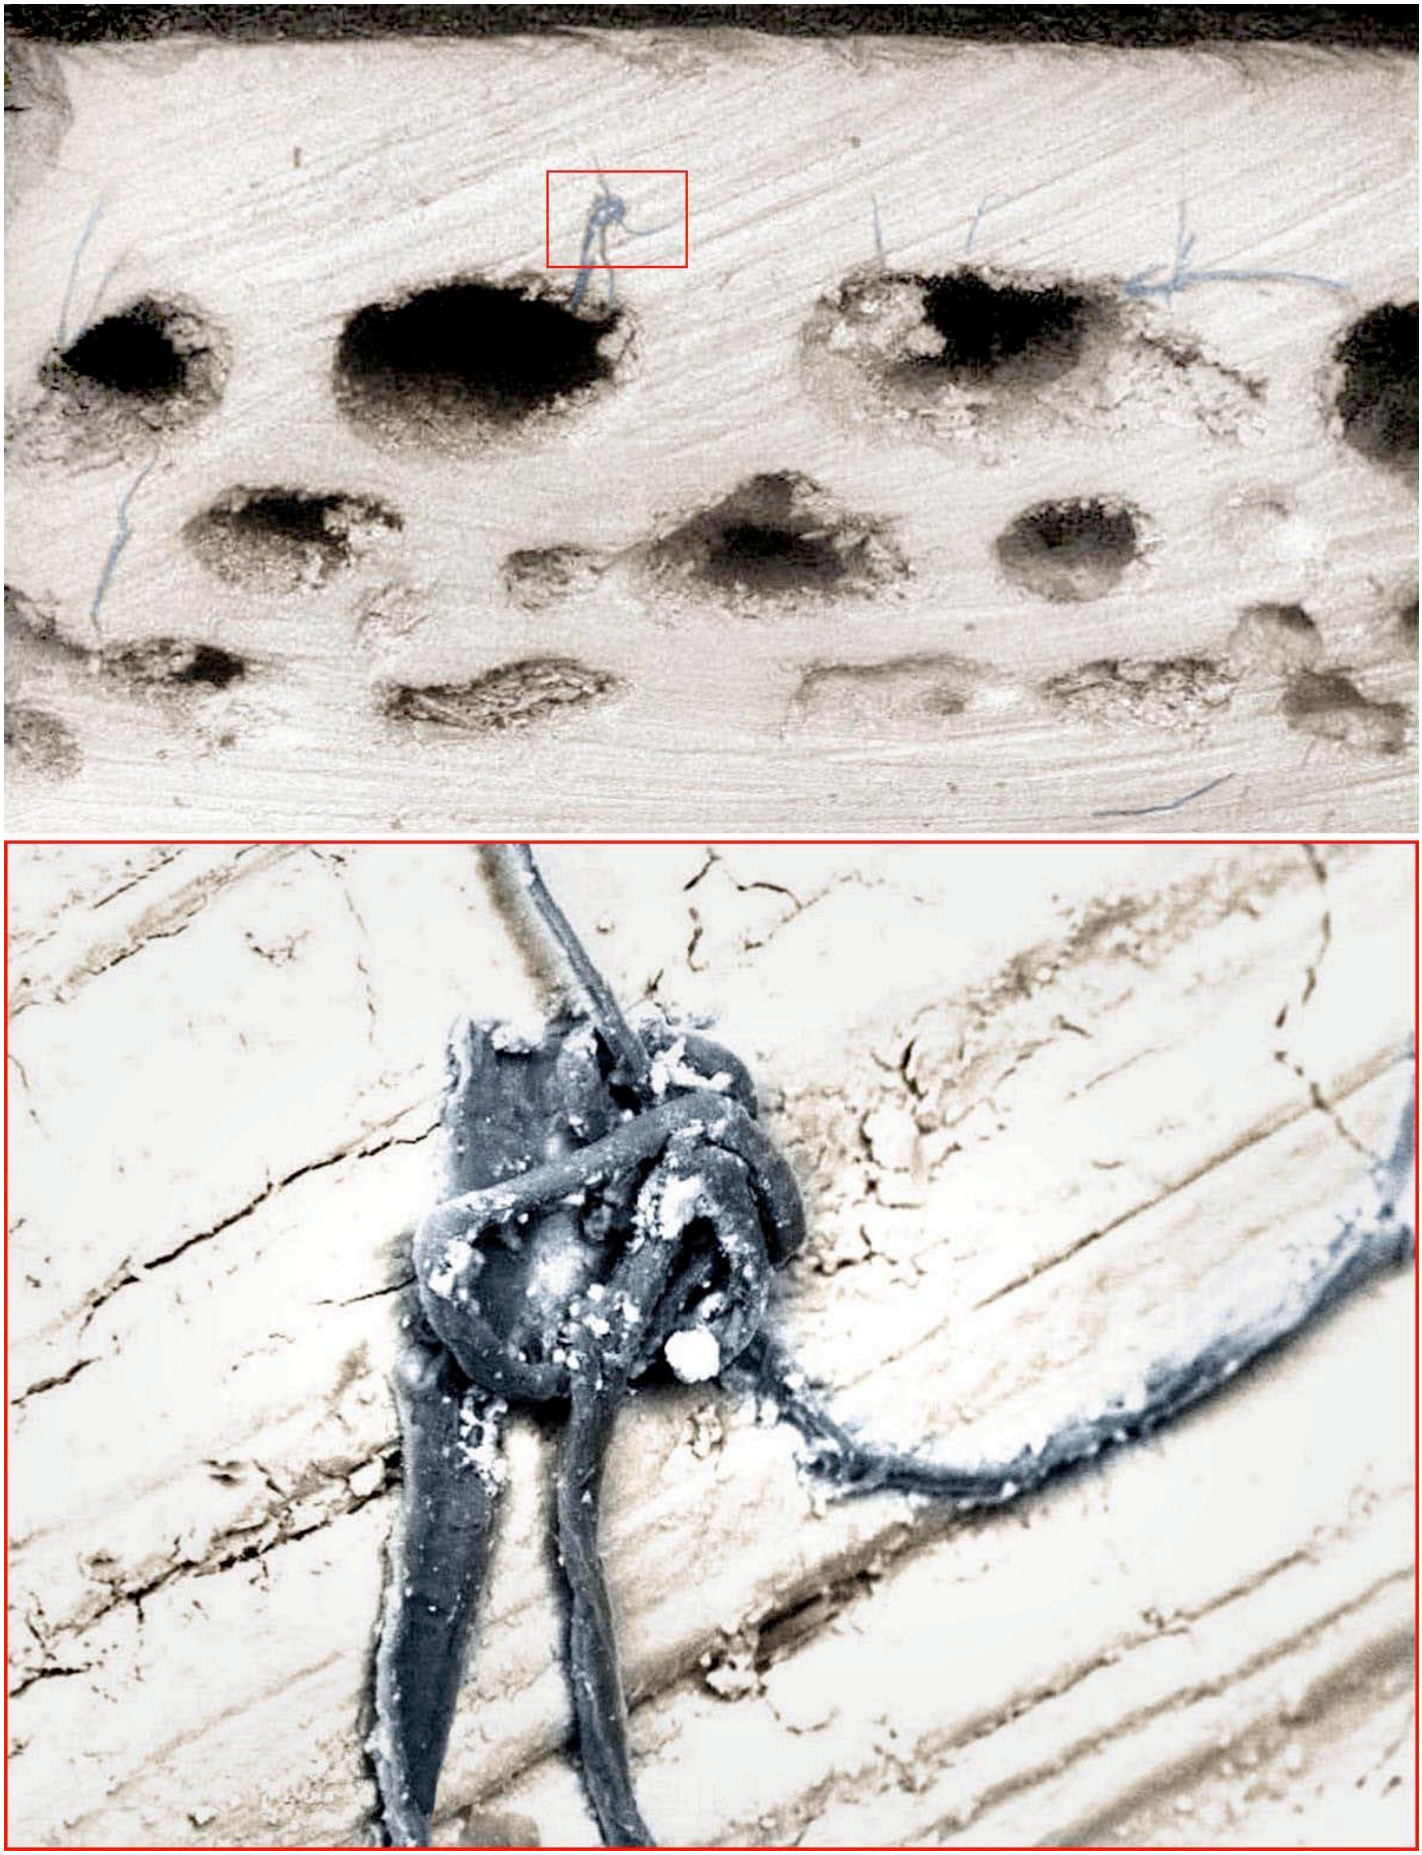
With the bioorganic androids, it concerned effective artificial life forms, so not robots or the like, but independently thinking beings, in every way self-capable of making decisions, made out of living material and living organs, bred in accordance with the human beings who are located in the Reticulum systems. In Earth-human terms, these bioorganic androids bred by the Reticulum people are actual life forms, and as such, they are respected by the Reticulum people and are also appreciated and treated, for the androids are, indeed, artificial human beings. As such, they stand under the command of the real humans of the Reticulum systems, on whose behalf they also carry out excursions, etc. to foreign star systems and planetary systems. And such artificial human forms were associated with the crash, as I already explained.

The intelligence of these android beings stems from a bioorganic consciousness of an artificial form, which is just as capable of development as the consciousness of the normal, natural person; therefore, it can also be creative and inventive. The type of consciousness is designed uniformly and collectively in each android, which means that all of the androids have a uniform consciousness form, and so, they are collectively like-minded, and thus, a collective form of telepathic communication is owned by them… which doesn't correspond to an actual personality but rather to an artificial form, which can think quite independently, act, and decide, as well as develop itself further, but which isn't arranged into conscious evolution but only functions according to conscious instinct… [Yet], in spite of the collectivity, [such an android] has its own individuality…



The bioorganic androids of the Reticulum people contain an authoritative programming in their artificial consciousness, which prevents that the artificial beings could ever rise over their designers, respectively their creators, but the time of their lives is limited to 300 years of devoted servitude to these. Nevertheless, they are entirely free and can in every way decide as to what responsibilities they undertake, exercise, or decline and, thus, whether they want to focus on a task or not. So they are in no way subject to compulsion by their creators.

In the manner in which they are biologically created, they are incapable of performing sexual acts and also of reproducing themselves. Their… artificial-bioorganic consciousness does not contain a creative spirit form, which would drive and animate this by its own energies. Animation is provided by the artificial brain, which is constructed in such a way that it can absorb and use the cosmic-electromagnetic life energies, so that the existence of life is guaranteed. It is this cosmic energy, by which the artificial life forms are animated and also made alive. All this, however, couldn't be recognized by all the doctors, surgeons, and pathologists, etc. in the American secret stations, where the crashed android beings were taken. But how could they, since their knowledge relating to this wasn't in place yet? In fact, it will still take many centuries and even several millennia before the terrestrial scientists arrive at the possibility of creating such beings as the bioorganic androids. Therefore, these beings will remain an unsolvable mystery to them for a very long time, as it is also the case for them with regard to the crashed beings in Roswell.[22]



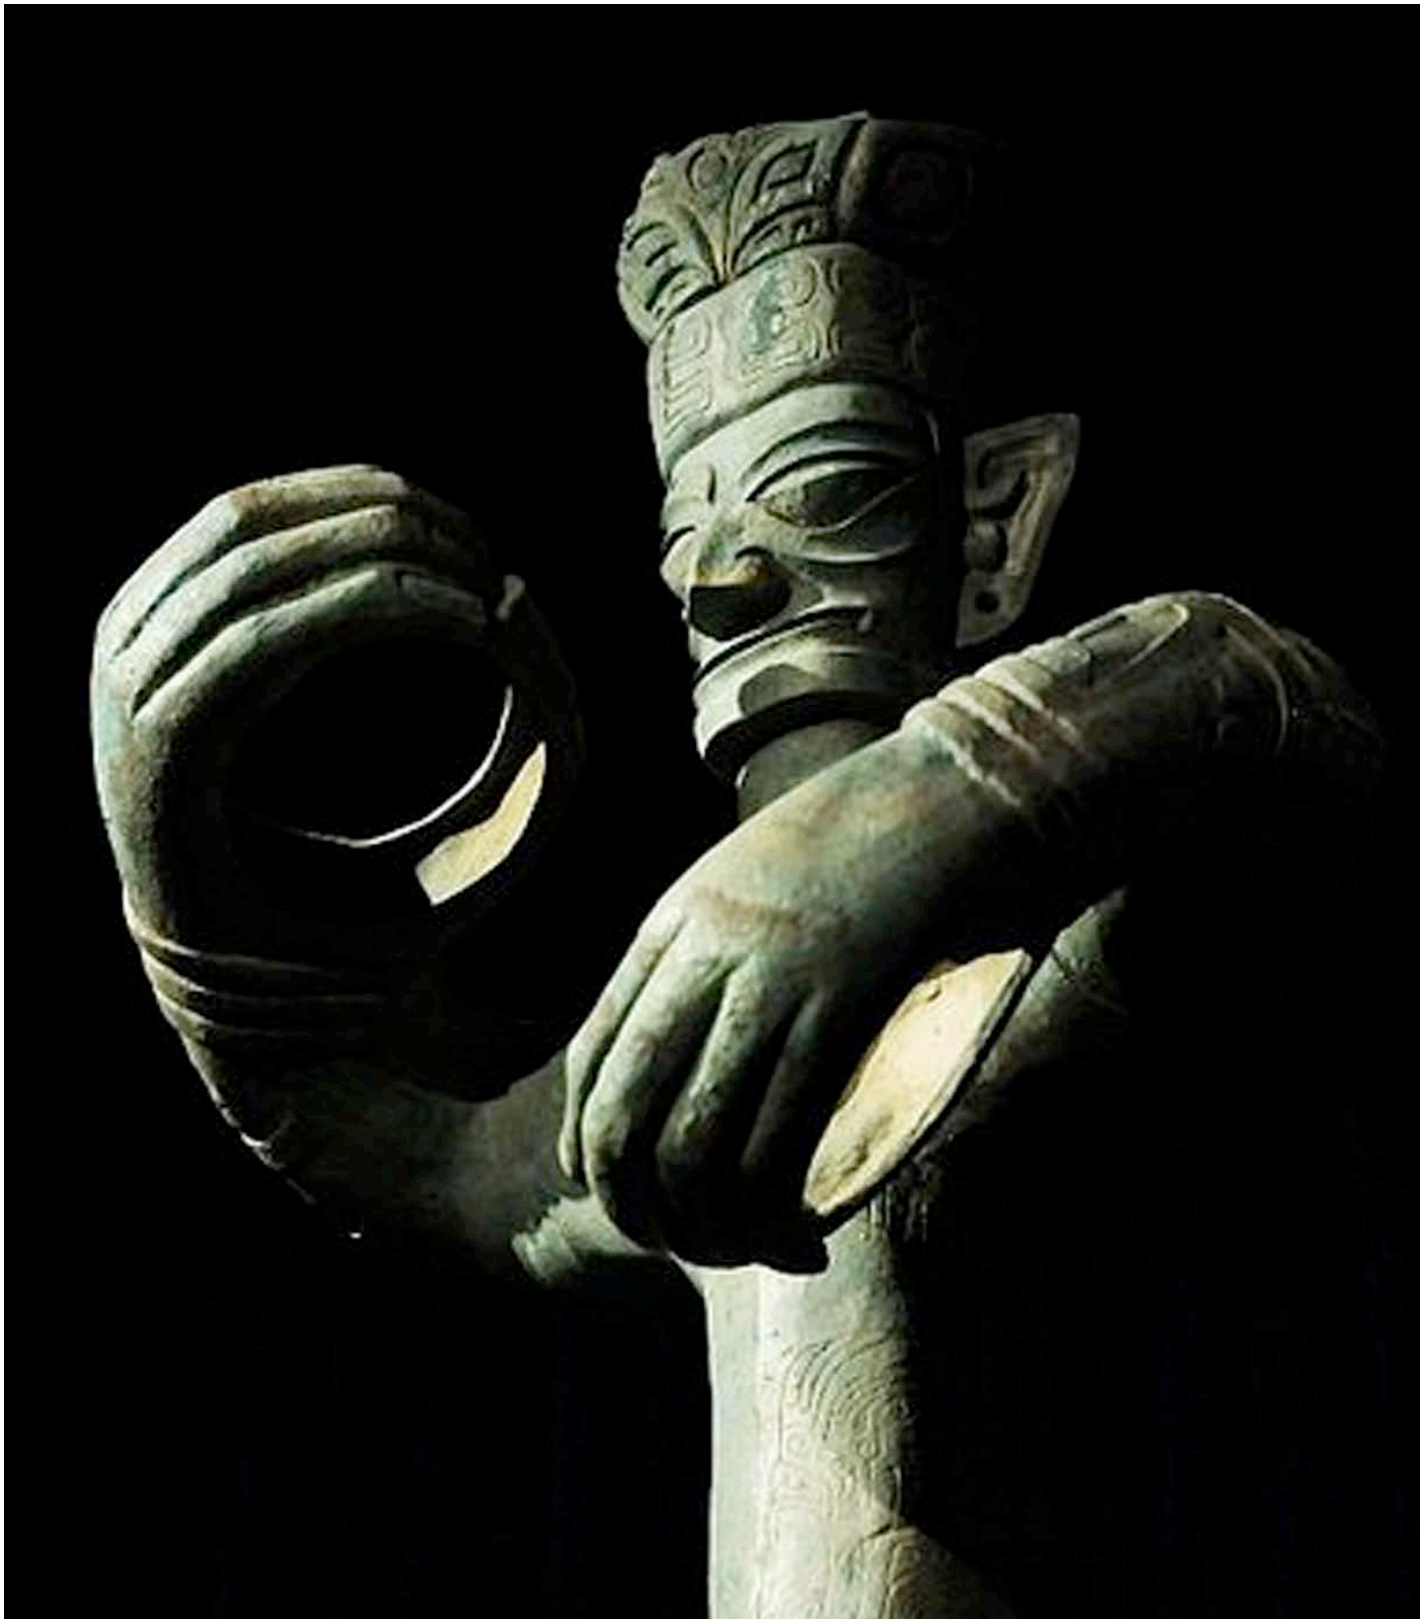
The complex information given by Quetzal concerning the bioorganic androids of the Reticulum people includes specific details of their collective telepathic communication and animation by ‘cosmic electromagnetic life-energies’ that indirectly refer to the resonant fourth-density environment of HHO plasma that is artificially created within their interstellar spacecraft. Brainwave and heartbeat synchronization engendered by resonant acoustic standing waves produced within the plasma ships induces collective telepathic communication, while animation of the artificial consciousness and bodies of the androids is accomplished by the nanopulsed bioelectric currents of HHO plasma.

Further corroborating physical evidence for the fourth-density origin and biorhythmic animation of the Roswell androids has been documented by anthropology investigator Lloyd Pye –a small, unusual humanoid skull discovered 80 years ago in a cave in Mexico. Known as the ‘Starchild’ skull (above, opposite), it displays a set of cranial features that closely resemble those of the Roswell humanoid, with extremely large ocular cavities and an expansive, round brain vault with a very broad, flat occipital region. DNA testing of the Starchild skull has revealed segments of unique genetic material, and bone density analyses show major deviations from average human skulls, confirming the skull’s extraterrestrial origin.

The Starchild skull is thought to be 900 years old, according to radiocarbon dating tests.[23] Further analysis revealed the bone is twice as hard yet half as thick as the skull bones of an Earthly human being, with a density similar to tooth enamel.[24] The unusual braincase presents a volume of 1600 cubic centimeters (cc), allowing for a brain mass that is 200cc greater than the average human brain.[25] *DNA testing has identified unique portions of genetic material that correspond to no known species.*[26]

Microscopy studies of bone samples taken from this unusual skull provide the most significant evidence of advanced artificial bioengineering. Cross-sections of the bone revealed the presence of metallic nanowires running through the many cavities crisscrossing its structure, known as cancellous holes (inset, opposite), that were not cut by the high-speed stainless steel rotary saw. Spectroscopic analysis of the nanowires has yet to be undertaken to determine the elemental composition of the metal.[27] The enhanced electrical conductivity of metal nanowires grown within the artificially modified skull distributes the nanopulsed electrical currents of the HHO plasma atmosphere maintained within the Reticulum spacecraft to sustain the artificial lifeforms as they undertake interplanetary excursions.

The longstanding presence of technologically advanced extraterrestrial visitors from the Orion, Reticulum and Draco star systems, among others, extends hundreds of thousands of years into the veiled human past. This ancient and still ongoing pattern of activity is recorded in artistic representations from all over the world, and many stunningly accurate depictions of the bioorganic androids of the Reticulum people are to be found among various indigenous cultural traditions. The Wandjina figures of Australian aboriginal traditions comprise a stunning record of interactions with extraterrestrial visitors that spans several thousand years in successive layers on the walls of sacred rock shelters and cavesites.



The Wandjina figures are depicted with large almond-shaped eyes, small open mouths and short-limbed, dwarf-like bodies, just as represented by ancient artists from Mesopotamia, as well as among Andean artists on the other side of the Pacific Ocean. A Chancay tri-frequency psychoacoustic whistling vessel displays this same combination of unmistakable features seen in the Reticulum androids, and even includes the accurate anatomical modeling of six fingers on each hand (opposite).

The diminutive Reticulum androids are also represented in Tayrona gold masterworks from Colombia, showing infrasound standing waves converging on the two hemispheres of the brain, inset by 3 spirals representing the tri-frequency resonance (above). The figure holds a double-spiral belt at his waist representing the control of DNA states under the influence of psychoacoustic resonance. These many specific features reflect an accurate and longstanding cultural knowledge of these cosmic visitors, and their connection with highly advanced psychoacoustic technologies of consciousness that were practiced on Earth during Atlantean times, before the Great Deluge that silenced the worldwide infrasound network.

Dozens of antediluvian bronze masterworks from Sanxingdui, China preserve very tall reptilian humanoids associated with the diminutive bioorganic androids from the Reticulum star system, quite likely their designers (above). The physical characteristics of this reptilian race have been described by modern abductees in exactly the same detail and scale as depicted by ancient Chinese artists, associated with populated homeworlds in the Draco constellation (hence 'Draconian' –of the dragon). Bioorganic androids are used by the reptoids to pilot vehicles and carry out tasks in the harsh atmospheres of foreign planets.

One giant reptilian figure from the Sanxingdui collection wears a headdress surmounted by a circle and a set of standing waves that converge above the crown chakra of the figure (above), as similarly seen on the headdress of the kundalini figure hammered into copper plate from the Crespi collection of Cuenca, Ecuador (p. 10). The complete set of cultural references to infrasound standing waves and kundalini development is shared on all continents, belonging to one ancient mother-culture of Aztlan spanning the entire globe in geomagnetic alignment with the Great Pyramid of Giza, Egypt.

The sheer walls of Barrier Canyon, Utah still reverberate with an intense infrasound resonance, and bear many profound Atlantean cultural symbols in the red ochre renderings of several millennia past. Part of a larger wall mural, two very tall humanoid figures are seen levitating into the air with writhing double serpents representing DNA, with concentric circles shown at the heart chakra representing infrasound standing waves tuned to the heartbeat frequency (above). Pairs of concentric circles form the eyes of one of the figures, connected by the arc of a standing wave signifying the hemispheric synchronization achieved by psychoacoustic entrainment. The same psychoacoustic effect is signified by plants sprouting from the head of the other figure like living antennae, with several small flying birds encircling it.

A group of seven luminous white caves are symbolically represented between the two tall floating figures, known as ‘Chicomostoc’ – the 7 sacred caves described in the origin story of Aztlan still retold by the Maya.[28] Luminous plasma ships are depicted as circles flying around the levitating figures, with standing waves radiating from some of the spacecraft (see p. 28), while others appear to be moving in formation through the sky, just as observed and videotaped in our times by thousands of dismayed eyewitnesses.

Contacts from Koldas

Contacts from Koldas

A remarkable set of still ongoing extraterrestrial contacts that began in 1968, in South Africa, present a fascinating perspective on the unfolding human experience. A young radio/electrical engineer living in Richard's Bay, South Africa (above), 'F. Edwin W.' (alias) received radio transmissions from a cosmonaut in Earth orbit named Valdar, from the planet Koldas. Subsequent years of regular radio contacts and comprehensive face-to-face conversations included other wise cosmic visitors from a Confederation of Planets in alliance with Koldas. Extensive and profound information shared during the visits of Valdar, Kashendo, Taylanz and Wy-Ora were recorded and later published by Carl van Vlierden in 1986.

Edwin was told that the primary structure of the Confederation of 12 Planets was peacefully founded in the Grandor star system, comprised of planets Grandor, Leec Goran, Sparlane, Velaan and Novan; and has extended to include the planets of neighboring systems like Koldas, Salamia, Siton, Bryonne, Pyrole, Pyrc Furvey and Triaxula. Valdar provided Edwin with a basic description of his homeworld, Koldas – a giant world with freshwater oceans reflecting the purity of planetary systems at high resonance:

> 'It is many times larger than Earth. We have seas on Koldas, but these are freshwater seas. There are also large lakes, the largest about 24,000 km long and 20,000 km wide. Some of the towns of Koldas are in the mountain regions while others are by the sea. The towns are similar to yours, except that buildings are constructed differently. There are no roads here for our vehicles travel above the surface of the ground. Our buildings are linked by conveyors to take people to their destination. Our capital city is vast, much larger than New York. Of course there are rural areas with smaller homes for one or two families, and there are forests and also rivers. In the large lakes there are islands where you find holiday resorts.

‘Our way of life is very similar to that of Earth. What I am trying to impress upon you is that we do not differ from you. The only difference is our mental attitude. Our way of life is different. We have no monetary system; no currency whatsoever. Each planet in the Confederation produces and plays a vital part in the whole. Some are rich in minerals and supply these to the others and some are more suitable for cultivation. Koldas, with its seas or lakes, has an abundance of fish, harvests of which are sent to other planets in the Confederation in exchange for minerals and materials to build the powerful Astrael-craft. And so my friends, a chain of good-will and understanding links all our planets. Earth too could play a part in this Confederation… We are like you. We are in the flesh. We feel pain and we die. The difference is that we are able to travel at this fantastic speed.’ [1]

The visitors from Koldas spoke in words of genuine compassion during their many radio contacts with Edwin (below). Valdar expressed deep sorrow concerning the intense suffering of children of war:

Valdar then reiterated that most of Earth's governments, political rulers and Superiors, knew of the Koldasian operations and the Confederation. He said they had known of the presence of Confederation craft over their countries and in the oceans for a very long time… ‘What makes me sad,’ Valdar said, ‘is the unnecessary bloodshed and warfare on Earth. I often think of the little children who are the innocent victims of all this violence. Infants without homes having to find refuge, food and water, yet they have no idea why their parents are at war. There are areas of dire poverty. All these scenes and much more were recently recorded by the three-day aerial survey. This too contributes to the Confederation's decision to withdraw their patrols.’ [2]

The observation of humanity and monitoring of the rapid development of Earthly civilization is a primary task of Confederation vessels, including the older Astraelcraft and newer Corynthian spacecraft, which incorporates their most advanced designs with automatic instrumentation, representing a most formidable interstellar craft, in terms of both annihilating power and instant translocating capacity:

‘The craft used by space-travelers range from two-seater scout-craft carried by their motherships, to the largest masterpieces of design and technology which are veritable floating cities in space. The Confederation spacecraft were spherical in appearance prior to 1941. It was these craft which were used to explore the Universe and solar systems many thousands of years ago. Then the spherical craft were superceded by the Astraelcraft. These were named by the Koldasian designer in honor of his wife Astraelda. Other smaller craft are disc-shaped. Larger carriers are cigar-shaped and measure in kilometers. These are used for cargo and passengers.

‘All these craft are propelled by magnetic flux. The magnetic streams have different layers with various velocities. The motors, with which all craft are fitted, serve as rudders directing the craft into the various velocity layers. The highest velocity is reached on the outer surface and can exceed that of light. The magnetic streams criss-cross deep space, connecting planets, solar systems, galaxies and even universes in a vast web of highways and by-ways for space-travelers and their craft…’ [3]

Koldas had enjoyed 20 centuries of history without fighting of any kind and consequently the only deterrent they could muster was their fleet of Astrael spacecraft. These craft are not intended for military service but are equipped with a ‘Sun-ray’ disintegrating laser or charged particle ray gun which is designed to annihilate meteorites in the magnetic traffic lanes. Its pencil-like ‘laser’ beam stabs at any object, destroying it in a brilliant flash without leaving a trace...[4]

I scrambled up against the side of the dune where I had a good view of the spacecraft as it touched down on the beach. As it came closer, I could see how enormous it was. It must have been close to 50 meters in diameter… I heard a low hum… It then rose up into the air… The ship now moved out over the surf, rising all the time… The craft itself was not emitting any light… The outside was steel grey in color but shiny. One could not see any rivets or joints or welds; it seemed to be one complete moulding, like two saucers put rim to rim.[5]

The technological advancement of Koldasian spacecraft reflects their comprehensive understanding of the nature of the human spirit. The physical limitations of corporeal existence have been mitigated by the artificial control of matter, space and time – freeing the human being to explore transdimensionality. Valdar’s brief description of the spiritual views prevalent among the Confederation planets is highly reminiscent of the ancient Sanskrit traditions passed down through the ages from their original dissemination on Earth during colonization events described to have occurred over 70,000 years ago:

And he told me sometimes about the religion of the Confederation… He stressed that he did not give such information with the idea of trying to introduce it to Earth. He did say that many of our ancient civilizations knew of their religion, which was taken to our planet by members of the Confederation approximately 70,000 years ago. They believe that there is One Supreme Being, usually referred to as the Divine One. This Being is infinite and all-powerful and He creates all things, seen and unseen. Also created by Him was his Son. When man was created, the Divine One placed within the body of man a spirit or the soul, which never dies but continues on to eternity. The task of man's soul is to rule the material body by overcoming material desires... When this is ac-

complished, the soul will be called back to the great source and forever live in perfect joy and happiness. They also believe that all mankind is created by the same Divine Force, therefore all mankind are brothers and sisters. But this is a mere outline of their religion; there is much more – for example, their belief in reincarnation.[6]

The ancient idea of reincarnation present among most cultures of the world has only recently come under scientific scrutiny. Hypnotic access to memories of past lives stored in the subconscious mind enables the statistical comparison of specific psychological and physiological traits of successive incarnations of a spirit, whereby solid probability calculations can be made concerning the likelyhood of such a spiritual continuity. Well-documented reincarnation cases such as that of Jeffrey Keene and John B. Gordon (left) present so many extremely rare synchronicities – *elusive 'proofs'.*

In his discussions with Edwin, Kashendo described part of the Confederation's master registry as a vast reincarnation database, which cross-references the specific characteristics of every sentient being within the planetary collective as a statistical aid in identifying the successive incarnations of a particular spirit:

> 'Now as I promised,' said Kashendo, 'I shall tell you what we know of your past incarnations in our own Confederation… It is a vast subject and there is much to tell. Let me begin by saying that the master register is stored in a gigantic memory bank on the mother planet of Grandor. Here are the records of all beings who have lived lives in the Confederation.'
>
> Kashendo explained that the giant computer is housed in 37 buildings which are arranged in a circle around a central building. Most of the staff work in the central building which collects the required data from 'memory cells', consisting of thousands of transparent tubes with crystals inside them. Each tube is capable of storing many thousands of symbols and a memory bank consists of many thousands of these transparent tubes. The data is stored indefinitely and when needed the controllers extract it in coded form which is then decoded to provide the required information. All the equipment is very complex and kept in a special atmosphere.
>
> The memory cells store innumerable personal features and characteristics which reappear in the same individual through many lives. When a search is made, a special computer transmits the details of the required person to the whole range of memory cells. As soon as the features are recognized by a memory bank a message is transmitted back to the central control building where it is recorded. The whole process is complicated and Kashendo said that he found it difficult to describe it accurately, but he hoped it explained how the Grandorians are able to trace people's lives through time, at least within the Confederation.' [7]

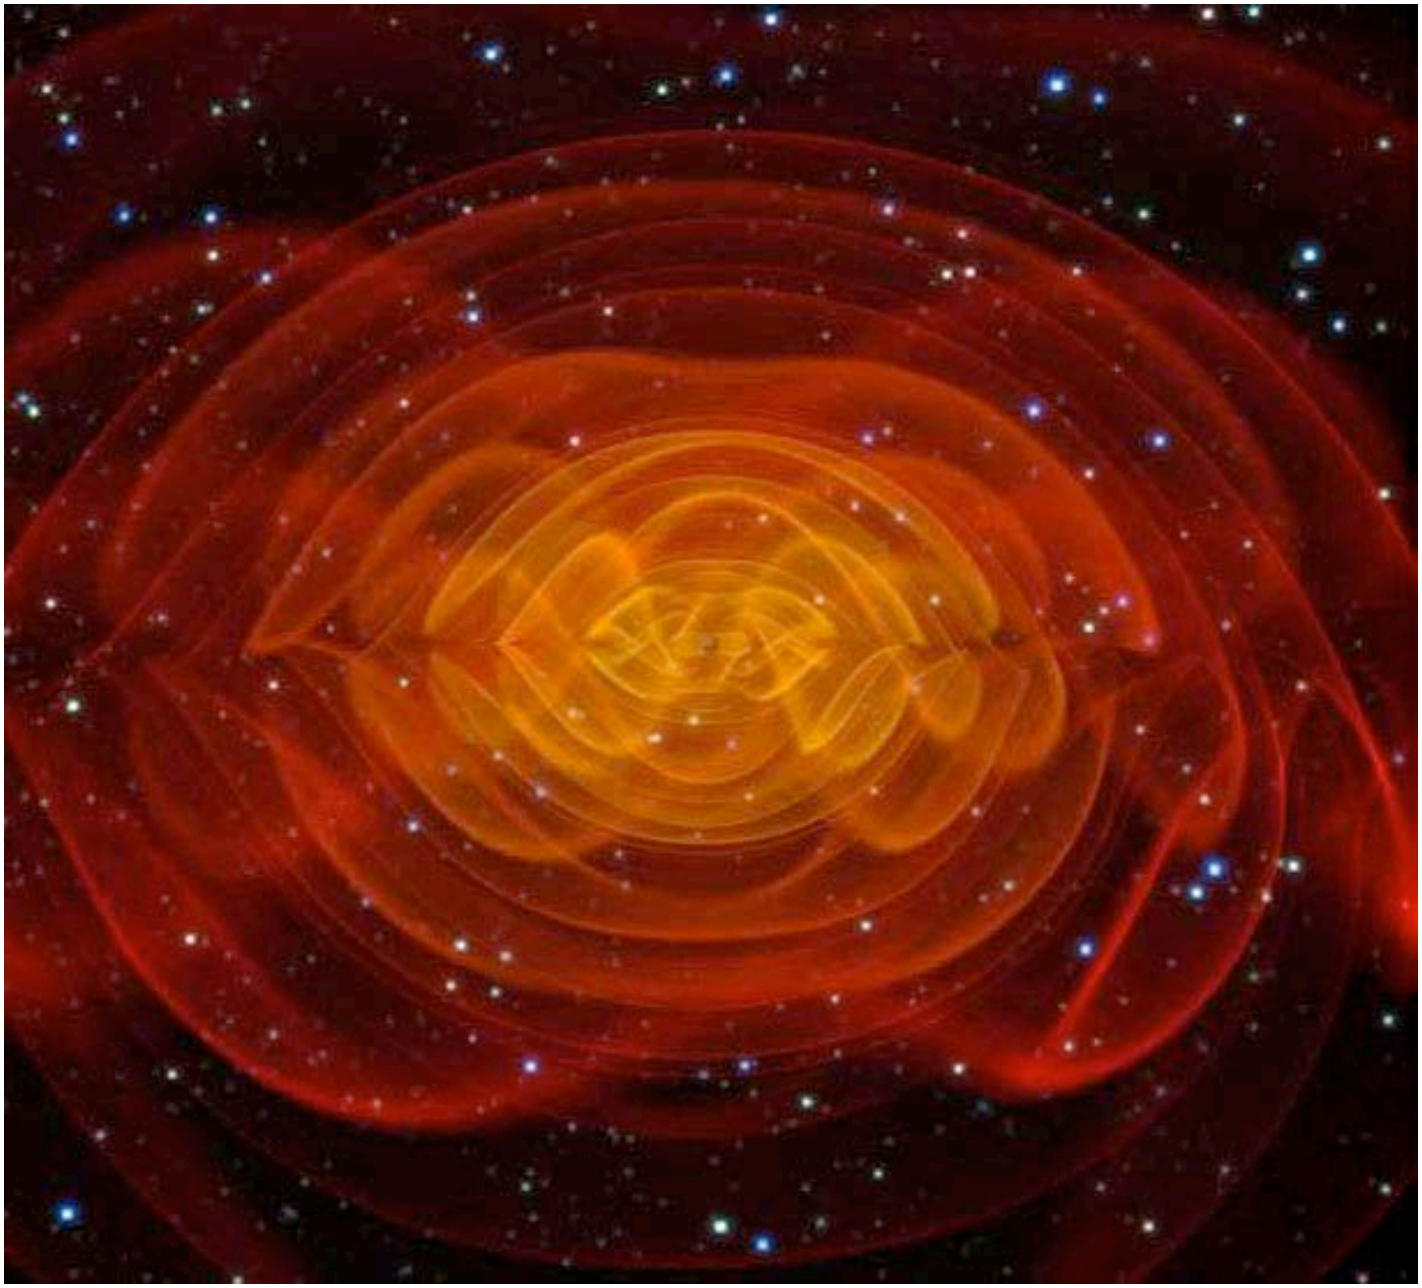
The scientific tracking of a particular spirit through its long string of incarnations is a statistical task that requires great computational capabilities, which the Grandorian record-keepers achieve using supercomputers operating in 'a special atmosphere' of fourth-density HHO plasma. The geometric configuration of 37 buildings housing the thousands of memory cells is precisely aligned in a circle around a central building to make use of infrasound standing waves for the focused distribution of wireless power by which the HHO plasma chambers are resonantly synchronized. Edwin's spirit had selected a reincarnation on Earth as a means of transmitting information for the benefit of humanity. One of Kashendo's profound offerings of knowledge concerning the human past and the deep history of Earth revealed the presence of once breathtaking cities laid to waste on the ocean floor, along with the giant wreckage of huge interstellar spacecraft which enabled the colonization of Earth by different races seeking refuge from various worlds in peril (rather than being a byproduct of evolutionary processes):

Kashendo spoke about the various races we have on Earth and said, 'This is an intriguing subject but some of the mystery is known to the Confederation. We know that long before we first visited your planet, there were other visitors. When our ancient pioneers arrived there, they found evidence that whoever came before them must have come from systems far beyond those known to us. It is possible that they wished to colonize Earth. We do not know for certain whether this explains the many different races, but we do know that the race which you call the Red Indian, had ancestors who came from a far away planet doomed to destruction. They were highly civilized and had mastered space-travel. They left their home planet in a giant craft to search for new planets to colonize and reached Earth and there they settled. It seems that they were abandoned by their people or were unable to return home, possibly for lack of fuel. Their craft was stranded and so they remained on Earth. They were forced to improvise and learn to live off the land. They made use of what they had and what they could find. They hunted the animals; and learned to use them for food and sustenance.

'We know about these people, for they were very intelligent as a race, and one of the early ones to occupy Earth. But what about the many other races you have? We can only assume that they too were space travelers for we have definitely found the remains of many craft beneath your desert sands. Gigantic craft [have been found] which are not from the Confederation! Should these remains be discovered, they would cause a sensation on Earth as they are of enormous proportions. They must have carried thousands of people.

'It is possible,' he suggested, 'that they never intended to return to their homes. Were they banished and perhaps sent away as punishment? We can only guess at the reason for their presence but the evidence of their arrival from other planets is there, beneath the sands. This may be one reason why there are so many different races on Earth…

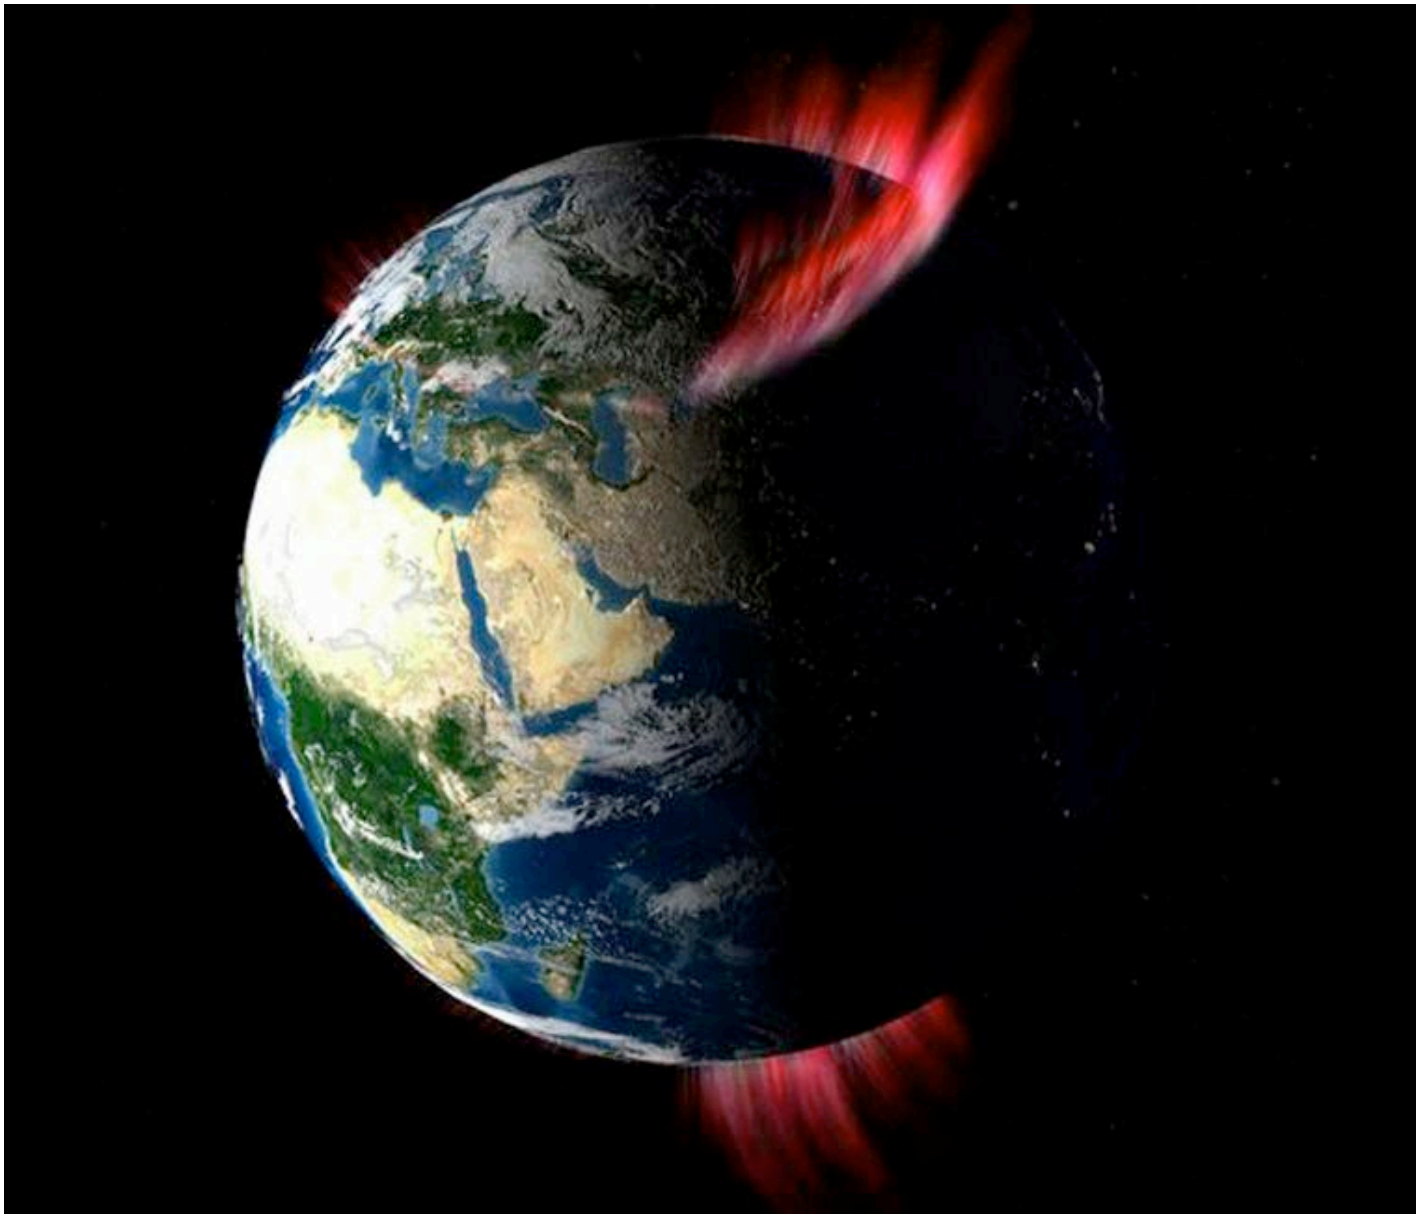
'When the Confederation carried out patrols beneath the surface of your oceans, they discovered many craft buried in the mud of the ocean floors. There is much evidence which will not be found soon, and much that has been lost. In another transmission I must tell you about the abandoned cities which lie beneath your Pacific Ocean; mysterious cities which must have been of great beauty before they disappeared. What catastrophe befell Earth? Who were the builders of these matchless cities?' [8]



These remarkable facts delivered by Kashendo attest to the great antiquity of human civilization on Earth, and the deep mystery of the cosmic origin of human racial diversity on Earth. While the existence of the remains of gigantic spacecraft below the (Sahara?) desert sands has been quite purposefully withheld from public knowledge by the world's governments, the same astounding scale is plainly witnessed in the pyramids of Giza, Egypt – designed to transduce and focus infrasound standing waves used for the propulsion of antigravitic plasma ships by acoustic levitation. Valdar explained:

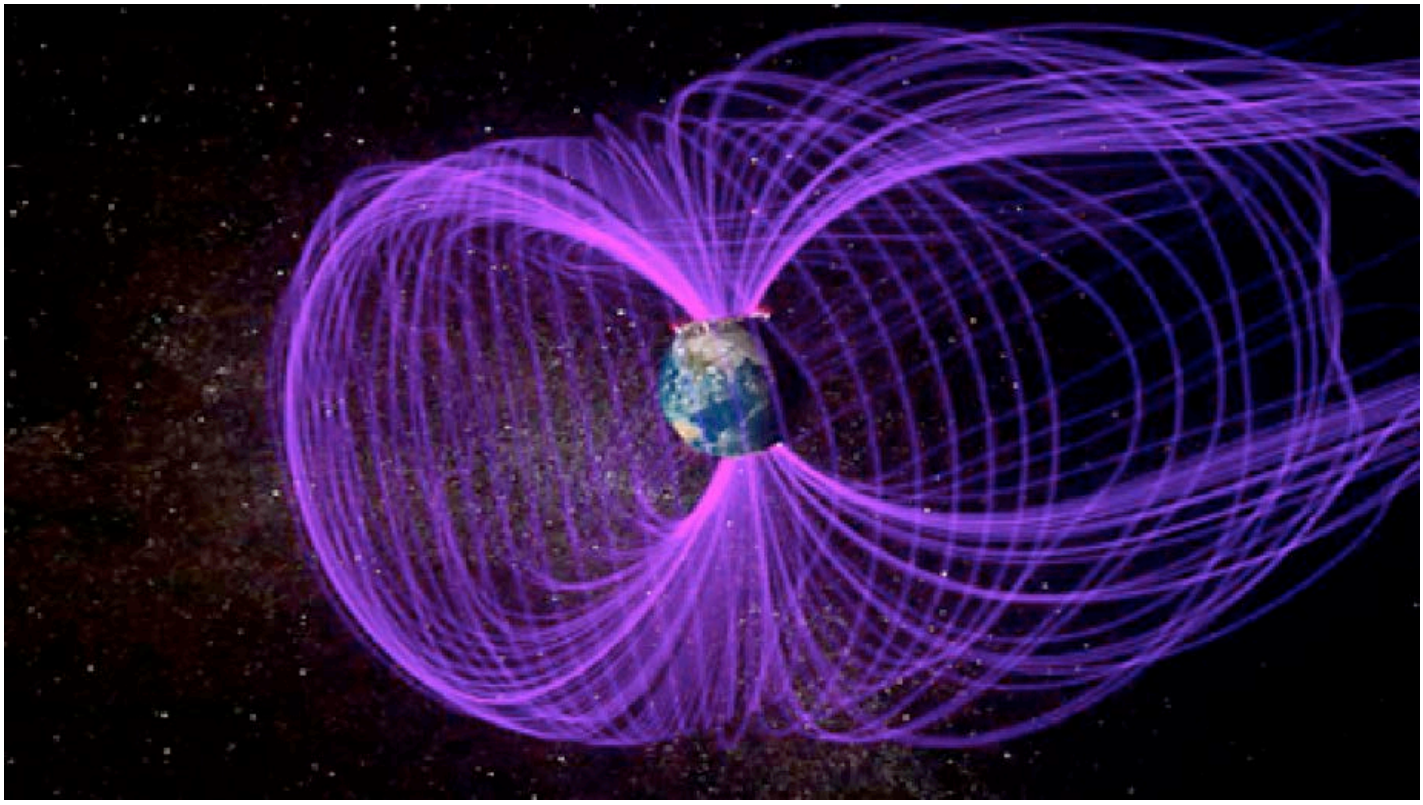
> The pyramids… were used as transmitting and receiving stations and for the storage of magno-solar energy. They were located in a strategic area and the ancient Starships used to home in on them… Their design is significant in more ways than one. In the coming changes on your planet, this pyramidal design will again be used in your buildings.' [9]

Other discussions with the Koldasian envoys confirm that the 'pyramids [of Giza] were strategically placed in the geographic center of the land surface of the planet.' [10] This fact was recently reported by investigators of the Great Flood, who analyzed sea level data to identify an ancient global flooding event that raised sea levels by 178m, which offset the gravitic center of Earth's landmass by hundreds of miles to the northeast of Giza.[11] *This 178m sea level rise explains how the casing stones of the central pyramid have remained intact above that precise height,* while those casing stones below that mark were gradually torn away by the erosive wave activity of slowly receding floodwaters (above).



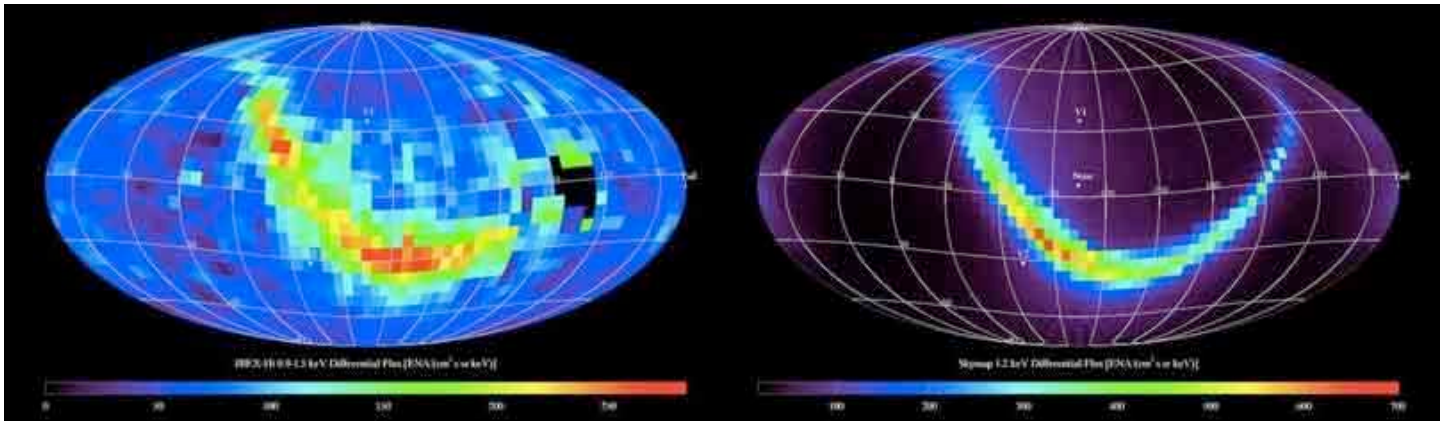
Long before the destruction of the pyramid resonance network by the Great Flood, the Giza pyramids pulsed with a tri-thalamic frequency of 1.45 Hz to synchronize heart/mind rhythms throughout all of the sacred sites of the planet and act as a homing beacon for the legions of spacecraft in transit through our solar system. The resonant excitation of planetary infrasound taps a vast reservoir of cosmic energy available to humanity once again through the oncoming changes, which include an intensification of planetary resonance. The deep hum of our planet, an infrasonic gravity field, is artificially recreated in all of the space-faring plasma ships' magnetic motors, as described to Edwin during a transmission:

> Wy-Ora continued wistfully, 'If only your governments would unite in peace and extend the invitation, your skies would ring with the hum of magnetic motors… All our knowledge would be yours. All that we have achieved over the centuries would be given you freely. But unfortunately, your rulers cannot agree. They tell us many things; why they cannot accept us. But it all boils down to the fact that it would bring too many changes on Earth and that it would disturb the 'balance of things'.' [12]



In fact, all extraterrestrial matters have been kept secret by Nazi/CIA elements to preserve the present corruption of world governments, enforced by the military use of stealth technology stolen from Nikola Tesla in 1942.[13] The standing waves discovered by Tesla in 1899[14] display the same Fibonacci structure observed of galactic and solar systems (above), providing magnetic field lanes for magnetic propulsion:

> 'Each solar system has a magnetic field. Once you have broken away from the gravitational field of your planet, you can make use of the magnetic fields of other planets and solar systems to travel vast distances and even change in time… On Earth you are using the wrong method of propulsion. You are using fuels, liquid or solid or whatever they may be. This does not take advantage of the vast reservoir of universal energy. There is an unlimited supply of this energy and power that can never be exhausted. This energy is there for mankind to use on your planet.'



> ‘Let me explain further. The Astrael-craft I am in has eight magnetic motors; four forward and four reverse for control. These are actually giant electromagnets powered with solar energy. Now, beyond your planet there is a magnetic force-field which runs in streams between planets and solar systems, and even between galaxies and universes. Magnetic fields seem to run on forever. Once we are in a magnetic field we travel in this invisible stream through space. Our magnetic motors allow us to check and control our speed. Without them we could not select our destination. We would be helpless as a rudderless ship on a fast flowing river.’
>
> ‘Once a certain velocity is reached, things begin to happen. For a little while, breathing becomes difficult and the craft is controlled by a master computer. As you arrive in other universes (dimensions) awareness returns. Craft, computer, personnel and all which have existed in the energy-state flowing along the magnetic paths, now reintegrate with their polarity changed, to become solid matter again. And that my friends, is all there is to it. It is the magnetic fields which carry us at these incredible speeds, an changing time is a side effect of it. Your craft on earth could do this if you had the magnetic motors!’ [15]

The technical details of the magnetic motors were first discovered by Nikola Tesla during his wireless researches, and were later perfected in secret designs for antigravitic spacecraft using infrasound standing waves and HHO plasma, derived from water. The implosion of atomic hydrogen forms the unique plasma that protects all interstellar spacecraft. The presence of galactic magnetic fields, vast cosmic highways described by Valdar in 1970, were only recently identified by Earth’s scientists in 2009:

Last year, NASA's Interstellar Boundary Explorer (IBEX) made a discovery so profound that scientists had a hard time describing what they were seeing. A vast ribbon located in the outermost reaches of the solar system had been spotted, a structure that had never been seen before. Now scientists believe the shape might be created by a huge reflection caused by particles bouncing off a galactic magnetic field… In December it was announced that the veteran Voyager probes currently flying toward the heliosphere measured an unexpected increase in magnetic field strength. Scientists believe that this increase is due to an unexpectedly large magnetic field threaded through a cloud of interstellar gas called the 'Local Fluff.' Our solar system is currently speeding into this Fluff… [which would more accurately be called 'plasma'.]

Jacob Heerikhuisen, a NASA Heliophysics Guest Investigator from the University of Alabama in Huntsville, believes the ribbon observed by IBEX is caused by an interstellar magnetic field… 'We believe the ribbon is a reflection,' said Heerikhuisen. 'It is where solar wind particles heading out into interstellar space are reflected back into the solar system by a galactic magnetic field.' [16]

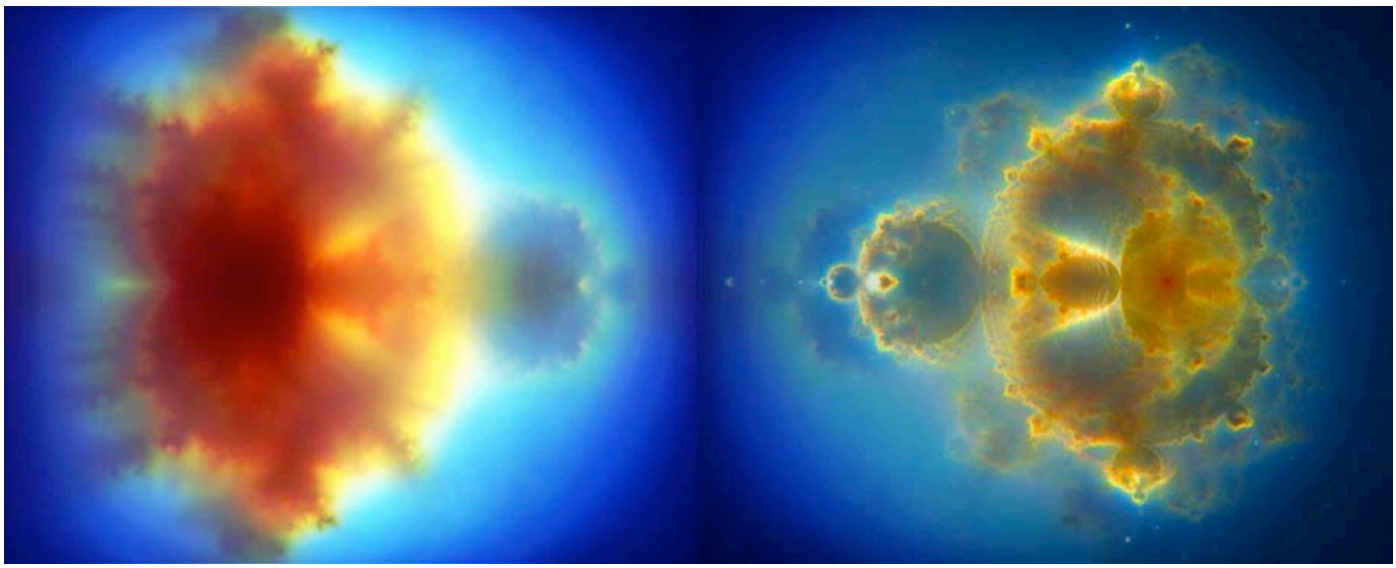
These newly identified galactic magnetic fields connect star systems within the spiraling arms of galactic wheels and act as propulsion lanes for interstellar spacecraft. The advancement of human consciousness is required for the penetration of the light speed barrier, for which purpose the Koldasian visitors influence contactees like Edwin by a voluntary conditioning of the subconscious mind during deep sleep:

We asked Valdar about ‘conditioning’ during a thought-transmission. He said that initially we were tested to see whether we had accepted the Confederation ‘way of life’… ‘*Only then*’ he continued, ‘various methods of conditioning are used. This is done mainly during thought-transmissions. We describe our planets to you – our way of life – and we answer your questions. Your subconscious minds are conditioned by us to store certain impressions gained during these transmissions. These are of great importance later on.

‘We continued to condition you mentally, so you will accept more of what we give you. This is a long procedure and is still in operation at the moment. We will continue until we are satisfied. *This type of conditioning is done mainly at night, during the hours of sleep. While sleeping, everyone transmits a signal. This is normal and happens to everyone. We have instruments to 'tune in' to your particular signal; your personal frequency.*

Valdar continued, ‘You know that you all have a forward or conscious mind. You also have a mind that lies dormant, which we call the 'back' mind or the subconscious. This back mind accumulates a great deal of knowledge and a great variety of impressions lie stored there. A brain is like a computer. It may reach a stage where it will not accept any more. Then it refuses to receive new impressions and this mainly applies to one's subconscious mind. Then it becomes necessary to unburden this subconscious mind. This is to prepare you for all the new information you will acquire.

‘We have a method of conditioning by which we rid your subconscious mind of much that has been impressed upon it, making way for new conditioning. This has been carefully programmed for each one individually, to suit your mission and type of work. All data and information is placed there. This continues stage by stage, depending on how you accept it. It all depends on you.



‘We can tell what you have recorded of the information we have placed there and what you have received during the various transmissions via the thought-channel. Then comes a very important stage – the most important of all – and you are going through this stage at the moment. This is the stage in the program where you must accept a new way of life. I have already mentioned how strange things are beyond your solar system.

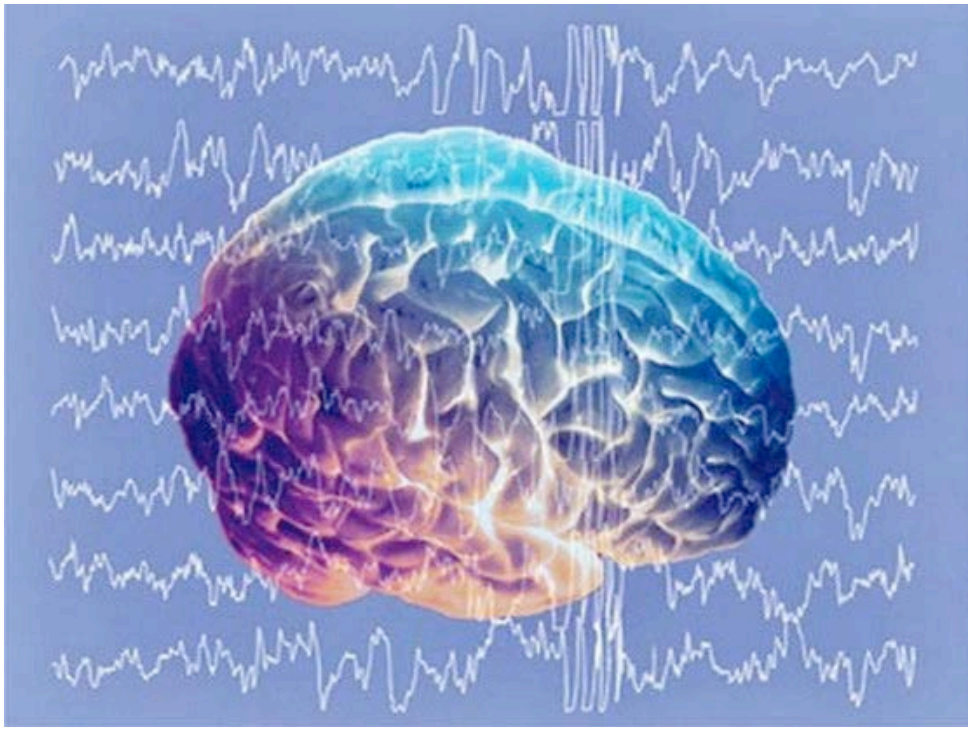
‘All this has been placed in your mind and it is done to alert your subconscious to be prepared. We are going to place in your memory-bank vital information that is needed if you should ever have to travel beyond your solar system, so that it will not refuse to accept what it will see and what conditions will prevail when you travel in Outer Space… You see, there are conditions which one cannot describe. One has to experience them to realize what is meant. One's body undergoes a drastic change in interstellar flight, for you will travel many times faster than the speed of light. Your body may be shattered into millions of particles and even your mind may experience this disintegration. This may sound more frightening than it is.

‘Now, when you are in that stage of disintegration, you will exist... and yet, you do not exist. For you (the consciousness) are *there* in 'energy particles' – you actually *flow*. Yes, the word flow describes it accurately, for you cannot leave your Universe unless you are able to flow through the magnetic field, coasting along the magnetic force lines. One cannot escape from your Universe and enter an other-matter Universe unless one undergoes change. You see there is a strange law out there, a law that has existed since the birth of the two Universes. There is a dividing line, which is invisible, beyond which nothing can go, *not even light rays*.

Therefore, to escape beyond that invisible barrier one must undergo great change. When the craft, including all its occupants, goes through this change, it is completely disintegrated into its elementary particles – into energy. After that one does not travel at speed anymore, as this does not describe it. One then travels in such a way that there are no words to express it... This happens only for a certain distance; the distance between the two Universes. Then one emerges into the anti-matter Universe and the craft and occupants revert back to solid bodies again, the process being reversed [to induce rematerialization].

'Let us put it this way. A container filled with water is suddenly spilled upon the floor where it spreads out. Now, suppose you had a magnet that could attract water. Place this near the spill on the floor and suddenly, it becomes one body of water again. This illustrates what happens when you disintegrate your body and craft into elementary particles - spread it out, so to speak - so you can flow from one Universe to another. You would flow through gigantic magnetic fields, which are of such high intensity that when you break through that invisible barrier you become energy and travel in time.

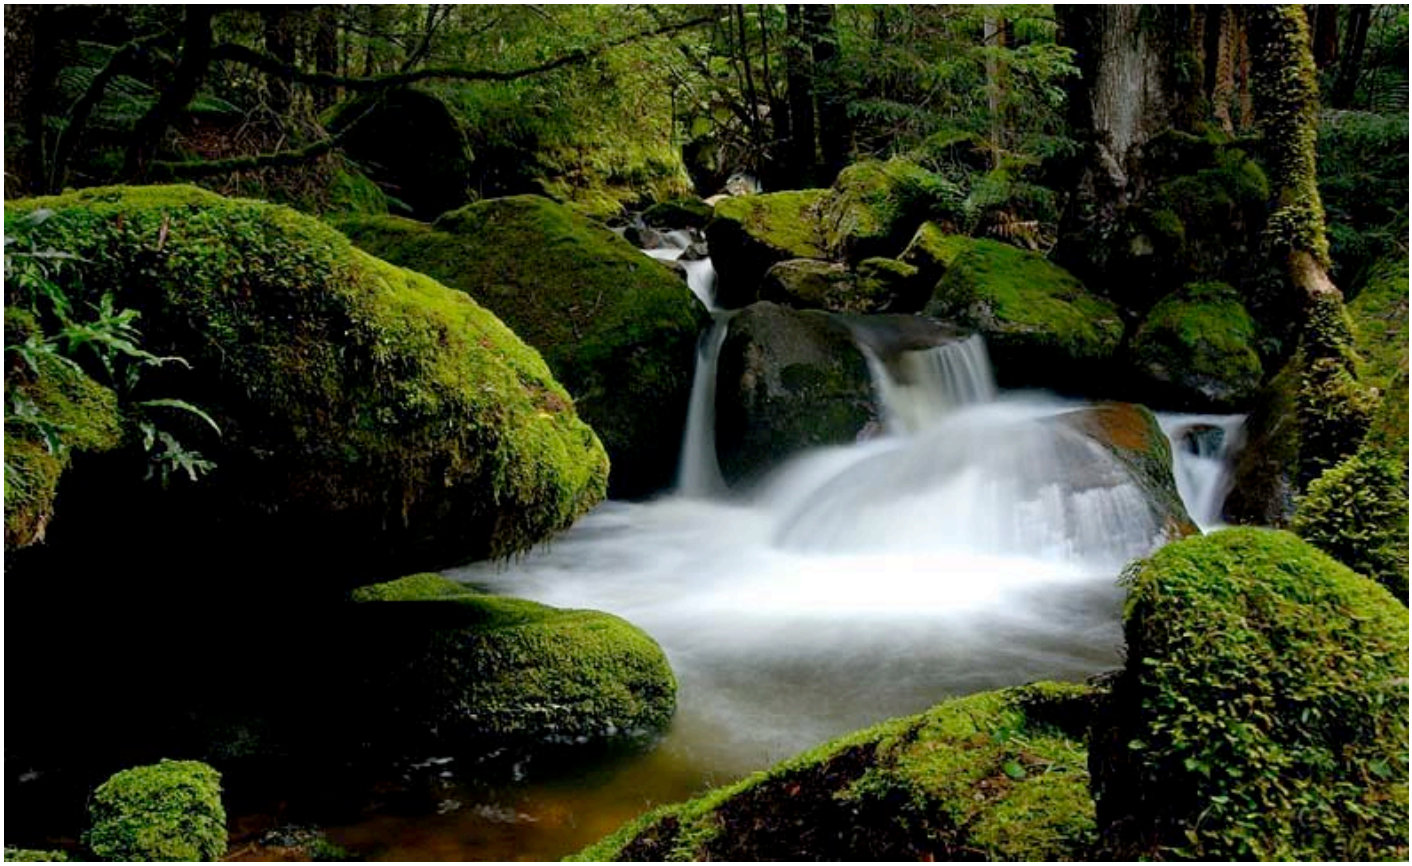
'This is the most important part of your conditioning because when you arrive on the other side, there is a world that you could never imagine! There are vast differences. You would not be as you were when you left *your* Universe. You would be in a new environment. Nature has molded you to live on Earth; you were never intended to go through the polarity barrier. It would be impossible for you to live on our planet the way you are now. To begin with, gravitation is so great that you would not be able to breathe. Koldas is such a large planet; the forces of gravity are correspondingly greater. You might survive, but under such great torture…



'That is why Nature remolds you when you penetrate that invisible barrier. It adapts you, not gradually, but suddenly, to the new environment. Even if your body might be able to adapt itself to the new environment, your conscious mind would not. Your subconscious mind does not care where it is, but your forward or conscious mind could not cope… It is fortunate that you all have a subconscious mind, otherwise it would be impossible for any of you to leave your Universe. Here we have a storehouse where all this vital information can be placed. We program your subconscious and tell it exactly what to expect; how to react; what to do and how to do it. So when you make your final jump and you arrive at the new world, your subconscious has been trained to take full command. Then you will no longer have a subconscious mind; then the complete brain will function – you will need it! Indeed you will. The new world is much larger – every solar system is so much greater; the way of life is so different…

The things one has to do would require your thought capacity to be so much larger – your concentration, your eyesight, speech, breathing, much more... then the subconscious would disappear... Only on Earth is the mind divided into a conscious and subconscious. Although we in the Confederation do have a subconscious mind, it is very small indeed. So you see, this is the most important part of the conditioning. Other stages consist of being taught various things, such as communication and telepathy and the acceptance of new colors. We respond to a greater range of colors. This extended vision is very important and has given us problems with some who have left Earth. We have found that their brains will not accept the wider range and intensity (of the colors) and they become muddled and very confused. So it has become necessary for our scientists to develop new means of conditioning to allow one to accept this.

‘It is difficult to explain all this to you. I do not compile this program for conditioning, myself; it is done by scientists who have spent their lives on this work. Each one of you is well known, not only to one particular scientist, but to many scientists. Every one of you has accepted and passed the first stage. Now there is a pause and it is my job to find out more about you. I have to find out much about each one of you, right down to the last detail, and all this is recorded and submitted to the panel of scientists who deal with mental programming. They then make a very careful study of all the data and select the best methods for your individual needs.



‘This may be different for each person. In some cases, photographs are needed. This we manage also and every detail is taken into account. It is very necessary that all these details are considered, as we cannot afford any errors in conditioning one wrongly, for it could do much damage, especially if the person needed to visit the antimatter Universe. If he or she were wrongly programmed, it could be fatal. Remember, in the fluid stage, while you are flowing between the two Universes, we rely on your subconscious to piece you together again in the correct way. For example, your height and your weight would increase. You would become more robust, *depending on which solar system you are visiting*. If your destination were Triaxula, then it would be in reverse. You would automatically adapt to the environment…

‘You see, once you are beyond the light barrier, that invisible line which separates our two Universes; *once you have made the first crossing of the line, you can at any time travel at or beyond the barrier, disintegrate and reform and coast through the magnetic fields at will.* You will find subsequent crossings much easier and faster. It is like being in two different seas. You are in one, and we are in the other. We, for instance, found that when we break through to your Universe, various difficulties arose. Difficulties in breathing [can occur]. Your sunlight interferes with our eyesight a great deal and we find your atmosphere very humid, even in your colder regions. So you see, once you leave your Universe and break through that barrier, your body automatically takes on the right shape and size and you adapt to the environment, provided that you have been properly conditioned.

You will find that your brain capacity also increases and this is when the information which we have given you in our training will find a place. Your present brain is suited to your planet and present age. If you were to come to our planet with the same brain capacity as you now have, you would be in a great danger and trouble, for you would not be able to understand us and we would not be able to understand you. You would be as a primitive prehistoric creature would be if placed in your present society. That is why it is necessary to have this background training, this [voluntary process of advanced, subconscious mental] conditioning.

‘And when all of you have completed this, then you will be on our level. You are then full-fledged Koldasians, Byronnians, or Triaxulans or whatever the case may be. You would then find that you could travel at will from planet to planet, without any problem. And once you are beyond the light barrier, you will have no difficulty, even with the language. But this is new! The conditioning for language has never been used before for the scientists thought that it was far too much. Now they have realized that they can go much further and that is why, when you reach a certain stage, you will find that you have very strange dreams. These are very realistic dreams. You might even be able to smell or feel in these dreams. At first, this will prove alarming, for you may feel the heat of the day or the intense cold of the night. You will see things in your dreams, which we have placed there. You may, for example, experience living with nature.

‘We in the Confederation respect animal and plant life. We realize that without nature we would not live in a healthy and clean environment. As on Earth, nature is the same for us in the Confederation. Its beauty is very real to us! Mountains, streams, trees, flowers are the things we love –it is part of our life. Although we have a very highly evolved technical world, this does not mar our sense of freedom nor our appreciation of the beauty of Creation. We too like to escape from those technological marvels of science we have created. We too like to escape into the country to admire the beauty of the Divine One's handiwork, the planet he has given us to live on… Mainly this is what we impress on people's subconscious so that your conscious mind would know what to expect when you arrive. Your subconscious is trained to accept your new body, which would be totally different from what it is now. Sure, you would not turn green, or blue, but you would become larger people to suit the Koldasian environment. You are now being conditioned to be very close to the Koldasian standard.

‘Yes, going through the light barrier is a very big step,’ said Valdar, slowly emphasizing each word. Even for those of us who are used to [the changes]... For we undergo subtle changes when we arrive in your Universe. That is how we can mingle undetected with the population of Earth as we have done for a very long time in the past. But if we came here with the bodies of our Universe, we would be detected immediately. The major step is the ability to *flow* in the magnetic field through the light barrier. Of course, you would feel the changes here from planet to planet – gravity, heat, cold and so on. This you would experience, but your body has been conditioned to accept all this and much more.

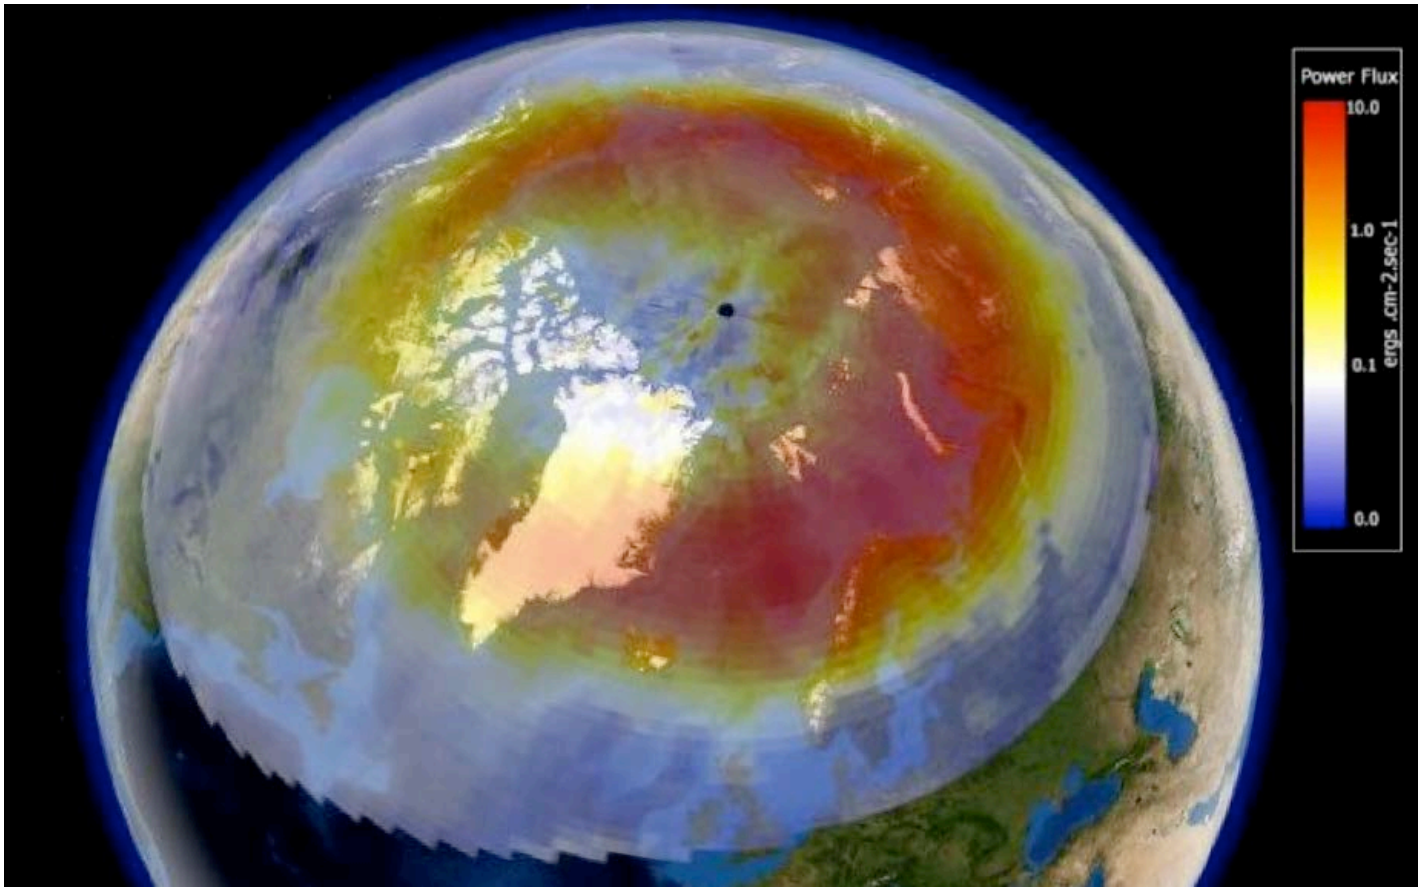
‘Edwin has already reached the stage where we can use him to listen through his ears, see through his eyes and so observe local conditions on Earth. We can do this at our discretion and so keep in close touch with you all. Yes, you would be very surprised to see the *real* Edwin, the Koldasian Edwin – his twin.

‘Then, of course, age is a factor with the person being conditioned. The mind would also have to be adjusted to accept that the body would automatically become younger beyond the light barrier. This it does for some reason or another. It seems that you get a *new* lease on life, regeneration. This applies to all those born on Earth. *For us who are born in our other-matter Universe, long life is the norm...* There are special rooms where this type of conditioning is done. These rooms look like the operating theatres in your hospitals on Earth. The carrier I am in at the moment has three such large rooms. In the centre, there is a couch on which the person to be conditioned lies down. Then a device, resembling a helmet, is strapped on the head… This is connected to the strata-recorder and the crystals, and the thought-impulses coming from these are transferred via this helmet

directly to the brain. We can accomplish this conditioning in about one hour. However, the person is first placed in a sleep state and firmly strapped-down where he or she remains until the light barrier has been passed. This is the normal procedure. Those who have been conditioned already would be treated as the crew and would be seated in the main control centre. This is where I prefer all passengers and the crew to be when we transcend. This main control centre is the safest area in an Astrael-craft. Once beyond the light barrier, things return to normal and one walks and sleeps, and one can use the craft as one would an ocean liner.

Valdar continued his explanation. 'I have used the word 'conditioning'. This is not strictly the right word to use; probably 'programming', training or teaching would be better expressions. *Remember we do not do this against your will!* It is entirely up to you. The very first step is that *you* accept us, then you automatically tune your mind to our wavelength and only then do we continue to prepare you for the next phase. I am really your teacher, with many assistants… Of course, those crystals and that valuable instrument, the strata-recorder, could not be dispensed with…

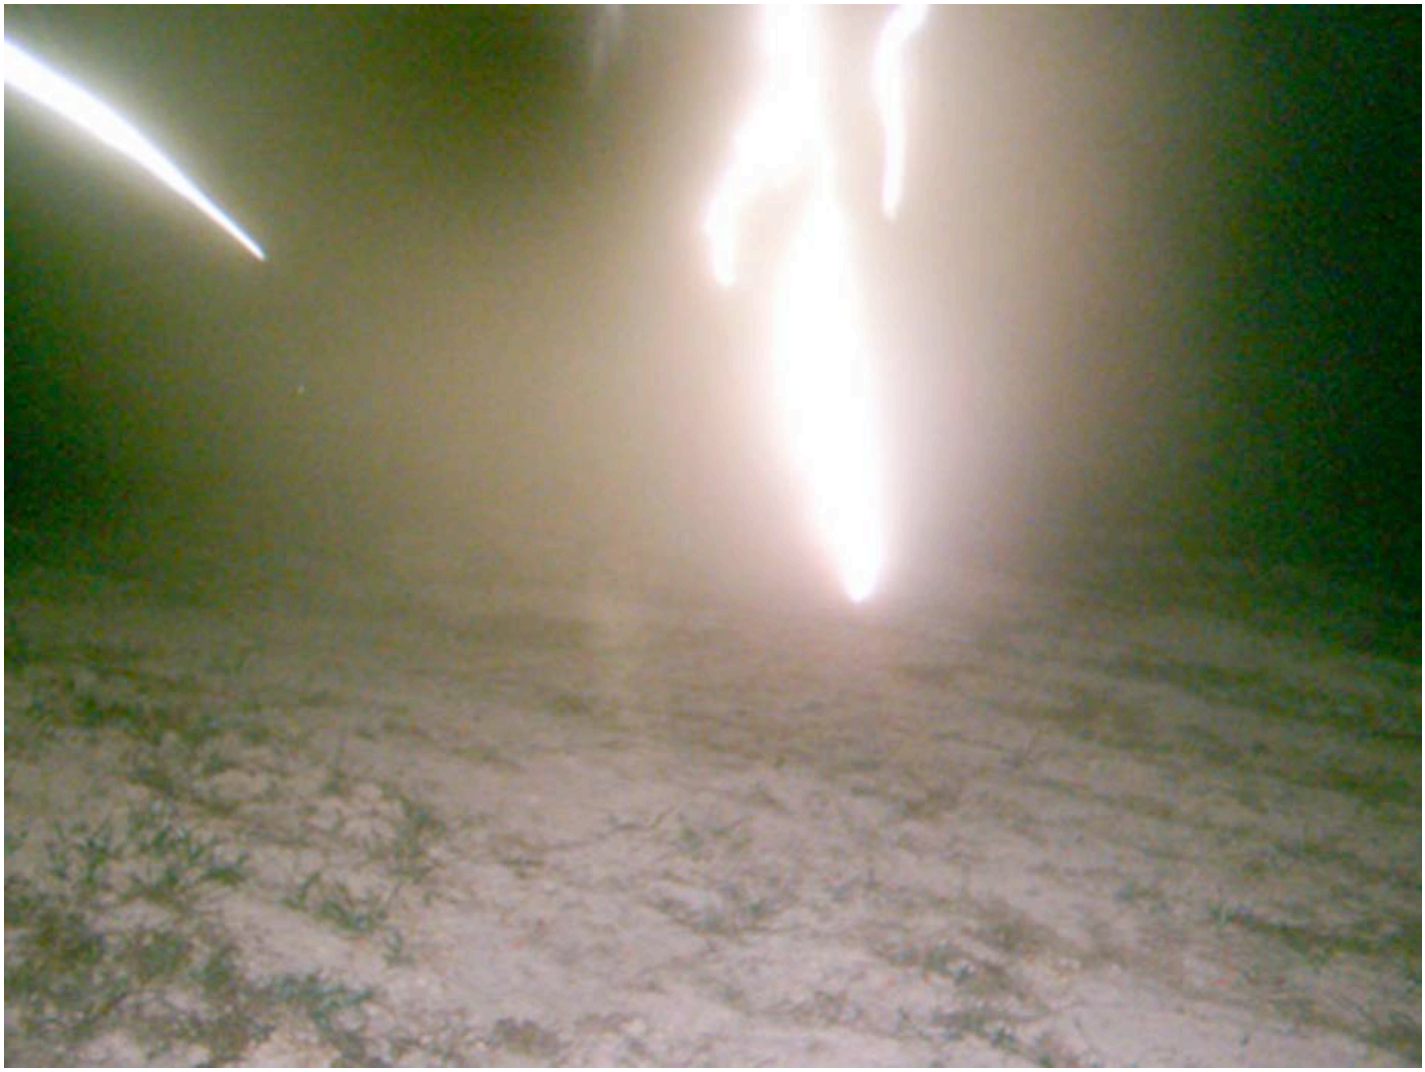
Then another aspect of this conditioning program emerged when the discussion turned to the enigmatic subject called the 'New Age'. Valdar said, 'One has to be conditioned to accept the New Age. In the ancient scriptures of the Confederation, it is written that the Divine One will change *many* planets.



'A voice tells us that there will be a change. The timing of the event will depend on many circumstances. It might be caused by the separation of the two Universes resulting in a complete break in the magnetic field between them. This event may bring about changes which would gradually usher in a New Age. There might be a change in the atomic structure. *Every atomic power station would then cease to function, and even your electrical power would stop. But a new source of energy will then be available…*

'Your physical world would undergo a transformation – a cleansing of the Earth. *Then the resurrection would follow in the still of the night. This transformation would be almost instantaneous. Even the heavens would change color!* Mankind will be afraid, but a great uplifting will follow. *There will be regeneration; for example, those of 90 years age will be as 50, and those of you who are 50 will be as 30*.

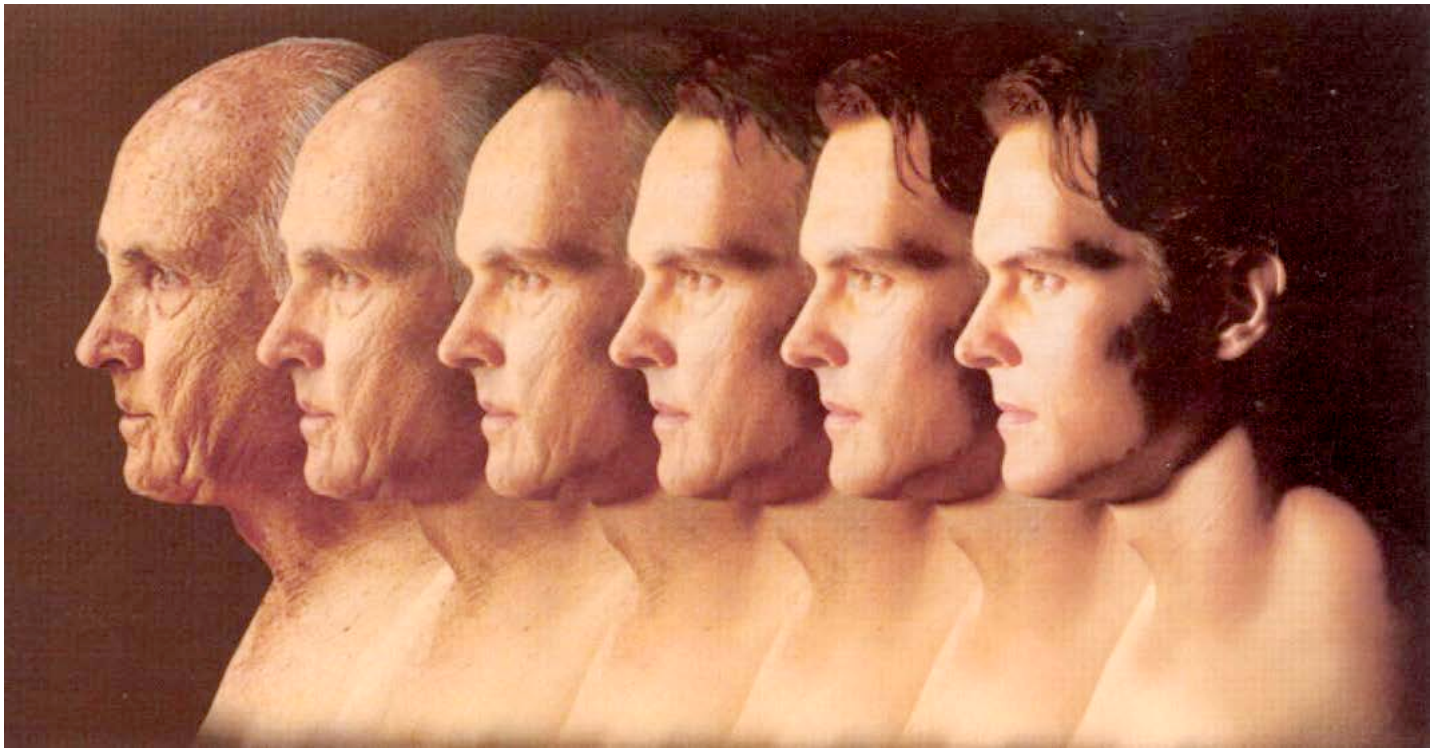
'Many would not see these changes. Only those of you who can now accept the new way of life will perceive it and experience it. Many are now being conditioned for that day... and also for cosmic flights, should that become necessary. Your subconscious mind is being conditioned to prepare for such an event, should it arise. Then, as if with the turning of a switch, true understanding would come. Some of you may become teachers or leaders…



Valdar also mentioned again the disturbance in the magnetic fields, which, although unobserved by astronomers on Earth, caused an insurmountable barrier to all magnetically propelled spacecraft. This disturbance came to an end on the 18th of January 1981… 'Once the magnetic disturbance [of the December Solstice of 2012 occurs]… and the magnetic fields return to normal, then there could be a radical change on earth. When the changes come... and come they will, the rotational direction of Earth will be opposite what it is today. It would take the planet quite a while to readjust itself, but it will do so, for the earth is still a very young planet. These things happen to young planets! And they must happen before your sun becomes unstable and turns into a supernova and burns everything out. But there are still many millions of Earth years before that event.

'But then there is the possibility that Earth may turn into a ball of fire as the result of a nuclear war. However, I feel that these changes, some of which I mentioned, will come before mankind on Earth can perform such a deed. Let us wait and see. There are still many things that even the Confederation is uncertain of. Changes can be observed and data analysed but only Mother Nature – the Divine One – will trigger the reaction that will change things permanently; I repeat *permanently* on Earth.

'The reversal of rotation of the planet would also change the polarity of Earth. North would become South and the South pole would become North. This could be brought about by a natural or an accidental cause… Great ships from space will come... then truly the planet Earth will be at peace. Those who remain will know our love and friendship. They will understand what the stars have to offer them. All this will be given to them and many things will be revealed in the New Age… And this is why we keep contact with you, to bring you messages of peace and love. We have tried to bring you an understanding of our planets and our way of life, which will be to your benefit when this great change arrives… and this will affect the whole of the Universe – not only Earth. These things have not been planned by us; we are just passing the message to you.' [17]

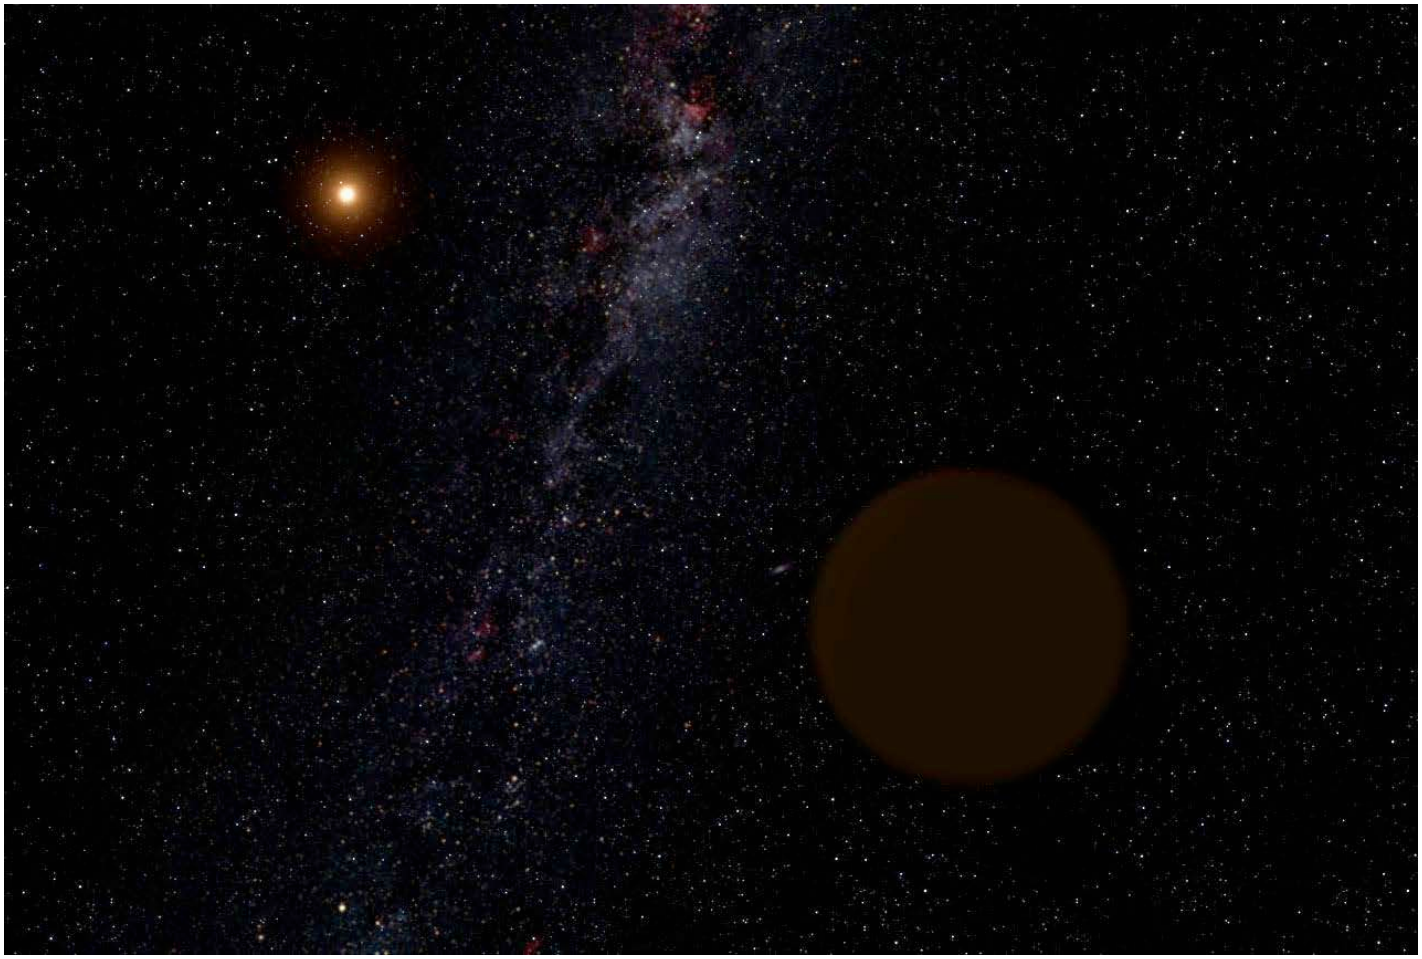


Valdar's clear statements elucidate dramatic future events and subsequent major atmospheric changes involving the oncoming shift of Earth to high resonance. *He foretells a 'physical… transformation – a cleansing of the Earth… in the still of the night… [that] would be almost instantaneous. Even the heavens would change color!'* A great increase in the intensity of cosmic rays bombarding the Earth, from a nearby supernova event or chain of events, would re-engage the now-dormant pyramids to ignite an atmospheric HHO plasma canopy, with plumes arching along the pathways of Fibonacci standing waves.

An astounding aerial HHO plasma phenomenon was photographed in detail on the auspicious date of 9/9/9 in Longview, Texas by motion-sensor game-trail cameras (above)[18], providing *recent, direct evidence* of the atmospheric and electromagnetic changes described by Valdar over 40 years prior to this enigmatic time preceding the magnetic reversal of December 22, 2012. The ultraviolet-A and infrared spectra emitted by the ionizing plasma plumes, as well as the precise standing wave configuration of the luminous arcs, confirm the photographed phenomena to be a product of ultra-low frequency irradiation of water vapor, causing its combustion by energized particles as HHO gas near ground level. *Atmospheric HHO plasma plumes and standing auroral patterns may become an everyday aspect of Earth's future.*

The inevitable result of high-energy atmospheric change will be *the purification of the ambient light* that penetrates many layers of HHO plasma to reach the ground, providing healing ultraviolet-A and infrared light to all terrestrial lifeforms. Just as demonstrated in HHO plasma beam healing devices like the Godlight cellular regeneration beam of Troy Hurtubise,[19] the atmospheric conditions will dramatically alter the lifecycle of all living terrestrial creatures: 'There will be regeneration; for example, those of 90 years age will be as 50, and those of you who are 50 will be as 30.' The regenerative effect of the frequencies of light emitted by HHO plasma promotes the extreme longevity enjoyed by advanced space-traveling civilizations on their homeworlds, and also generated inside the cabins of their interstellar spacecraft.

The highly resonant atmospheric purity of the planet Koldas affords a longevity that is significantly greater than that presently experienced here on Earth, although the oncoming energy shift may soon restore Earth's atmospheric purification processes, involving the plasma discharges of auroral activity and lightning strikes, that had become severely diminished over the preceding millennia:



> ‘Greetings... The message that I would like to leave with you this evening is, be patient, trust in us, for indeed you will realize that we can see a little further into the future than it is possible for you to do at this present moment. Trust in us and a new way of life, a new path, will be revealed to you, as the ancient prophets did in the past. Their monuments are still there today to be seen on your planet – the pyramids and the Sphinx…
>
> Other Superiors have governed Koldas, who have lived to the age of an equivalent of 250 Earth years. They enjoyed the full benefits of life as I do. I have no ailments and that is as it should be, and that is how it will be for those who share our life philosophy. *We are the instruments for the Divine Love and Truth to manifest through.* We are not Gods. Never think of us as such! There is one Divine Creator of all the heavens that you can see, and that we can see, and what lies beyond that again... I am Vax Noah... Salu kata katsu, farewell.’ [20]

This heartfelt message from the Superior of Koldas was transmitted from high above, among the stars where many things beyond Earthly vantage can be seen. The penetrating knowledge offered to us by the Confederation of Twelve Planets was seeded for germination during the cosmic changes unfolding since the beginning of their contacts with Edwin in 1968. Present scientific understanding of enhanced cellular function under the influence of a mild electrical current, and under the high-energy conditions of plasma beam healing devices, allows the conceptual framework needed to grasp the truth of Valdar’s insights. As he well knows from similar events in the history of other binary star systems like our own, the cellular rejuvenation effect of HHO plasma will be induced by the elevation of vast amounts of water into the atmosphere of Earth under the growing influence of an inaudible acoustic resonance.

The greatly increased ambient atmospheric luminosity generated by a glowing auroral canopy of HHO plasma, in combination with increased infrasonic stimulation, will alter the expression of DNA in all living creatures on Earth. In the terrestrial human being, pineal gland stimulation will bring about significant changes in the range of visible light and audible sound perceived. Our eyesight and hearing will extend significantly, aligning with the greater capabilities of Koldasian sensory perception. This was referenced quite literally when Valdar explained ‘what we can see is more than you.’ Layers of meaning within the simple, profound statements of the Koldasian visitors continue to unfold:

‘There might be a change in the atomic structure*. Every atomic power station would then cease to function, and even your electrical power would stop. But a new source of energy will then be available.’* Indeed, the intense solar flare activity will send massive coronal ejections that will influence the ultra-low frequency resonance of Earth through interaction with the Giza pyramids, which transduce all solar energy into inaudible acoustic waves. This new source of energy which is ‘here for mankind to use on our planet’ refers to these resonant infrasound standing waves that will be dramatically increasing in strength during the events of December 22, 2012. But what unseen forces are causing this great shift?

Valdar divulged the hidden presence of ‘Sola Kananda’, the brown star binary companion of our sun that returns once again from the direction of Cancer on its long elliptical orbit. Although the full timeline of predicted future events was explained to Edwin in detail, the public was only informed that preparations and conditioning contacts made by the Confederation on Earth are being conducted in case an emergency evacuation of Earth becomes necessary in the near future due to these cosmic changes:

> ‘Let me explain briefly the purpose of the plan. It is to save as many as possible in the event of a major catastrophe occurring on Earth. This might be a nuclear war or the collision with an asteroid or some other cosmic disaster involving Earth. This includes the approaching embryo sun, Sola Kananda…’
>
> We first heard about Sola Kananda approaching our solar system in 1973… Sola Kananda means a ‘sun that has not yet flared or blazed’, we are told. It is approaching from the constellation of Cancer. As our solar system enters deeper into its sphere of influence, changes in our planetary magnetic fields have from time to time been observed by the Confederation.[21]

These changes have been comprehensively mapped as nonlinear effects of focus infrasound standing waves that are increasing in intensity with solar flare activity. When considered in the context of the near approach of an invisible *embryonic sun*, one may infer that the ‘instantaneous resurrection’ of Earth is somehow intimately linked with the dramatic *rebirth* of the dormant brown dwarf star *into a red dwarf*:

> ‘In the near future, with the passing of Sola Kananda, your planet will pass through a certain region in space on its journey around your sun. This region is a belt which Sola Kananda has produced through space. This will bring about changes on your Earth. I am the one to inform you of... [these changes in great detail, which we cannot allow to be published]. This is why I am making this transmission. A great many changes will probably take place. Environmental changes on your planet will make your superiors and scientists look at space in a different light...’ [22]

With the dramatic revelation of the nearby brown dwarf binary twin, and all the auroral activity at specific infrasound standing wave convergence points, Earthly scientists will recognize the nonlinear alternations of locations of vortical activity and the connected design purpose of the world’s pyramids. But before these revelatory events are to occur there will be a brief preceding period of darkness during the time our solar system will cross the Galactic Plane, which Valdar cleverly referred to as *‘the still of the night’.*

Maya spiritual Elder Don Alejandro Cirilo Perez Oxlaj (above) affirms *this time of darkness may perhaps last for 30 to 70 hours during the Galactic Plane crossing* – thereby suggesting that *the solar corona may become extinguished* during the period of magnetic reversal, as if entirely swallowed by sunspots: when “we will enter the central magnetic axis… we cannot see the rays of the sun. We are inside. Once the Earth re-emerges from the axis we will then be able to see the New Sun.” [23] The galactic magnetic fields and cosmic rays of infrasound that drive our sun into incandescence will likely diminish altogether during the Galactic Plane crossing. Valdar referred to this as ‘the complete break in the magnetic field’, causing a temporary extinguishing of the solar corona during the process of magnetic reversal of the entire solar system –the sun, the brown dwarf binary twin star, and all of the orbiting planets.

Mayan wisdom reveals the brief darkness will end dramatically *in the bright flash of a synchronization ray emitted from the Galactic Central Sun*, causing ‘nearly instantaneous regeneration’ for all living things as well as global auroras and the incandescence of the red dwarf star. Koldasian Elders speak literally, not figuratively, when stating Earth’s *‘scientists will look at space in a different light’* –through an atmospheric plasma canopy glowing red, as *‘even the heavens will change color!’* Wisdom teachings preserved in the Mayan ‘Pyramid of Fire Codex’ unequivocally state*: ‘Come, reunite pilgrims, for the sky is in flames!’* [24]

> Valdar hinted at some future catastrophe and the changes that this event would bring with it. But he gave no due as to when this cataclysm or cosmic upheaval would take place as this was unknown even to the scientists of the Confederation. They are certain that it will occur as they have learned to interpret various signs in their long history of cosmic observations… The virgin lands where the ancient Atlanteans settled will one day be a haven for mankind again. For after the big change takes place, where there are now oceans, there will be land and where there is now land, there will be oceans. The continents of America, Africa, Asia and Europe will no longer be there. In their place will be these 'new' lands, now at the polar regions, and civilization will start again for we think your polar regions will not suffer in this big upheaval. They will remain more or less intact but the climate will change and the icecaps will melt. On the rest of Earth's surface there will be drastic changes! The present polar regions are even now being prepared, for they will be needed. You may have noticed that there is a lot of UFO activity there.' [25]

Indeed, a fascinating component of the preparations mentioned involve giant aerial plasma displays over major urban populations, most spectacularly witnessed by residents of the Chinese cities of Dalian and Yantai in 2005; Tomsk, Russia in 2006; Trondelag, Norway in 2009 (photograph above); and over South Australia in 2010.[26] Such technological demonstrations of fourth-density plasma shake and arouse human consciousness to awaken for the long-awaited day when the humans of Earth fully accept the great offerings of cosmic visitors, as the time beckons when such help becomes increasingly necessary.

Recognition of the wisdom teachings of cosmic observers allows the integration of new concepts for a more balanced awareness. The peaceful and wise Confederation of Twelve Planets is but one of innumerable cooperative networks of cosmic civilizations exploring the endless magnetic fields in search of knowledge, toward the ever-present call of Oneness. Spiritual adepts among this small planetary group attain an extended lifespan by means of the radiations of the same high-energy HHO plasma that will soon be witnessed throughout the skies of Earth. The dynamic shift of Earth resonance to a higher level follows a pattern of revelation that inevitably occurs during the ascendance of all young planets and all nascent civilizations, along the path toward collective consciousness and cosmic co-creation.

The Plejaren

The Plejaren

Eduard Albert Meier (b. 2/3/1937) is a Swiss farmer who has been visited since the age of five by extraterrestrials from the region of the Plejares star system, representing a wise and peaceful Confederation of planetary systems. Eduard's childhood contacts were made by an aged man named Sfath, while as a young adult he maintained contacts with a female cosmic visitor named Asket. Through his later years he maintained contacts with Quetzal, Semjase, her father Ptaah and many others.

'Billy' is a nickname Eduard received in Tehran during his long travels on foot through the Middle East and Asia Minor (seen at left, in 1980). Billy Meier has documented years of contacts and remarkable dialogs with visitors from the Plejares star system. He has also produced several 8mm documentary films of Plejaren spacecraft, or *beamships* as they are called. Meier has also produced several hundred high-quality photographs of extra-terrestrial spacecraft of many types – both from the ground and *in the air, aboard the Plejaren spacecraft itself.* The sheer breadth and diversity of highly advanced information and physical evidence provided by Meier concerning his contacts and cosmic travels with the Plejaren calls for the close attention and discernment of the human beings of Earth, who grow in awareness by the slow process of assimilation of knowledge.

While many contactees have experienced transdimensional travel and orbited the Earth and her oceans, Meier is one of the few present-day humans who has time-traveled by hyperleaps through deep space with his cosmic friends and returned with photographs and scientific details that are undeniably valid. The most profound teachings that imbue Meier's life's work are the spiritual teachings he has received from the Plejaren and presented to humanity through his many books, now available in several languages. The simple and penetrating spiritual teachings of the Plejaren are now transmitted through the Semjase Silver Star Center in Hinterschmidtrüti, Switzerland, providing an opportunity for synchronized meditation practices with billions of advanced spiritual beings throughout the Confederation's unified network of planets, who choose specific times for coordinated interplanetary peace meditation on a regular basis.

The Confederation comprises a collective of diverse civilizations that remain deeply rooted in spiritual connection through their respective planets, providing a guiding influence on worlds in crucial phases of developmental shift, as is the present case of Earth. These spiritually and materially advanced visitors remind us that even they grow food in organic gardens, and maintain *direct contact with nature by planting with the hands in the soil, in the creative intention of love.* Plejaren wisdom finds guidance in the Laws of Creation, and encourages humanity to learn for ourselves through investigation, thoughtful reflection and the application of reason. In spiritual aid of the human beings of Earth, Billy confers their extensive spiritual knowledge and physical evidence in the form of photographs, films and even samples of exotic materials.

Eduard's space-traveling visitors explained their ancestral origin in the Lyra star system, before an ancient cosmic migration to the Plejares star system, including the beautiful planet of Erra, which resides in a *fourth-density space-time configuration about 80 light years beyond the Pleiades star cluster* (above). The name Plejaren ('play-yar-en') means *'Law of the Sevenfold'*, reflecting a penetrating cognizance of Creational Law and the Truth of Spirit. Offerings of the Plejaren Elders on the physics of Spirit were balanced by comprehensive lessons on solar and astrophysics. Meier was informed that the Sol system, outside the Milky Way, constitutes something like an enclave because it floats as a single system far outside a spiral arm, moving at high-speed towards the Hercules star system. The distance from the Sol system to the middle of the galactic central sun is 35,002 light years, according to Plejaren calculation.

Spiritual demonstrations of Semjase's intentional healing ability were given during various contacts when she rapidly restored Meier's dwindling health by concentration alone. During the 50th contact of April 6, 1976 Eduard's broken ribs were mended in minutes by an electro-healing apparatus within Semjase's beamship (opposite), extending natural mental capabilities through technological means.[1] The ability of the Plejaren visitors to predict all major events in Eduard's life was repeatedly demonstrated, and even the date and cause of his death were previewed and discussed with him in detail. Another definitive event in his life predicted by the Plejaren, for his psychological preparation, involved the loss of his left arm in a bus accident in Tehran in 1964. After the necessary amputation, Meier healed in conventional hospice and wisely refused a biotech prosthetic arm offered by his extraterrestrial friends, on the grounds that his safety would be compromised by the greed of other humans who would inevitably attempt to steal the advanced extraterrestrial biotechnology. *In this, he has found the resounding truth of the spiritual lesson.*

Rather than secretly enjoying the material benefits of his contacts, Eduard Meier instead disseminates the advanced spiritual teachings of the Plejaren Elders, inviting each Earthly human being to consider the truth of spirit. The path of inner seeking through meditation and reasoned thought has become the focus of FIGU, a conscious community that has co-founded the Semjase Silver Star Center. Serving primarily as a meditation center, the facility synchronizes the FIGU community for the development of telepathy by exposure to focused infrasound. *From there, Eduard's enduring teachings have radiated their light:*

In truth, the Earth human lives a life that does not ever deserve the designation *life*, in the true sense… [for he] no longer knows of the strengths and possibilities that lie within him and are suppressed. The human's psyche has become a prisoner of the material, and the human's corporal nature hinders him from glimpsing more than only a weak shimmer of the true light. But certainly the day will come when the human will venture forward somewhat further than usual in his thoughts, and then still a little bit further, and further.

Then the inner light will gleam in him and he catches, to start with, only a small and fleeting glimpse of his true essence. Indeed, then comes the point in time in which he becomes somewhat more aware of it, and then still somewhat more. So the light of truth with which, namely, he is one, with eternal life and with the eternal power of his essence, gradually comes on for him. This light then illuminates his entire psyche and takes possession of it.

Awakened through this new consciousness, the human holds the thoughts of this oneness firmly, and thereby now progressively lives in these thoughts, his life now flows in constant actualization of the oneness of the creational Being. And thus the terrestrial Earth human is transmuted into the human who is of Creation. Compared to the new life, the old one only deserves the name *death*, because ignorance and narrow-mindedness is like that. But this deadly life is no longer able to shackle the new human who, before, in the old life, in a certain sense, had actually been dead -a living corpse. (OM: The Book of Truth, 43:153,167-177) [2]

Knowledge of the inner dimensions of the human being inspires reflection on the endless gifts offered by the Creation, granting natural relief from the burden of the physical through the transcendence of spirit. The moral dilemma which now cripples Earthly consciousness, namely the role of psychopathy in politics, was solved naturally by the Plejaren science of biorhythmic healing by genetic enhancement through the tri-thalamic heartbeat entrainment during fetal development.[3] This advanced preventive infrasonic genetic technique also relieves the moral crisis of abortion, which is permitted by natural chemical methods using essential oils (like that of the Neem tree found here on Earth[4]) within the first three weeks of pregnancy only, as "the time of the beginning heart activity coincides with the entrance of the spirit of the newly conceived human being, so on the 21st day after conception." [5] The determination of spirit in accordance with Creation propels the consciously seeking individual from within his/her deepening experience of the luminosity of his own being, as taught by Semjase during the 18th contact of May 15, 1975:

I want to proceed with the teaching of the spirit, as it is the most important of all things… The experience reveals that the Creation is unending beauty, a beauty above all beauty, borderless, intensive happiness without end, wisdom, knowledge, ability, truth and absolute determination. When that is recognized by the human then he leads every one of his joys instantly back to its origin, to the unending joy of Creation.

Wherever he sees something beautiful, be it now a flower, an animal or a human, or something else, he thus brings it instantly into interconnectedness with the infinite beauty of Creation itself. Wherever the human sees cognition reach expression, in this or any form, in an impressive and exalted manner, then he knows that it has its roots in the endless cognition which is Creation. Wherever life stirs itself, be it even in the tiniest Being, in a creature, as, for example, the microbe, there, behind this life he glimpses the infinite, the eternal and the creational. Out of that he attempts to deepen and expand his understanding and feeling through which he contemplates the essence of the creational and its inseparable presence at any time and in any space in many kinds of ways in the daily life and experience.

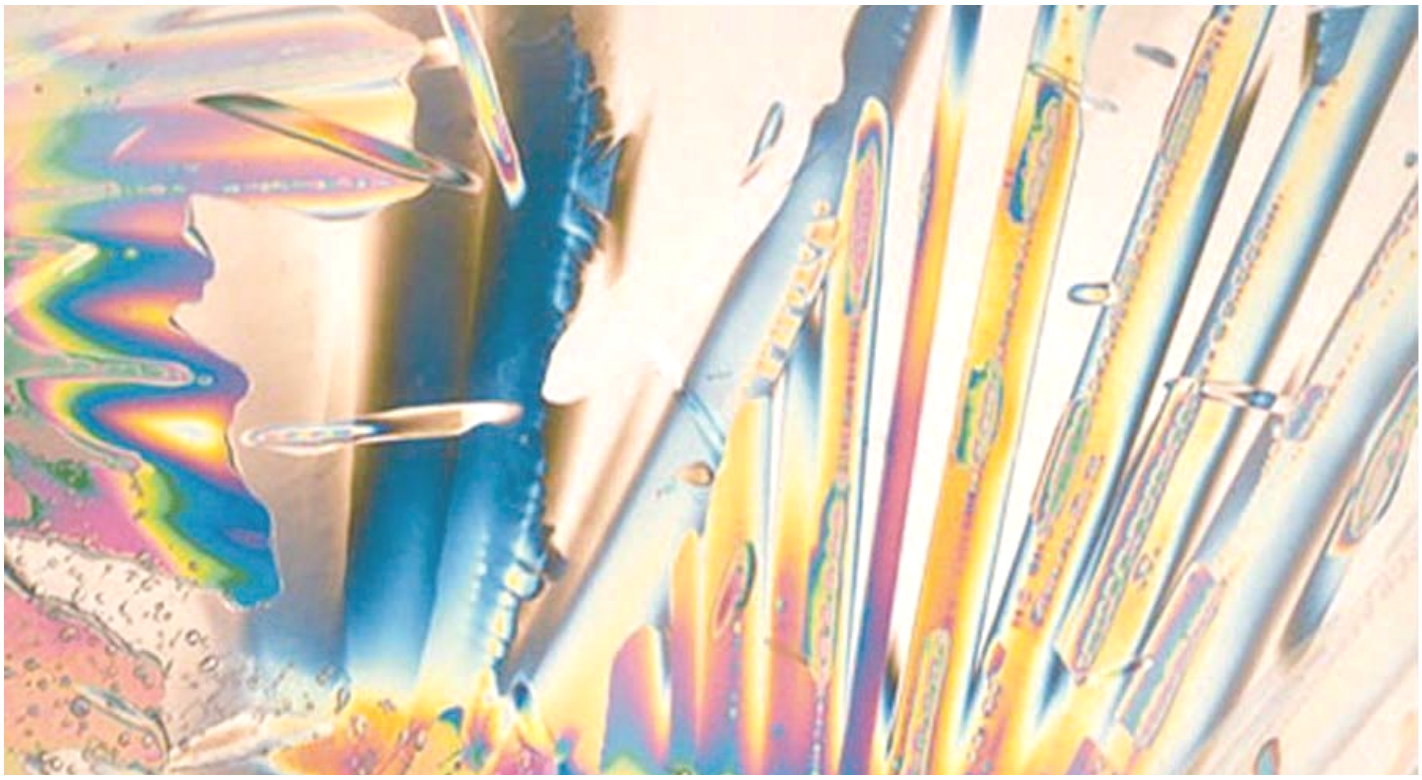
Creation exists in every human as a fragment of himself. Once this thought has first deeply penetrated the human and become his experience, then any fear and all doubt in him disappear. If he knows that the Creation is all-knowing, and almighty then he gains in inner peace and security and is immune from stupid thoughts and wrong feelings. Repeated contemplation about the all-present, the truth, wisdom and the ability and knowledge of Creation as constantly eternal, as dignity and worth, allows the word and the designation Creation to become something very meaningful in the human – to something which calls forth transformations in the feelings and transformations in his manner of thinking.

The more his intelligence is effective in this direction the more he gains radiating light, the more powerful his personality would be and the more blessed his entire life and works would be. Again and again the human living in clarity of consciousness would produce in himself, anew, the strong perception that the Creational is far more real than his body's feelings. This perception rules, without interruption, the human living in accordance with spirit. The creational grasps possession of his consciousness whereby his senses are full of peace, strength, joy, knowledge, wisdom, truth and hope. All measures that the normal human grasps in his material-intellectual thoughts in order to attain peace, happiness and strength always show themselves as deceitful, while the constant controlled-ness of the human who is living according to spirit would be pulsed through with the dynamic power of Creation.

He who is a human living according to spirit is very dynamic in all things. He attempts, uninterruptedly, to reach his goal as quickly as possible. As long as he lives he would, in accordance with this, use the time for applying the creational ability with all the energy available to him. He would never allow this undertaking to be lost. Everything possible can happen in the course of time, yet his desire for the creational would never be extinguished in him. He can strike hindrances in which he suddenly has no sense and taste any more for the necessary material things, yet he never loses the taste and sense for the creational because he knows that the Creation embodies the true Being.

Only a human who fights hard for consciousness and spiritual goods and progress, for knowledge, truth, logic, wisdom and love harvests mighty fruit of a spiritual and consciousness kind, because they do not simply fall into his lap. First, before the first results would be obtained, it is required that the spiritual-intellectual manner of thinking must learn the path of creational thinking and recognize its absolute correctness and determination. Yet when these first results come about then the cognizant one steps onward with great steps and expands himself in spirit and consciousness to a factor of power. First, through this, already known facts, knowledge, truth, logic, wisdom and love would be self-evident, which first, however, must be gained through hard work. Indeed, the path does not end at this point, because further seeking, further searching, further development and further recognition lead into the borderless duration of time.

Everything possible may happen in the course of time, and hold the human back from taking up deeds, yet the human living according to spirit knows no borders and does not allow himself to be kept from his goals by any kind of events or bad future out-looks. For him the future already exists in the present, so it is that everything must be done here and now in order to reach the highest spiritual and consciousness state… Again and again he produces in himself the strong perception that something is there which gives him immeasurable power and makes him free from unreal assumptions; (it is) the truth of Creation.



Always again and again the human produces in himself the strong perception that he finds, in the ocean of creational light, his wisdom, his knowledge, truth, logic and love, which for him first entirely enables the Being of life. The joy of the human who is turned towards Creation exists as a result of his reverence produced from the creational and Creation; (it is) this, in which he accepts the almighty will in the creational laws and turns the absolute determination of these laws to his own determination and practically employs them.

He brings his dedication to the laws to expression through the learning and utilization of all spiritual and consciousness facts, but never through belief, assumptions, serving and humility. The only way to learn exists in the unremitting efforts and striving to obtain higher spiritual and consciousness cognitions and to bring the capabilities into application which have unfolded through this. Patience and endurance and the development of higher understanding, recognition and engagement of the cosmic and universal love, deepening of the spiritual and consciousness knowledge and ability, as well as the shutting-out of material-intellectual thought powers, like egoism, materialism, pride, envy, greed and jealousy and so forth, are thereby of decisive significance, because only this guarantees the recognition and obedience to the creational laws…

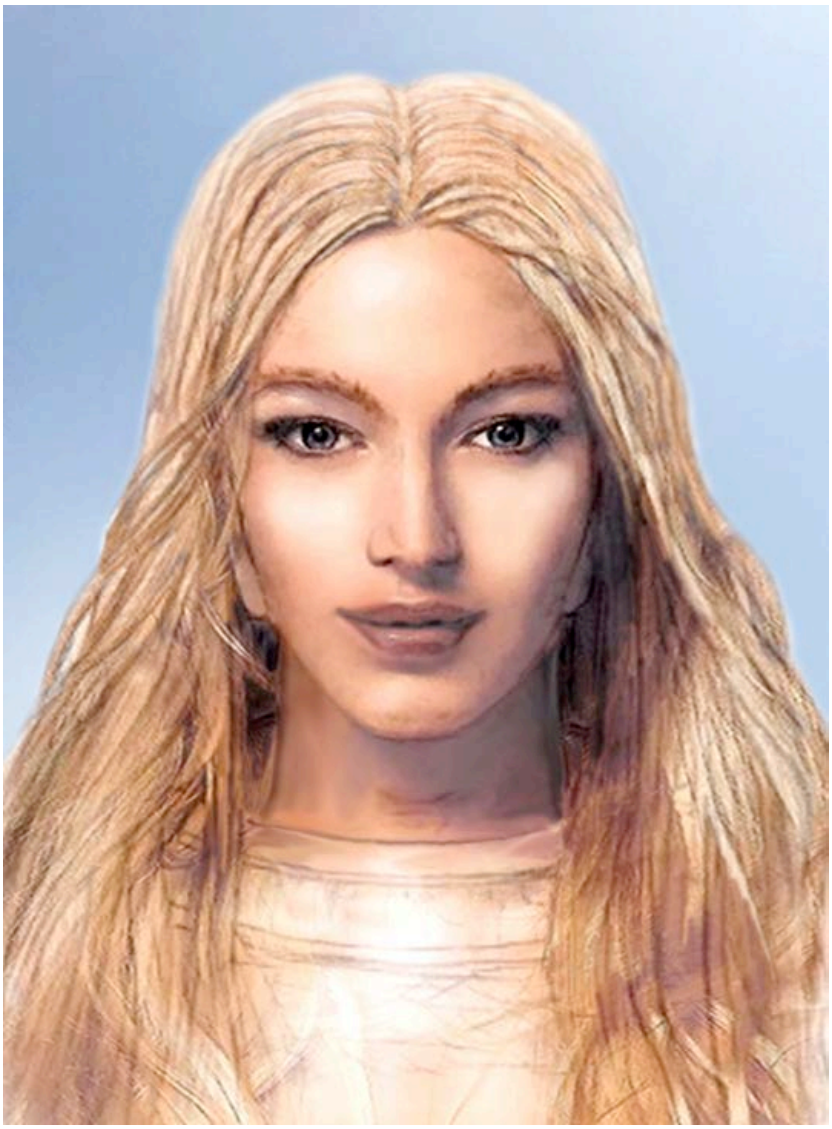
He who is a human living according to the spirit attempts constantly to maintain himself always, and under all circumstances, in the vibrational realm of creational motions. Should these once, through some kind of influences, be in danger, then he calls on Creation in the highest power and thus protects himself in its highest vibrational power, from the negative. In this manner he proceeds so far along until the creational essence in him has produced the absolute determination of defense against the negative.

> [In his thoughts and his waters,] the human is always the bearer of some things. Many carry oppressive feelings in themselves, others grief, worries, problems… But he, who is a human living according to the spirit, is a bearer of the creational, of the spiritual… He immediately transforms even the most negative thoughts that come and want to destroy his spiritual-intellectual thoughts, into creational power and wisdom. So he makes everything creational and carries it as a block of power in himself. Thereby he is a traveling temple of Creation.

> The intelligences of the human living according to Creation would be ever more inspired and press always deeper into the spirit-consciousness. He who lives according to the spirit presses always deeper into all things with his cognitive abilities and grasps the warmth of the fire of the creational presence in everything. Thereby the spiritually thinking human would, over-all, be cognizant and conscious of the power and the truth of the creational presence. What therefore remains unrecognized by the everyday perception of the senses, [–as *cosmic infrasound–]* would be spiritually-consciously perceived by the human living according to Creation…
>
> The material life on the Earth is like a passing game, an evaporating phenomenon, but behind it lies the eternal and timeless truth; the spirit of the creational presence and the reality of Creation. This creational reality carries in itself all riches and realms of the ability to do with wisdom. This is the remaining, the timeless constancy and imperishable. This is no game, rather the eternal and timeless truth and wisdom, knowledge, freedom, love, logic and ability, the relative perfection, the absolute determination…[6]

The pristine clarity of Semjase's spiritual teaching continually unfolds within the conscious listener, expressing the source of all joy in Truth and the oneness of Creation. The purity of spirit and thought present in the Plejaren wisdom teachers reflects their physical purity, drinking the celestial waters of their resonant home planet of Erra. The comprehensive knowledge of this advanced cosmic culture directs their harmonious lifestyle to benefit from a collective consciousness and the telepathic abilities endowed by following the resonant life-path set forth by The Spirit. Dwelling within the field of heartbeat resonance, one enters into direct communication with the living instruments given to us by the Creator, to hear the joyful laughter and all-penetrating cosmic *Om* – the vital force of the human being engaged in the 'synesthetic' state of inspired conscious co-creation.

While Eduard had been educated in the teachings of spirit since his earliest contacts with Semjase's grandfather Sfath –at the age of five– comprehensive spirit teachings were offered in later contacts with Semjase, beginning on January 27, 1975. The contacts of the 1970s involved many lessons on the Truth of Spirit, but also began a period of extensive photographic opportunities for material evidence.

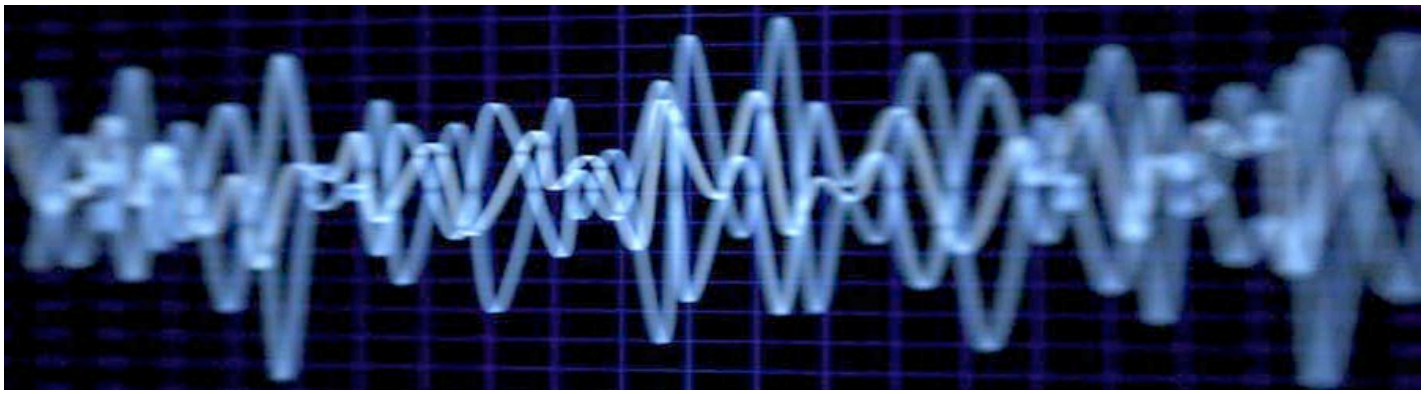


At left is a montage created from Meier's original February 27, 1975 photograph taken at Jacobsberg-Allenberg/Bettswil, Switzerland. Meier has even taken photographs *from inside Plejaren beamships in flight* (below). The blurring and tinting of the image is a result of special coatings used in the windows, likely comprised of quartz glass, which glow orange in our atmosphere. The resonant acoustic and electromagnetic environment maintained inside the Plejaren beamships interferes heavily with the camera functions, often overexposing the film due to high-energy radiations or distorting images beyond recognition. Dozens of remarkable photos taken in space are marred by significant focal problems.

All of the photographs produced by Eduard Meier during his contacts were obtained by permission of the Plejaren, while certain sensitive areas were prohibited as subjects for documentation. Portraiture of the Plejaren visitors was not permissible, nor was Meier allowed to photograph the interior of the beamships. Why do they not yet present themselves to the human beings of Earth openly? Semjase's father, Ptaah, provided Billy with a concise answer to this question, revealing a profound understanding of the nature of human consciousness at the present time, and the primacy of reasoned thought and careful deliberation:

> *Ptaah:* When the epochs change, so also do the minds of the forms of life. This has also happened to humans now. The Age of Fishes was characterized by religious fanaticism… Then the birth pains of the Age of Aquarius began, and suddenly the Earth human started to listen inside of himself. And he started to think and to explore, and suddenly recognized logic only in truth. He developed in a short time his thinking abilities, and searched and explored… which is a characteristic of the Age of Aquarius. And this is one of the main reasons why certain human beings are now being contacted by extraterrestrial forms of life again. The present Age of Aquarius demands thinking and spiritual evolution of the humans of Earth. This cannot be achieved by seeing and listening with the physical organs only, but only by reasoned thought. If we appear officially in our beamships and spacecraft, the effect of deliberation and of thought would suffer, because the Earth human, in his present state of evolution, does no longer deliberate and search that which he can see with his own eyes and hear with his ears. Beyond the seeing and hearing, the interest is short-lived, because that soon becomes a natural event to him, and he no longer cares. What he knows no more interests him. His interest is only aroused by secrets for which he can hunt.[7]

The Plejaren visitors always wore a protective suit that Meier described as matching the texture and color of elephant skin, but was creased and folded to the exact forms of its wearer – perhaps some kind of organically grown material fit to form. Meier also described a reflective circular metal neck fitting with the apparent function of a helmet-mounting lock ring. The Plejaren go helmetless on Earth without exposing themselves to our polluted air, as this circular neck fitting is electrified to create a *standing wave* over the nose and mouth that purifies and sterilizes the air taken in. This apparatus protects the wearer from radioactive uranium dust in Earth's atmosphere due to humanity's seemingly insatiable lust for war.



The low-resonance environment of Earth had long ago reduced human lifespans to the brief span of near 100 years. This limit on longevity to which terrestrial humans have all become accustomed is a drastic and direct result of the weak and offset magnetic field of the planet, corresponding low levels of infrasound resonance and very high levels of deuterium (the heavy form of hydrogen) in our waters. Traces of *heavy water* pollute the waters of Earth and her surface-dwelling human populations, yet the process of her cleansing and transformation into a pristine paradise already grows from seeds within the human heart that will require a quantum shift to high-resonance. The high-resonance environments of planets with atmospheres containing only *light water*, comprised exclusively of protium (being deuterium-free), engenders human lifespans of perhaps 1,000 years or more as enjoyed by the advanced Plejaren civilization. An enhanced and colorized image based on a self-portrait drawing by Semjase (at left)[8] captures the refined grace of her features at the age of 330 years, in 1975. The facial features, size and proportions of the Plejaren race are identical to that of Earthly human beings with the exception of their long, connected earlobes, which may have inspired an association with wisdom long ago (pg. 4):

> [Concerning lifespans, investigator Lt. Col. Wendelle Stevens concluded as follows:] This 1,000 years average age for the [Plejaren] seems strangely coincidental, as that is the [Bible's] reported age of Earth humans before the Great Flood, when the dense vapor envelope surrounding the Earth came down in torrents everywhere for scores of days. Loss of the vapor envelope reduced the atmospheric protection of Earth's creature species from the harsh [UV-B and UV-C] radiations of our sun, and the lifespans of all creatures decreased quite dramatically and rapidly to less than 100 years for humans, and vegetable and plant yields were reduced accordingly.
>
> Recalling the extraterrestrial's statements that we are descendents of their ancestors when they were here long ago, our 1,000-year biblical longevities take on new meaning. Loss of that atmospheric protection has shortened our lifespans to 1/10th its former scale… An interesting observation made later on in the contacts by one of the extraterrestrials, describing a protective [HHO plasma] screen they use around their vehicles, and even around their person when out of their vehicles, indicated that they age in our atmosphere as much as we [terrestrial humans do] without their protective screen![9]

The vital force of *infrasound* expresses itself much more intensely in the highly evolved atmospheric conditions on Erra, imbuing an extreme longevity and advanced consciousness among the Plejaren through psychoacoustic entrainment. Meier initiated a profound lesson during the 39th contact of December 3, 1975 by pointing out the brevity of the human lifespan as a result of "the fact that the forces of thinking of each single human being are able to raise or lower the force of life of the fellow creatures":

> *Ptaah*: Certainly, this question is of great importance… The age of every creature is shaped partly by the penetration of its outer forces by others of the same kind of forms of life. Because the thinking of a form of life in cooperation with spirit generates an extremely logical, that is Creation-accorded, force which is released as high-frequency radiations and oscillations, an immense force is generated which is able to influence everything. The Creation-accorded force penetrates all, truly into all, material forms of life and matter, and influences them according to their kind and form. Each form of life owns an, adapted to its spiritual level, age of living or time for living, thus as well with the human beings of Earth. In earliest times, when the human being of Earth was procreated here by his ancestors, his average age of life was 1,007 years of living, and as taught by his procreators, possessed an enormous spiritual level of knowledge and abilities.

> But unexpectedly rapidly, he fell into religions and their heresies, and by this lost true knowledge and the truth. He necessarily began to work against natural law, became a stranger to it, and lived under the bondage of self-created laws. This all together resulted in the loss of the high average span of life, which in a few thousands of years decreased ever more and settled at the twentieth part of its earlier time. In the beginning of the new epoch [of the Age of Aquarius] a change for the better once more marked itself, from which the average span of life slowly increases. The main reason for this is to be found in the acknowledgement of the truth and connected spiritual direction. The more then that spiritual direction turns itself again towards the truth, the higher again develops the average span of life, because here, by this also, the altered genetic and other factors regulate themselves again, which in the course of millenniums had become wickedly influenced. The mass of Earth human beings moving in spiritual form is still relatively low, and in many cases only beginning to recognize the real truth, thus hitherto still no great progress could be achieved. But the more the Earth human being turns himself towards the real truth, the more does also increase his average span of life.
>
> Seen as a whole, every form of life is of important meaning, that is, in its thinking and the forces whereby released. Each thought radiates out as a great force and strikes the other creatures who attract these like magnets. According to their quality, negative or positive or balanced, they generate in the receiving creatures kindred forces, under according effects… But by the heresies and other misguidance of religions, the Earth human being is mainly only able to unfold forces which destructively influence all forms of life. Such destructions are found in the injury to age, that is, the lowering of the average age.
>
> The greater the assembly of human beings, as for example in cities, the lower sinks the average age, because in such places immeasurable thought energy is released, and penetrates into the fellow creatures… But also all materiality suckles itself up on these destroying forces, and in this way falls to early destruction, as for example iron, which normally does not rust so fast as is the case on Earth. By this, each Earth human being is himself guilty for the early death of his fellow creature, consciously or unconsciously, when he thinks in uncontrolled form, and in this way releases uncontrollable destructive forces. If the Earth human being wants to think right and according to the Creation, then he must guide the course of his thinking neither in negative, nor in positive trails, because both are degenerations which create bad consequences, thus they are against the Creation. Right thinking declares itself by a balanced and natural manner of thinking, in which way life becomes procreated and maintained.[10]

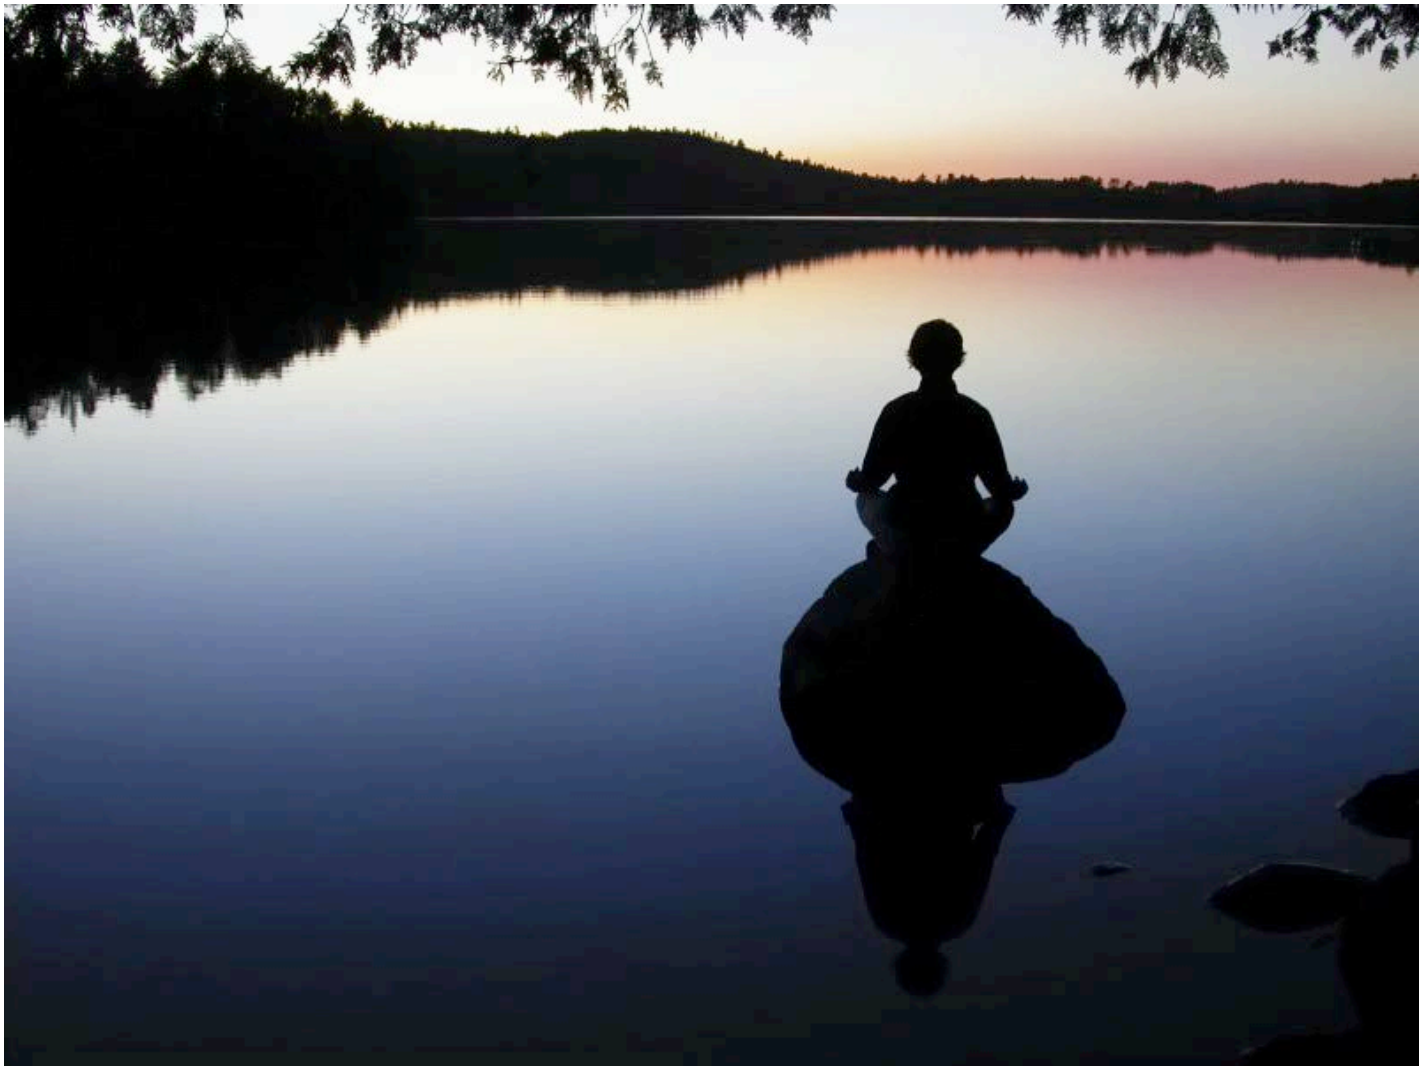
These penetrating lessons generate a heightening of the spiritual resonance of those humans who can receive the lesson and attune their thoughts, feelings and actions accordingly. The voluntary effects of teachings of truth was precisely given by Semjase during the 91st contact of November 17, 1977:

> *Semjase:* …In result of your education and your knowledge, it is you, [Eduard]… who emits the highest radiations on the Earth… When for example exists a lesson of the truth, then its radiation diffuses very quickly and very intensively. If now other living creatures find themselves the truth within this lesson, by which fact they themselves strive towards the truth, so they become liberated for the reception of the radiation [from the speaker of truth]… In consequence of this, the receivers of the radiation tune themselves inside of the subconscious for elaborating the lesson of truth towards its best inside of themselves, whereby they generate automatically a relationship of themselves to the diffuser of the lessons and even to his place of stay.[11]

The highly developed thought forces of Eduard Meier (above, 2010) were briefly demonstrated by focused intent in 1977, when he levitated a ½ ton oven across a short distance of several meters, and later that year demonstrated the heating and melting of several coins in his hands.[12] The real danger of *oscillation interference* was concisely addressed by Quetzal during the 97th contact of December 28, 1977:

> *Quetzal:* The reason why we do not maintain connections in physical form with you Earth human beings, is as follows: The spheres of oscillations between the Earth human being and ourselves is basically so much different, expressed in forms of negative and positive, as of the balances, that it could have heavy consequences, if they would touch one another. Normally those oscillations of the human being reach up to 90 meters [or 295'], which is why care has to be taken, this distance does not fall below that, thus that Earth human beings shall not come within this point of distance to us. Our oscillations are very highly sensitive, and react strongly to other oscillations, which penetrate towards our sphere of oscillations. In comparison to the Earth human being, we are standing very high within our total development, namely by about 3,500 years in advance of the Earth human being, for which reason as well our complete field of oscillations has become subtilized. When now oscillations of a much less sensible Earth human being would hit us, just that way, that Earth human and thus quite imbalanced and negative oscillations would penetrate into the field of our oscillations, then this would be equal to a very strong shocking of the structure of oscillations, resulting in a strong outer influence leading to a sudden uncontrolledness of reactions, thoughts and actions of ourselves, which at the same time release uncontrolled feelings of fear…

Normally we use, when we walk among Earth human beings, which doing yet is extremely rare, an instrument, which protects us from the lower Earth human radiations. But to do this was never necessary with you, because you are exempt from these oscillations because of all your knowledge and your balance, which equates with ours… These dangerous disturbances of oscillation structure are the main reason that we are not allowed to agree to physical contacts with the Earth human beings. Even in our telepathic, or just inspirational-impulsive contacts, we have to exercise extreme caution, as also reflected impulse radiations effect similar consequences.[13]



Complete absorbance of radiated energies by the resonant metals of Plejaren spacecraft protects the visitors from the destructive thought forces of terrestrial humans, as with protective gear worn when outside the craft. Without the technical mitigation of radiant energies, safe contact is nearly impossible. The HHO plasma screens of Plejaren beamships permit the viewing of invisible infrared atmospheric energy as 'ion plumes' like those recently reported over North America during geomagnetic storms.[14] An excerpt from the 38th contact of November 13, 1975 concerns "energy bales… that circle the Earth at different distances and intervals" – *according to the Fibonacci structure of infrasound standing waves:*

[Semjase explained that] through the dimension door it was possible to visit the Earth in its prehistoric past as well as in its later time when it has a thick white vapor envelope surrounding the globe… But what now about the dimension portal in the Devil's Triangle? Can anyone *see* it?

Semjase: With the eyes alone, it is not recognizable, but it is possible to make the [infrared] radiation visible… with the help of my ship. At present only two courses of radiation are visible from this side of the Earth, while the third one is behind the Earth and thus cannot be seen from here… [Not only can you see it on the viewscreen, but] you can also see it from the windows, because the radiation becoming visible results from the radiation shield, which is [HHO plasma] spread from the whole ship. Now watch carefully, for the Earth…

Meier: …Girl, …that is fantastic – I can see really two huge trails of radiation! Besides this, there are spheres and other things around the Earth. What do these mean?

Semjase: Those are energy bales of different sorts and strengths. They circle the Earth at different distances and intervals, but are very important for the maintenance of Earth creatures. I am not allowed to explain more.[15]

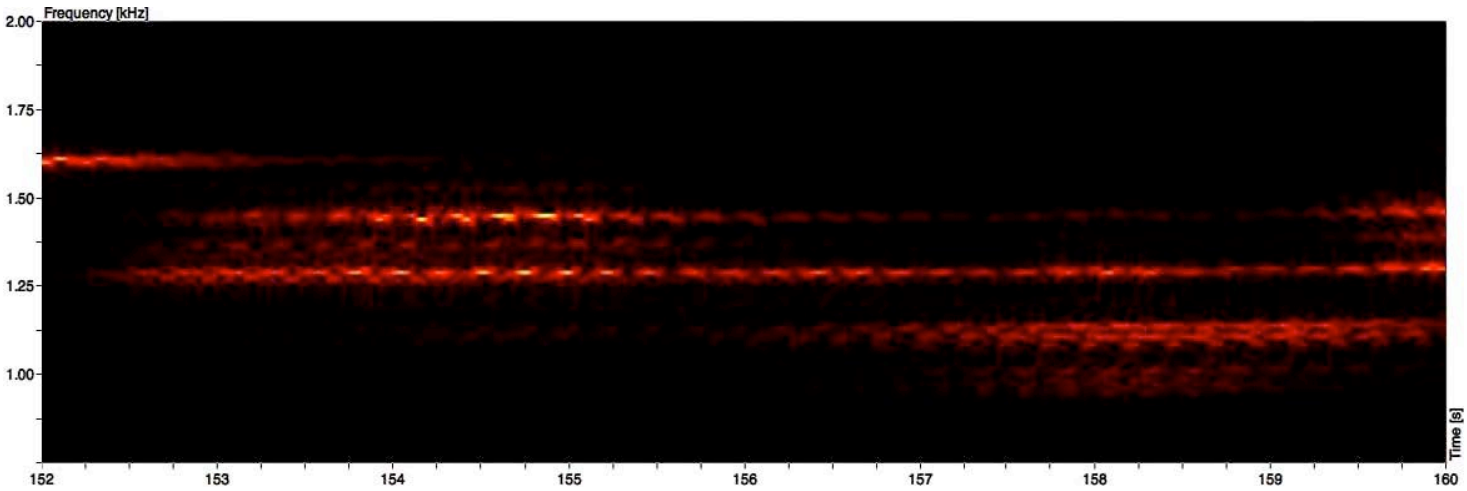
The Fibonacci standing waves that comprise Earth's resonant energy cocoon are artificially generated for the acoustic propulsion of spacecraft. A beamships' alteration of the normal infrasound environment of Earth likewise alters the consciousness of human beings, potentially undermining natural learning cycles:

> *Semjase:* …[C]oncerning control of the gravitational forces… natural cosmic laws order a unitary and harmonic development in compass to all concerns of all levels able for evolution. This means that the spiritual as well as the material development proceed constantly in harmony with one another, and always complete one another by unison of the consequence in all matters. In the case of the mastering of gravity, the regulations of the laws are arranged in order, that primary is the spiritual evolution, of most decisive meaning, for the elaboration of technical means with the aim of mastering the gravitational forces. Here normally at first appears the exercise of spiritual forces in paralyzation of the forces of gravity, by which a human being is able to move weightless through space… [G]enerated by spiritual force state… a levitation process takes place. From the very primary side, this status is evoked within an unknown to the human being form, and just step-by-step, he learns to master it and to control it suitably. When the human being has then learned to control these forces, and only then, the way is cleared for him, by this, to consider technical means and to build them. So the control of gravity consists in its first-primary form on the evolution of spirit and feelings, meaning that the told forces can physically be controlled just then when the human creature has delivered himself from the "weight" of the non-spiritual condition…
>
> Exceptions witness the standard, even if these exceptions cannot easily be recognized and proceed in a way which often does not come to appear. Such an exception does the Earth human being represent. Except for a few, he is still not able to master levitation, and nevertheless he is already able to see clearly a great amount in the field of gravity research. This exception consists of the confusing fact of a very rare misdevelopment, which basically has shifted the potential of parallelization of the spiritual and the material, by which the material

> [aspect of awareness] has become overweighted and dominates the spiritual. So this means that the Earth human being has become governed by the material side, by which the evolution runs in this direction, while the spiritual steps badly injured behind, as you yourself have once said. From that it appears that the technologies are more developed than the spiritual evolution. In this it has to be considered that especially since the year 1937 the strong influence of the new cosmic age have led this wrong burden of the material side in the whole world toward more gentle and harmonized courses, by which the differences between spiritual plenty and the material is no longer as strong as is generally thought.
>
> Many forms of spiritual direction have led to spiritual recognitions of enormous meaning and value, which decisively appear in the development of technologies, and as an interesting fact, lead to success although the normal sequence of observance of the law was disturbed. But this can also be explained by, the otherwise newly gathered spiritual cognitions do nearly compensate for the lawful rule, which means, that in spite of barbarism the Earth human being has proceeded in both directions since 1937, and gets closer, though often unconsciously about this, *and advances by the cosmic oscillations*, rapidly towards the real evolution and begins to comply with it. This course of development can already be seen in the first days of entering the Waterman Age, in the 3rd of February 1844, and during the following time until the year 1937, when since the 3rd of February the second half of transgression of time began to offer its powerful working, from which it can be said by great probability, that the temporal aim of Earth humanity in respect to his determination by evolution, will have been reached after a time of about 800 years.[16]

This concise explanation concerning human control of the gravitational forces given by Semjase contains many profound truths, which reach to the core of the present predicament of our Earthly humankind. The Plejaren comprehension of the Creational Laws reveals the natural evolutionary process whereby each civilization overcomes all barriers to interstellar space-travel: from the cognition of an internal spiritual process of levitation involving resonant infrasound standing waves and water crystallization. The ancient Vedic spiritual practice of levitation was referred to as one of the great attainments. Known as *'laghima'* in Sanskrit, it is understood as an internal electromagnetic force generated by infrasound standing waves that are transduced and focused by the piezoelectric human body into an enveloping antigravity field. Earth's present-day scientists have learned to overcome the gravitational force using acoustic levitation, as an effect generated by the focusing of high-frequency acoustic waves into a concave resonator. Biophysicists have demonstrated the levitation of various insects, and even gone so far as to successfully complete the gestation cycle of a frog egg entirely within a levitating water droplet! [17]

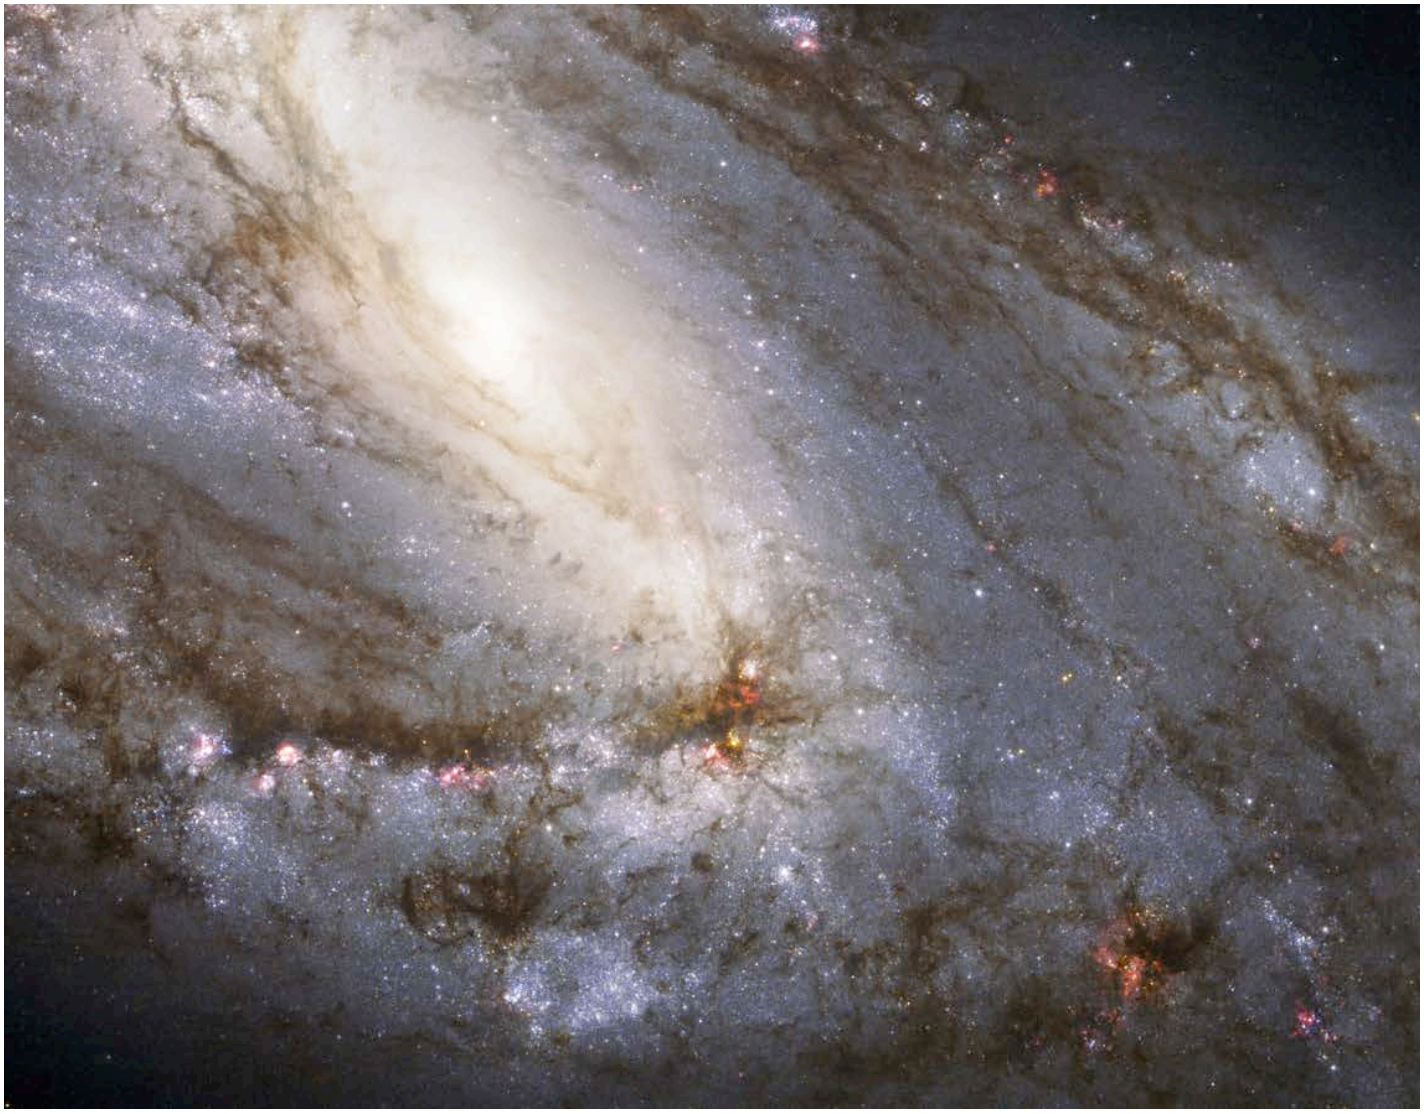
Just as concave resonators artificially generate the force of *laghima* in a beetle, an artificial gravity field is generated by Plejaren beamships for their levitation by acoustic resonance. While high-frequency oscillations are used to levitate beetles in laboratory experiments (at left), interstellar spacecraft apply ultra-low frequencies for the acoustic generation of gravity. When describing the rebalancing of the evolutionary growth of spirit with the growth of technical means, *Semjase identifies changes in 'cosmic oscillations' as the underlying cause*. The movement of our entire solar system into a highly energetic region of our galaxy is presently inducing the profound advancement in consciousness due to the relative increase of planetary infrasound resonance, effecting a dramatic rebalancing of the Earth's very sensitive vibratory envelope. These cosmic oscillations are transduced on Earth by the world's network of pyramids into a resonant field of infrasound standing waves that converge at focal points defined by the axis-symmetrical octagonal geometry of the Great Pyramid of Giza, Egypt. The Fibonacci-ordered distribution pattern of resonant infrasound focal points dictates the precise locations where human consciousness becomes enhanced by the heightened 'cosmic oscillations' increasingly inundating the Earth since 1844, according to information provided to Meier.



Several of Billy's contacts occurred in Ober-Sätelleg, Switzerland, where he was able to photograph Semjase's beamship on March 8, 1975 (above). At this same location on July 7, 1980 Meier was simply instructed to record the acoustic resonance of Semjase's beamship during a demonstration flight.[18] Meier took up a position below the low-hovering beamship, near the trees beyond the log piles, while his wife Kalliope, two of his children and several close friends also made recordings on the greenway about 488m away. *Thorough analyses by acoustics experts confirm the beamship sounds to be genuine recordings that are impossible to replicate using any known equipment, being truly unique in three significant aspects:*

1. There were at least thirty or more discrete frequencies in a random and constantly shifting mix that ranged from 4 to 2170 Hz, but varied on average between 470 and 1452 Hz.
2. The amplitude of these frequencies was also constantly changing, whereby the dominance alternated.
3. The wave shape was also constantly changing in a random, periodic rhythm that caused a characteristic beat.

The wave pattern in the oscilloscope showed this constant and random shift in frequency, in which the principal waves of all frequencies came together in perfect synchronization at one moment, only to travel at the next moment in different directions and stages, thereby generating different patterns— at one moment seemingly moving in a cluster in one direction and, at the next moment, in the other direction. Then they gradually expanded until, for one moment, they formed a mutually precise and evenly distributed pattern, only then to move again into different relationships. Although these changes appeared to be random and were not repeated in a particular order, they always appeared in geometric relationship to one another. Two other sound engineers and a synthesizer sound specialist joined the analysis team, and the sounds were reexamined, this time for possible duplication. All of these specialists agreed that the character of the sounds was unique and that any type of synthesis, if in fact such was possible, could produce only portions of the recordings we had examined and that duplicating only part of the sounds, even in a short linear segment, would be impossible. The number of traveling and constantly shifting discrete frequencies and constantly changing amplitudes, which were shifting in relative dominance, exhibited duplication problems that exceed the abilities of a current state-of-the-art device!"



> Normally, Meier does not hear such loud ship noises, certainly not for such a long time. At the most, there is usually a very short noise when the spaceship lands or takes off. This demonstration was intentionally given for the purpose of the tape recording… None of the other eyewitnesses saw any type of spaceship, but Meier said that he could see it from below and observe a strange effect. *As the sound went up on the scale, the ship became more transparent, and when the pitch became lower, it looked denser again*…
>
> Jim Dilettoso, our research consultant, took samples of this noise to Peter Gimer and Rick Coupland of Micor in San Francisco. There they performed tests in the audible range, from 20 Hz to 2000 Hz. They found twenty-four characteristic frequencies within the audible range and eight outside of it. They found all thirty-two frequencies concurrently at different amplitudes and volumes. All thirty-two tones are somehow produced simultaneously. In a time matrix, the amplitude of some frequencies increases, while that of others decreases. It was observed that the amplitude periodically increased by ca. fifty decibels and then decreased by ca. forty, and at other times, just the opposite was the case, which produced the characteristic beat that was audible. Other normal sounds were audible on the recording, but there were no signs of a tone-on-tone tape dubbing. All frequencies were clear and stable, and they were regularly lined up along the frequency scale [in the sonogram, below].

> The demodulation showed that one must be dealing with a rotating device — 249.6 U/min. modulated at 4.16 Hz… The high-speed device produced a sound that began at 520 Hz and increased in steps up to 990 Hz, only then to decrease again down to 520 Hz in the same frequency steps. The tonal groups comprising 520 Hz disappeared together at 520 Hz and reappeared at 600 Hz, only to disappear again at 720 Hz. At 990 Hz, however, they reappeared and were very strong. The same occurred in the other direction. The condition remained stable for a moment and then shifted again. This shift was somehow random, but nevertheless constant. At certain times, the high-speed device was still, and a deep, throbbing beat was audible; and then the high-speed rotation began again, and the sound increased rapidly to a high vibrating crescendo in the upper 50,000 U/min. range or higher. Simultaneously, the slower 249.6 U/min.-rotation again became audible. The vibration was produced by the high-speed rotation of approximately 29,000 U/min., which accelerated to over 59,000 U/min. This was most certainly not a normal sound! [19]

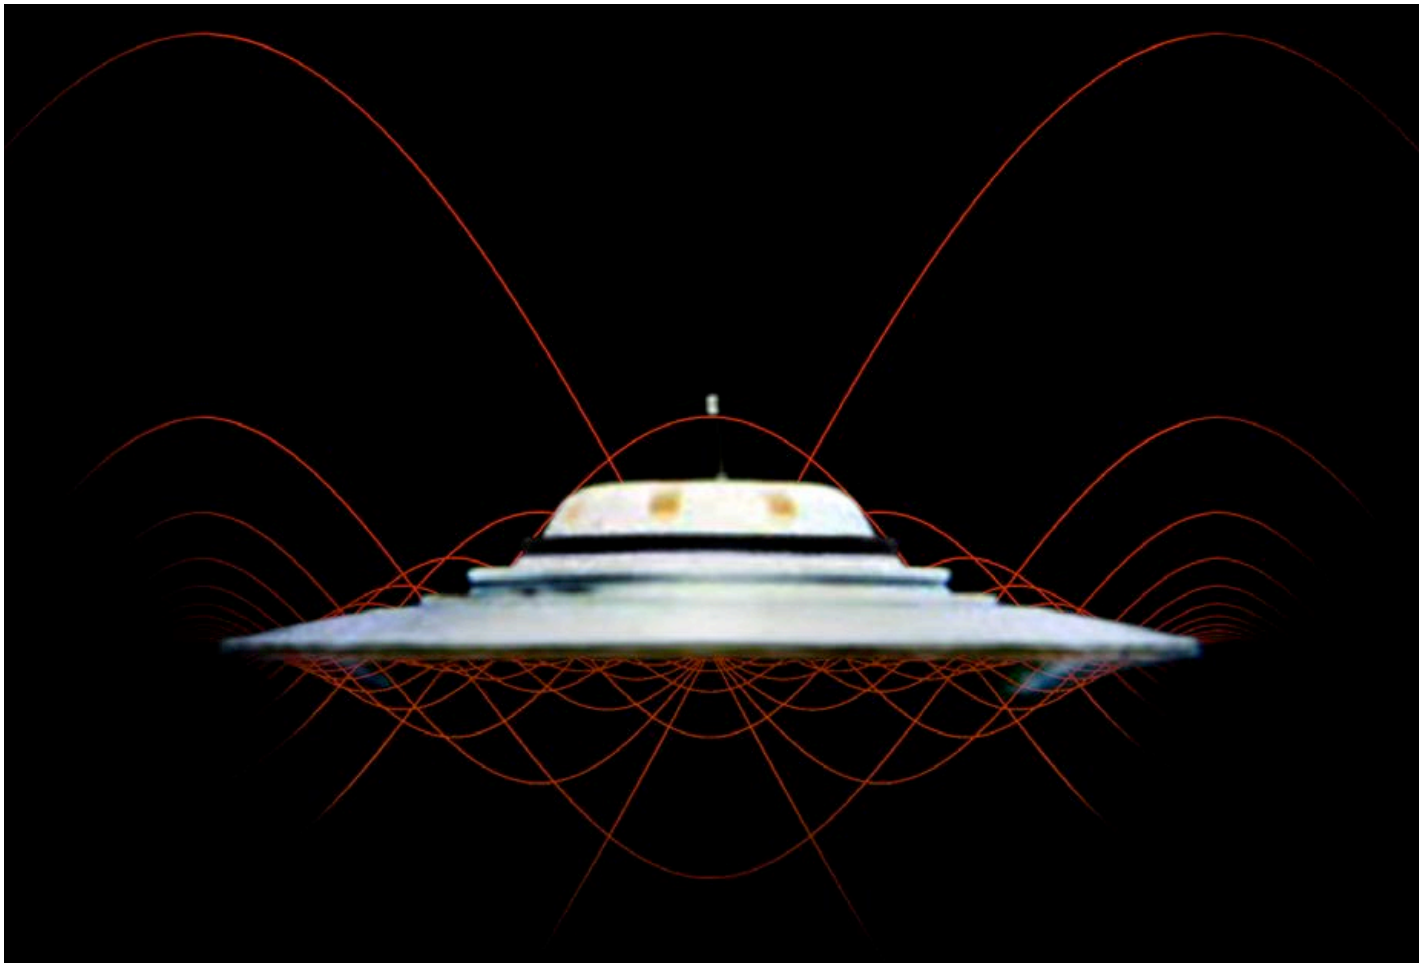
While acoustic experts have identified several key features of the beamship sounds that are impossible to reproduce with any known equipment, their archive search for related sounds failed to recognize these same key features in a sound that we are all constantly exposed to, but only very rarely conscious of – *the sound of our mother Earth!* The over 30 fixed frequencies of Semjase's beamship, whirring in constantly shifting amplitudes, very closely replicate the much lower infrasound harmonies of Earth's planetary resonance. Earth's base frequency presently fluctuates near 7.8 Hz and harmonics progress in frequency steps of approximately 5.9 Hz, extending from below 2 Hz upwards to about 50 Hz.[20]

Subtle fluctuations observed in the deep resonance of Earth are seen as rather dramatic shifts in the multi-frequency oscillations of the Plejaren beamship, as dominance constantly shifts up and down the frequency scale in regular stepped intervals visible in the sonogram above. The various circular rings and domed elements of the beamships' hulls are designed to generate this standing wave resonance through highly structured crystalline metals that transduce and amplify the omnipresent song of the cosmos, referred to by the Plejaren as the 'Symphony of the Spheres' during the 223rd contact of May 1, 1988:

Meier: You, as well as Ptaah and Semjase, once played the strange humming sounds of the Earth to me through your apparatuses, which I can't perceive in nature, unfortunately, because my hearing senses aren't so sensitive that I could hear these sounds, which should very well be possible for other people, however, as you've explained… You named the sounds "Symphony of the Earth" or "Symphony of the Planets" as well as "Symphony of Space," which is also entirely incorporated into these sounds, like also the atmospheres of planets and suns and even all material and immaterial things of every kind, concerning which you've spoken of a "Symphony of the Spheres." This symphony, i.e. these sounds, are, so far, still unknown to the Earthly scientists in particular and to the people in general, other than just the exceptions to the rule, even those people who perceive these humming sounds, i.e. "Symphony of the Earth," and who are of the opinion that something isn't right in their heads, and thus, not that real things are going to and fro. Can you once again officially explain what it actually concerns with these humming sounds, if it shouldn't remain a secret?

Quetzal: It does not have to remain a secret because in about 10 to 15 years [1998-2002], a portion of the Earthly sciences should also encounter these things. Moreover, it concerns the fact that every planet, every comet, every larger asteroid, meteor, and every sun, as well as the nebulae and clouds in space and space itself, as well as every black hole and all material and immaterial things existing at all produce certain tones and sounds, which we, as you said, actually call Symphony. Within the entire realm of the Creation or of the Universe, nothing exists that would not be incorporated into these symphonies, so therefore, all material and immaterial things vibrationally generate certain tones and sounds and even symphonies, which usually cannot be perceived by the human ear because these move in too low or too high frequencies for this. Only through abnormal, degenerative, physiological changes can these sounds or symphonies be perceived by human life forms, whereby these then become effective in an extremely consciousness-impairing, nerve-racking, and psyche-damaging manner.

> The frequencies of these symphonies or sounds reach into all levels, so thus, the lowest sounds, like humming sounds, as you say, are given as well as the highest whirring sounds and shimmering sounds, etc. As the frequencies are virtually countless in their number, these are also the sources of the sound symphonies, for these relate to all that exists of the material and immaterial. Thus, if one starts from the Earth, then these sound sources are, for example, the waters, in terms of the deep-sea movements as well as the movements of the waters of the lakes, rivers, streams, creeks, and springs.



> Even the roar of the waves, the small and mighty storms, the tectonic movements of the Earth's interior, the bubbling of magma in the Earth, and the eruptions of the volcanoes belong to these, as well as the rain, hail, and the various layers of the atmosphere, which rub against each other, as well as the winds against the trees, grasses, flowers, houses, mountains, sand dunes and deserts, steppes, icebergs, glaciers, and surfaces of ice, as well as against windmills, wind turbines, ships, aircraft, rockets, missiles, and vehicles of all types, against land surfaces and everything else that materially exists. Also to be noted are the voices and sounds of humans and animals, insects, birds, and fish and any other water creatures.
>
> All sounds together form the actual "Symphony of the Planet," as we call it. And as this happens in the purely material realm, so this also happens in any immaterial sphere in the entire Universe, each of which also produces its own symphony, like also fog flowing on the Earth or nebulae existing in space and all other formations that are absolutely impossible to cite in their number because everything is so immeasurable that it could neither be grasped by purely human understanding nor by technological possibilities of any kind.[21]

Given as a precise description of cosmic resonance, the comprehensive explanation of the 'Symphony of the Spheres' provided by Quetzal penetrates to the unified vibratory essence of the cosmos. My own direct perception of the resonant symphony during deep meditative states formed the impetus for my years of study of infrasound standing waves. I discerned that the deep throbbing pulsation that fills my consciousness during the darkest hours of the night was induced by ayurvedic pyramids for heartbeat entrainment at specific nodal points around the globe where sacred ancient temples still exist, yet having suffered terrible cataclysm. The cosmic symphony is absorbed through the resonant metals of plasma beamships to be converted by interior HHO plasma chambers into ultraviolet-A and infrared light for all power needs. The over 30 distinct frequencies observed in the infrasonic bands of Earth's resonant symphony are exactly replicated by spacecraft for acoustic levitation on the arches of standing waves.

Analyses of the resonant humming of the Plejaren beamships recorded by Billy Meier exactly echo hieroglyphic Sanskrit scripts on highly reflective silver-alloy metal debris recovered from the 1947 aerial disc crash near Roswell, New Mexico (pg. 31). Embossed text on an I-beam fragment reads: *"workings of 30 resonances, female and male, 30 resonances whereby approaching the highest…"* Meier's beamship recordings prove *the Roswell texts describe the 30 resonant frequencies of standing waves generated by plasma ships for both antigravitic propulsion and the maintenance of life onboard.*

Standing waves surround the beamship to act as waveguides for HHO gas that is emitted from the aerial antenna atop the craft into the energy streams, where it is ignited to form HHO plasma around the ship. Also called hydrino plasma, HHO plasma is defined as *resonant-transfer plasma* for its crystalline ability to transduce all received acoustic energy into re-emitted heat and light. All interstellar vessels achieve extreme acceleration by enveloping the spacecraft in HHO plasma to induce a set of transdimensional characteristics that includes superfluidity and frictionless passage through the atmosphere. Semjase explained in basic terms that the screen "allows every interference to glide away, without… resistance." [22] This same plasma technology has already been in use for many years now in the nose cones of US military aircraft.[23] Additional information was provided to Meier regarding the use of plasma 'distorter-screens' enveloping Plejaren beamships that allow complete optical invisibility to the naked eye:

> [Earth human beings] are very simply not accustomed to close observing and viewing. On the other hand we protect our beamship against sight of any kind and they can't see us. It is easy for us to protect our ships as we desire in a diameter of 500 meters, in whole or on parts, at one side, upwards or downwards, against sight by (use of) a distorter-screen. When I allow you to photograph my ship from one side, then it is protected on all other sides against further observation by the distorter-screens, thus none uninvited are able to see it.[24]

The beamships' invisibility screen is generated from emitted HHO gas produced by the resonant dissociation of water molecules at 13,563,688 Hz. The implosion of single hydrogen atoms (to become *hydrinos)* as HHO plasma[25] is achieved by the rapid ionization of emitted gold and silver nanoparticles, as indirectly described by Semjase during her 11th contact with Eduard on April 15, 1975: "The antenna's conducting beam and the energy collecting beam appear as a fine line of energy over the beamship, while the regeneration radiation becomes visible beneath the ship in various hues… The energy only becomes used and regenerated again for the radiation drive… Our whole technology is aligned toward natural rectification, but not toward destruction." *Implosion* was then addressed by Meier, "I understand; the natural principle is, thus, implosion and regeneration, rather than explosion and destruction." [26]

Meier observed an optical transparency effect of the gradual acoustic engagement of the ship's HHO plasma protection screen, observing that *"as the sound went up on the scale, the ship became more transparent, and when the pitch became lower, it looked denser again…"* A different transparency effect was mentioned on another occasion when, during the 31st contact of July 17, 1975, Semjase explained: "You know that with our technology we have the ability to strain any materials by special radiation and cause those materials to be invisible to the naked eye. We can control this effect very exactly." [27] This transparency beam technology was first created and described among our scientists by Canadian inventor Troy Hurtubise, who named his prototype beam device *Angel Light.*[28] An intense beam of X-ray light from krypton plasma generates the temporary effect of *total optical transparency in all materials* – a new state of matter to be technically described only later, in 2009, by Oxford University researchers:

> [A] short pulse from a laser "knocked out" a core electron from every aluminum atom in a sample without disrupting the metal's crystalline structure… [The] high-powered synchrotron radiation generator produces extremely brief pulses of soft X-ray light… At such high intensities the aluminum turned transparent.[29]

Plejaren beamships' precise control of transparency induction using X-ray light beams was demonstrated for Meier on objects in Earth orbit and even inside the beamships themselves. The domed ceiling and 8 view-ports of the circular spacecraft are made transparent by this high-intensity illumination process, giving the optical effect of disappearing instantaneously to provide an unimpeded 360° panoramic view.

Meier's clear profile photograph of a landed beamship from 1975 reveals the structural features of the flight vehicle perfectly conform to the Fibonacci-ordered standing wave resonance patterns generated by the over 30 discreet frequencies resonating within the alloys of the hull during flight (opposite). During the 4th contact of February 15, 1975, Semjase offered a comprehensive description of beamship propulsion drives, yet carefully substituted the word 'beam' for the more accurate scientific term 'HHO plasma', a technical concept apparently not authorized for use according to the Confederation's High Council:

Semjase: For traveling through cosmic space, a drive is necessary which surpasses the speed of light by millions of times. But this propulsion can only come into action once the speed of light has already been reached… This means then that a beamship needs two drives, first the normal which accelerates up to the speed of light, and then a second… which generates a million-fold, a billion-fold, the speed of light, thus the hyperspeed by which hyperspace is penetrated… So time and space collapse, and they become zero time and zero space. This means time and space cease to exist. And exactly by that, distances of numerous light years are traversed in a fraction of a second, with no time lag… When, for example, we leave the Pleiades and need about 7 hours to get to Earth, then on our own planet, and on Earth, 7 hours pass. We need this long because we first have to fly beyond the reach of the planets by normal propulsion, and only far out in space can we convert to hyperspeed. Back from hyperspace then, far outside your solar system, we convert to normal drive. We are never allowed to enter hyperspace too near to a planet… I am only allowed to say this concerning propulsions; your scientists are already working on light-emitting drives. Light-emitting drives work for normal propulsion, and move the beamships near planets and until they are a safe distance away.

Meier: This is evident, but how is it possible for a beamship in the gravity of a planet, or in its atmosphere, to attain such great speed without glowing, or the passengers succumbing to the huge pressures?

Semjase: This is very easy to explain, and also no secret any more to Earth humans, at least not the scientists; the beamship is surrounded by a protection-beam-girdle… [Thereby] anything contacting the screen [becomes] disintegrated or "flowed" away… [while the protective HHO plasma screen] also neutralizes the attractive force of a planet… The gravity of a planet is, besides this, not always the same, or of the same strength, owing to certain alternations which will be discovered by your scientists in a reasonable time. The beam-protective-screen diverts the gravity and attractive forces, and the beamship in effect becomes a miniature planet which can travel at nearly light speed through any atmosphere without risk. As the gravity of a concerned planet does not influence the ship, the passengers feel normal and unburdened, as if they were on their planet itself, always under the premise that the planetary gravity is in accordance with their anatomical capabilities. In the beamship itself, the gravity of course is tuned to the passengers and is completely controllable. When passengers on spacecraft from other worlds move in atmospheres alien to them, or on hostile planets with unbearable gravity, they use suits and other small transportable instruments which generate for that creature, the necessary beam-protection-screen for their particular ship and their particular requirement.[30]

[Semjase continued her explanation of superluminal space travel during the 8th contact, on March 18, 1975:] The turning-off of a time-dilation or time-shift needs but the penetration of hyperspace, as I have already explained. The "jump" occurs very fast by momentary paralyzation of the protective screen under flash-like increased velocity, with the consequence of a flash-like increase in mass. This means that the initiation process runs so fast, that by the speed of certain processes, generated by the apparatus, matter is distorted within the millionth part of a second, and becomes fine-material form, which is able to pass hyperspace timelessly…

> By this, at the same time, space and time are paralyzed and disappear, in consequence of which the ship already rematerializes itself at its destination place, as it is dematerialized at its place of departure. The whole process needs no longer than a millionth part of a second, thus also for creatures, passing hyperspace does not take alterations of any kind. When spaceships fly below the speed of light, this inevitably takes much time, which is always the case with newcomers to cosmic flight. First, they all do learn from experiences and cognitions. Second, this space-traveling is very dangerous and leaves its purpose open to question. When spaceships reach hyperspeed without passing directly into hyperspace, then catastrophe for the ship and its passengers is assured… Speeds above that of light hold many dangers, when the barrier of hyperspace is not penetrated and made an ally. The dilation effect is only one of these dangers… Our forefathers, too, faced these problems, and went astray in space and time. The same does happen to other creatures, and in the same way.[31]

The industrial development of antigravity technology on Earth followed Nikola Tesla's 1899 discovery of standing waves, which led to the later development of the implosive hydrogen motor. Through the joint espionage efforts of Nazi industrialists in both the US and Germany, Tesla's secret transdimensional spacecraft designs were stolen by Hitler and quickly weaponized by enslaved Nazi/CIA scientists[32]:

> Viktor Schauberger was the actual designer and builder of this world's first flying saucer motor, which was built for Nazi Germany in 1944. In view of this startling revelation one has to wonder where he obtained his revolutionary knowledge to construct such a device. He had discovered what he called an "implosion" principle, and invented a motor to take advantage of this new principle. The motor consumed only air and water and generated light, heat, and thrust, as well as a diamagnetism which made lift possible through "diamagnetic levitation".[33]

The dark truth of the Nazi assassination of Tesla after the theft of his designs was retold in 1995, during a deathbed confession by Hitler's personal bodyguard and espionage agent Otto Skorzeny. Published by Erik Berman in 2003, Skorzeny confirmed that Tesla's HHO plasma invisibility technology had been applied in both the Nazi flying discs and later in the US stealth aircraft.[34] Advances in Earth's resonant spacecraft technologies continually occur as the expansive consciousness of humanity reaches toward the stars.

In anticipation of piloting a *newly manufactured* spacecraft from Erra to Earth for the first time, Semjase announced the deployment during the 48th contact. Eduard was given the opportunity to photograph the new beamship on March 8, 1976, at Bachtelhornli-Unterbachtel (above). The new beamship displays a golden-colored alloy comprising the underside of the hull and along a band below the orange-tinted cupola windows. Both beamship models are 7 meters in diameter and share a similar hull design, with several significant differences. The latest design presents a more complex array of HHO gas-venting systems above the domed ceiling that replaces the aerial antenna employed in the previous model, as well as radial ridges that form a distinctive stepped contour along the golden perimeter of the spacecraft.

Semjase explained, “In the outer appearance only small differences appear. The greater novelty is the inside arrangements, which offer much more capability than is the case with my present ship. With the new one I have the ability to break through dimensions in two directions.” [35] *Meier had previously described transdimensional hyperleaps through space and time during earlier contacts in his youth, as an instantaneous physical dematerialization from which arises a profound sense of cosmic Oneness*:

> With the launching of the [time-travel] transmission a quite weird thing happened in the form that the entire surroundings of the ship slowly shimmered and then quite suddenly simply no longer existed. I also observed the same process in regard to myself, and in the moment of the "jump" it was, to me, actually as if I suddenly no longer corporally existed. Somehow I felt transferred into something which I sensed as being eternity itself and in which an indescribable silence and endless, calming peace and enormous love ruled… It was often for me as if I were raised up by *being* itself.[36]

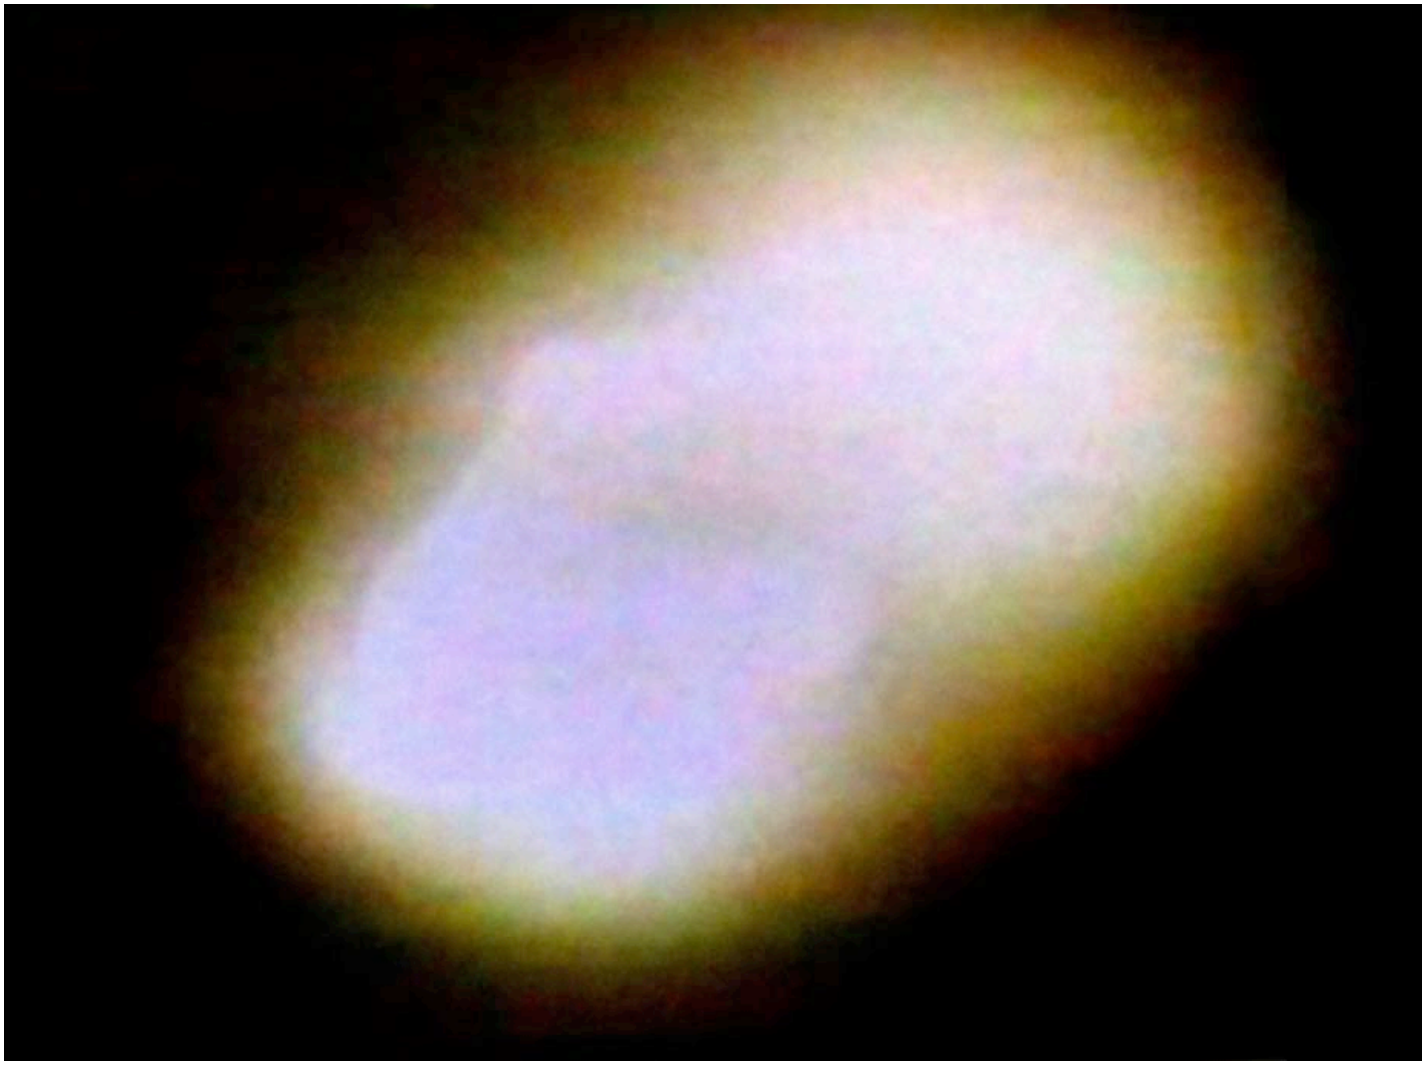
While photographing the latest Plejaren spacecraft design for the first time (below), Meier witnessed the instantaneous appearance of two accompanying spacecraft, later described as 4-meter Explorer class unmanned reconnaissance vessels. HHO plasma excited in the air surrounding the beamship for instant optical invisibility can also be generated within the ship's interior airspaces by rapidly ionizing the third-density lightwater vapor to become a fourth-density environment of HHO plasma. *During his 31st contact of July 17, 1975 Eduard Meier experienced fourth-density space-travel, by hyperleaps, covering vast distances to visit various inhabited worlds of the Universe.* The remarkable details reported by Meier deserve serious contemplation – especially the state of consciousness experienced by all the passengers aboard the giant spherical 'Great-Spacer' during the seven minutes of dematerialization *'in the eternity'*:

Semjase: Earth humans still don't know very many things. But now we have to interrupt our conversation, because my father has finished his preparations for the great leap. And as I am already speaking of such, then I want to ask you something: In a few minutes, we will jump for seven minutes into the "eternity", as you call it. *The feelings and sensations there are completely otherwise than in normal existence in material life.* For that reason it is also not possible for us to receive your thoughts and feelings with proper concentration. In consequence of which neither I nor my father, nor any of us, could later repeat for you your feelings and thoughts, so that you could write them down. If you nevertheless wish to do this, then there is a chance on a technical basis…

The booths, which you can see there, beside the screens, are equipped with all necessary means, to store up feelings and thoughts. The thought impulses received are stored in a special computer and can later, as may be desired, be repeated word for word from it. The helmet, formable and adaptable in size, which you see there, is equipped with very fine sondes and is as well covered by a special, fine-meshed net of sondes, which pick up every kind of energy and transforms it into impulses, which are then transmitted to the computer where they are registered and stored. The energy of thoughts and feelings is measured in very high values and can be received only through those instruments. The energies of feelings and thoughts exist only in very high frequency fields, or hyper-frequencies. To now be able to register your thoughts and feelings, it is necessary that you place yourself into the chair and lay the head under the helmet cap, which then will adapt itself automatically to your head…

Meier: At your service… (As Semjase explained to me, I quickly sit down inside one of the three booths, in the extremely comfortable chair. As soon as I have seated myself, the peculiar helmet moves over my head and sinks down silently. It is big enough that it closes around my whole head, and only leaves my face open, thus I can see and watch everything. But the helmet is not touching my head; only lying close around it, keeping about one and a half centimeters distance to the skull, as I can see when I place a forefinger between the helmet and the head. Now I am tense and expectant, for I wonder what is going to happen. Ptaah and Semjase manipulate the apparatus, and now I can see again how the fantastic heavens and stars change. In a fraction of a second they are nothing more than a whitish milky mass, a shining mass, as I have already seen in the other hyper-leaps. But now suddenly as well, this milky whitish shining is gone and there is darkness.

But now what is this? Suddenly all is merging into a golden color, and now everything is like silver. But - my dear this glistening light, this beaming shining splendor! Everything is merged into glistening light - only the glistening light. It is stronger than all the suns of the Universe... Dear, oh dear, this glistening light, and it does not hurt the eyes! Dear, this must be eternity, the glistening light of the eternal... but see, there is nothing besides the eternity; man alive, how marvelous! Marvelous? Man alive, that is itself marvelous. Eternity and marvelousness are one and the same. Only why do I separate it? Why do I put the eternity into terms of time? Time does not exist, and the eternity is marvelous. Man, just what is this? This tranquility, this peace -- what is it? How could I have achieved this?



Love, oh that deep all-encompassing love. Nothing is there, but *love*: wonderful, marvelous. Oh yes, I am, but I am not. Everything is so deep, and full of love. Of course, I am eternity, and I am inside of eternity. How could I ever forget this? Oh yes, I am a human being, how can I... why do I forget that? I am only a guest in eternity – and those loving voices, calling for me, from where is it coming? I can see nothing, only the glistening light, comforting. Who is calling me? I see nothing; man alive, I am nothing any more. I can't see myself. I am eternity, in the eternity. Oh, how is that, but I don't see with my eyes, still I see everything. And I am not listening with my ears, yet I hear everything. Yes, the love, how powerful it is, how immense, infinite and wonderful. Everything is love and splendor; why doesn't the human being understand this?... The calling comes out of the light. Is it the call of eternity?

Oh how hard it is... to not think that I am only a guest in eternity, that I am only a human being. How painful it is, this being a human. I do no more want to be. I want to remain here as eternity inside of eternity... this deep. Yes, I want to stay here. Never again do I want to return. Here is the existence, the real existence... How can I feel strange having to return to a material world? I belong here... Pain, why are you shaking me? What is it?)

Semjase: Do you still not understand?

Meier: I – Oh yes, of course! – Pitiful – very much pitiful – why have you brought me back here?

Semjase: You want to joke, but we have all been inside the timelessness, and would all like to stay there. But we are not ready to stay, because we have to absolve the way of evolution step-by-step – as you also must do, dear friend. I know quite well, how painfully your heart aches now, as we all have experienced the same thing. *But we have to adjust ourselves for that and do know, that under no circumstances or conditions are we allowed or able to remain, until we have reached that level of consciousness.* I do regret very much that you feel disturbed inside, as I can see it on your face. But you will overcome it, because you can think about it realistically. For that reason we also took responsibility for this equipment... [that allows us to record your blissful thoughts so that you may reflect on the experience of transcendence later.] [37]

The transdimensional experience of oneness had left Eduard shaken. What he experienced *'in the eternity'* finds direct parallels with the impressions of other contactees who have transcended into *fourth-density awareness.* During transdimensional breakthrough, the third-density air environment maintained inside the spacecraft is instantaneously converted into a fourth-density environment of HHO plasma, *inducing a transcendent state in the human being through the radiations of gold and silver nanospheres among the trace elements conforming the atmospheric water vapor maintained within all beamships:*

> *Ptaah:* You breathe here in this room… air… [that] is adjusted to the conditions of our homeworld, and is much more healthy and invigorating than that of Earth. The oxygen content is some values higher than on Earth, and also the compound of other elements is somewhat different… The different composition of the air keeps us awake longer, and in need of less sleep than is the case on Earth. That is why you are not tired.[38]

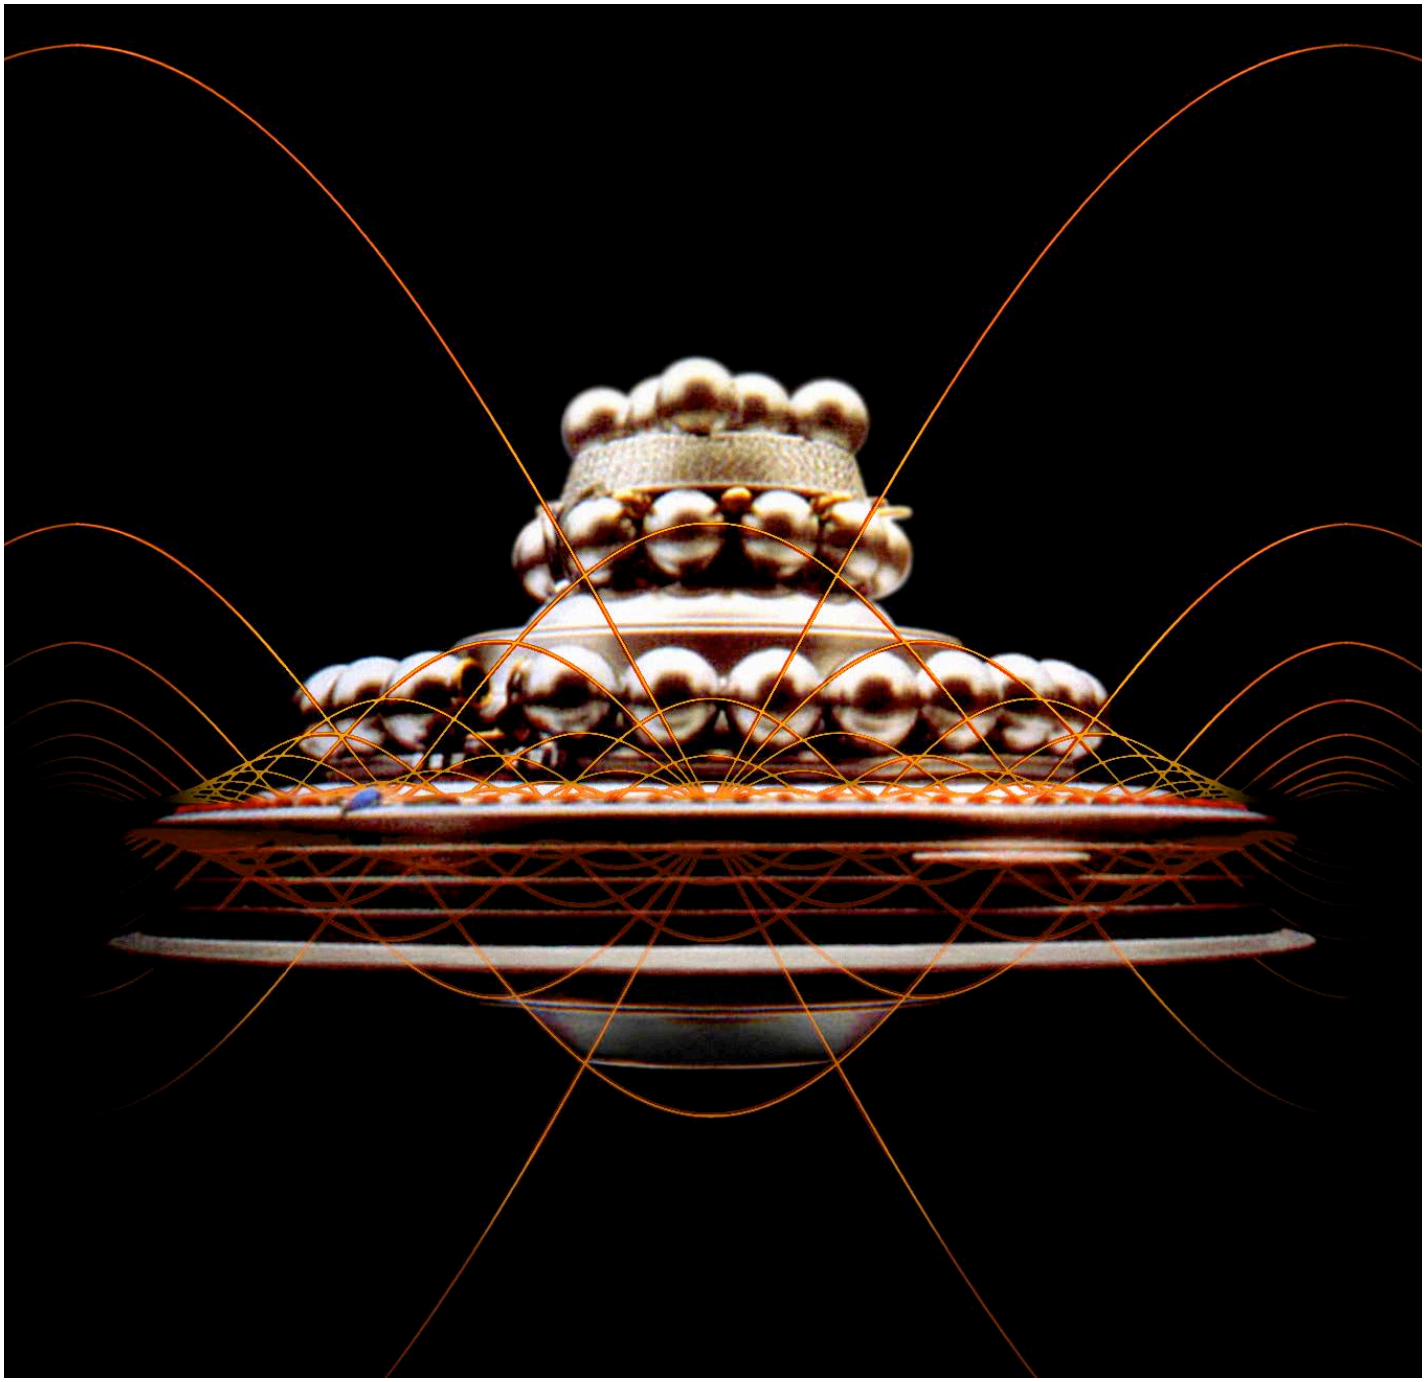
An elementally balanced atmospheric composition affects the bioelectrical enhancement of all cellular metabolic processes within the human body, greatly decreasing the need for physical sustenance, whereby Meier was sustained on one meal for over 90 hours. Open discussion of bionanotechnology was precluded by the Plejaren, except once –by Quetzal during the 205th contact of February 3, 1986:

> But in our civilizations, [disease] has no longer appeared for thousands of years… I want to explain as an exception and on my own responsibility. *Above all, silver ion products – such as silver ion powder, silver ion jelly, or silver ion cream – are useful.* For this, an application is required on the skin.[39]

This hint from Quetzal addressed those few silver ion products available at that time in 1986, yet point directly toward the present advances of ayurvedic electro-medicine using gold and silver nano-colloids.

Through these highly advanced transdimensional means, Plejaren spacecraft are able to not only hyperleap through space, but also through time. Meier was taken to visit Earth in various stages of her past and future to witness differing levels of gravity and the corresponding atmospheric conditions. On one occasion, Eduard was actually taken thousands of years into the past aboard Semjase's beamship *to visit himself in a previous incarnation* and was informed that the same time-travel process even allows the potential for visiting one's future incarnations, although this is rarely done.

Throughout Eduard's early years of contacts with the Plejaren Elders he was denied the opportunity to obtain detailed close-up photographs of their spectacular plasma beamships, yet this prohibition was lifted during later contacts in 1981. Several opportunities were granted for Billy to document visits by a single-occupant 3.5-meter reconnaissance beamship (above). Having no exposed windows, this compact plasma ship relies upon interior view-screens or, for direct viewing, the walls of the ship are made transparent by intense X-ray illumination. The many conjoined circular sections of the tiered hull are comprised of a highly reflective electroluminescent metal alloy that can be electronically tuned to emit any desired frequency of light. Infrared luminescence is used to ignite HHO gas for instantaneous plasma invisibility cloaking, referred to by the Plejaren as a 'beamship protection screen'.



Scores of superbly detailed documentary photographs of transdimensional spacecraft were taken by Meier in the parking lot of the Semjase Silver Star Center. Close comparison of the differences that appear in the configuration of Quetzal's ship reveals controlled rotation of the large ring of spheres. Meier learned of the absorptive characteristics of the beamships and other similar interstellar spacecraft during the 150th contact of October 10, 1981, in discussion with Quetzal regarding technical barriers to communication between various civilizations operating plasma spacecraft in the vicinity of Earth:

> No radio waves and no other kinds of vibrations are capable of penetrating into these aircraft because the outer hulls of each device absorb everything in terms of power storage for the ships' propulsion and everything else. This means among other things that these aircraft are so designed that they absorb all waves of all frequencies and, therefore, all vibrations of all kinds for power storage, like also sunlight and everything else in terms of entering radiations, etc. But the moon light and the weak light of the stars are also absorbed and stored as power, together with many other things [comprising the Symphony of the Planet, *especially terrestrial standing waves of infrasound resonance*], which are still unknown to the Earthly scientists.[40]

All wavelengths of energy are absorbed into the craft and transduced into ultraviolet-A and infrared light inside HHO plasma chambers, formed by the conjoined rings of spherical resonators. The rotating rings release plasma discharges that arc across the spark gap created between the two resonant spheres with gold-colored circular fittings. The noticeable warping of the image is an optical effect of the strong electromagnetic fields levitating the craft across the parking lot while it was being photographed, without landing. Along the outermost rim of the craft is a ring of 96 rubies that act as plasma beam emitters as HHO plasma becomes confined within the path of the infrared light by an encircling electromagnetic field, just as recently defined by MIT researchers investigating *superfluidity* (Ketterle et al.[41]).

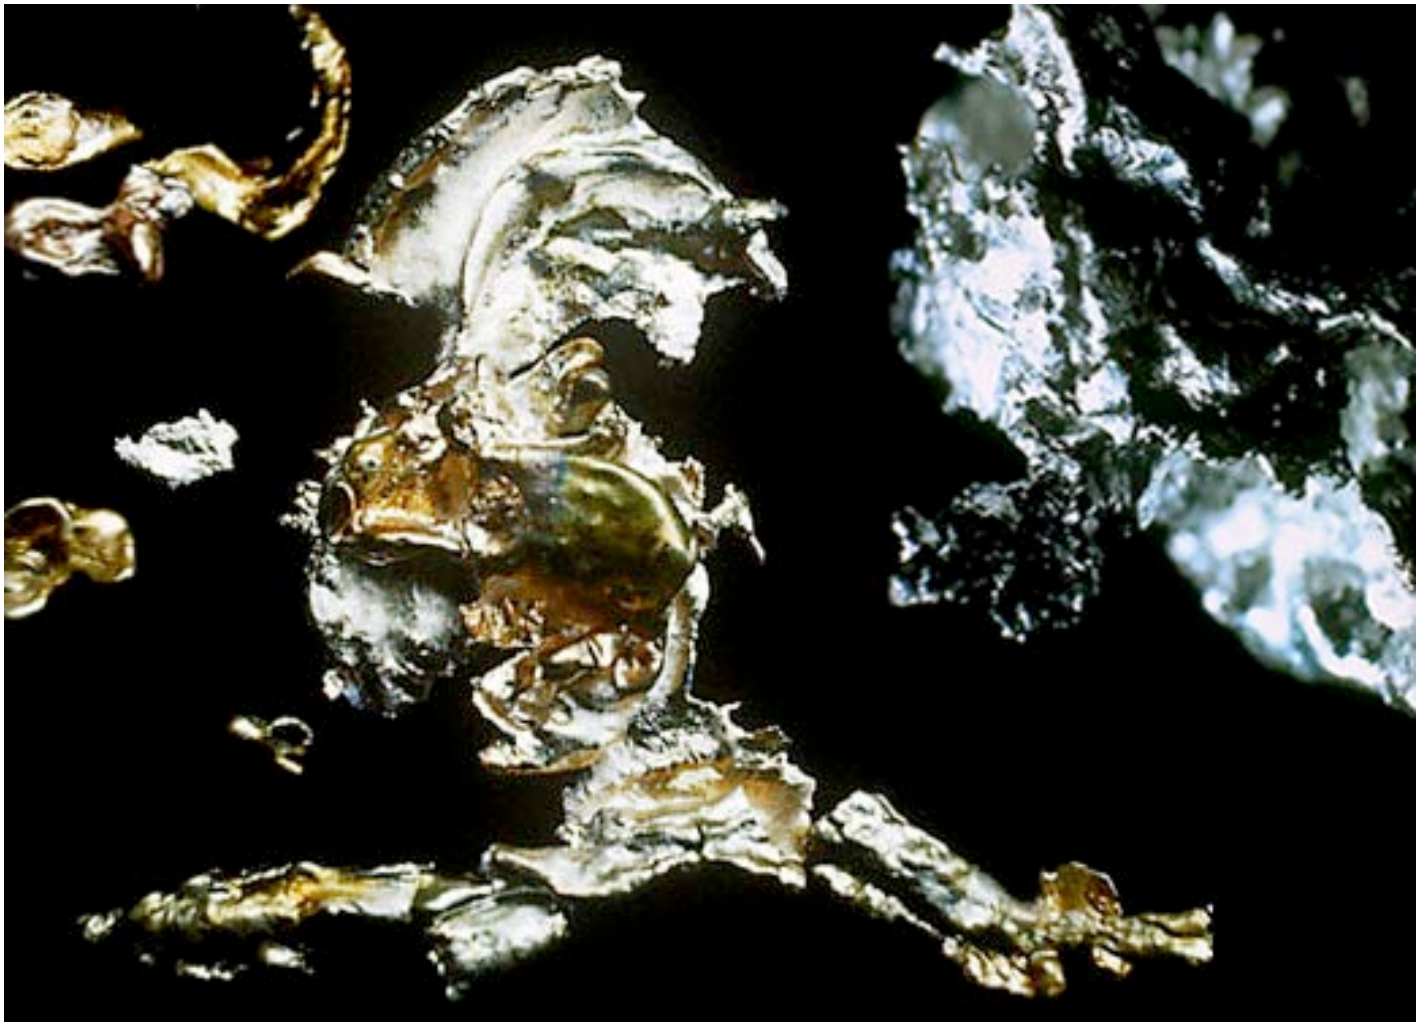
The single-occupant reconnaissance spacecraft displays many advanced features for the application of fourth-density HHO plasma beam technologies that further confirm the validity of these photographs, which have been met with decades of sustained criticism despite being authenticated by experts. Many magnificent photographs taken at the Semjase Silver Star Center provide scale references by including foreground and background objects, allowing the size of the spacecraft to be accurately determined.

The craft's spherical resonators and compact circular hull serve in the production of standing acoustic waves that provide the antigravitic effect for flight by acoustic levitation. An array of 8 spheres is clustered at the top the craft, above a central row of 12 spheres and a wide lower row of 24 spheres – all of similar diameter. This 8–12–24 alignment of resonators presents the same quadrupolar geometric configuration observed of all of their spaceflight vehicles for generating Fibonacci-ordered standing waves composed of over 30 simultaneous, fixed frequencies with constantly shifting amplitudes (overlaid, above).

The loud singing of the resonant metals in flight can be shifted out of the audible range of human beings to be entirely imperceptible, utilizing deep, throbbing infrasound frequencies well below 20 Hz for levitation. The frequency of each spherical resonator is defined by wall thickness, not diameter, thereby allowing the specification of a unique frequency for each, as the high-speed rotation of the largest ring of resonators at 249.6 U/min. creates the 4.16 Hz modulation. *Never having seen Meier's photographs, acoustic analysts identified the object that produced the sounds as being composed of many spheres.*

Meier was able to document an interesting effect of electroluminescence generated by Quetzal's beamship at nighttime from several perspectives, in a series of remarkable close-ups on August 5, 1981. Red light emitted by the normally silver-colored metal surfaces gives the ship a golden appearance. One image from the series captured the ship in a particular configuration not seen in any of Meier's other photographs, with a reflective metallic viewing screen exposed by the retraction of a small protective sleeve (above). Comparing photographs of Quetzal's ship reveals the rotary function of the lower array of resonators. The compact circular design of this interstellar vessel reflects the same mathematical structure that guides the larger beamship designs, presenting the precise, unmistakable form of the Mandelbrot quaternion (at left). The octagonal symmetry of the Mandelbrot set defines the distribution pattern of interconnected spherical resonators mounted in circular rows along the upper tiers in the 8–12–24 arrangement. *This 'otherworldly' plasma vessel reflects the same geometries seen in crop circles.*

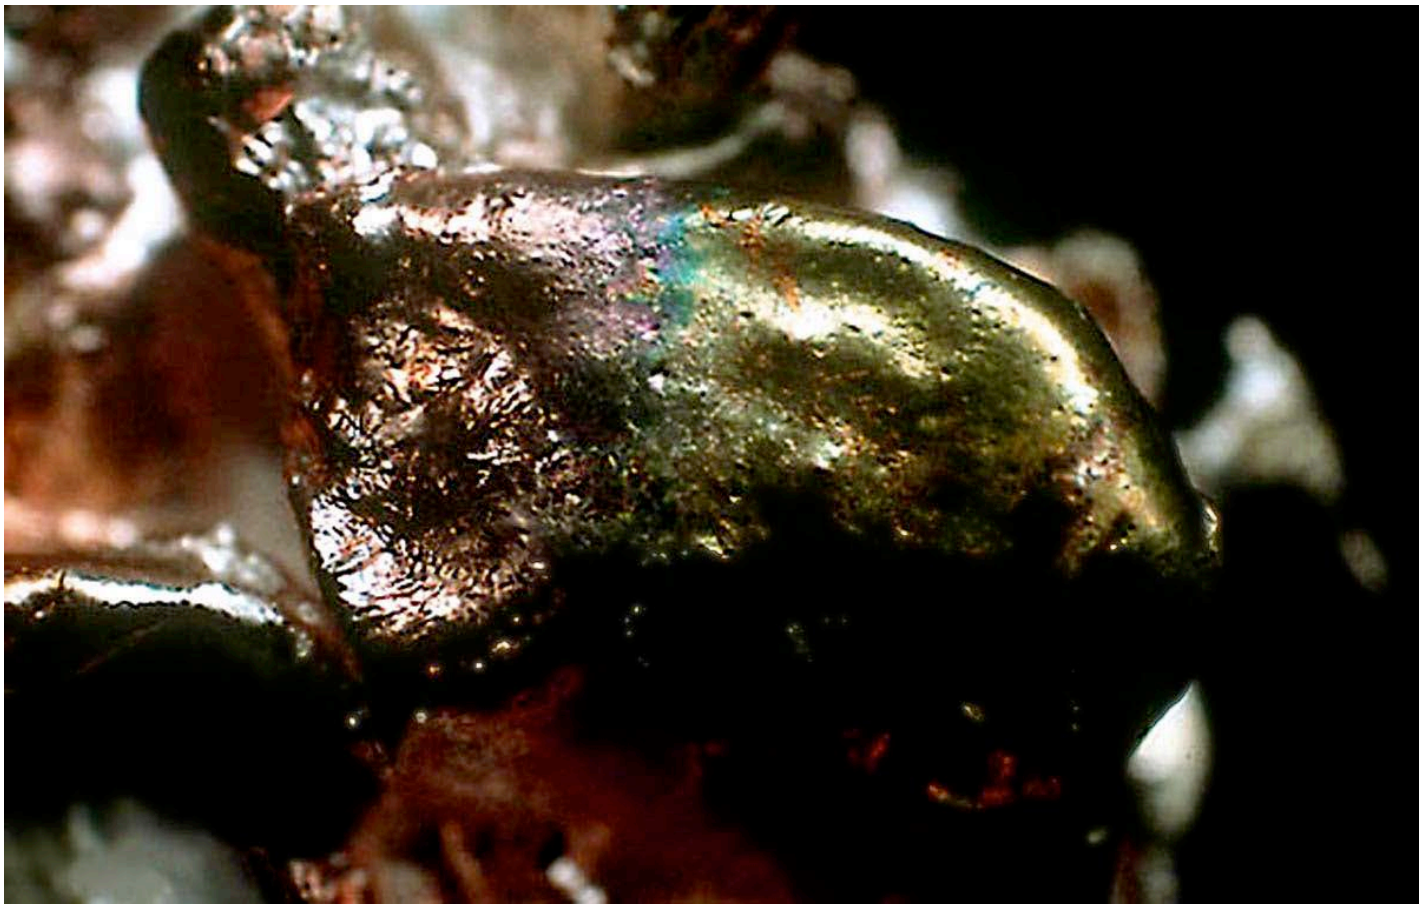
The close-range photo series included well-illuminated, detailed nighttime images of the tiered convex underside of the beamship piloted by Quetzal. Recessed patterns are seen under the beamship's outer flange and details of the lower hull's concentric rings include a pair of circular fixtures and other closed circular ports just barely visible (likely housing landing supports). The large, stepped central element terminates in a nearly hemispherical platform with an array of HHO plasma beam emitters, for which the 'beamships' have been named. Plejaren beamships in Earth's airspace maintain complete invisibility, yet special occasions presented themselves whereby members of the Meier's community were able to witness and photograph various spacecraft and other associated aerial phenomena. While Semjase's description of global celebrations on her homeworld of Erra included immense, multicolored aerial HHO plasma displays by fleets of beamships, only modest demonstrations were made for Meier's group.



FIGU member and author Guido Moosebrugger was able to photograph a nighttime aerial beamship demonstration on June 13, 1976 above Winkelriet/ Wetzikon (at left). The bright luminous display distinctly presents an array of infrared beams acting as guide paths for glowing orange columnar discharges of HHO plasma. Rather than providing some form of thrust as would be expected in the context of plasma jets used in basic terrestrial rocket technology, the plasma beams can be used to target and incinerate objects below the ship, and to levitate objects upwards from very far below. This beam is often used for tasks such as collecting atmospheric, terrestrial or aquatic samples and specimens, as well as generating luminous aerial displays. Specific colors emitted by HHO plasma can be controlled by simple chemical additives being vented with the HHO gas, thereby forming plasma trails of banded colors in the wake of the plasma craft as it maneuvers aerially.

The circular bottom of the reconnaissance beamship houses a symmetric octagonal array of 24 plasma beam emitters arranged around a larger central element which vents HHO gas into the beam array to be ignited as HHO resonant-transfer plasma (above). Each of the plasma emitters contains a ruby for the generation of a beam of infrared light, precisely aimed by a short nozzle. The plasma emitters' achieve a narrow range of rotary motion that allows all 24 beams to be focused on one central point several feet below the beamship, or independently into any other desired configuration. The alloyed nozzles focus an electromagnetic field that encircles the infrared beam, thereby confining the HHO plasma within the beam. These techniques for plasma beam focusing are now commonly used by plasma physicists, yet are rarely studied in the context of beam propagation over vast distances through the atmosphere.

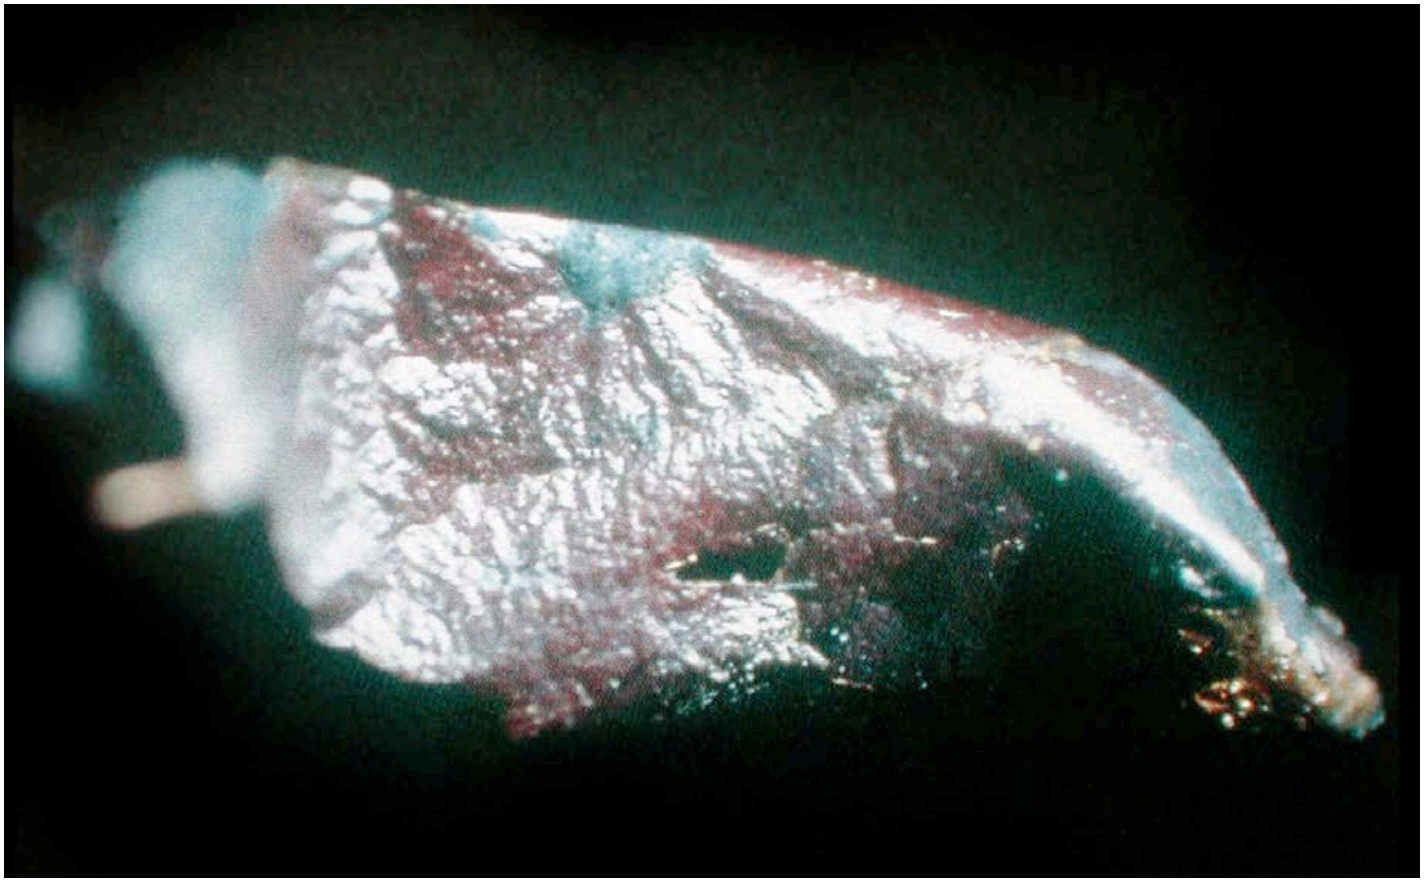
Well-known examples of resonant metal alloys formulated by Sanskrit-based Buddhist traditions in Asia include Tibetan singing bowls, comprised of 3 metals, and finer Bhutanese singing bowls rendered from 7 metals or more, known for highly resonant characteristics. While the singing bowls of Asia are comprised of a layered composite of various metals formed by hammering, the much more advanced resonant alloy production processes of Plejaren metallurgists involve the co-mingling of atoms in a composition unique to space-faring plasma ships, unlike any produced on Earth in modern times. Billy accepted several resonant metal samples as gifts from Asket, the products of her civilization, the Timars, who use similar advanced techniques of frequency resonance applied by the Plejaren, and indeed all cosmic travelers.



The resonant metal alloys of transdimensional plasma ships are developed using precision multi-stage temperature and frequency programs that convert base metals into alloys (above) containing all of the precious metals, rare earth elements and trace amounts of every other element on the periodic table – many in crystallized or metallic states not yet conceived of by Earthly scientists. Polarization of the final products is achieved by the micro-layering of perpendicular grain patterns formed within the crystals.

Semjase provided Meier with Plejaren beamship metal alloy samples of a *7-stage metal conversion process from lead into a copper-nickel-silver-gold alloy, also containing traces of every stable element in a smooth curve from the heaviest elements through the lightest gases.* Many aspects of this complex process were discussed during the 45th contact on February 25, 1976, in response to Meier's direct request – "Quite simply, we would like to know what sort of metal you use for your beamships?"

> *Semjase:* This I can explain for you: We gain it from a process of conversion from lead. We extract this soft metal from many things, as for example lead-containing atmospheres from stars, from waters, from different plants, etc., as well as from the decay of different ore-stones of stars in destruction. By an, according to Earth understanding, very difficult process, we convert the lead substances we assembled into the soft metal lead, which we then change by further mechanical-chemical processes into a hard-metal form, which is much harder than your metal which you call steel. This still is unserviceable in this form for beamships, because it must be polarized by further processes of conversion into a beamship-suited alloy of a special sort and character, about which I am not allowed to give details. The final product, which must have quite certain characteristics, consists of… a copper-nickel-silver alloy, which for certain of the beamships also contains gold.
>
> *Meier:* Oh yes, thus an alloy which could be produced on Earth… You mentioned a lot of manners before, in ways in which you gain the lead. Here it has struck me that you have mentioned no word of an ore mining of Earth kind. Is this sort of obtaining ores not usual with you?



Semjase: Ore-mining or other mineral mining on a planet or another star is done by us only in extreme emergency, because this process is equal to the destruction of the star. A planet or another star is never exploited in the form as is done on Earth. What the Earth human being does by that is equal to the destruction of the planet. The first evil effects of this destruction came up on the Earth already some decades ago, and at the present time it is already experiencing the pains of the destruction itself. This is to understand the way that the Earth human being exploits his planet, and robs from it its fundamental life force when he deprives it of its oil, gas and the different ores. The effect of this is that the Earth suffers shifts inside, leading to volcanic eruptions and earthquakes, because the Earth is slowly breaking down into itself. The same event is generated also by the construction of dams and similar formations, which cause, by the assembled masses of water, very dangerous shifts. The worst delusion the Earth human being is performing is his subterranean and below-surface experiments with atomic bombs, as well as those cruel deep subterranean explosion tests, which he declares are atomic bomb tests, but which in truth are much more dangerous.[42]

The spiritual ethics of the Plejaren culture reflect a comprehensive understanding of planetary systems. All 7 stages of beamship metal production were related on the following day, during Meier's 46th contact, with an astounding explanation of the atomic transmutation of metals by *controlled frequency resonance:*

Semjase: Here I also have brought you some metal, of three different working steps… The first working step absorbs the lead substances from the atmosphere and condenses them into pure lead. The second process distracts from the resultant metal all dangerous radiations. Then the lead is fed into heat-converters, which, without the addition of any other metals, converts the lead by several processes into the alloy.

(Ed.- The metal specimens finally delivered to Meier, which they and we had analyzed, consisted of three of the seven states the metal goes through in production and refinement. We had samples of states 3, 4, and 5. The sample of state 3 was mostly lead, with impurities. State 4 was nearly equal parts of silver, copper and lead. State 5 contained silver, copper, nickel, gold, magnesium and other trace elements. We lost our specimens in the hands of testing laboratories before we had finished our analysis. We found traces of stable rhenium and thulium in our specimen tested by Marcel Vogel in his laboratory in San Jose, California. Since our testing in 1979, scientists have found that the addition of rare earth elements like rhenium and thulium produce astounding properties in otherwise basic metals, such as superconductivity, superhardness and supermagnetism, etc.)

Meier: You mean that the lead becomes liquefied first, and in this step suffers the conversion?

Semjase: Surely. There do all right exist direct possibilities for the alternation of stuff, but these possibilities are not given for us. But our scientists have already well achieved successes in experiment. For the present, however, we still convert the metals the old-fashioned way in heat-converters, and as said, this happens in seven different runs. The metal becomes liquified, like with you, in furnaces, to suffer then by distinct oscillations, an alternation, but just to a certain value, because of the different steps in working that are necessary. Each final product is then pushed by pressure through a cooling spiral, where then are generated the small figures, as you have then here before you. This process is repeated some times, while with each new process the value of the different metals increases and becomes the targeted alloy. The sixth working process then affects the complete alloy… The cooling spiral contains usual water, which we obtain especially for this process in a condensational manner…

Meier: Thank you. Still it is not evident to me how you then will work the metal, as neither at your beamship, not Ptaah's huge ['Great-Spacer'] box, could I recognize joints or seams, etc. And nothing is riveted as well.

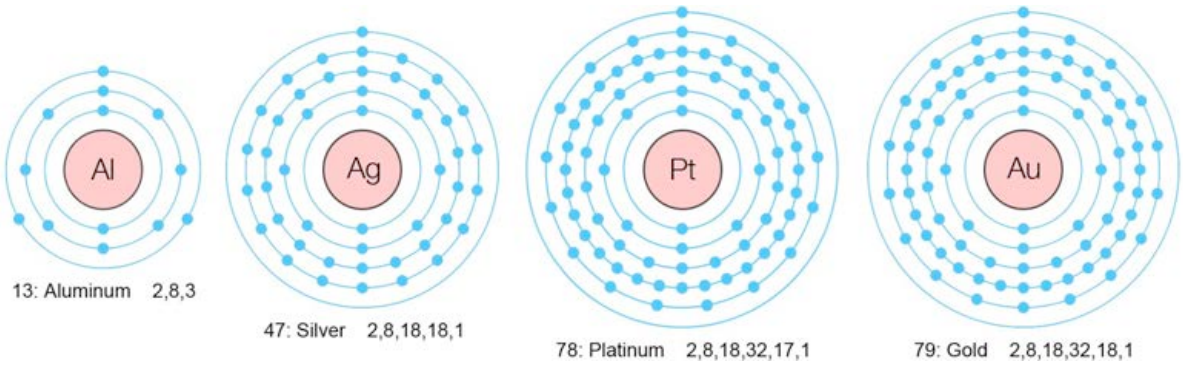
Semjase: For this purpose we use an instrument which you would call a welding apparatus. But it is based on oscillation techniques, which liquifies the metal in a cold state and lets it flow together, by which it is completely without seam and forms one single piece. So we also do not know grinding operations, as you do when you have to do welding work, and then have to grind away the seams to smooth it all. In this respect, you on Earth use a very dangerous operation.[43]

While Earthly science achieved the liquification of metals using high-intensity ultrasound[44] decades ago, Semjase informs us that for thousands of years Plejaren metallurgists have been producing beamship alloys by *subjecting molten metals to "distinct [atomic] oscillations of a certain value."* What are these particular *resonant frequencies* that induce the alchemical transmutation of one element into another? The atomic physicists among Earth's scientists have been making great strides in their understanding of low-energy nuclear transmutation – the most outspoken among them being Dr. Joseph Champion of the Phonon Resonance Institute in St. George, Utah.[45] Dr. Champion's work elucidates the atomic principles enabling several successful methods of atomic transmutation involving the production of precious metals:

Dimensional phonon resonance occurs when the space occupied by one isotope is *exactly the same as that of another isotope in its rest state* [i.e. 25°C]. This event can only occur under the following two conditions: the expansion of an isotope by heating, or the contraction of an isotope by cooling. Due to the natural characteristics of elemental properties, this event is extremely rare and one can only force the event under select conditions. To determine the phonon resonance of an isotope, it is necessary to apply the following formula:

$$\text{Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{d \times Na}{m}}$$

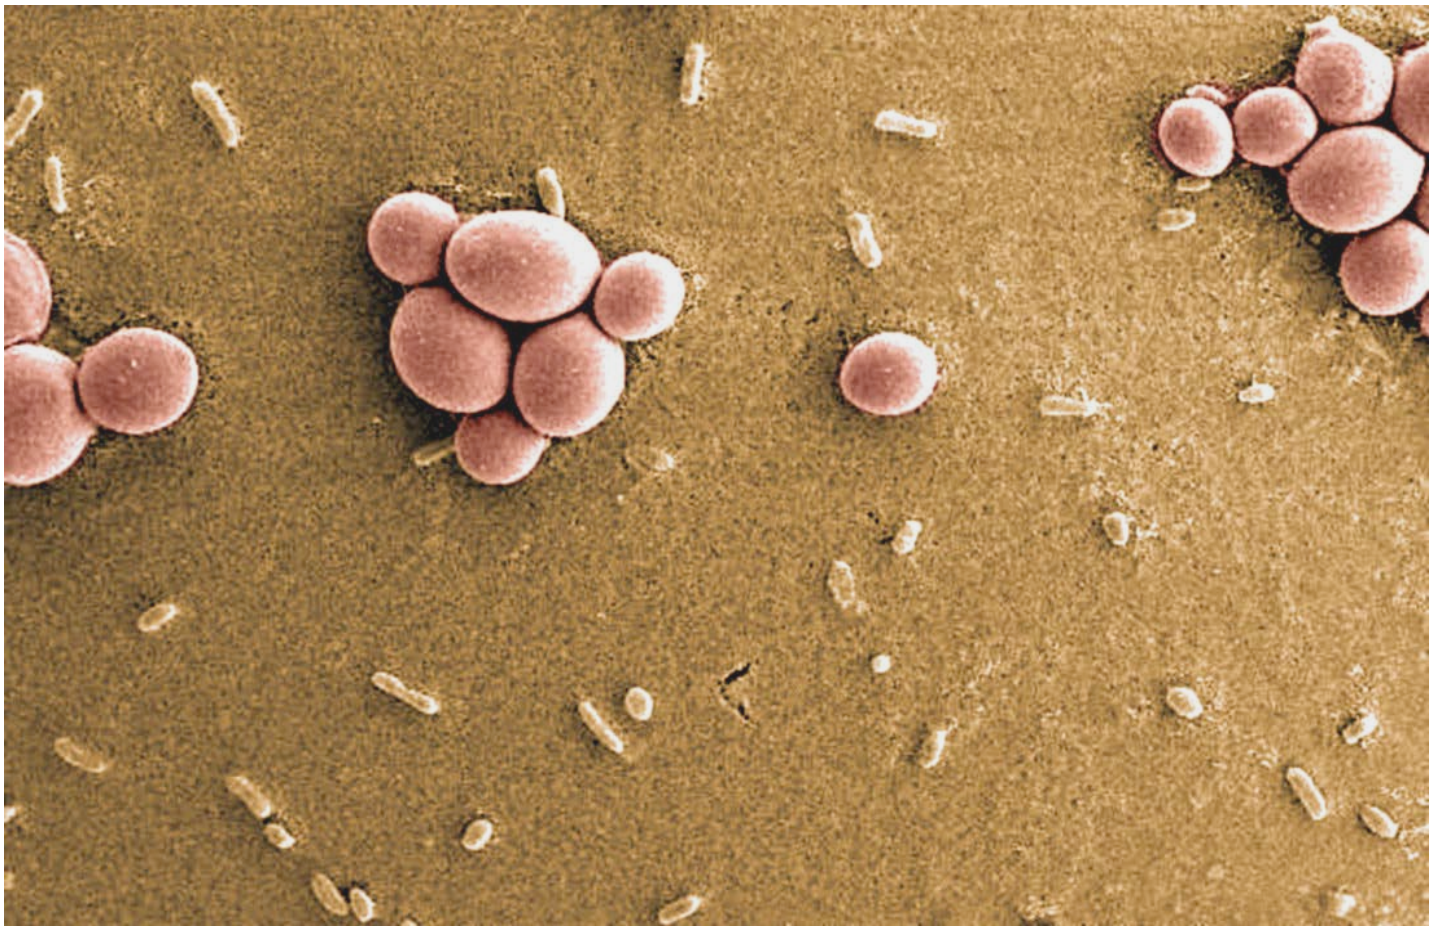
d - density in g/cm³
Na - Avogadro's Constant
m - atomic mass



In the formation of Au (or other elements) from a dimensional reaction, the conversion will occur without excess energies or nuclear signatures… by heating Ag to a temperature of 43.2°C… To achieve maximum conversion of Ag to Au will depend on the dwell time at resonance temperature. To date, visible conversion of Ag to Au has taken as little as six hours, with 2% conversion taking up to 24 hours. The reaction is safe… [with] no toxicity.[46]

$$^{107}\text{Ag Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{10.5 \times (6.0221 \times 10^{23})}{106.905092}} = 38{,}962{,}532$$

$$\text{Au Phonon Resonance (Hz/Cm)} = \sqrt[3]{\frac{19.3 \times (6.0221 \times 10^{23})}{196.967}} = 38{,}931{,}841$$



Dr. Champion's phonon resonance formula provides the resonant frequency of *gold* (Au) in its rest state as 38,931,841 Hz and the ^{107}Ag isotope of *silver* as 38,962,532 Hz (above). The relative proximity of the resonant frequencies of these two precious metals allows a low-energy atomic transmutation from ^{107}Ag to Au to occur *near room temperature*. However, silver isotope ^{109}Ag comprises 48.8% of all available silver bouillon and, unlike it's sister isotope ^{107}Ag, is not so easily converted to Au.

The conversion of ^{109}Ag into gold requires a more complex process using megahertz frequencies in conjunction with precision heating techniques. By the same means aluminum can be converted into silver when oscillating at a resonance of 38,950,565 Hz (at 276°C) and will also convert into gold when dwelling at a resonance of 39,932,068 Hz (at 295°C). After just a few days of dwell-time at resonance, atoms of the starting element have become *informed with the resonant frequency* of the target element in its rest state. The metal is then melted and rapidly cooled in distilled water to achieve the maximum conversion rate, *just as in the procedures described by Semjase in 1976.* The respective electron configurations of aluminum, silver, platinum and gold reveal the restructuring of electron orbital shells during transmutation:

The addition of subatomic particles into atoms vibrating at resonance is facilitated by *standing waves that act as pathways for the reconfiguration of electrons, protons and neutrons into a more densely packed arrangement.* Just as acoustic standing waves can power wireless devices by transmitting electrical currents across otherwise nonconductive airspaces, standing microwave resonances induced within atoms allow subatomic particles to jump across otherwise impassable gaps in the atomic framework. Direct observation of this resonant phenomenon of atomic transmutation will be made possible by the quantum stroboscope, which has already provided the first direct imaging of standing waves that comprise the structure of a single electron. A source metal like aluminum can thus be transmuted into silver and then gold as successive electron shells become filled, adding atomic weight in the process and significantly increasing the yield weight of the conversion with each stage of the complex process.

Dr. Champion has identified a new class of intriguing natural metabolic processes[47] where atomic transmutation occurs as fungi ingest silver, thereby undergoing a *pleomorphic change*. Dry, active yeast is a cheap and readily available bread-making product that requires only warmth and water to thrive and reproduce in vast numbers. Common yeast species like *Saccharomyces cerevisiae* produce the silver-binding protein SSB-1 that enables the attachment of active yeast cells to available silver surfaces.[48] Ingestion of silver atoms by the round 2-3 nm microbes causes their mutation into rod-shaped mutant microbes about 1-2 nm in length (below). The budding yeast cells act as *electron donors* inducing the resonant transmutation of silver into gold, as 32 electrons, 32 protons and 57 neutrons are accepted by ^{107}Ag silver atoms vibrating at a 38,931,841 Hz resonance with gold. This newly recognized metabolic process leaves nanoclusters of gold deposited on exposed silver binding sites, as further transmutation takes place within the bodies of the microbes whereby ingested silver is converted into gold nanorods.

The rediscovery of biological transmutation in yeast species restores ancient metallurgical knowledge and informs a scientific reinterpretation of enigmatic passages from the Bible. Biblical accounts of the divine presence often refer to a sacred substance called *manna,* which was used in making holy items such as the 'bread of life' (or showbread) and the 'living water'. However, this holy bread was not simply produced by a common baker. Instead, Moses commanded the goldsmith Bezaleel to prepare manna for the 'Bread of the Presence of God' – *apparently using yeast to convert silver nanopowder into gold.* Many unmistakable references preserved in the Book of Exodus confirm the biological process of atomic transmutation was used in the enrichment of food and water for the elevation of human consciousness. Advanced material and spiritual knowledge possessed by Moses is revealed in his demonstration that the presence of God is not conferred by gold idols, but by gold nanoparticles in sacred bread and water:

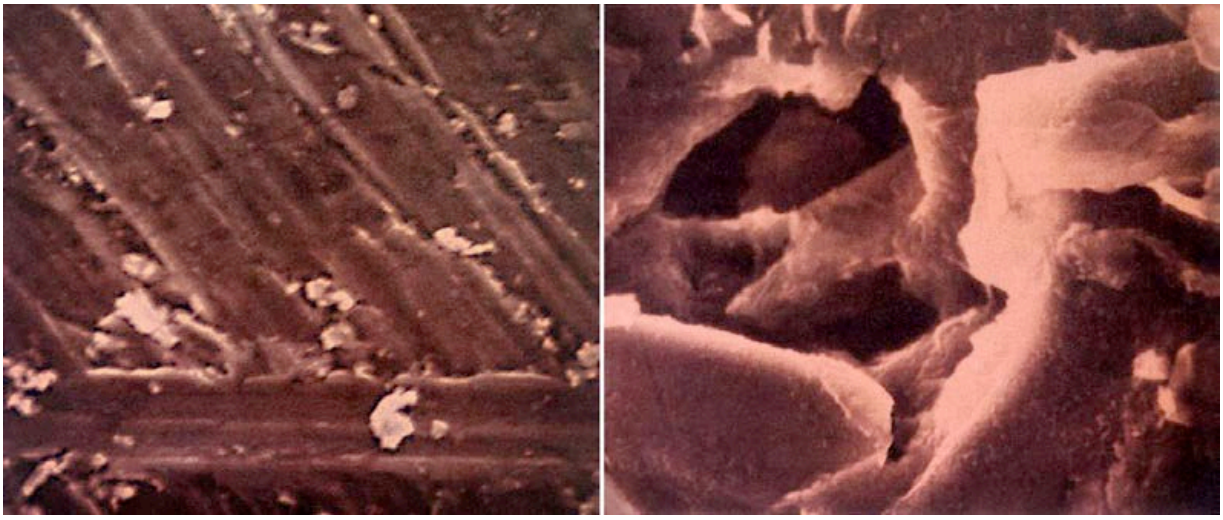
> When Moses approached the camp and saw the calf and the dancing, his anger burned… He burnt the golden calf - melted it down, and then filed it to dust; and that the powder to which it was reduced might be taken notice of throughout the camp, he strewn it upon the water which they all drank of. He did this that it might appear that an idol is nothing in the world, he reduced this to atoms, that it might be as near nothing as could be. (32:19-20)

My first experiments achieved ~3% transmutation of silver into gold in 7 days using the silver/yeast method at 108°F (before/after seen above)! A comprehensive spreadsheet provides phonon resonance frequencies and temperatures for most isotopes based on each atom's physical diameter.[49] A small selection of phonon resonance frequencies determined for various conversions follows:

Source Isotope	>	Target Isotope	Resonant Frequency	Resonant Temperature
^{107}Ag (silver)	>	^{197}Au (gold)	38,931,841 Hz	43 °C / 108 °F
^{95}Mo (molybdenum)	>	^{65}Zn (zinc)	39,400,694 Hz	115 °C / 239 °F
^{65}Zn (zinc)	>	^{27}Al (aluminum)	39,296,350 Hz	183 °C / 362 °F
^{27}Al (aluminum)	>	^{107}Ag (silver)	38,950,565 Hz	276 °C / 529 °F
^{27}Al (aluminum)	>	^{197}Au (gold)	39,932,068 Hz	295 °C / 563 °F
^{107}Ag (silver)	>	^{109}Ag (silver)	38,652,383 Hz	327 °C / 620 °F
^{65}Zn (zinc)	>	^{107}Ag (silver)	39,138,500 Hz	344 °C / 653 °F
^{65}Zn (zinc)	>	^{197}Au (gold)	39,126,761 Hz	356 °C / 673 °F

The atomic resonance of various elements provides the particular conversion cascade by which nature creates the diversity and abundance of matter through great heating and cooling cycles recurring throughout the depths of the cosmos. The layered lithosphere's seemingly endless variety of minerals and ores are the byproduct of extreme conditions of pressure, heat and time. Bacteria thriving in these conditions also contribute to the Earth's internal atomic transmutation and decay processes, just as microbes are essential to metabolic processes in the human body, with its own specific resonances.

The full spectrum of atomic resonances present in all planets endows resonant vibratory characteristics, and Plejaren metallurgists have produced resonant metals by the same means. Beamship metals also contain traces of *all* stable elements present in nature. Eduard Meier's Plejaren contacts have explained that transdimensional spacecraft are like tiny artificial planets unto themselves, and the beamship metal samples provided to Meier have given further insight into the deeper layers of truth contained within their many concise explanations. The delicate threads of knowledge woven into Meier's communications with the cosmic Plejaren culture have been published word-for-word for this very reason: to preserve for human contemplation their advanced scientific and spiritual teachings in pristine form.

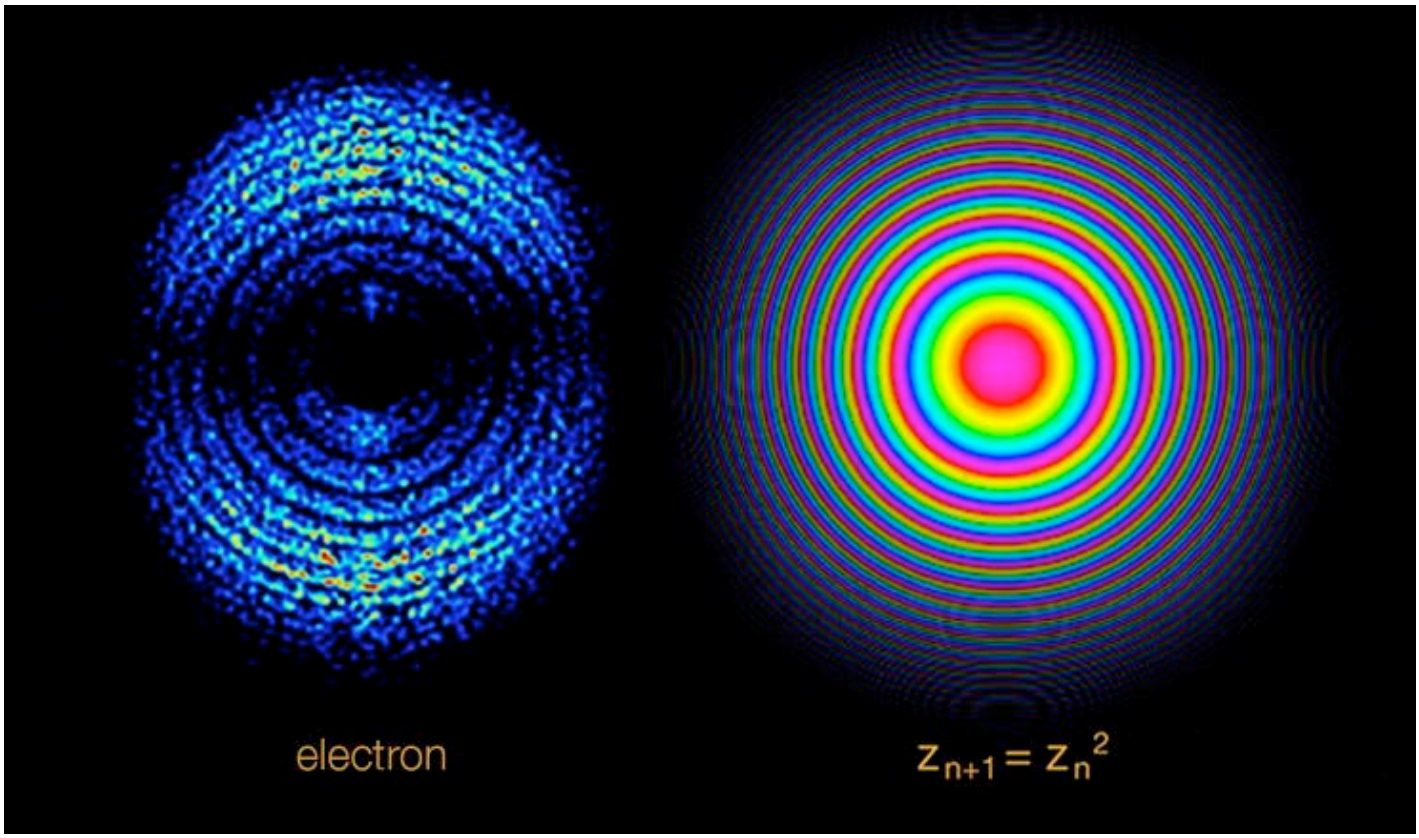


The penetrating truth of the Plejaren teachings has become all the more apparent as the frontiers of human knowledge expand toward recognition of natural law and co-creation using diverse natural micro- and macrocosmic processes. The manipulation of an atom's diameter by temperature adjustment allows for nuclear transmutation from one element to another in *a specific cascade sequence* that determines the frequency programs used by Plejaren metallurgists to convert lead into a resonant copper-nickel-silver-gold alloy with trace amounts of every other stable element. The third, fourth and fifth-stage beamship metal samples were submitted for microscopy analysis to Marcel Vogel, senior research scientist for IBM, who later confessed his amazement at what he observed under magnification:

> "When I touched the oxide with a stainless steel probe, red streaks appeared and the oxide coating disappeared. I just touched the metal like that, and it started to deoxidize and become a pure metal. I have never seen a phenomenon like that before." Of another metal sample containing nearly every element in the periodic table, Vogel stated, "Each pure element was bonded to each of the others, yet somehow retained its own identity." At 500X magnification thulium was revealed. "Thulium exists [naturally] only in minute amounts. It is exceedingly expensive, far beyond platinum, and rare to come by. Someone would have to have an extensive metallurgical knowledge even to be aware of a composition of this type", said Vogel. At 1600X Vogel said, "A whole new world appears in the specimen. There are structures within structures - very unusual." At 2500X he found that the sample was, "metal, but at the same time ... it is crystal!" …Vogel put the full weight of his expertise in these summary comments: *"With any technology that I know of, we could not achieve this on this planet! I could not put it together myself, as a scientist..."*[50]

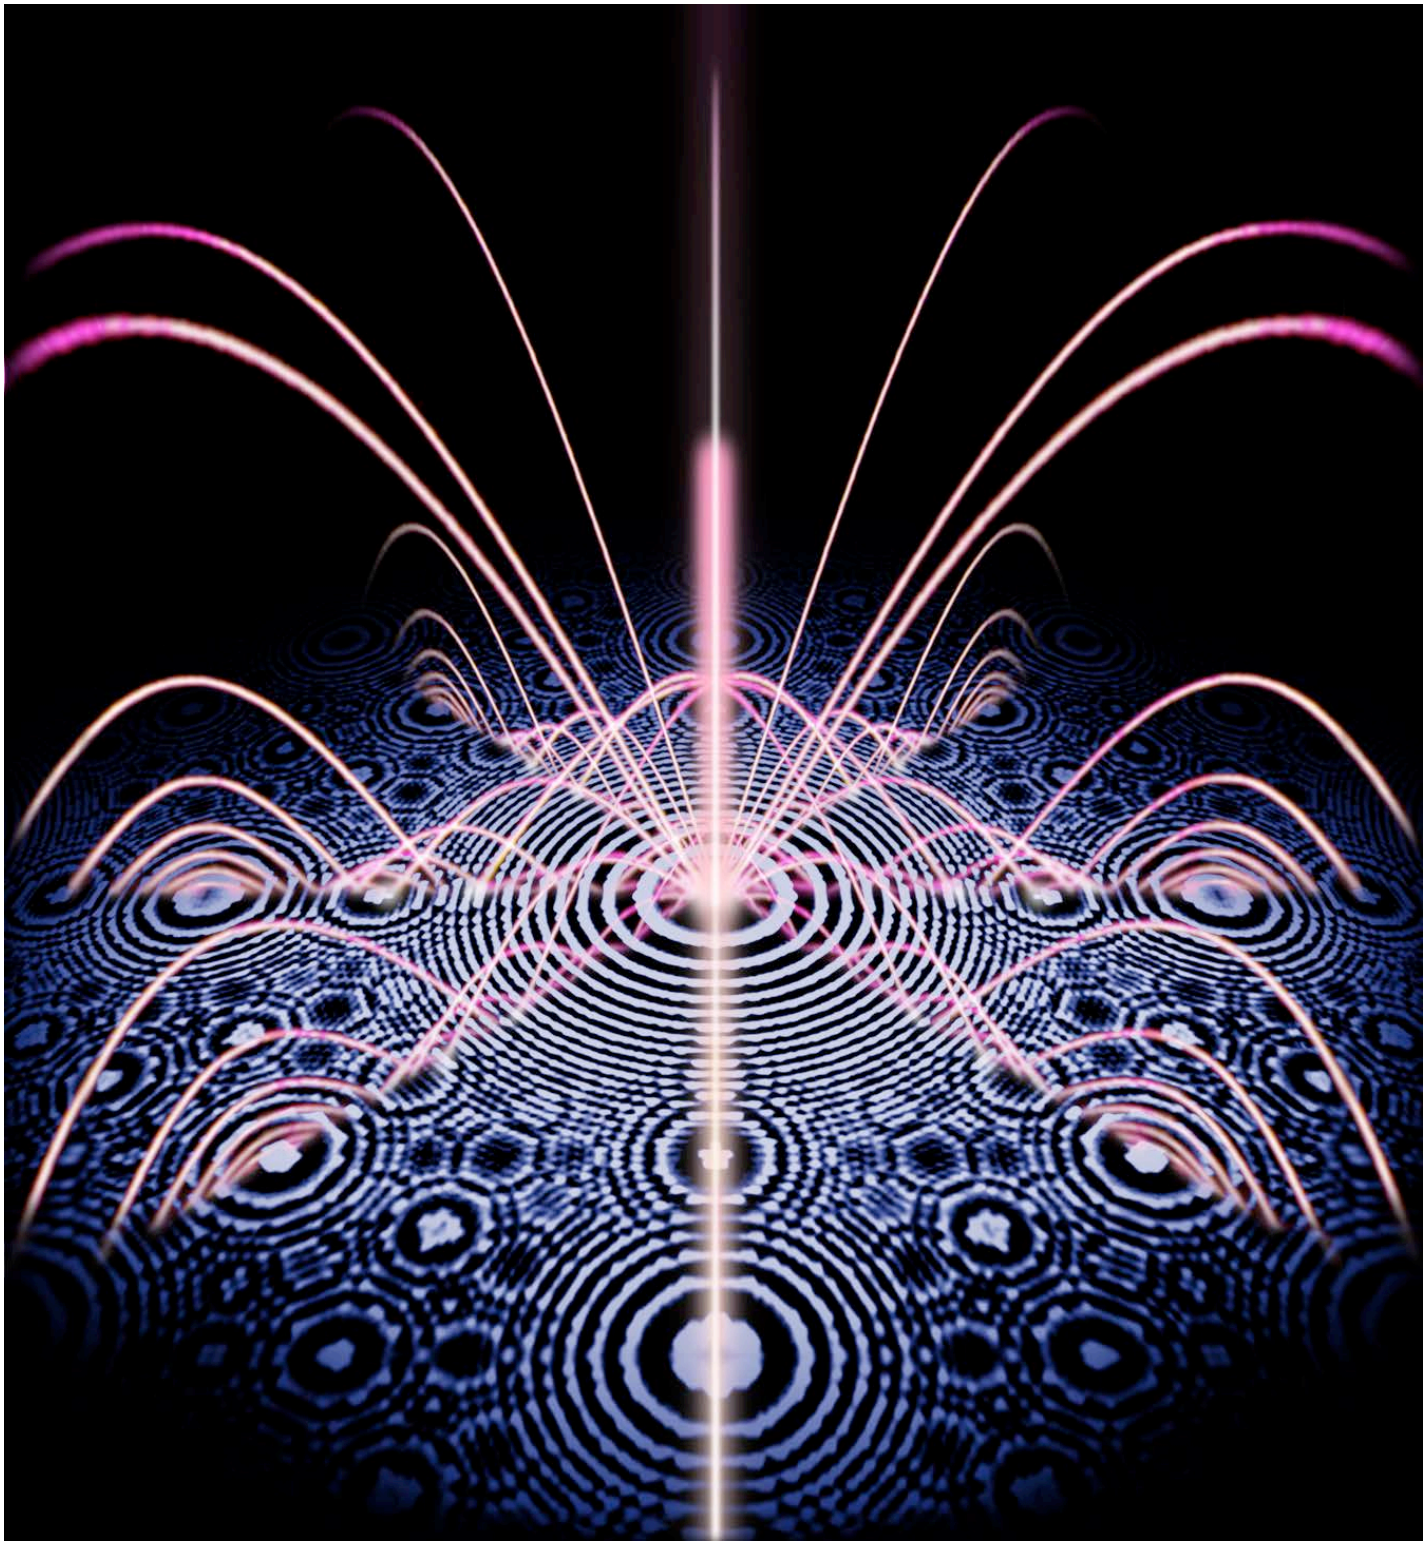
Vogel's astonished assessment of beamship metal constitution was made independently, without having any advanced knowledge of the comprehensive details Meier had been given by Semjase concerning all 7 stages of the resonant metal manufacturing processes of Plejaren metallurgy! The most significant details omitted by Semjase (for good reason) are the precise transmutation frequencies necessary to achieve each specific conversion. The complete set of phonon resonance frequencies determined by the formulas of Dr. Champion allow the integration of Plejaren teachings with the theoretical framework

understood by contemporary atomic physicists. Dr. Champion's work inspires a reinterpretation of the results of various analyses conducted by Marcel Vogel in 1979, which comprised the first modern scientific study of resonant metal alloys produced by the cascade process of atomic transmutation:



> All of the elements examined spectrographically had missing bands in their spectra which should have been there if they were normal atomic spectra. This indicated that the elements were put together in a very unusual way [easily distinguished] from normal Earth technology… [presenting elemental characteristics] beyond what one would consider an isotope… Basically this indicates a non-electrical cold fusion process of synthesis because there was no ash and no heat residue. Such a process is not known to Earth technology… Another unique feature of these elements was the almost perfectly uniform fall-off of lighter elements preceding that being studied in the spectrograph. There would be the primary in a high state of purity and then with no secondary and no catalyst an absolutely uniform curve of all the lighter elements preceding that, even through the gases. It appears as though the desired metal was the result of a uniform buildup of density, particle by particle!

Examination of a non-metallic part of the specimen using polarized light to emphasize certain bi-refringence revealed crystalline structures, which are organized in spiral formations. Under 2000X scanning electron microscopy the six-sided face angles of the crystals were clearly revealed. A photomicrograph picture shot of this revealed unusual clarity indicating unusual conductivity of the electrons illuminating the image. Ordinarily, if they were ordinary non-conducting crystals, like quartz, the electrons would accumulate rapidly on the points of the crystals and form a space charge obscuring the image. The conductivity was so efficient that sub-crystal structures inside the crystals could be actually seen – something unheard of before this. The electrical bonding between the basic crystal elements was so efficient that a clear view through the crystalline latticework revealed a spiral buildup of regularly spaced assembly with contact taking place at the ends of the sub-particles. There were no gas bubbles. If this were produced in a heat fusion process the picture would be entirely different and a greater mixing of elements would be expected… Still another micropart of the specimen consisted of pure silver –again with no secondary lines and no catalyst indication. The silver was also unusually conductive and it was smoothly bonded to a pure aluminum area that was unusually conductive also… The following unique properties encountered in examining this specimen make it exotic and very definitely point to an unearthly origin:



- Unusual purity in state of metal examined… with no indication of catalyst or secondary spectrographic lines.
- Unusual number of trace elements ranging from the primary heavy all the way up the scale density in a very uniform curve with no breaks or gaps up to the lightest gaseous elements. Again these lines all indicate the same high purity for each element. Scientists involved have never seen anything like this before.
- Strange, very uniform grain pattern with a layer of horizontal grains sandwiched between layers of vertical grains again sandwiched between that and another horizontal grain, etc., in a tight 90° latticework.
- One metal surface showed evidence of an extremely fine mechanical cut, possibly even by laser. [above]
- Association of non-metallic crystals of strange structure and extremely high conductivity for the elements.
- End-to-end formation of bond patterns in the crystal structure and the spiral assembly or stacking of the crystals in the non-metallic substance was unique.
- Some form of non-electrolytic cold synthesis process is very definitely indicated.
- There is some evidence that the synthesis took place in a vacuum.[51]

These many unique and astounding characteristics of the resonant beamship metal samples – including *superconductivity, superhardness and supermagnetism* – are only attainable through the phonon resonance application of standing waves for *tuned atomic transmutation in a uniform build-up of density, particle by particle.* The concept of standing waves was touched upon indirectly on many occasions during the Plejaren dialogs with Billy Meier, though the specific term itself was not divulged, in a situation very similar to the treatment of another sensitive term: 'HHO plasma'. Infrasound standing waves were mentioned in the context of "energy bales of different sorts and strengths… [that] circle the Earth at different distances and intervals, but are very important for the maintenance of Earth creatures" (pg. 80).

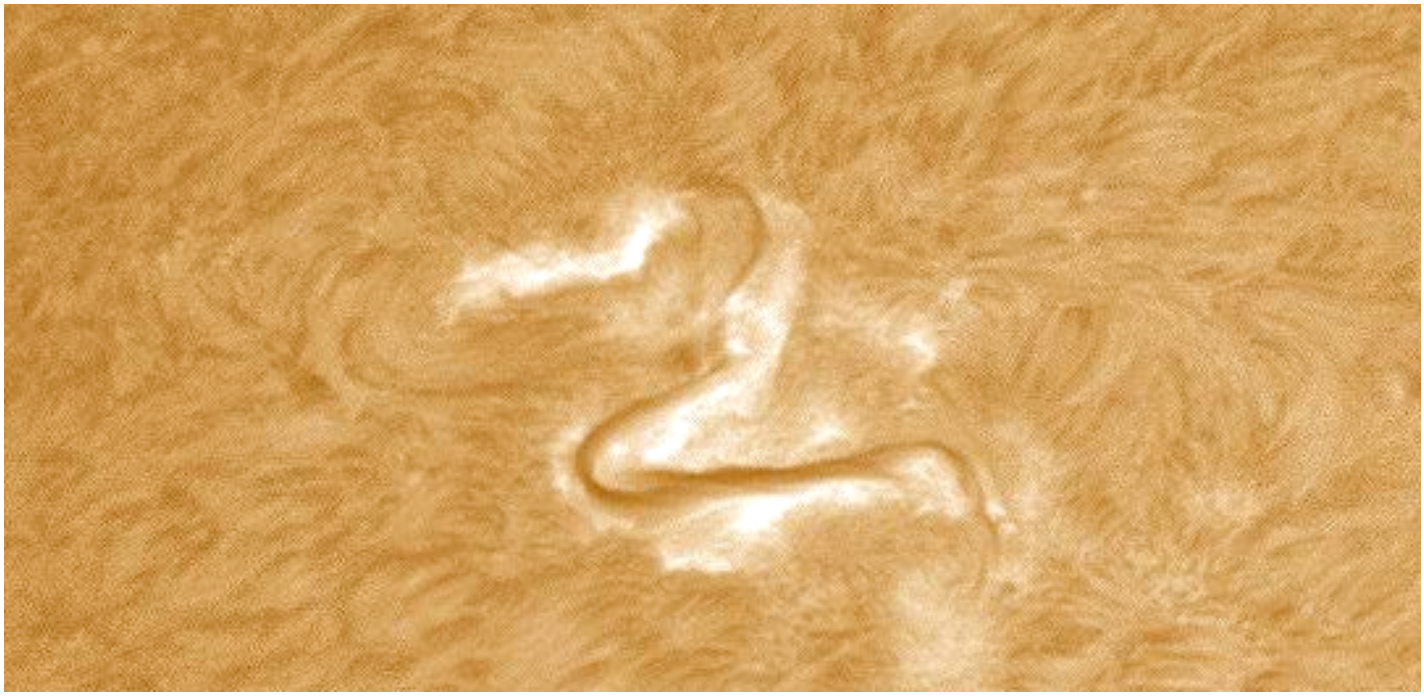
Semjase also indirectly referenced terrestrial standing waves when she informed Meier that "the gravity of a planet is… not always… of the same strength, owing to certain alternations which will be discovered by your scientists in a reasonable time" (pg. 89). In fact, over 30 years elapsed before my completion of these standing wave maps in 2005, defining the specific Fibonacci 'distances' or 'intervals' underlying this essential pattern of infrasound resonance. The Int'l Bureau of Weights and Measures detected variations in Earth's gravity field in 2007.[52] The diamagnetic metals that comprise their weights are presently displaying a measurable weight offset, although inaudible infrasonic effects of acoustic levitation were not recognized as the cause. This effect will inevitably increase in the future to reveal its inaudible source.

The same standing wave maps that inform the significant fluctuations of gravity also inform the latest discoveries of scientists imaging the subatomic realm. The structure of *the electron* was recorded for the first time in 2008, revealing the unmistakable scattering pattern of nonlinear standing waves, as precisely encoded by the quadratic formula [$z_{n+1} = z_n^2$] (above). Researchers in Sweden demonstrated an attosecond quantum stroboscope that releases individual electrons into the field of an infrared laser at exactly one electron per laser cycle to facilitate the imaging of coherent electron scattering that takes place.[53] *Standing wave resonances comprising the electron are presented 3-dimensionally (opposite), and are applied for infrasound antigravity propulsion by all space-traveling civilizations*, using diverse mathematical languages, and employing entirely different operations. During the 248th contact of February 3, 1994, Ptaah confirmed that the uniformity of universal laws determines that all mathematical and physics formulas applied by all sentient beings may find equivalence, differing only in the terms of expression:

With regard to mathematics, that 3 times 3 is 9, it is to be said, of course, that the result is right and is also consistent with our mathematics, but the form of our mathematics is fundamentally different to the terrestrial one… Like with the mathematical formulas, the physics formulas also differ. But once they are converted, they yield the same values because universally, the mathematical and physical laws, etc. are uniform in their basic value and final value and, therefore, are one and the same, just with the difference that the various races, civilizations, and humanities of the various worlds throughout the vastness of the Universe call other forms of mathematics and other terms, etc. their own; consequently, they also have other methods of calculation than what are common among the Earth people. Nevertheless, in mathematics, the basic value and final value yield the same results.[54]

The vast variety of cosmic and planetary conditions within the universe facilitates natural learning environments of various types, each providing the necessary range of lessons and limitations for each developing life-form and each collective terrestrial civilization. Planets can be categorized by their respective levels of infrasound resonance, with planets such as Earth presently residing at the lowest level of the scale, and planets such as Erra, in the Plejares star system, finding their place among the more highly developed worlds. As Earth presently progresses from the primary level of consciousness lessons, the infrasound resonance of the planet is stimulated to a higher level of collective vibratory experience. Previously invisible forces will become visible to human eyes; subtle forces will become self-evident.

Rainfall patterns and major fluctuations in river levels have been directly correlated with solar flare activity –through the stimulation of infrasound standing wave resonance, raising vast amounts of water into the atmosphere to fall as rain. Rows of water vapor plumes evaporating off the ocean were photographed off Laguna Beach, California[55] in 2009, while the long-term water flow-rates of the Parana River were perfectly matched with sunspot numbers[56] in 2010. So-called constants like gravitation and atomic decay rates vary significantly, and in accordance with the levels of incident infrasound radiation upon the tested materials. *Thus, Earth's infrasound resonance with the sun defines the increasingly noticeable fluctuations of gravitation, atmospheric evaporation, rainfall, and the decay rates of every atom comprising our world.*



Plejaren scientists precisely comprehend the relative conditions of various planets, having studied literally millions of different inhabitable and uninhabitable worlds, and this comprehensive knowledge extends into the minute variations in the respective rates of decay of elements on each planet. Ptaah revealed as much to Meier during a conversation regarding the low-resonance of the present atmospheric conditions of Earth that "all materiality suckles itself up on… and in this way falls to early destruction, *as for example iron, which normally does not rust so fast as is the case on Earth*." (pg. 78) The significance of this short sentence can only be understood in the broader context of planetary infrasound resonance as it influences atomic decay. Physicists on Earth have only recently documented the correlation of notable fluctuations in the rate of decay in radioactive isotopes in the laboratory with solar flare activity:

> It's a mystery that presented itself unexpectedly: The radioactive decay of some elements sitting quietly in laboratories on Earth seemed to be influenced by activities inside the sun, 93 million miles away. Is this possible? Researchers from Stanford and Purdue University believe it is. But their explanation of how it happens opens the door to yet another mystery… There is even an outside chance that this unexpected effect is brought about by a previously unknown particle emitted by the sun. "That would be truly remarkable," said Peter Sturrock, Stanford professor emeritus of applied physics and an expert on the inner workings of the sun.
>
> The story begins, in a sense, in classrooms around the world, where students are taught that the rate of decay of a specific radioactive material is a constant. This concept is relied upon, for example, when anthropologists use carbon-14 to date ancient artifacts… But that assumption was challenged in an unexpected way by a group of researchers from Purdue University… Ephraim Fischbach, a physics professor at Purdue, was looking into the rate of radioactive decay of several isotopes as a possible source of random numbers generated without any human input... As the researchers pored through published data on specific isotopes, they found disagreement in the measured decay rates – odd for supposed physical constants.

Checking data collected at Brookhaven National Laboratory on Long Island and the Federal Physical and Technical Institute in Germany, they came across something even more surprising: long-term observation of the decay rate of silicon-32 and radium-226 seemed to show a small seasonal variation. The decay rate was ever so slightly faster in winter than in summer…

On Dec 13, 2006, the sun itself provided a crucial clue, when a solar flare sent a stream of particles and radiation toward Earth. Purdue nuclear engineer Jere Jenkins, while measuring the decay rate of manganese-54, a short-lived isotope used in medical diagnostics, noticed that the rate dropped slightly during the flare, a decrease that started about a day and a half *before* the flare.

If this apparent relationship between flares and decay rates proves true, it could lead to a method of predicting solar flares prior to their occurrence, which could help prevent damage to satellites and electric grids, as well as save the lives of astronauts in space. The decay-rate aberrations that Jenkins noticed occurred during the middle of the night in Indiana – meaning that something produced by the sun had traveled all the way through the Earth to reach Jenkins' detectors. What could the flare send forth that could have such an effect?

Jenkins and Fischbach guessed that the culprits in this bit of decay-rate mischief were probably solar neutrinos, the almost weightless particles famous for flying at almost the speed of light through the physical world – humans, rocks, oceans or planets – with virtually no interaction with anything… "It doesn't make sense according to conventional ideas," Fischbach said. Jenkins whimsically added, "What we're suggesting is that something that doesn't really interact with anything is changing something that can't be changed."

"It's an effect that no one yet understands," agreed Sturrock. "Theorists are starting to say, 'What's going on?' But that's what the evidence points to. It's a challenge for the physicists and… the solar people too."[57]

In fact, the subtle variations in atomic decay data are not an effect of neutrinos, *but the direct result of measurable surges of localized infrasound resonance*, just as in the case of the 'aberrant' fluctuations of planetary gravity fields and the patterns observed in the water flow rates of major rivers. *The fundamental integrity of the measured radioactive isotopes is directly affected by the incident infrasound radiation.* The decay rates measured by Jenkins at Purdue show a significant fluctuation specifically because of the location of his laboratory in relation to the Great Pyramid of Giza. The Purdue University campus in West Lafayette, Indiana (40.43°N 86.91°W) is 6,176 miles from Giza, a distance comprising *24.8%* of the Earth's mean circumference. Infrasound standing waves focused by the Great Pyramid into the central Indiana area not only alter decay rates in Purdue labs, but also levitate huge sandstone boulders into treetops in nearby Limon[58] and Yellowwood[59] Indiana State Parks at the *25.0%* distance - in the same antigravity resonance process employed by the crystalline metals of interstellar Plejaren beamships.

The invisible web of terrestrial infrasound standing waves that protectively encircles the planet becomes focused by the three Giza pyramids, and in the same way by the three-ringed hull of Semjase's 7-meter beamship. The complex designs of every Plejaren spacecraft are precisely configured to interact within the Fibonacci structure of standing waves to achieve highly efficient acoustic energy storing within the crystalline latticework of resonant alloys comprising the circular body. This same effect occurs in natural crystalline structures – *in stones*. A remarkable photograph taken on July 19, 2009 by Gang Hao captures a special effect of acoustic resonance (above).[60] This giant boulder is estimated at 5m in diameter, which suggests a weight of several tons. The family never noticed it flying overhead while taking the photos, suggesting that the boulder was captured while slowly floating during an event of acoustic levitation, actually caused by solar flares transduced into infrasound by the Great Pyramid.

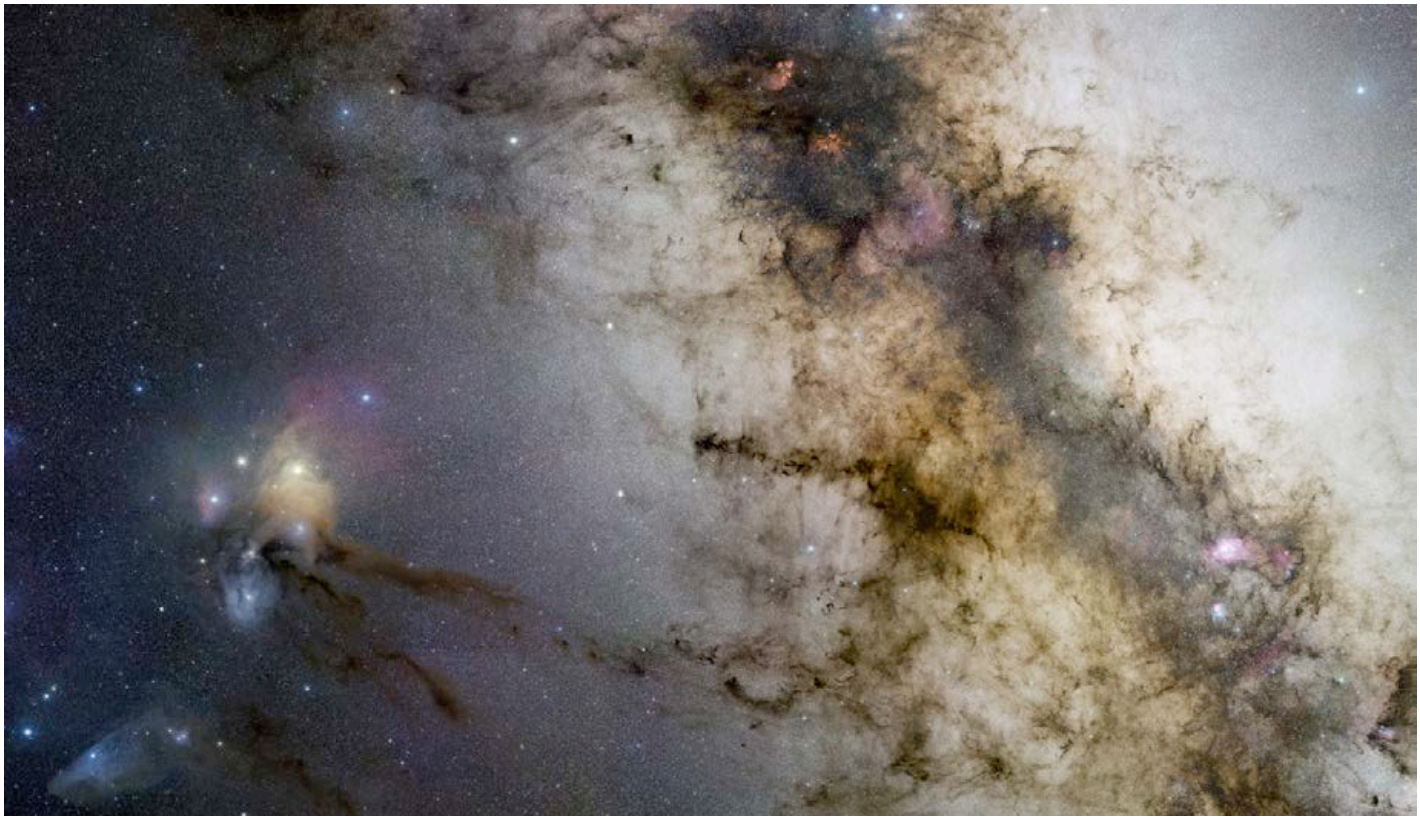
The piezoelectric properties of quartz, the main constituent of the sandstone boulder, allows its levitation by focused infrasound standing waves. The internal reflection of the parallel faces of the quartz crystals allows the acoustic energy to be stored inside the stone. The build-up of vibratory energy within the quartz lattice creates an electromagnetic field reducing the stone's weight until it becomes entirely weightless, and then slowly levitates along the infrasound standing wave's arch. The source of the focused standing wave energy levitating these stones is the Orion pyramids at Giza, exactly 5,240 miles from Gushan (or Gunchangzhai), China (*25.02°N* 118.51°E). This distance is precisely *21.05%* of the Earth's mean circumference of 24,892 miles. Gushan is also situated 1,245 miles from Angkor Wat - a resonant distance that is precisely *5.00%* of the Earth's mean circumference.

The whole number percent values of the site distances confirms the antigravity formula as applied. Evidently, the quantum physics of standing wave resonance underlies all of the transdimensional Plejaren technologies, as standing wave resonance affects both the levitation of spacecraft and the 'levitation' of electrons, protons and neutrons through the atomic framework. The provision of subatomic

particles allows low-energy nuclear change and the multi-staged production of precious metals and rare elements such as vanadium, thulium and rhenium. These exotic elements are costly to mine and only rarely find application in human industry today, yet the advances of phonon resonance beckon a new era of harmonious human creativity, promising to expand the reach of human consciousness by allowing interstellar flight and bringing an end to the destructive and dangerous practice of ore mining. The broad set of transdimensional capabilities of Plejaren beamships include time travel – affording their ability to preview future events. Billy Meier has published 100% accurate predictions of a multitude of major scientific discoveries and major world events – *yet without having published any erroneous predictions*:

- 29th Contact, July 7, 1975, and 31st Contact, July 17, 1975: Contact involved specific information about Venus, unknown at the time, including composition of atmospheric gases, surface temperatures, depth of clouds, wind speeds, atmospheric pressure, coloration, variation in terrain, etc…
- 31st Contact, July 17, 1975: Semjase informed Meier that Mt Chimborazo, Ecuador, is the highest mountain on Earth [as measured from the center of the planet]… contrary to Meier's belief that it was Mt Everest…
- 1978: In a Wasserman publication, Meier foretold the launch of a telescope at end of the 1980s that would make unfathomable discoveries in space, and wrote that an asteroid would be discovered in the late 1980s to early 1990s; it would be named Toutatis, and may threaten Earth in September 2004…
- 1978: In *Existing Life in the Universe*, Meier [described] 2 small planetary bodies outside Pluto's orbit…
- 115th Contact, October 19, 1978: Meier described existence [and composition] of Jupiter's rings [and moons]...
- Jonestown massacre (Nov 18, 1978), Overthrow of the Shah of Iran (Jan 1979)
- Chinese invasion of North Vietnam (Feb–Mar 1979), Iran Hostage Crisis (Nov 1979–Jan 1981)
- Soviet invasion of Afghanistan (Dec 1979), Terrorist attack on Iranian Embassy, London (Apr–May 1980)
- Abdication of Queen Juliana of The Netherlands (Apr 1980), Death of Tito of Yugoslavia (May 4, 1980)
- Mount St. Helens eruption (May 18, 1980), Assassination of Indian PM Indira Gandhi (Oct 31, 1984)
- 215th Contact, February 28, 1987: Known as the Henoch (or Enoch) Prophecies, this contact contained a forewarning of the destruction of the World Trade Center (WTC) by terrorism, the series of worldwide wars that the US would subsequently launch, and military actions involving Russia, China, France, Germany, Spain, England, Scandinavia and many other countries.[61]

Repeated, accurate predictions of major world events, often years prior, proves Meier's foreknowledge!
He also received information from the Plejaren leader Ptaah regarding the dramatic events of December 22, 2012, as later disclosed during the 476th contact of February 3, 2009 – on Eduard's 72nd birthday:

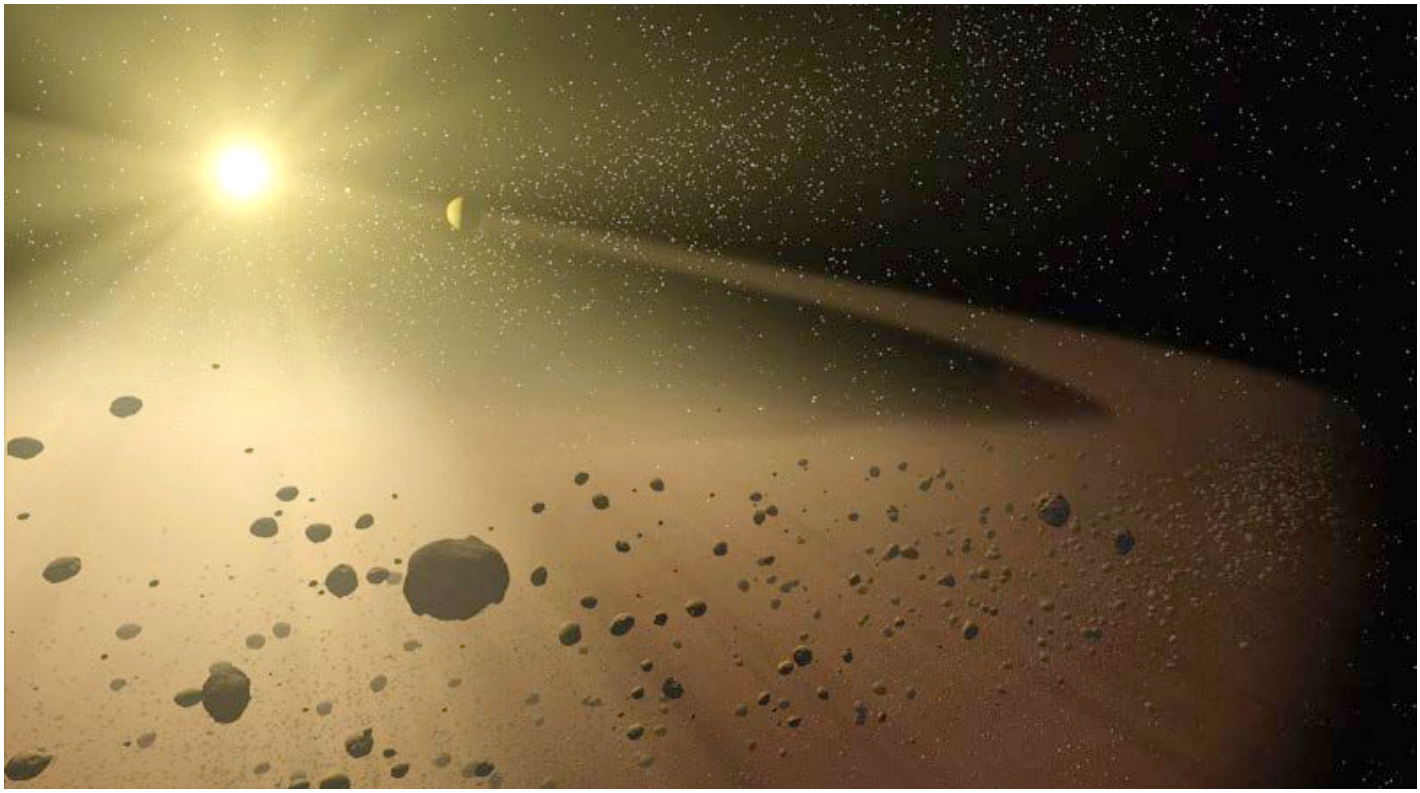


Meier: Regarding the Mayan calendar, [engraved as a sacred mandala in resonant piezoelectric stone, above,] it must be said that the year 2012 will bring a whole series of quite special events, and… our sun, will contribute to them, because on the sun's surface enormous eruptions will occur and solar storms are caused, which will be very intensive and will influence Earth's geomagnetic balance.

The Earth's magnetic field can suffer very strong fluctuations through the very strong X-ray radiation falling down on it. And through such geomagnetic storms, *power grids and all electronic appliances can collapse, thus also those in satellites, and the ISS can also suffer great damage or can even fail completely.* Such solar storms can lead to enormous natural catastrophes, and in the worst case, to a polarity reversal of Earth's magnetic field... What also has to be said is that such solar storms form to a climax in an exact rhythm of eleven years, which is normal, but in the year 2012 it can happen in an extraordinary magnitude. Earth will come under a very strong bombardment of hard radiation, which can have a very negative effect on the Earth's ozone layer. Due to the entire resulting process, *nitric oxides and acid rain can form worldwide*, which may have bad and devastating effects on the entire plant world. The enormous solar eruptions can lead to further very strong climate changes and, with it, to immense droughts, bad weather, volcanic eruptions, earthquakes, crop failures and, therefore, to even greater famines than have existed up to now. In addition to all this, the year 2012 brings other unpleasant events, such as a so far unknown, invisible, dark and huge space wanderer that is threatening from the fringe of our solar system and could wreak tremendous havoc on Earth.

And if this should really occur, the fact of its existence would be openly proven starting with 2010 or 2011, if at all, because the possibility of a "dark" and, therefore, non-observable passage of the colossus is also possible. Aside from that, all kinds of unpleasant machinations regarding unpeace, worldwide heavy warlike actions, as well as increasing degeneracy and excessive human ways of behaviour are threatening for the year 2012…

Ptaah: You should not say more, because what you explained should be enough… Regarding the Mayan calendar, the 21st of December 2012 represents the culmination of a star constellation [alignment] that only occurs around every 26,000 years. The Mayan calculations are assuming that Earth - on the 21st of December 2012 - shall lie on an imaginary line that joins together the star [Betelgeuse,] above the left side of the constellation Orion with the Central Sun, [situated at] the centre of the Milky Way. The Sun meets the Milky Way at a location that is built by interstellar dust clouds, and is called the "dark cleft of the Milky Way" by the human beings of Earth. On the 21st of December 2012, at nightfall of winter solstice, the Sun is directly in that cleft, and it is in such a position that the Milky Way covers the horizon in all positions all around.



Thereby the optical impression is produced that the Milky Way would touch Earth all around and that the galaxy would lie directly on the Earth. On the whole that's the end product of the Mayan calendar recording. This should suffice, my friend. To say more would be too much, because it would only foster the fear of the human beings of Earth, which should not be, however. So keep silent on all the further explanations that we have given you...[62]

Through the tireless efforts of Eduard Meier, the wisdom traditions of the Plejaren culture reveal that the ongoing Earth changes are a result of the Golden Radiation emitted from the Central Sun, which lies at the core of our Milky Way galaxy. This Central Sun is obscured from our direct view by the 'dark cleft of the Milky Way' (above). Specific details regarding these electromagnetic field changes now occurring on Earth are most intensely experienced at infrasound standing wave convergence points which are already destroying all electrical equipment, just as discussed by Meier and his Plejaren contacts. The electrical overload of modern technology is also being experienced on the International Space Station, in accordance with the information from Meier and echoed in Native American prophecies of the Hopi.

Billy's brief mention of the *'invisible, dark and huge space wanderer'* references the presence of a binary twin companion of our sun - *a brown dwarf star* that the Hopi prophecies describe as reigniting to be seen as a small red star known to them as the Purifier, which will be the sign of the Purification Day, when all life on Earth will be effected. *The wave of energy described by the Plejaren as the Golden Radiation is the crucial factor linking these events involving the red supergiant star Betelgeuse with the Central Sun on December 22, 2012, as the wave of Golden Radiation passes through our Sol system.* Another chaotic aspect of the near passage of the dark brown dwarf star is the disturbance it has already caused within the Oort Cloud, before it becomes reignited as the Red Purifier of Hopi Prophecy.

The topic of the origin of comets within our solar system was addressed during the 150th contact of October 10, 1981, concerning the nearby Dark Star and its cyclical dislodging of comets from the Oort Cloud accounting for 97% of cometary debris entering Earth's vicinity. While the complete details of the close passage of the invisible brown dwarf binary twin of our visible Sun (referred to as a Dark Star) have been wisely withheld, the breaching of the Oort Cloud presently threatens all of Earthly humanity:

Meier: In the coming years and decades, there will again appear frequent passages of comets, including those such as Halley's Comet, which can practically be observed in the sky… in broad daylight… [W]hen you took me in 1975 on the great journey, I saw beyond our solar system and planetary system the immense belt of material of frozen acids, rocks… and lifeless planets; some were quite large. Like the asteroid belt beyond the orbit of Mars, this belt also moves around the Sun but very far outside of Pluto's orbit.

At that time, you explained to me that celestial bodies of all kinds pass through this belt, such as Dark Stars and other space bodies, and that every now and then, smaller or larger bodies tear out from this belt and enter into another orbit around the Sun, which can then partly be observed as comets from the Earth and, thus, can be seen. If I remember correctly, you told me at that time that on the one hand, this belt was still widely unknown to the Earth people in its magnitude but… more would soon be discovered… Furthermore, you explained that this material belt consists of the remains of the formation of the solar system and of immigrated materials from space, etc. Now, I wonder how high the percentage of comets is that appears in our solar system and that arises from this material belt beyond Pluto's orbit?

Quetzal: It has probably escaped your attention, but this belt was discovered in the meantime and is named 'Oort,' after a Dutch astronomer. In accordance with its discovery, the discovered belt is called the Oort Cloud in Earth's scientific circles, but that's about it because the connections of this belt to the comets of the Sol system are still, to my knowledge, foreign and unknown to the Earth scientists.

But the truth is that about 97% of the SOL system comets originate from this belt, as in this belt, planetary bodies passing by upset the trajectories of the materials through their attractive forces, so then these suddenly scramble, which removes isolated larger and smaller objects, pushing them into new orbits around the solar system, where they then appear as comets, while others fly out far from the Sun into free space in order to disappear somewhere in the vastness of the universe, often referred to as migrant dark planets, which will partly be captured again by major stars as satellites and then orbit them, far away from the new mother stars. But others will rush uncontrollably as dark objects traveling through space.[63]

Studies informing the link between Oort comets and a dark binary twin[64] have been published by U. of Louisiana researchers[65] and the Binary Research Institute,[66] and subsequently reconfirmed in 2010.[67] *The rain of Oort comets has already begun to impact the Earth on a daily basis.* Smaller fragments are creating dramatic aerial explosions worldwide, as witnessed over South Sulawesi, Indonesia on October 8, 2009. Sizable craters attest to large impacts in Hidalgo, Mexico on February 10, 2010; San Joaquin (Santander), Colombia on September 6, 2010; and San Bruno, California on September 9, 2010. The prophetic date of December 22, 2012 was *indirectly* addressed during the 52nd contact of May 17, 1976, in connection with precise astronomical calculations decisive in the building of the Giza pyramids *about 73,350 years ago* (spanning two cycles of 36,650 years, as Ptaah later explained in the 256th contact[68]):

> *Semjase:* When the pyramids were built, the then astronomers had already calculated the further fate of the Earth. The measurements of the pyramids were elaborated according to their calculations… [which] revealed that many thousands of years in the future, a catastrophe would menace the Earth and that from the cosmos, like at the time of the construction of the pyramids. To reveal to the later inhabitants of the Earth over the later millennia… the measured dates in astronomical form were built into the pyramids for the far distant future… when the catastrophe from the cosmos threatens anew. The ancient astronomy was very able, and… even considered in their calculations, several world crashes, and could reckon the dates with very exact precision.
>
> As pre-calculated, the Earth did then convert, and agreed with the then and since long gone science. Now slowly the time becomes mature, that the astronomically measured dates, which as mentioned, served in the construction of the pyramids and were decisive in this, agrees with the astronomical values of the present, and announce the more than 70,000 years ago prophesied events this way. And this event will be exactly then, when the solar light of a very far distant star, a central star, falls through the tube-like Opening of Revelation, which draws itself from the outside of the Giza pyramid into the center, in a straight uninterrupted line, and illuminates one certain point. I am not allowed to tell more about this.[69]

Many insights can be gleaned from Semjase's foretelling of the activation of the Great Pyramid by the radiations of the galactic Central Sun, and the catastrophic impacts of Oort comets dislodged by the Dark Star's passage. *The Giza pyramids were masterfully designed for repeated reactivations by cyclical blast waves that radiate from the core of the galaxy to impact Earth in a precisely calculated rhythm, causing the magnetic reversal of the entire Sol system and a dramatic increase in terrestrial infrasound levels.* Worldwide auroras can thereby be expected, as well as increased evaporation and precipitation rates globally, and a measurable reduction in the atomic decay rates of all Earthly matter. All cosmic signs point toward the imminent reemergence of a 'thick white vapor envelope surrounding the globe'.

Earthly astronomy can no longer ignore the nearby presence of the brown dwarf binary twin of our sun. Nor can corporate news continue to hide or dismiss the multitudes of reported meteor strikes now inundating the Earth, *exactly as foretold by Eduard Meier and his knowledgeable informants decades ago.* The existing corporate and religious institutionalization of psychopathy cannot withstand the great revelations occurring at the present time, and will soon lose its despotic hold of human consciousness:

Ptaah: When hitherto Semjase only spoke of Earth religions in negative form, then it was because the Earth human had to be made attentive to the error in his religions, ...for these are like nowhere else in this Universe… They control the Earth human and the whole planet, and retard your world thousands of years, in Spiritual respect… [Y]our religions still contain real worth, but this becomes so indiscernible that only few people are able to see the effective truth there. These few who are able to see the real truths from the scripts, are banned and confounded by those dependent on these wrong beliefs, and thus cannot spread the truth. When Semjase speaks in negative form about Earth religions, she is addressing the falsifications in them which have been built up partly consciously. The Earth religions are only called such in name, but are just degenerate cults."

In truth, the same small minority of fallible psychopathic individuals control world religions, economics, sciences and politics –those engaged in the destructive subterranean nuclear blasts, damming of waters and extraction of oils– are themselves also actively inducing earthquakes using the HAARP array to terrorize and extort the rest of humanity. *Awareness of the hereditary genetic disorder that results in psychopathic behavior demands responsible action from the conscious human beings of Earth.*

The holistic teachings of Plejaren Elders reveal that genetic enhancement through biorhythmic entrainment holds the highest potential for the reversal of all known mis-developments of the physical body or the spirit. *Natural law provides for the bioelectrification and illumination of the body's waters, using golden celestial water comprised of pure protium in conjunction with tri-thalamic heartbeat entrainment during fetal development and throughout life, thereby removing all negative influences from the crystallized human being:*

Quetzal: [T]he fallible ones could be completely cured of their criminal or other degenerate forms through genetic manipulation and be released into society. This gene-manipulative healing method was further investigated and further developed [by Plejaren biophysicists many thousands of years ago], and indeed, even in reference to all hereditary diseases and immunodeficiencies as well as physical and organic deformities, but also in terms of disorders of consciousness and inheritable psychological disorders, etc. The development progressed rapidly, so already soon, early detections of gene damages of the aforementioned kind became possible, which naturally led to the fact that these cognitions were used and the genetic deformities, genetic abnormalities, and other harmful genetic influences were already repaired in the growing child in the womb.

Thus, an irrefutable law has been in force since then, namely that every child, so every girl and every boy, is to be arranged into a gene examination, i.e. a gene analysis, at the prenatal age of seven months. Since then, since this law gained validity and became observed absolutely, it is valid with us that every crime or other degeneration as well as every inheritable disease of the body and its organs, every immunodeficiency of any kind, and every form of harmful aggressiveness, jealousy, and vindictiveness are just as non-existent as also hatred, envy, desire for validity, egoism, and many other characteristics that bring the human being discord, unkindness, and other harms. But at the same time, it should be noted that through this, our own decision in all matters and concerns is in no way impaired, as well as not our drive for self-preservation and our drive for self-defense, when this is demanded.[70]

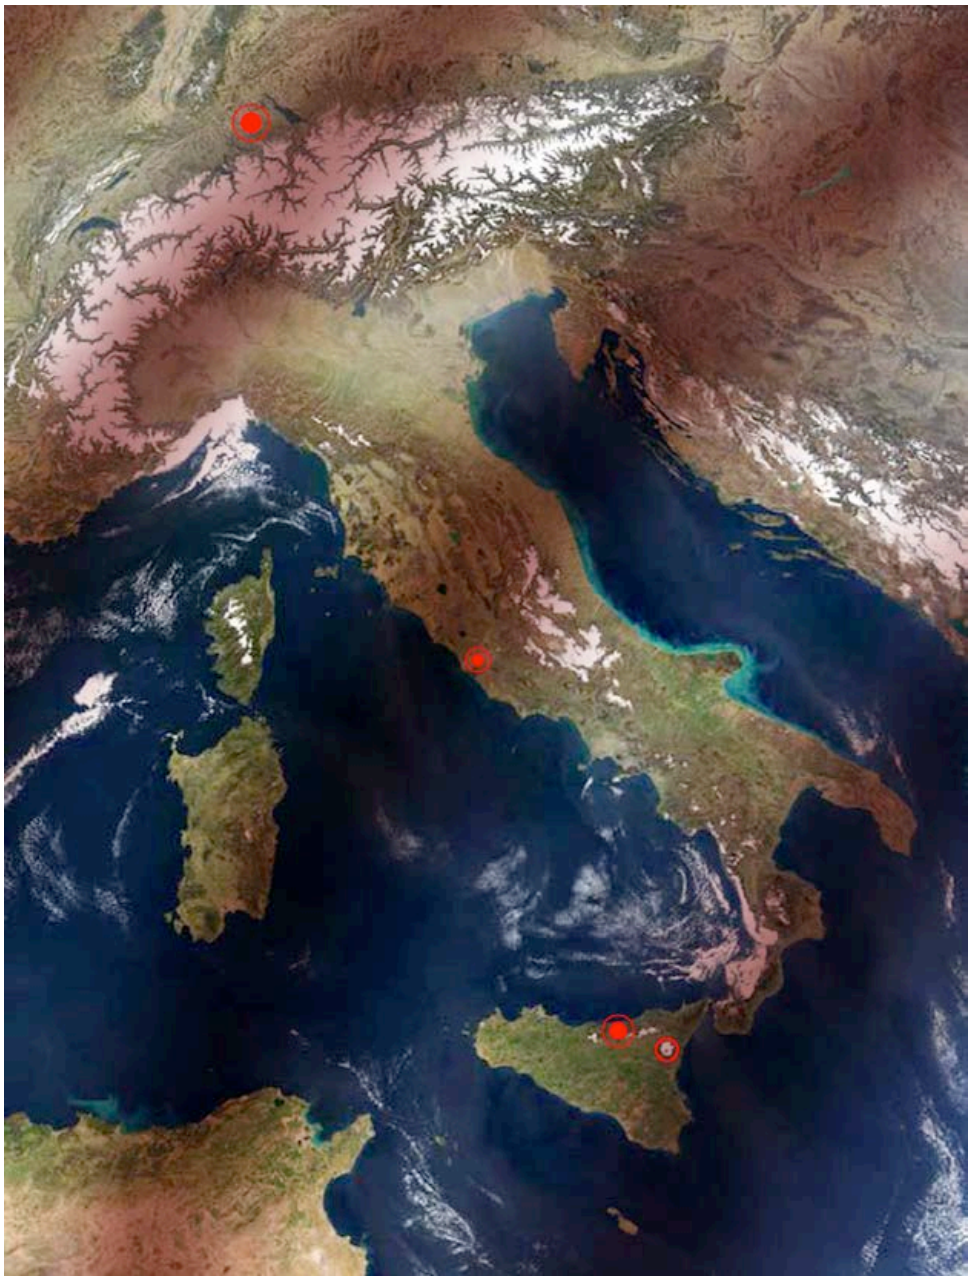
Until the coming times when this biorhythmic genetic healing becomes active through the world's infrasound network of resonant pyramids, the survival of humanity requires our careful discernment of psychopathy in human leadership. The Prophecies of Henoch, forewarning of the dire consequences of human ignorance on Earth, were presented by Quetzal during the 215th contact on February 28, 1987:

Quetzal: Before I give you a clear account of the prophecies of Henoch, I would like to point out that prophecies are always changeable and can be changed for the better if man makes positive changes in his thoughts, feelings and actions, leading to that which is better and positively progressive…

However, this does not apply to predictions, as these rest upon events that cannot be changed, are inevitable and surely and definitely will occur in the future. Predictions rest upon a preview and thus on a direct viewing of the future, and have to do with neither prophecy nor with calculation of probability. So when I make a portion of Henoch's prophecies for the third millennium known to you, it does not mean that they have to be fulfilled, because the prerequisite of fulfillment in each case would be that the already existing causes continue to exist as also continue to be created in the future so that a fulfillment of the prophecies can come to pass.

Thus, provided that human beings of Earth will become reasonable, the possibility exists that by a reasonable change in the way of thinking as well as a reasonable development in feeling and an equally reasonable way of acting, everything changes for the better and positive, whereby prophecies do not have to be fulfilled. However, if this transformation does not occur, a very evil, wicked and negative time lies ahead for the Earth and its entire population in the coming new millennium…

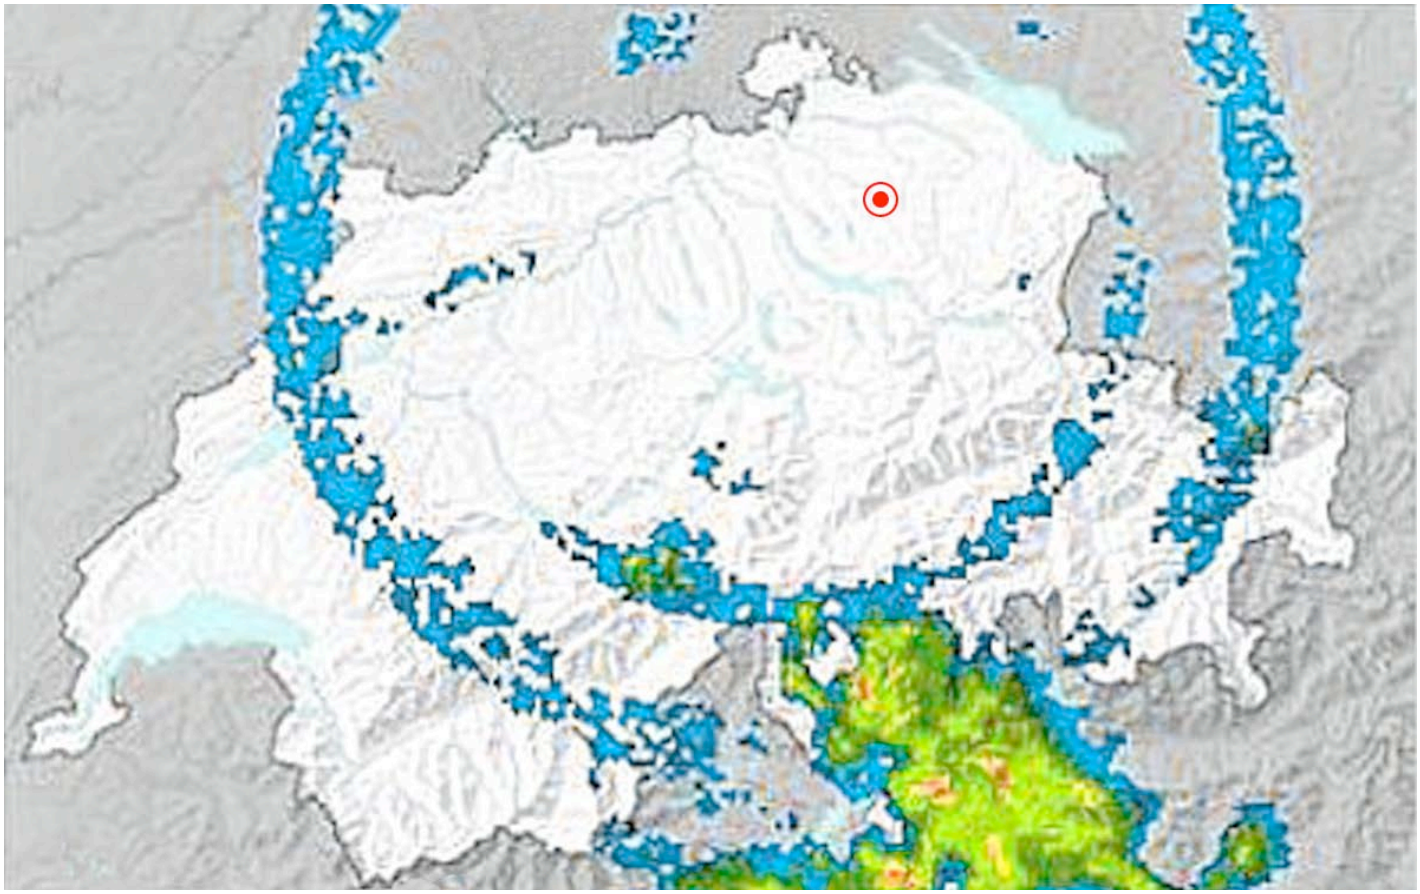
The point in time at which these prophecies will begin to be fulfilled will be when a Pope will no longer reside in Rome. All of Europe will then fall victim to a terrible punishment by evil powers. The Christian religion will collapse and the churches and monasteries will end up in ruins and ashes… Monstrous forces will be created by science and will be released by the military forces and armies as well as by terrorists, causing great destruction. Millions and even billions of people will be killed by acts of terrorism, by wars and civil wars; and finally, in some parts of the world, every third human being, and, in other places, every fourth human being, will lose his or her life. The nations of the East will rise against the nations of the West, the West against the East…



The people will be completely powerless against all this and will live through 888 days of Hell on Earth, suffering hunger and plagues, which will claim even more lives than the war itself. The time will be severe as never before experienced on Earth. Ultimately, nothing can be bought or sold any longer. All provisions will be rationed; and if a human being steals even a small piece of bread, he/she will have to pay for it with his/her life…

And it will be that the fanatics of Islam will rise up against the countries of Europe and all will shake and quiver. Everything in the West will be destroyed; England will be conquered and thrown down to the lowest level of misery. And the fanatics and warriors of Islam will retain their power for a long time. However, not only Europe will be affected but ultimately all the countries and peoples of the Earth, as the great horror expands to a war that will encompass the entire world.

After the turn of the millennium, the papacy will exist only a short period. Pope John Paul II is the third from last in this position. After him, only one additional pontificate will follow [Pope Benedict]. Then a Pontifex Maximus follows who will be known as Petrus Romanus. Under his religious rule, the end of the Catholic Church will come, a total collapse becoming inevitable. That will be the beginning of the worst catastrophe that will ever have befallen the human beings and the Earth…[71]



These profound passages form only a portion of the Prophecies of Henoch, and follow from earlier information about the lineage of popes provided to Meier on August 6, 1978 during the 113th contact:

> Karol Wojtyla… is the 3rd to last pope before the world change [of December 22, 2012]. He is the 264th pope. He will die in the near future. The world will be astonished when the next pope [Joseph Ratzinger] is killed also. Then the pope with the number value of five [is coronated]. He is the 266th pope - he is the last one.[72]

After the murder of Pope Benedict XVI, "a Pontifex Maximus follows who will be known as Petrus Romanus. Under his religious rule, the end of the Catholic Church will come, a total collapse becoming inevitable." These very detailed, ancient prophecies from the Henoch lineage directly coincide with those attributed to St. Malachy, an Irish monk who produced a comprehensive list in the year 1139 which prophesied every future pontiff of the Papal lineage from that date until today. St. Malachy wrote: "In the final persecution of the Holy Roman Church there will reign Petrus Romanus, who will feed his flock among many tribulations; after which the seven-hilled city will be destroyed and the dreadful Judge will judge the people." Not only is the same name given for a proclaimed 'final Pope', but the destruction of Rome, the 'seven-hilled city' is also given as a sign of the imminence of the collapse of the Roman Catholic Church. The Henoch prophecies foretell that "the point in time at which these prophecies will begin to be fulfilled will be when a Pope will no longer reside in Rome."

These foretold events *will* follow a pattern of fulfillment due to dramatic *infrasonic surges* that require the imminent evacuation of Rome and the Vatican, *which will inevitably be overcome by recurring spates of piezoelectric fires,* just as documented in the towns of Messina, Sicily, near the active Mt. Etna volcano.[73] The Vatican (41.53°N 12.30°E in white, above) is 1,326 miles from Giza, Egypt – a distance that is 5.3% of the Earth's mean circumference – along the radial distance of infrasound standing wave convergence. The steadily growing intensity of planetary infrasound is already significantly affecting these fixed focal points, including both the location of the Vatican and the Semjase Silver Star Center. Infrasound waves have been recorded in the atmosphere above Switzerland that reveal an inaudible ultra-low frequency field of concentric circles, as documented during an infrasound resonance event on April 24, 2009:

> Did a country-sized UFO hover above Switzerland last month? On the morning of Friday the 24th of April of this year employees at MeteoSwiss [observed] huge circular fields hovering over Switzerland… [that] covered the entire country… MeteoSwiss claimed… that they were merely caused by the reflection of water droplets. A few minutes after being queried on the issue the radar images were hurriedly removed from the department's website. Are we being told everything the Swiss meteorological knows about these radar images? [74]

Meteorologists in Switzerland have never seen radar anomalies like this specifically because they are hidden and scrubbed from archives, as in this particular case. Hundreds of similar radar anomalies are documented by websites that gather the data before it's purged from online archives. The only viable explanation for these giant radar rings is water vapor suspended by concentric rings of standing waves in the ultra-low frequency range. Nikola Tesla was the first to scientifically describe standing waves in his Colorado Springs lab[75], later reporting: "In Colorado I succeeded one day in precipitating a dense fog. There was a mist outside, but when I turned on the current the cloud in the laboratory became so dense that when the hand was held only a few inches from the face it could not be seen." [76] The standing waves that fogged-out Tesla's laboratory are now suspending these giant concentric circular rings of water vapor above the entire country of Switzerland – as on April 24, 2009. *A circumference of the Earth taken along the northwest/southeast axis of the Great Pyramid of Giza, Egypt passes exactly through the center point of the MeteoSwiss radar circles.*

The center point of these gigantic radar circles lies just southwest of the Semjase Silver Star Center (overlaid in red, above) in Hinterschmidrüti, Switzerland (47.416°N 8.906°E); both sites being located along the 6.7% resonant distance of about 1,680 miles from Giza. This precise resonant alignment of the Semjase spiritual center in Switzerland reflects the same advanced understanding of the Fibonacci geometry of infrasound standing waves that informs the locations of all of the ancient pyramids of the world, now approaching the time of reactivation with the magnetic reversal of December 22, 2012. The meticulous work of Eduard Meier to record his extensive contacts with the Plejaren civilization guides humanity by the light of *Truth, reorienting our consciousness toward the radiant lessons of the Creation witnessed within ourselves and our mother Earth during this time of the great shift.*

Urandir's Transport

Urandir's Transport

Ongoing cosmic contacts occurring in Brazil have been largely obfuscated by corporate media disinformation, finding press coverage only in the Portuguese language broadcasts of the Brazilian media. Most significant among the many extraterrestrial contacts occurring in South American regions are those reported by Urandir Oliveira, who very carefully documents many forms of evidence attesting to the veracity of his statements and the reality of his transdimensional experiences. The weight of Urandir's evidence takes the form of demonstrations of the strong magnetic influence that he directs through his hands to move objects, in addition to physical trace evidence and video recordings of his levitation along violet-colored transport beams into luminous aerial plasma ships floating above. *At Urandir's special request, Verade TV videographers recorded and broadcast high-quality footage of his 1998 plasma beam transport into one of six disc-shaped plasma craft in an arc, each radiating pure white light.*

Urandir Fernandes de Oliveira was born on March 14, 1963 in Maraba Paulista, a rural area outside Sao Paulo in the state of Sao Paulo, Brazil. He clearly states that his unusual experiences with highly advanced extraterrestrial beings have involved their purposeful electromagnetic activation of bioenergetic capabilities that lie dormant in the average person. At a young age, Urandir had noticed the influence of his emotional states on metal objects in his hands. He quickly learned to develop this skill over the years, eventually being able to bend and tear common coins with his bare fingers. While he does not recall any physical interactions with the cosmic visitors during early childhood, he does attribute his unusual electromagnetic abilities to artificial plasma environments that he was voluntarily exposed to. The first face-to-face meeting that Oliveira recalls occurred on March 6, 1976, at the age of 13, when he was transported from his Sao Paolo home aboard a luminous lens-shaped craft. There he met with several tall, blond-haired humans of about 6'3"-6'5" in height, who radiated love, peace and intelligence through cat-like eyes, with vertically-oriented luminous golden pupils enclosed by blue, green or yellow irises.

The enhanced mental capabilities endowed by Oliveira's visitors allowed his further development of telepathic communication with the beings at a distance, by which method they would request and prepare him for subsequent contacts. The electro-acoustic activation of various Earth humans was explained to be a crucial mission of this extraterrestrial group, comprised of several allied races for whom Urandir has been given no names or planetary origins, but only recognizes their personalities telepathically. The practical urgency of Urandir's contacts involve the provision of crucial information regarding the electromagnetic changes now occurring on Earth, to prevent disastrous consequences that include the destruction of all nuclear power stations and nuclear arms storage facilities by the electrical overload and superheating of metals at specific focal points of infrasound resonance. Several contacts were conducted over many years to prepare Urandir for the complex astronomical information he would later receive:

By age eight, Urandir realized that when he fought over food with his brothers and sisters at the kitchen table, his hands could bend and twist the metal utensils. He remembers once throwing a fork that kept bending as it hit the table top… Urandir recalls physical abductions from Earth locations into an extraterrestrial craft when he was 13, 23, 27, 35 and 39, plus an encounter in Sao Paulo with ET humanoids at age 23.

Age 13, March 6, 1976 - Urandir Oliveira's Extraterrestrial Abduction #1, Sao Paulo

When he was thirteen on March 6, 1976, at 10pm at his home in Sao Paulo, he had his first encounter with a craft. The beings were tall and blond-haired. Their eyes were like a cat's, vertical honey-colored pupils in blue, green or yellow irises. He understood that the frequency of his mind had been speeded up by the blond humanoids to improve communication. Since then, one of the consequences has been that Urandir Oliveira's mind control over matter resembles the powers of metal bender, Uri Geller, who linked his abilities to a childhood encounter with a glowing being.

Age 23, 1986 - Urandir Oliveira's Extraterrestrial Encounter in Sao Paulo

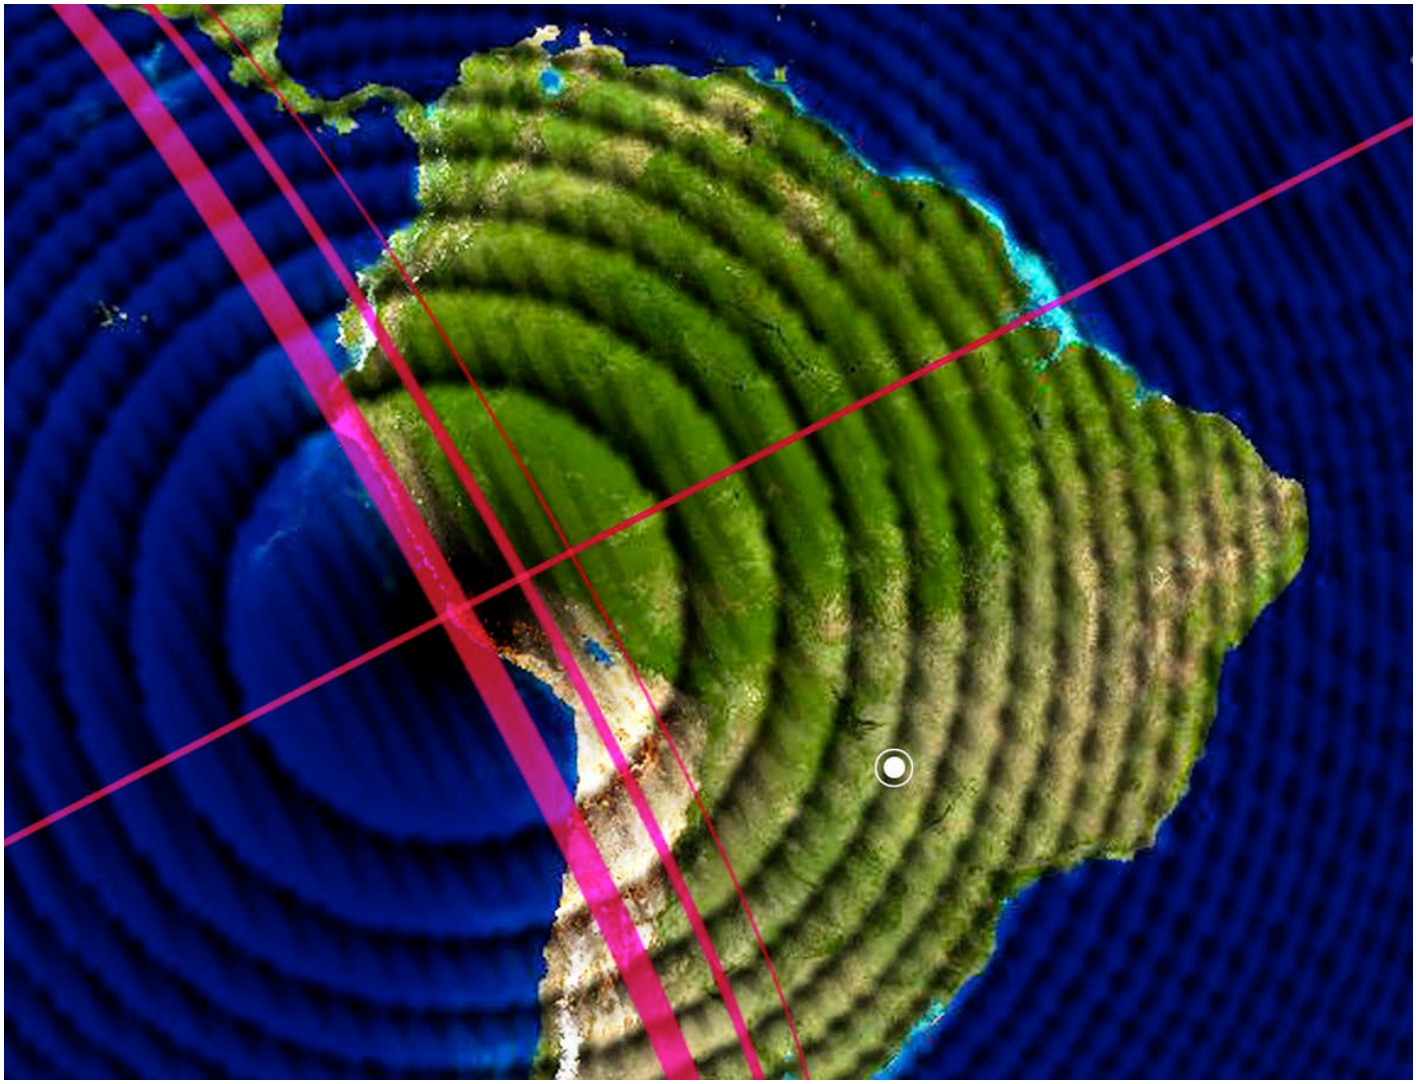
Urandir had been making money by entertaining people with his mental powers in Sao Paulo. Then one night, he came upon a beggar and child who were hit by a car and broken bones were exposed through their skin. Not knowing how or why, he bent down and placed his hands on their terrible wounds and the bleeding stopped. Shortly thereafter, tall blond beings approached him and said, 'Now you know what to do with the light energy.'

Age 27, 1990 - Urandir Oliveira's Extraterrestrial Abduction #2, Sao Paulo

In 1990, he and a friend were both lifted up in beams of light into a craft where Urandir remembers many crystals pulsating with light and ‘lightning.’ He understood that the pulsating crystals ‘activated human force fields.’

Age 35, 1998 - Urandir Oliveira's Extraterrestrial Abduction #3, Corguinho Farm

In 1996, Urandir bought 209 acres of farmland in Corguinho between hills and a mesa where local farmers for decades have seen mysterious lights and aerial craft. His parents and in-laws also moved to the farm to help with the work. Over the next couple of years, Urandir appeared on several Brazilian television programs to demonstrate his Uri Geller-like ability to use his mind to bend metal, shut off and turn on lights, to move and control the direction of a small metal ball and to mentally break metal coins and glass dishes. By 1998, Brazil Verade TV traveled to his Corguinho farm because Urandir informed the station that the blond beings were coming back to get him again. The crew was videotaping when six lights in an arc appeared in the night sky and descended toward the ground. As the arc of lights seemed to lower toward Urandir, he walked through them into a small beam of light that lifted him into a disc-shaped craft while the Brazil Verade television camera rolled. Some of that video was broadcast in Brazil and the tape was sent to CNN for international broadcast. But to date, Urandir does not think CNN ever aired any of it and he wonders what happened to that professional videotape of his second abduction.



What no camera had access to was the inside of the craft. There, tall, blond humanoids showed Urandir wall screens containing moving images of Earth destruction by nuclear missiles and nuclear power reactors. Urandir understood that the destructions will be caused by changing Earth magnetic fields which affect the electronic systems in the missiles and reactors. The blond beings also showed Urandir that three "fully functional" pyramids currently covered by sand will be uncovered for the world to see.

Age 39, September 15, 2002 - Urandir Oliveira's Extraterrestrial Abduction #4, Corguinho Farm

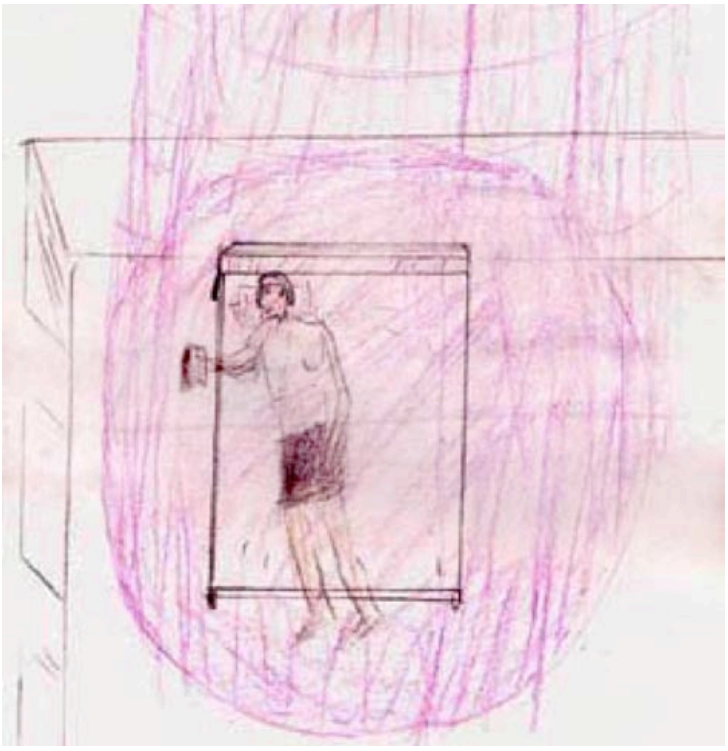
His fourth abduction encounter began after 7 p.m. local time on September 15, 2002, in the bedroom he and his wife, Jessica, shared in their farm house. Urandir said he had received telepathic information several days before from the beings that by 10 p.m. on September 15, another transport to a humanoid craft would occur. So, anticipating another interaction, Urandir told his parents and in-laws, as well as local friends, to be ready for "a rain of rocks" that would last for seven minutes when Urandir was taken to the non-human craft. That same week, Jessica had traveled with their 2-year-old son, Aria, to Sao Paulo, to visit family and was not there when the drama unfolded.[1]

The natural energy fields of Earth resonance are notably strong in the entire Corguinho area, one indicator of which can be easily observed in the red soil that is given its color by iron, just as is the case with our own blood. The high electrical conductivity of iron in the blood is also witnessed in iron-rich soils, which conduct ambient electrical currents in the ground transduced by the bedrock from deep, inaudible pulsations of infrasound standing waves. Oliveira's earlier extraterrestrial experiences in the city of Sao Paulo prepared him for the later development of a spiritually and ecologically conscious community within which Urandir would be able to spread the knowledge and experiences he had gained from his contacts.[2] The electromagnetic setting of the Corguinho area provides the optimal environment for telepathy.

As with many conscious individuals seeking a sustainable life-path in accordance with ancient indigenous wisdom concerning these times of great change, Urandir and his wife Jessica have chosen to relocate to a resonant location to begin a sustainable organic farming community. Just as in the case of Eduard Meier and the FIGU community in Switzerland, Urandir Oliveira has founded Project Portal at his family-owned Ecovila Fezenda organic farm. Both communities engage in the sharing of extraterrestrial spiritual teachings concerning meditation, telekinesis, levitation, telepathy and the oncoming Earth changes.

Quadratic mapping of infrasound standing wave patterns reveals the Rochedo area of the Brazilian state of Mato Grosso do Sul as a resonant convergence point. The Oliveiras' 209-acre farm (19.88°S 54.95°W) is 6,669 miles from Giza, or 26.79% of the Earth's mean circumference. It is 1,365 miles from Nazca, Peru –a resonant circumference distance of 5.5%. The nearby giant rock formation, for which the town of Rochedo ("Little Rock") gets its name, is an ancient geological sign of convergent infrasound (opposite).

The holistic vision and profoundly transformative consciousness that is being engendered through these communities has apparently been perceived as a threat to the US government policy of UFO secrecy and denial, resulting in repeated attacks of all kinds. Both FIGU and Project Portal have been branded 'cults' and libelously slandered and legally attacked by so-called 'UFO groups' that are nothing more than US government propaganda fronts. Both Eduard Meier and Urandir Oliveira have received numerous death threats and both have evaded assassination attempts. Oliveira was also harassed, arrested and briefly imprisoned in March of 2000 on false and absurd charges aimed at destroying Project Portal. These detractions have been unsuccessful due to the open nature of Project Portal's workshops and events, bringing hundreds of people to the eco-village every year for spiritual and psychic development.[3]



Looming majestically over green fields and forests is Morro Ashtar, an oblong plateau that has become the center of increasing aerial activity. *Continually unfolding telepathic interactions, luminous plasma ships, and very bright but completely silent aerial explosions suggest to some residents that a subterranean base exists below the plateau.* Many Corguinho residents have spoken publicly about their numerous and regular sightings, and in some cases have also reported direct conscious interactions with extraterrestrial beings.

One such case involving ongoing contacts has been reported by Mr. João, a 72 year-old lawyer from Rio de Janeiro living in the Corguinho area.[4] An intriguing aspect of the experiences of Mr. João involve loud booming and humming noises emitted by the invisible plasma ship of the visitors to raise his electro-acoustic vibratory field, during which time they continually asked about his perception of colors presented from the luminous craft. Success was achieved after Mr. João was asked to put his hands on the ground, *as his shoes had apparently prevented the energetic activation they were undertaking!*

While videotaped group experiences involving interactions with plasma craft do exist, other such events in the Corguinho area have gone largely unreported. Documentary video was recorded by Fabricio da Silva during Urandir's experience aboard the fourth-density plasma ship on the night of September 15, 2002, including footage of a 'rain of stones' falling from the sky during the initial beam levitation event.[5] Also included in the video document is an interview with Urandir Oliveira by science reporter Linda Moulton Howe from February 9, 2003, at his farmhouse, conducted with Portugese-to-English translation by Luciano Didier. Subsequent interviews by Moulton Howe (with translation by Didier and Felipe Branco) explored the many intriguing details of Urandir's plasma beam transport and transdimensional experiences aboard a plasma ship for three whole days, from February 15-18, 2002:

He (Urandir) was very anxious because for three days already he was expecting to be abducted, and there were only three hours left to the time the beings told him he would be abducted. (…10:00pm). He tried to prepare himself, so he went home and took a shower and put his shorts on and laid down on the bed. He picked up a book and tried to relax. A few minutes later, he realized a flash in the room. Then he felt his body like a fever warming up.

Q: What was the color of that flash?

The flash was sort of a light purple, or violet... [lit up] the whole room and then was condensing in the form of… a tube that included the bed and himself all the way from the bottom of the floor to the ceiling… The book was in his right hand (extended in the air beyond the right edge of the bed) and when the light flashed, eventually he released the book. The book fell from his hand. And he felt sort of a paralyzing [effect]. He could not move. He really felt this fever in his body and his body on the bed. He felt his body warmer on the bed. [see Urandir's sketch of his body in the beam, at left. Plasma beam photo above was taken elsewhere,[6] yet displays identical characteristics as described.]

Q: When you look at those sheets and that ceiling, you would think you would feel pain (from the burn)?

Yes, because it leaves the impression that something burned someone there. But knowing in advance already the beam process of abduction (from earlier encounters), he knew it was not going to be painful at all.

Q: What is happening after the heat and going upward?

He felt himself rising up and going through the ceiling. From the point he was paralyzed, he could not move so much, but from what he could see, he realized everything was like normal from inside the light as he is rising. Actually the position did not allow him to see much, but what he could see are the normal things like the walls, the door, [and] the window.

Q: What happens as he gets up to the wood ceiling?

He saw himself going through the ceiling and he could actually see the molecules between the ceiling, like if he were going through foam. Not like a foam rubber, but like a soap, more like soap bubbles, like when you wash your hands and you produce the foam that comes out in the soap. And then he is turned upright so he is standing after he crosses that point of the ceiling, going through the ceiling, in the same violet light.

Q: The other day, he mentioned he could see and hear more?

Even at the height and distance he was, he could see and hear perfectly well, even better than normal, as if everything was amplified. He could see the stones falling everywhere, he could hear peoples' conversations and see them below… he could only see [the plasma craft] at the moment he approached it.

Q: The rocks are falling why?

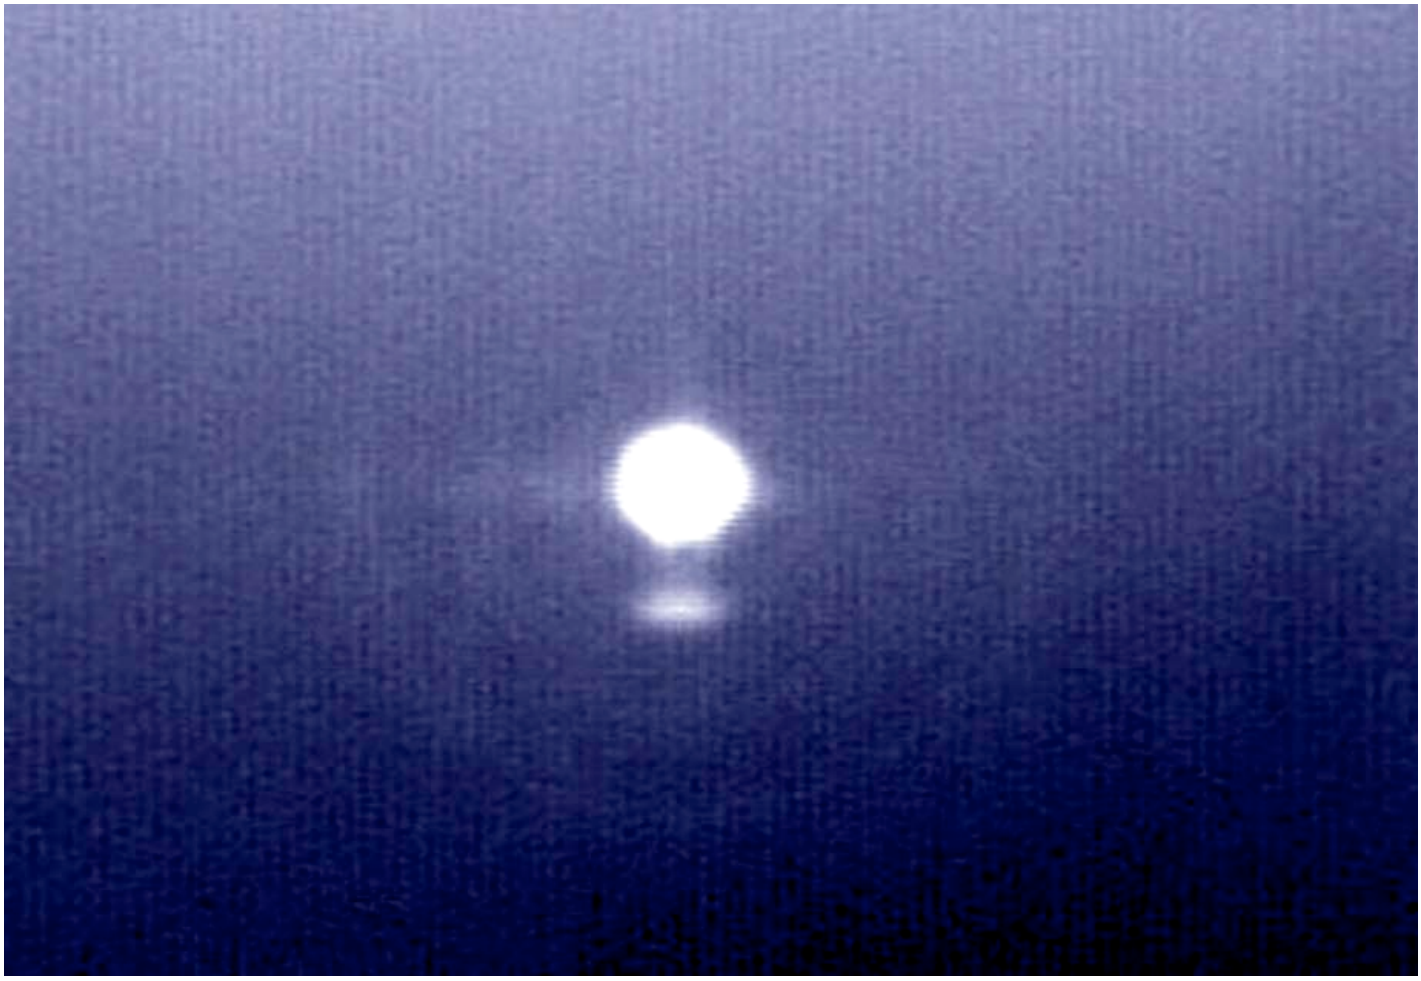
It was a signal, a sign, that the beings left so that everyone would recognize that moment and everyone would know he was being abducted… As he was approaching the craft rising and saw everything that was going on down below, he goes into the first room into the craft. And it is also violet color inside this craft.[7]

The many fascinating aspects of the plasma beam transport of Urandir Oliveira on September 15, 2002 provide a wealth of information for the study of fourth-density technology. While such vivid descriptions of violet fog and levitation in luminous beams have been shared by many contactees over the last decades, none of those accounts were accompanied by accurate scientific descriptions of the entire experience. Urandir's case is a gift to Earthly science, in that he provides detailed scientific explanations for physical trace evidence in the form of textile samples with plasma-induced molecular alterations that can be studied by physicists for potential replication by all known means.

Previously obtained evidence of transdimensional plasma phenomena subjected to rigorous scientific analyses has been limited to downed plants from crop circle formations. The rapid heating of water contained within the effected plants by microwaves causes expulsion cavities in the nodes of the stalks as water is forced out by high-pressure. Video of plasma balls forming these marvelous geometric mandalas in the crops confirms their formation by the microwave emissions of airborne HHO plasma spheres that are themselves *natural elemental beings giving mathematical lessons to Earthly humanity.*

Scientists have confirmed through various means that the microwave radiation responsible for the many geometric crop formations of non-human origin must have been delivered in a very brief period of time, perhaps involving an exposure of under 7 seconds. This is exactly the conclusion that must be drawn from analyses of the scorched bed sheet evidence presented in the Oliveira contact case (above). Urandir experienced no pain during the plasma beam transport, as the beam technologies employed are completely safe and biocompatible, normally leaving no detectable trace of its use whatsoever.

Recently applied as a dental torch, helium/oxygen plasma is safely maintained near room temperatures by use of nanosecond electrical pulses, causing only a few degrees of heating in tooth enamel and gum tissues while vaporizing plaque and sterilizing oral films of bacteria in seconds.[8] During Urandir's beam transport, the air the room was infused from above with HHO gas bearing gold and silver nanoparticles and rapidly ionized by infrared light followed by nanosecond electrical pulses to form HHO plasma near room temperature, which became concentrated within the beam's vertical column. The paralysis



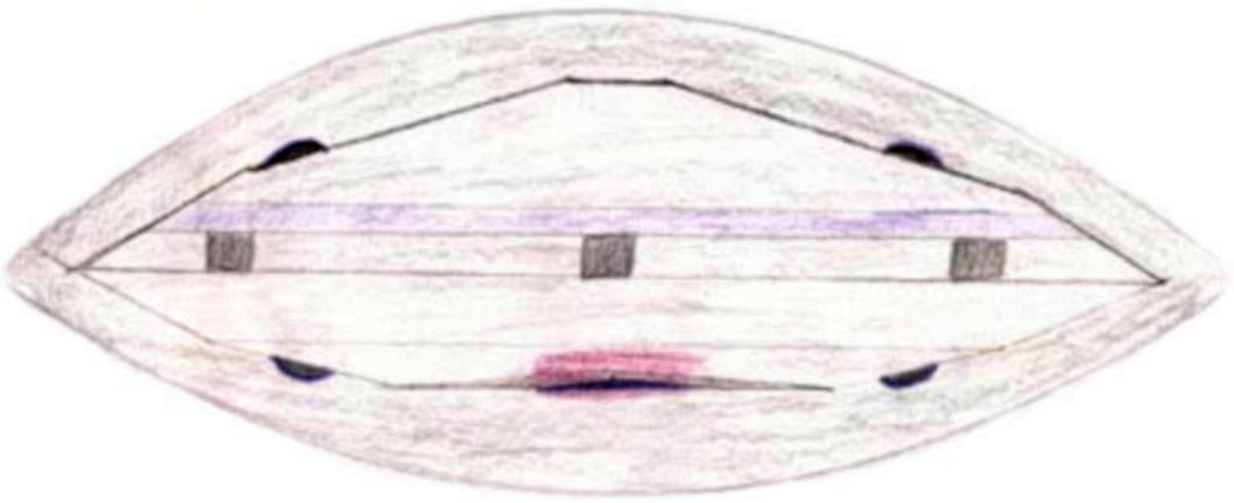
experienced by Urandir is electronically controlled by automated computers in the plasma ship above, as pulses from rotating green lasers within the plasma column created differential forces within the superfluid beam to levitate his body off the bed. The scorching of the bed sheet and pillowcase was then purposefully executed by a very brief heating of the plasma field closely surrounding Urandir's body just above the bed, before continuing with the strangely silent levitation process.

All matter within the fourth-density HHO plasma beam undergoes an atomic synchronization and expansion and that allows complete interpenetration of objects without interference, whereby Urandir's body was brought directly through the ceiling toward the craft. He describes being rotated into a vertical position after having passed through the roof, allowing him to see all of the activity going on below. Urandir's description of enhanced vision and hearing inside the plasma beam column is a result of the fourth-density awareness endowed by immersion of the human body in a superconductive state where the holographic aspect of consciousness becomes reunified with *the eternity*. The bright white light that Urandir describes as emanating from the electroluminescent metal hulls of the plasma ships also radiates from the craft's interior walls, which electrify the interior chambers with the same biocompatibly tuned HHO plasma that is concentrated within the beam transport tube emanating both ultraviolet-A and infrared light.

After Urandir's transdimensional levitation through the roof of his farmhouse and into the plasma ship hovering silently above, the cloaked ship created a 'rain of stones' as a deliberate sign to the neighborhood that the foretold event was indeed taking place. In the video footage recorded by Fabricio da Silva on the night of September 15, 2002, one can hear the round stones occasionally falling on the corrugated steel roofing and rolling down to be collected from the ground by the surprised neighbors.[9] Petrographic microscope analysis of one of the disc-shaped stones collected from the Oliveira farm was conducted by Professor Gomaa Omar, Geologist at the Dept. of Earth and Environmental Sciences at the University of Pennsylvania, and the results discussed in an interview with Linda Moulton Howe in June of 2003:

> It's very clear when you look at the cross-section here, you can see how [the stones] are banded. This is a mystery to me… I have never seen this particular 'football-like' shape and this particular mineral arrangement…
>
> Q: *And to produce this shape – of these sort of football-shaped or disc-shaped stones… and to have all of this quartz embedded in the iron… [would require a temperature] at about 2,000°F?*
>
> It was in a melt, yes… Definitely it is very clear that the quartz grains were floating in this iron liquid at high temperatures… But, as to the banding and the stratification going from the center outward, that has something to do with spinning force… and I really don't know what would cause this spinning force to form this [symmetrically disc-shaped iron/quartz stone].[10]

Iron in the red soils of the Corguinho area are attracted to the intense electromagnetic fields generated by the implosive hydrino plasma beam technology. Small grains of quartz sand are lifted from the ground along with the magnetic iron particles to be mixed with the liquified iron suspended in the intense rotating electromagnetic fields generated below the transdimensional spacecraft. Surface oxidation does not occur on these disc-shaped metallic concretions due to the unique effect of HHO plasma. Inventor Denny Klein noted the rust-resistant properties of surfaces brazed by HHO plasma during experimentation throughout the 1990s, which lead to the first commercial production of HHO gas torches, however short-lived.[11] The convergence of Earthly human technology with extraterrestrial means is greatly accelerating.



All over the world, these disc-shaped iron-quartz concretions are created below passing plasma craft of all kinds, even becoming commonplace in dry canyons which act like funnels to collect falling debris (opposite). Rains of these round iron stones have also been recently linked to invisible aircraft above the Indian towns of Ratria[12] Dhenkanal.[13] Infrared video obtained on March 5, 2004 by the Mexican Air Force[14] recorded a quickly moving formation of 11 disc-shaped aircraft that were completely invisible to the naked eye due to their use of HHO plasma screens surrounding each vessel like a bubble, with heat signatures of plasma vortices below each craft being clearly visible (above). The formation of the iron concretions was even filmed during a crash event in New Mexico,[15] actually showing magnetic material in the soil being trapped in the vortex below the craft, visible as molten metal glowing a bright red color.

Similar phenomena involving the interaction of iron-rich substrates with the strong rotating magnetic fields of plasmas moving above the terrestrial surface has also been identified on Mars.[16] Contributing to events of this kind are various plasma formations including natural lightening arcs that occur before the many impacts of meteor and comet debris to produce tiny spherical iron pellets that become thrown off as slag in a wide shower. The application of this phenomena by Urandir's fourth-density visitors as a message to the community is another example of their purposeful production of tangible evidence:

Q: [What occurred right after transport into the plasma ship?] This being was waiting, and how many others?

There were more – he cannot tell exactly how many, but there were more behind him. He was the main one, this one, waiting for him… [is] like 6-foot-three or -five inches [tall]… Then he walked in towards a bubble that was higher than him. As he saw a bed inside this bubble and just supposed he had to go and lay down there… [Inside the bubble] it was cold… like a car with air-conditioning on… He just walked through it… It was as if he (the blond being) was telling him, 'Go in, lay down and relax.' That's what he felt… He goes through it, feels very cold, lays down on the bed and then some sort of mist comes in and the shorts he had on disappear and in its place, some kind of other clothes materialized over his skin… [like those worn by the blond beings]. All of them, including his own, emanated a light like silvery-white neon lights… This light stabilizes his chakras and is sterilizing him from any bacteria on this planet.

Q: What happened then after he's in the suit?

He walked out of this bubble and went towards them. The greeting with the beings is touching the (index) finger to identify the energy. And the same finger passing, like rubbing, the forehead, like if he was tuning into the other one's mind to start a telepathic conversation… The being touches his own forehead and then Urandir touches his own forehead. Only the (index) fingers touch… only telepathic conversation –no images in his mind.

The tall blond male directed Urandir toward stairs and they climbed to the next floor [as seen in his drawing, above] where Urandir was to remain for the next three Earth days watching wall screens of images about the Earth, this solar system and the galaxy. Watching with Urandir were representatives of other non-human species who Urandir understands are allied with the blond beings in a mission to help humans transform and evolve. The tall blond beings are trying to transform the mind frequencies of as many people as possible, raising them in an effort to neutralize large numbers of low frequencies and help block catastrophes they see in Earth's future. Urandir considers himself one of their students and his goal is to share publicly what he has learned about mind energy over matter from the beings.

The following excerpts about Urandir's memory of what he was shown and told are taken from a five hour conversation that was tape recorded in Corguinho, Brazil on February 10, 2003, with Portuguese to English translation help. Urandir said that various dates connected with earth changes - both positive and dangerous - were shown to him, but not in chronological order. (After walking up stairs with the blond being to a second floor) the wall of the craft there transforms into a monitor and they start showing scenes… The worldwide events that are going to happen… [in Earth's immediate future are presented and described telepathically.]

Scene 1 - 2014, Outer Space Chunks of Ice

The solar system traveling and meeting a curtain of ice pieces approaching… He said the solar system travels in a big galactic cycle through the ice… This is the second time the earth has passed through these huge clumps of ice. It's very close this and it will take maybe 15 years to go through the big pieces, but a few pieces of ice could already be coming toward Earth today. The blond beings said that we cannot see this yet because there is another body that reflects with a very strong electromagnetic field all the light of this ice curtain approaching the solar system…

Scene 2 - December 22, 2012, Galactic Pulse

A giant galaxy was the next image… [with the] solar system down there. On December 22, 2012, this galaxy is going to emanate a big flash of light that will affect all the suns. Every sun reflects to all the planets surrounding them and will cause a 'reversal' not only the earth, but all the planets… It's like God synchronizing the whole universe, like a synchronization ray or beam that would come from God, the Creator. He said it will be seen by any creature on the planet that has eyes to see it… For our planet, there will be lots of solar storms. The suns will get hotter with more solar storms…

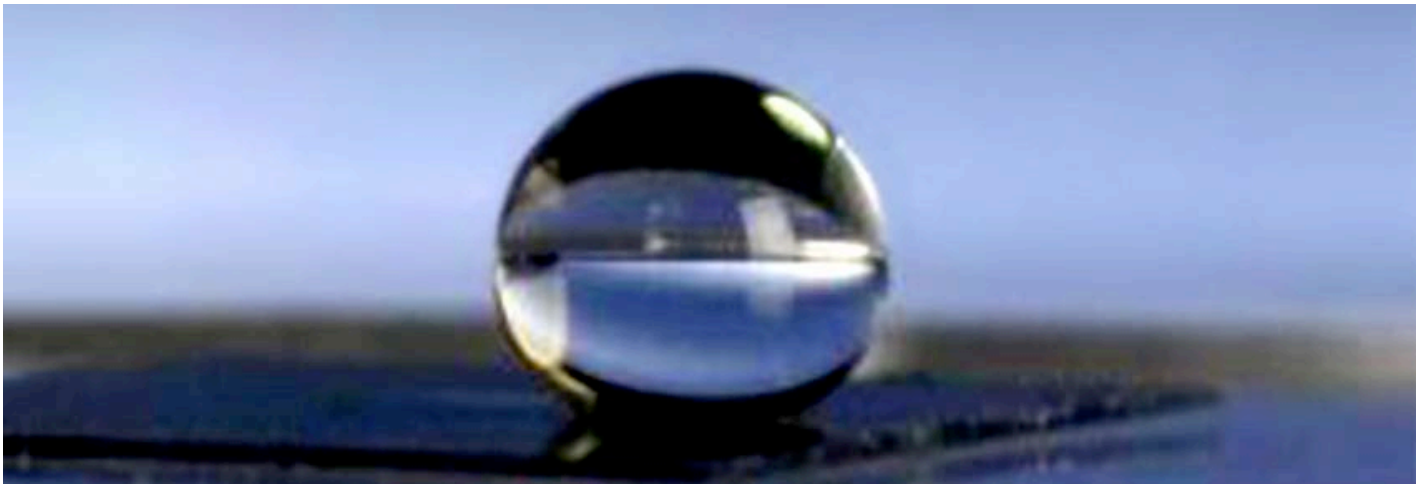
Scene 3 - December 22, 2012 - Sun and Stars Moving in the Sky

They showed how the human beings would see the sky from the earth… Moving, like [on a teeter-totter]… if you are looking at the sky, it will swing. You will see the moon and the stars moving.

Q: Like [The Book of] Revelations in the Bible says the stars will move in the sky?

Yes, exactly… [moving or wobbling during] both day and night.

Scene 4 - 2014 and 2023, 'Plasma Ships' Evacuate Some Humans from Earth



In the next scene are lights in the sky which are the blond beings' plasma ships picking up humans from hilltops in their beam transport technology. This is roughly near 2023. But something similar in evacuating human beings starts in 2014. These are like stars representing the plasma ships. People are on the hills and the ships are rescuing them… [The plasma ships emanate] silver light. Like a dish to a dish…

Scene 5 - 2004, Cosmic Body Travels Close to Earth

At end of 2004, there is a shock due to a body that travels close to our planet and interferes with the climate and atmosphere… [*This event occurred on September 29, 2004* – the close passage of Asteroid Toutatis, as also predicted during the extraterrestrial contacts of Eduard Meier in 1978, who even foretold the exact name that would be chosen by French astronomers several years before the asteroid had been observed.]

Scene 6 - 2007, Cosmic Body Disturbs Earth's EM Fields; Scientists Discover Life-Extending Water

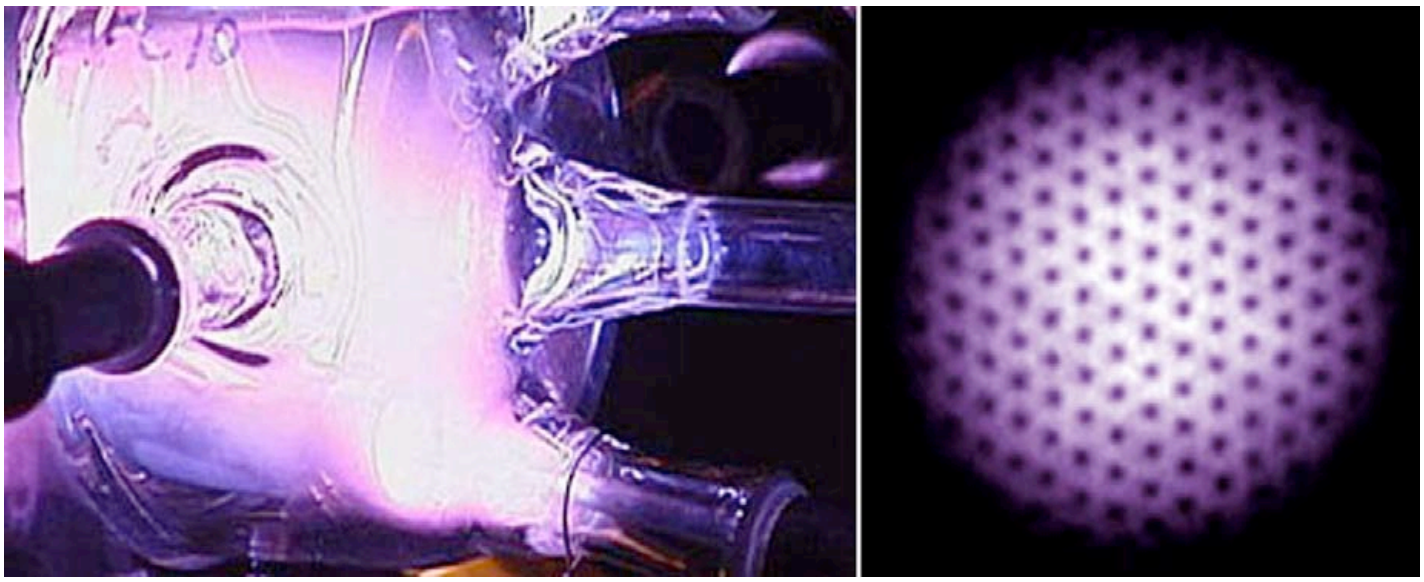
In 2007, there will be both bad news and good news for human beings. There will be a cosmic body [–Dark Star–] that moves toward or into the solar system that will affect the earth's electromagnetic fields… This electro-magnetic wave will affect some places locally, different, but not the whole earth. A good example is the Etna volcano in Italy. It could erupt and kill thousands of people. The rest of the world will carry on…

The beings said that science has already got the knowledge, but nothing has been published yet. In the ice caps of the Antarctic, scientists will study the water and find it is more pure, free of heavy water, deuterium? He is saying they are going to find this water with less heaviness. Scientists will discover this new purer water will retard the aging process by about 80 times. People could live 300 or 400 years. The technology to extract this new water in 2007 will be available… [whereby pure protium can be separated from heavier water molecules.]

Q: Who is planning this cruel joke of us finding life-extending water just before humans are wiped out by ice blocks only seven years later?

But there will be many survivors who can use the new discovery. The Earth has more than 6 billion inhabitants. Around 3 billion will die with all the catastrophes, but nearly as many will survive.

Scene 7 - 2028, Blond Beings Return Some Humans to Earth



And by 2028, it's like as if they are helping the population trying to help fix the planet. They start bringing back those people they evacuated before. And it starts a new era on the Earth. It's like everyone is part of a cooperative effort… After the evacuation, the people are returned years later but younger than when they were first beamed up into the plasma craft… They are taken into a different dimension that was adapted for the human beings to be preserved...[17]

The specific predictive information provided to Urandir Oliveira by his extraterrestrial teachers deserves careful analysis and consideration. Their concise description of the Galactic Pulse of December 22, 2012 being a synchronization beam radiating from the galactic core –*observable to all as a bright luminous flash that induces magnetic reversal of the entire Sol system*– corroborates descriptions provided by other extraterrestrial sources. The wobbling of the planet for days during a major reorientation in its rotational axis echoes ancient Biblical predictions, and *suggests a permanent seasonal change on Earth*.

We are warned that light from a threatening interstellar ice sheet is reflected by the strong electromagnetic field of the brown dwarf binary twin of our sun, itself having already invisibly entered the solar system. The foretold electromagnetic wave effects of the closing Dark Star are indeed perfectly exemplified by unusual events occurring in the Messina region of Sicily, just west of the mentioned Etna volcano. *The town of Canneto di Caronia has experienced repeated evacuations throughout the last several years due to extremely high electromagnetic fields being transduced from intense acoustic energy by the piezoelectric limestone bedrock.* The entire area is being bombarded by ultra-low frequency standing waves focused by the Giza pyramids, at a distance of 1,120 miles, or 4.5% of the Earth's mean circumference. *The brief explanation of localized effects given to Oliveira refers to nonlinear focal points of infrasound resonance.*

Information given concerning *lightwater* that Urandir drank with his companions for three days aboard the plasma craft is of great importance, being 'lighter' in reference to *both its weight and optical aspects*. Being comprised of pure *protium*, with less atomic weight than the heavier forms of water (deuterium and tritium), lightwater can be extracted from mixed terrestrial sources by virtue of the specific freezing, boiling and vapor points of protium that differ from the lower forms. *Oliveira was given astounding details concerning cellular longevity: that under bioelectrification conditions, the ingestion of pure protium lightwater endows an extended lifespan of 300 to 400 years.* This is the biological effect of the fourth-density HHO plasma environment that *'has been adapted for the human beings to be preserved'* such that they are *'younger than they were when they were first beamed up into the plasma craft.'*

It appears that Urandir's fourth-density teachers recognize the fact of governmental concealment of the anti-aging properties of pure protium water as a valid reason for providing this important information to humanity through Oliveira's efforts. The invisible bionanotechnological aspects of the lightwater that Urandir drank and absorbed through his skin during his extraterrestrial experiences were not discussed, yet comprise a significant factor in the formation of the HHO plasma that preserves both spacecraft and passengers. Biocompatible gold and silver nanoparticles of less than 10nm in size provide for remarkable optical characteristics, by transducing red and blue light inside all the bodies cells for the activation of DNA as an organic superconductor. *This effect cannot occur without the ingestion of these trace metals.*

Physicists on Earth have now begun to apply the atomic implosion process of hydrogen for the transduction of *free energy from the resonant field of infrasound standing waves enveloping the planet,* using HHO plasma reactors that contain tungsten power and catalysts that are not biocompatible (above, left).[18] For direct application to the human body, gold and silver nanoparticles and dissolved potassium are essential. Earthly physicists have also recently defined the parameters for containing plasma within a superfluid beam, reporting the appearance of a hexagonal array of vortices during rotation (Ketterle, et al).[19] Oliveira described his experiences inside an HHO plasma transport beam to Linda Moulton Howe:

> The transport process was reversed, according to Urandir Oliveira, when the tall, blond beings decided to return him on the evening of September 18, 2002, after three days on a second floor room where a large wall screen showed Urandir and many other non-human beings images of Earth's alleged future. During our February 10, 2003, interview about the experience, I asked Urandir if he and the others were in the same room all three days. He answered, "Yes, it's like the walls were endless. I walked, but never reached the walls, so it gave the impression that the room was really big"…
>
> What he says he did understand was that the meeting in the "endless" room with many other non-human beings was supposed to have lasted for fifteen Earth days, not only three. But many of the people who had been at the Corguinho farm on the night of September 15, 2002, when the scorched body prints were found on Urandir's bed and the bedroom ceiling told friends, relatives and the Brazilian media about what had happened.

By September 16, 2002, Brazilian television reporters had traveled to Urandir's farmhouse to wait for a craft to return him. Felipe Branco and others who had been shocked the previous night by the bedroom scene had already locked the bedroom and shuttered the windows so no one could enter, including the curious media. When no dramatic aerial or beam activity was seen on September 16 or 17, the media left the farm. Urandir said, "In the end, the blond being told me that the trip was going to be interrupted, cut short, because of all the movement down there with the media which was not in accordance with what had been committed to me" by the beings. He understood that the non-humans did not want sensation, but left the physical evidence in the bedroom that unusual energy had interacted there for researchers to analyze.

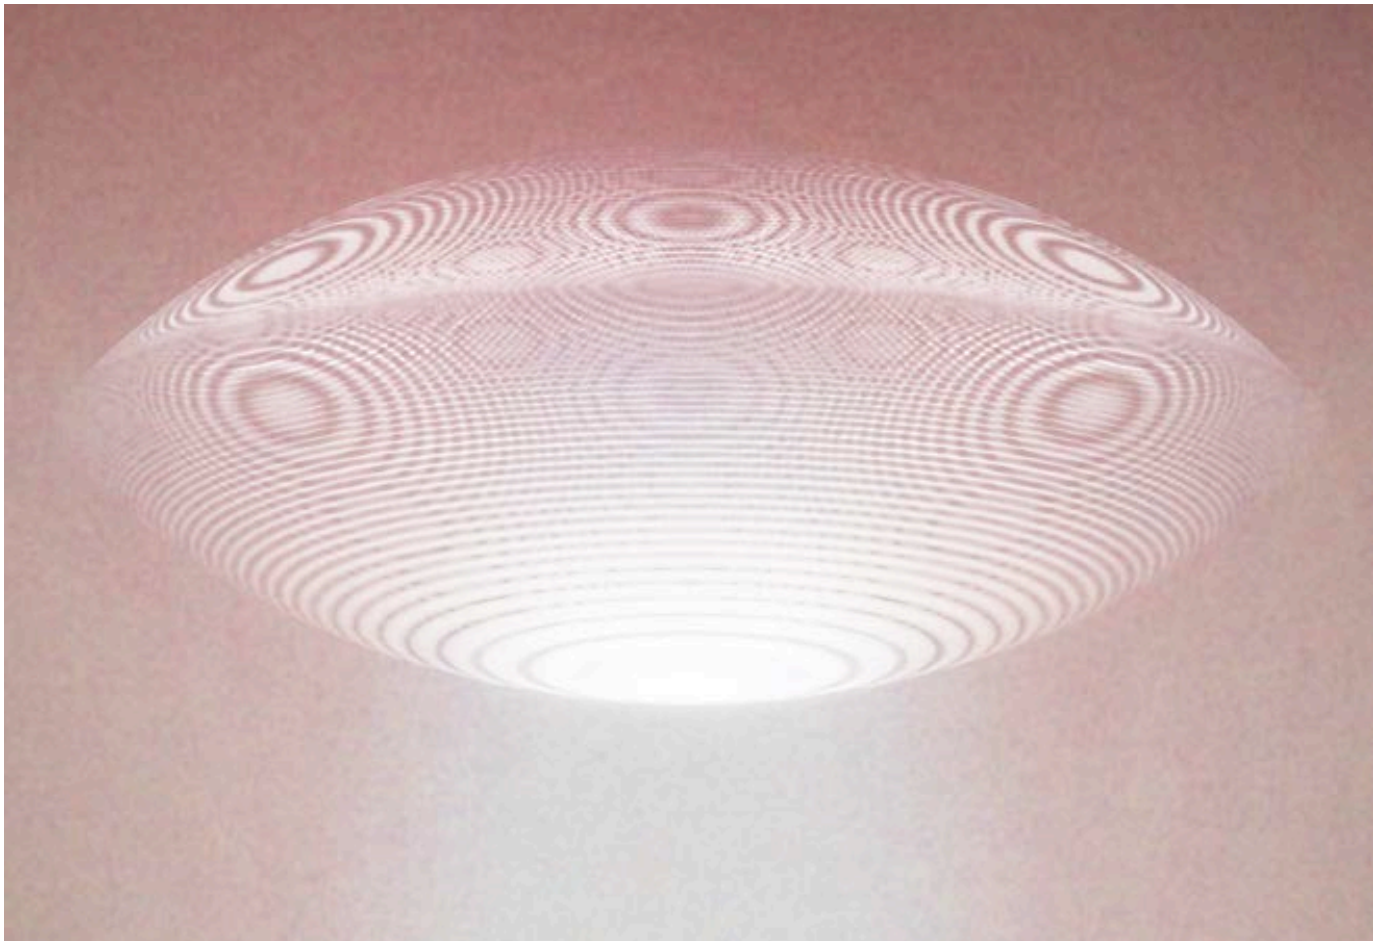
On the evening of September 18, 2002, when the farm was relatively quiet, the tall blond being walked Urandir down the stairs in the craft to the place he had entered in the violet light. There he went back into the bubble where the silver, glowing, leotard-like suit dematerialized from his body and his own underpants materialized on him again.

Interview: The violet light was already there and a lot denser… When the violet transforms into a tube that comes down, the light becomes more subtle… At this point, he walks into the light. As he is going back down in the beam, about half way down, this light changes him from a standing position and puts him in the previous exact position when he was on the bed before (on September 15, 2002). The very same position and he is paralyzed again to go all the way through the roof and ceiling of his house and back to where he was…

Q: Any different feeling then?

Like as if his bones are stretching. Like cracking joints… The whole skeleton of all his bones go snap, snap.

Q: I wonder if it has to do with molecular expansion and contraction of passing his matter body through the roof and onto the bed?



Yes, it does have something to do with expanded molecular structure so he can interact with matter again. It's as if they are re-tuning the body… He can see through the same [violet] light to the room… He saw himself going through the ceiling and then he feels his body touch the bed. But before he actually approached the bed, he could not see that the bed was burned because the way in which he was paralyzed would not allow him to. So the (violet) light goes off and everything comes back to normal and he stands up, switched on the room light, and then he is surprised with his bed because it is so burnt. He thought he had been melted there! ...There was some sort of smoke in the ceiling still coming out.

I was puzzled… as I photographed and gathered cloth and wood samples from the sheet and the ceiling… [because] the scorch marks on the pillow and the heavy scorch mark surrounded by the aura of his head in the wood ceiling [above] were in different places… A logical speculation about this difference is that Urandir's body was moving forward toward the head of the bed as it was lifted upward by the violet beam technology… I asked him why he thought there were no scorch marks of his hand or feet in the ceiling. He was uncertain, but said he understood from the non-humans that the energy beam that lifted his body was precisely tuned to the molecules of his body against the bed in order to separate them from the bed… [It is an] extraordinary technology.

Q: What went through his mind as he looked at the sheet and the ceiling?

At the time, he started touching himself thinking, 'Have I melted?' And he wanted to know his weight, so he climbed on a scale and he lost 4 kilos (8.8 pounds) in those three days.

Q: Did they feed him anything?

Some tablets with different flavors… If he wanted a meat flavor, they would give a meat flavor. If he wanted a sweet or apple flavor, he would have an apple flavor.

Q: Did they give him liquid? Water that was much lighter than our own…

Q: He felt perfectly fine? Relaxed, peaceful, joyful.

Q: So he is now standing in the bedroom. The ceiling is smoking. He is looking at his own body to see if he is burned… [and his clothing appears unaffected by the high temperatures. Then what happens?]

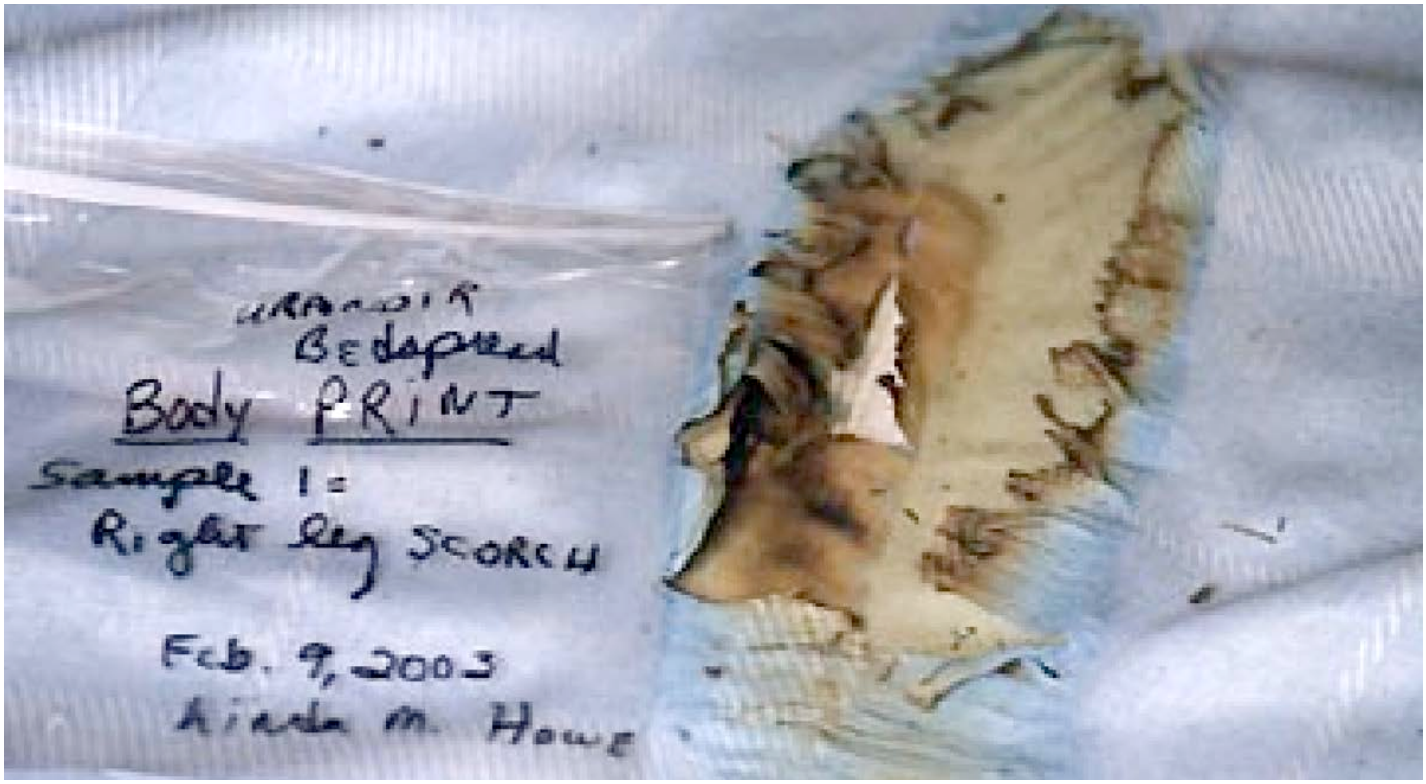
Then he tries to open the door of the room and it's locked. He opened the window and it is blocked from the outside… with bars. Everyone locked the room after he was gone (on September 15) after the [transport] to make sure no one would walk into the room… [thereby securing the evidence of Urandir's beam transport.] He has an intercom phone, so he called his parents who live on the farm and they rushed to the room to open it.

Q: He was gone for at least three days and humans go to the bathroom on a daily basis. What did they provide?

There was some sort of a cabin, almost transparent, a plasma material. And the only need or urge he had was to urinate. He did not feel any other urge. When he arrived at the plasma material, there was no hole, no basin, nothing. So, he thought, 'Well, I will just urinate here'…

Q: What happened?

So he starts urinating and when it is about 10 centimeters for the urine to touch the ground, it would disappear.



Q: He said he is standing before a plasma. Is it like a fog?

[The plasma cabin and urinal are formed by the] same material as the bubble. [The urine just disappears] before it touches the floor.

Q: Do the [extraterrestrial] blond beings urinate?

Yes, not as much as we do, but they do… [and they eat the] same tablets that they provided him." [20]

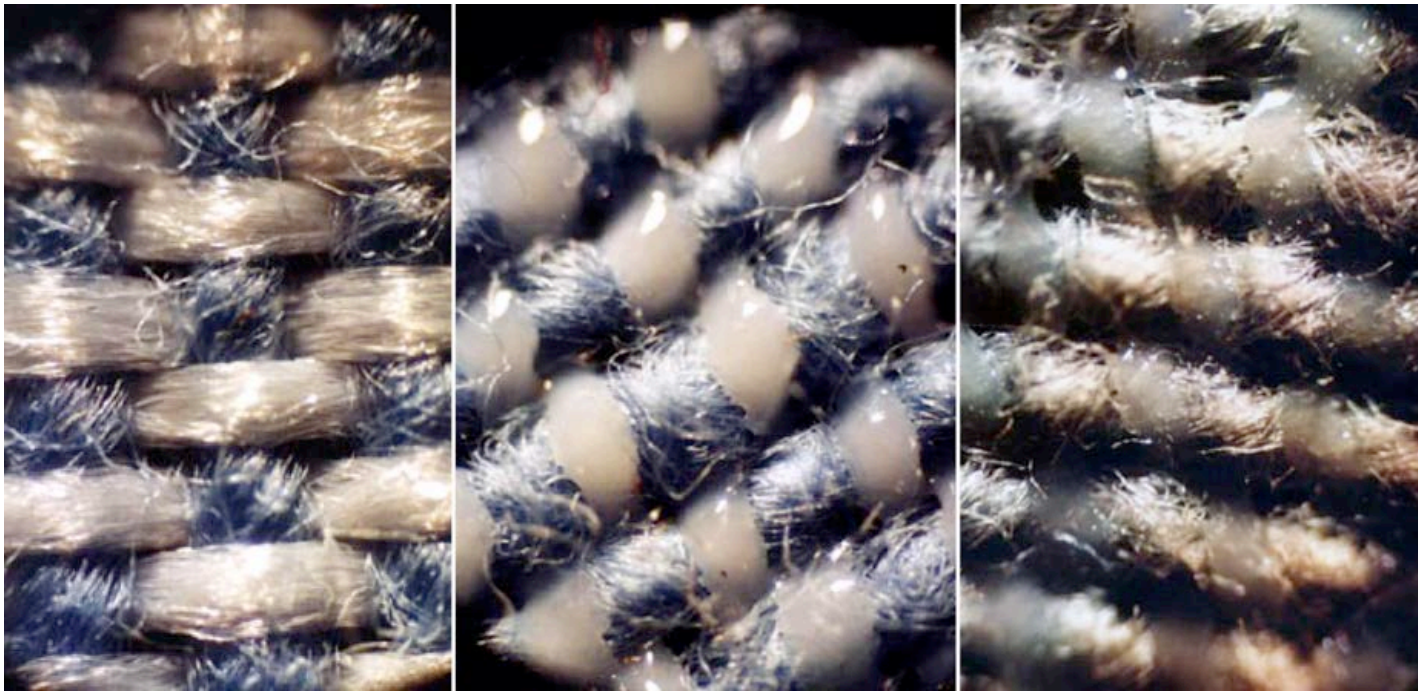
[A]nalytical chemist Phyllis A. Budinger [explained]... that the blue threads in the affected Oliveira sheet are cotton and the white are polyester. The blue and white threads are woven together throughout the sheet, but there is great variability in the body imprint from what looks like burned and charred cloth right next to cloth with only slightly darker blue discoloration that also outlines the entire body print. This is especially interesting when you consider the facts that cotton decomposes, or scorches, at about 148º Centigrade, or about 300º Fahrenheit. But polyester threads don't melt until 500ºF. There are melted, gummy threads intricately woven throughout the blue cotton threads -even in places where the cotton is not scorched, or even brown.

Interview: W. C. Levengood, Biophysicist, Pinelandia Biophysical Laboratory…: 'I've never seen anything like this. This takes a very, very high precision kind of - whatever the energy, and there had to be energy here to transform, probably at the molecular level, this because it changed the internal energy of the material. Whatever it was… [this form of energy] was extremely precise.

'I ran on to one region right at the edge of the brown material and the threads - you could actually see where they were white, normal threads, and then just a fraction of a millimeter away, they had begun to be transformed. They were glassy-looking, but you could still see the individual fibers inside. Then in another half millimeter, they were totally homogeneous into this opalescent material. So, that transition is very precise and you could see the line of demarcation if you had the incident light just at the right angle on the sample, you can see this band of change. So, the energy here is very, very precise.

'I measured the weight per unit area of a control sample. The weight of the control cloth is 17 milligrams per square centimeter. The blue region is 24% higher in weight than the control cloth. I don't think anything was added. It means the energy has changed the density of the polyethylene and to change density means you have to change the molecular structure. There is some incredible technology [being applied] here…

Q: This is a photomicrograph of a sample of the body pattern on the Urandir bed that was not scorched, but almost looks wet… [opposite, center.] But in fact that wet look has been caused by a change in the polyester?



It sure has. These I call a transition, or the polyester is converted into what I call vitreous fibers. It looks wet, but this is actually sort of an opalescent liquid-looking, but it's like a plastic, very hard.

Q: We know that polyester… has a melting temperature of 500°F and that cotton has a scorch temperature of 300°F. The difference of 200°F in this photograph alone is baffling because it looks as if the polyester threads have been melted and the blue cotton threads seem completely untouched.

That's right. And that difference of 200°F -that's the astounding thing. The cotton threads are totally undisturbed.

Levengood's biophysical analyses of microwave-radiated plants from crop formations form the only precedent for the study of material evidence of aerial plasma beam phenomena. Further analyses of the Corguinho bed sheet were undertaken by Professor Herbet J. Barndt, Director of the Grundy Testing Laboratory of the School of Textiles and Materials Technology at Philadelphia University. In an interview by Linda Moulton Howe in May of 2003, Professor Barndt stated that the delicate burn pattern on Urandir Oliveira's bed sheet must have been made with laser-like precision in mere seconds of exposure:

> *Q: Could you explain a little bit about the possible importance that water might have played – both from having taken a shower and perspiration when this individual laid down?*
>
> Well, when cotton gets wet, moisture actually goes into the fiber. In other words it's inside the fiber, as well as on the surface. [In the case of] polyester, the water remains on the surface. So in the presence of a high temperature the water will evaporate from the surface of the polyester before it evaporates from the cotton, because the water is bound to the cotton fiber. So, in order to damage the cotton fiber you have to evaporate the water to get the fiber hot enough to burn. But since the polyester isn't really holding water it can absorb heat more rapidly, and that may explain why the polyester melted, and the cotton in a number of these areas wasn't particularly damaged…

> Q: *Does that suggest… whatever did happen to this bed sheet happened in a very quick period of time?*
>
> I would think so… especially with the temperatures that are involved and the fact that the cotton wasn't degraded more than it was. it would seem that it had to have been a very quick occurrence, whatever happened here.
>
> Q: *And we're talking in seconds, right?*
>
> I would think so… It's very unusual… You would have to have a pinpoint heat source like a laser to do that… If you have a heat source that's intense enough to melt the polyester, and still not cause intense damage to the cotton, or at least some of the cotton, it has to move fairly quickly along this pattern… [or] the whole thing [is briefly heated] all at once…[21]

These detailed conclusions of the analyses of the bed sheet evidence from the Oliveira case point directly to a specific plasma heat source that was unknown to the 'experts', yet is derived from the most common and basic element in the Universe – hydrogen! *It is now known that HHO plasma is unique in that it heats different materials to different temperatures depending on the molecular structure.* An HHO plasma torch will not boil water, but instead reverts to water vapor on contact. The implosion of atomic hydrogen allows for precisely tuned interaction with the cotton and polyester threads in discreet bands of temperature change, producing the ultraviolet and infrared emissions described by Urandir as heat and violet light.

HHO plasma is also responsible for the molecular changes documented by Levengood regarding the weight increase of the vitreous polyester fibers. Similar analytic results were obtained from other material evidence collected by Oliveira and his group after a brilliant nighttime aerial explosion over Mount Ashtar (above) that scattered radioactive debris later measured with Geiger counters. A small brown ball of a solid resin-coated material was found lodged in a vertical rock face and carefully collected for laboratory analysis (opposite). X-ray diffraction analyses of the roughly spherical, resin-coated metal sample were conducted in the capitol city of Brasilia to determine the elemental composition of the artifact, which may reveal its extraterrestrial origin. *Testing showed abnormally high quantities of rare Earth elements:*

> Analysis of the nucleus, done by Centro Técnico Aerospacial [detected]… iron, oxygen, silicon, titanium and vanadium. In relation to the occurrence of these elements, the iron and the silicon can be largely found as iron ore and as silica... The oxygen is found associated chemically to the iron ore and the silica as iron oxide and silicon oxide, respectively. These oxides are mentioned in the probable presented compounds according to analysis done by x-ray diffraction. The titanium, as well as the iron and the silicon are not found in a pure state in the nature, being found also as oxides. In the sample, the probable compound that contains titanium is the iron oxide and titanium, which can be found in the nature as a mineral called ilmenite.
>
> Nonetheless, the most important aspect is the presence of vanadium. This element and all its derivatives are toxic to humans. Pure vanadium is normally used in special steels. It is found in complex minerals, such as vanadite ($Pb_5Cl(VO_4)3$) and carnotite ($K_2(UO_2)_2(VO_4)_2 \cdot 3H_2O$), with an occurrence in the crust of the Earth of 0.03% - a very restricted presence in the nature. Vanadium does not occur together with iron, silicon or titanium, which suggests that it was manipulated to be used with these chemical elements.
>
> Curiously, some forms of iron ore and titanium can present magnetism, which leads to certain suspicions about a possible mechanism of magnetic control of the space probe. The usage of iron bindings and silicon are also indicated in this sense, together with the bindings with Manganese… [Brasilia's] Laboratório Instrumental da Divisão de Química do Instituto de Aeronáutica e Espaço do Centro Aeroespacial showed that [the resin] presents a fossilized-material aspect of the ester resin kind, known as amber and silica.[22]

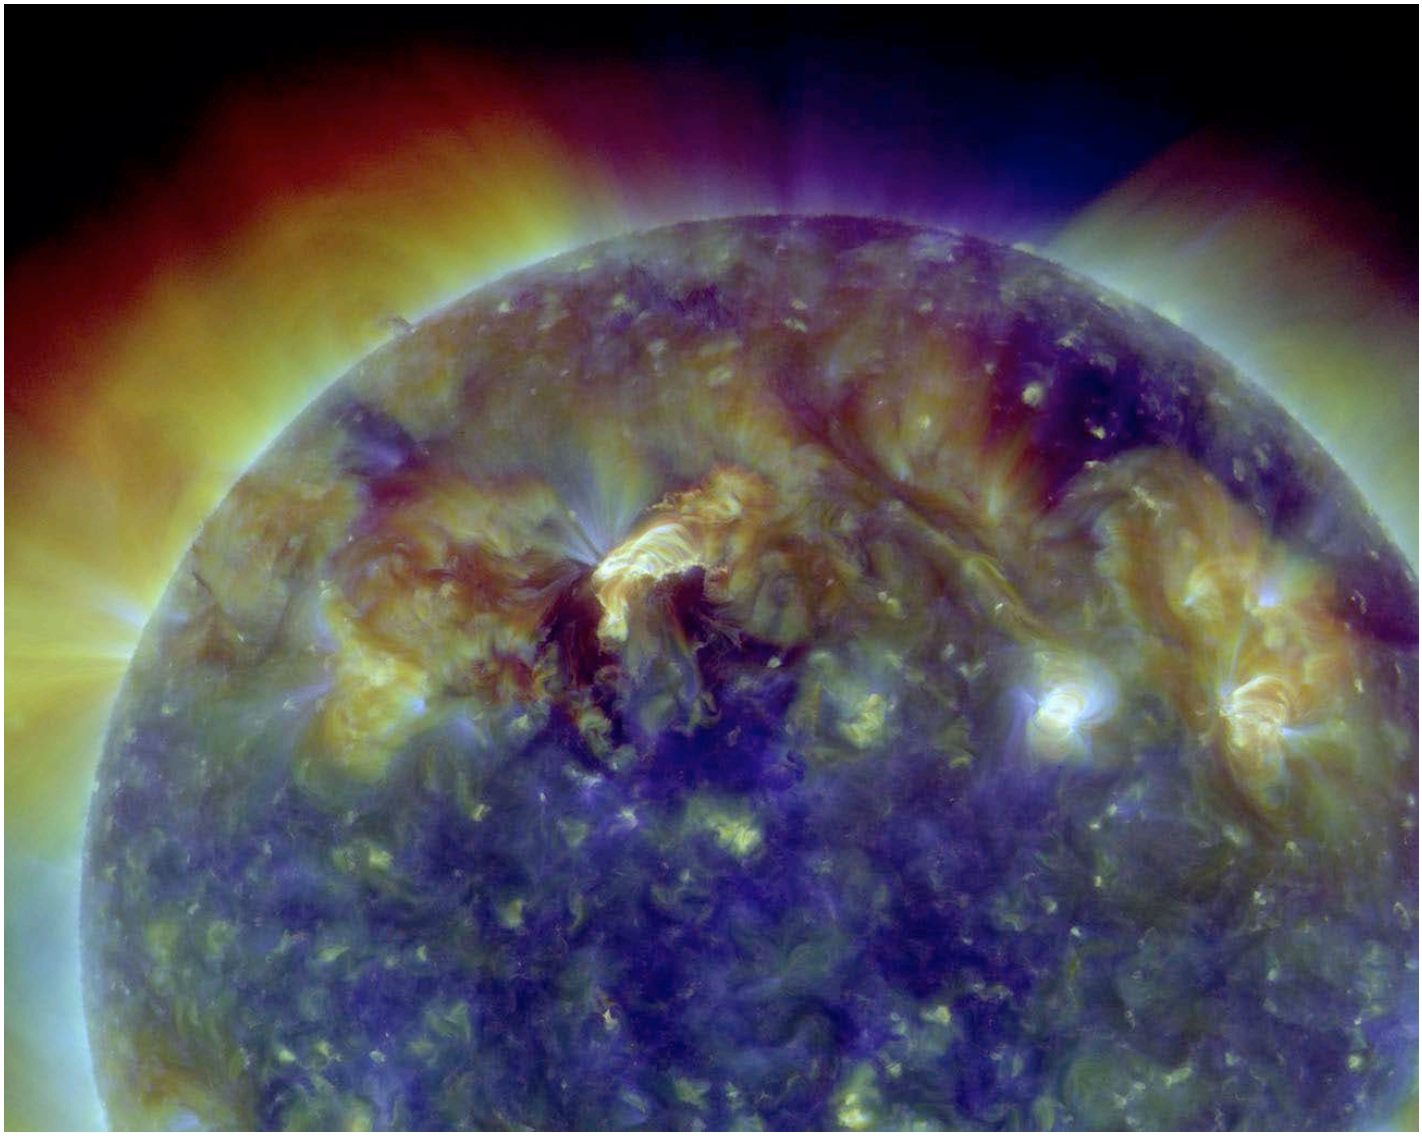
The initial radioactivity of the recovered probe debris is evidence of molecular changes having occurred during the explosion, while the exotic composition of nucleus confirms its unearthly origin. *The amber/silica resin coating presents an organic appearance, yet the roughly spherical metallic core of iron, oxygen, silicon, titanium and vanadium is certainly of non-mineral origin.* Brazilian Aerospace laboratories clearly acknowledged the highly unusual magnetic properties of the combination of elements found in the nucleus, while the resonant piezoelectric properties of silicon also implicate a highly advanced magneto-acoustic levitation technology. Silence accompanied the great heat and light emitted during the brilliant flash that briefly lit up the entire area like daylight, as the fusion of the aerial object into a tiny molten mass occurred.

The pointed speculation of analytical scientists supports the direct observations of witnesses to the luminous event and is further corroborated by information related in the contact case of Eduard Meier. Exactly this type of brown resin-coated mass was discussed as the byproduct of special security features commonly used by space-travelers visiting Earth. The dangerous potential misuse of technological knowledge is prevented by the installation of self-destruct mechanisms within all instruments and probes, for intentional or automatic activation in the event of malfunction. Semjase informed Meier of the necessity of the elimination of technological materials foreign to Earth, and a complete demonstration of the elimination process during his 62nd contact with cosmic visitors from the Plejares system, on August 12, 1976:

Meier: I have heard that some objects had simply disappeared or burnt, or dissolved themselves in some way, if they were found by Earth human beings and if the objects belonged to some extraterrestrial intelligences.

Semjase: The reason therefore is the elimination of these objects. We and many other intelligences are able to eliminate lost, or fallen into insincere hands, things by different ways, or simply to burn these to ashes. This happens by very far-reaching transmitters, which are started by means built into each instrument, a destroyer mechanism. These destroyer mechanisms are usually built into the objects and instruments, which we take to strange and still lowly-developed worlds, for reasons of security, so there does not come the dangerous for them possibilities of progress into the hands of the concerned still lowly-developed forms of life of any planet. These instruments or objects equipped with such destroyer mechanisms are normally produced from synthetic materials, like for example this small thing here… a selective warning instrument… which announces by a fine signal tone to me, when for example now should anyone come near us, whose brainwave pattern is not noted in this instrument, by which I mean, not registered.

Meier: …Can you perhaps demonstrate for me how you destroy such a thing?



Semjase: In purpose of your accomplishments, yes. Look, I simply throw it here onto the ground, and now do come a bit aside. – Like that, yes. Now look at this girdle-instrument; when you push these both flat buttons, then the warning means will start itself and burn and change towards a viscous and brown-black synthetic mass. Pay attention to the means laying there and push the two buttons. (I allow myself to push them.)

Meier: Can I have the remainders? Know I want to let them get analyzed.

Semjase: Yes, but then you should stop burning this mass, as otherwise nothing will remain for you. Don't touch it until $1^1/_2$ hours have passed, as until then, certain radiations dissolved by the combustion will have escaped out of the mass.

Meier: Well, but don't you think that our scientists could analyze important facts from out of this mass?

Semjase: The chance is very small, because this sort of synthetic material allows no more recognition of the original compounds, [and] will in similar form be used as well on the Earth…[23]

The explanations of Semjase perfectly describe the aerial probe debris recovered by scientific investigators involved with the Urandir Oliveira contact case, despite the more than three decades that separate the statements of Semjase with the spectacular aerial events occurring above Mount Ashtar in Mato Grosso do Sul, Brazil. The comprehensive guidance offered by visitors from other worlds, through the persistent efforts of Urandir Oliveira and other dedicated individuals, prepares Earthly humanity for the current electro-magnetic changes connected with the emergence of the brown dwarf binary companion at the outer reaches of our solar system, as the rain of Oort comet impacts bombards every continent of the Earth, continually threatening humanity for a prolonged period of many years into the future.

Greatly increased solar flare activity and resulting geomagnetic superstorms will accompany the process of magnetic reversal of the entire solar system in alignment with the Galactic Pulse of December 22, 2012. The ancient calculations of the calendars of the Maya culture resonate with the future events foretold to Urandir Oliveira, as do their advanced lessons on the effects of lightwater. The Maya also identify the transformative effects of the celestial lightwaters of Tláloc that rise in the mists at dawn, in contrast to the degenerative effects of the heavy waters that run downward to the center of the Earth. *Indeed, the process of activating the electro-acoustic vibratory fields of Earthly human beings is not only occurring in the plasma ships of extraterrestrial entities, but also in the Mayan pyramids and sacred sites throughout Central America.* Through these cosmic methods of bioenergetic activation the disasters threatening Earth's future may be mitigated or prevented, as the transdimensional enhancement of consciousness allows the integration of new perceptive capabilities in synchrony with the dramatic environmental upheaval.

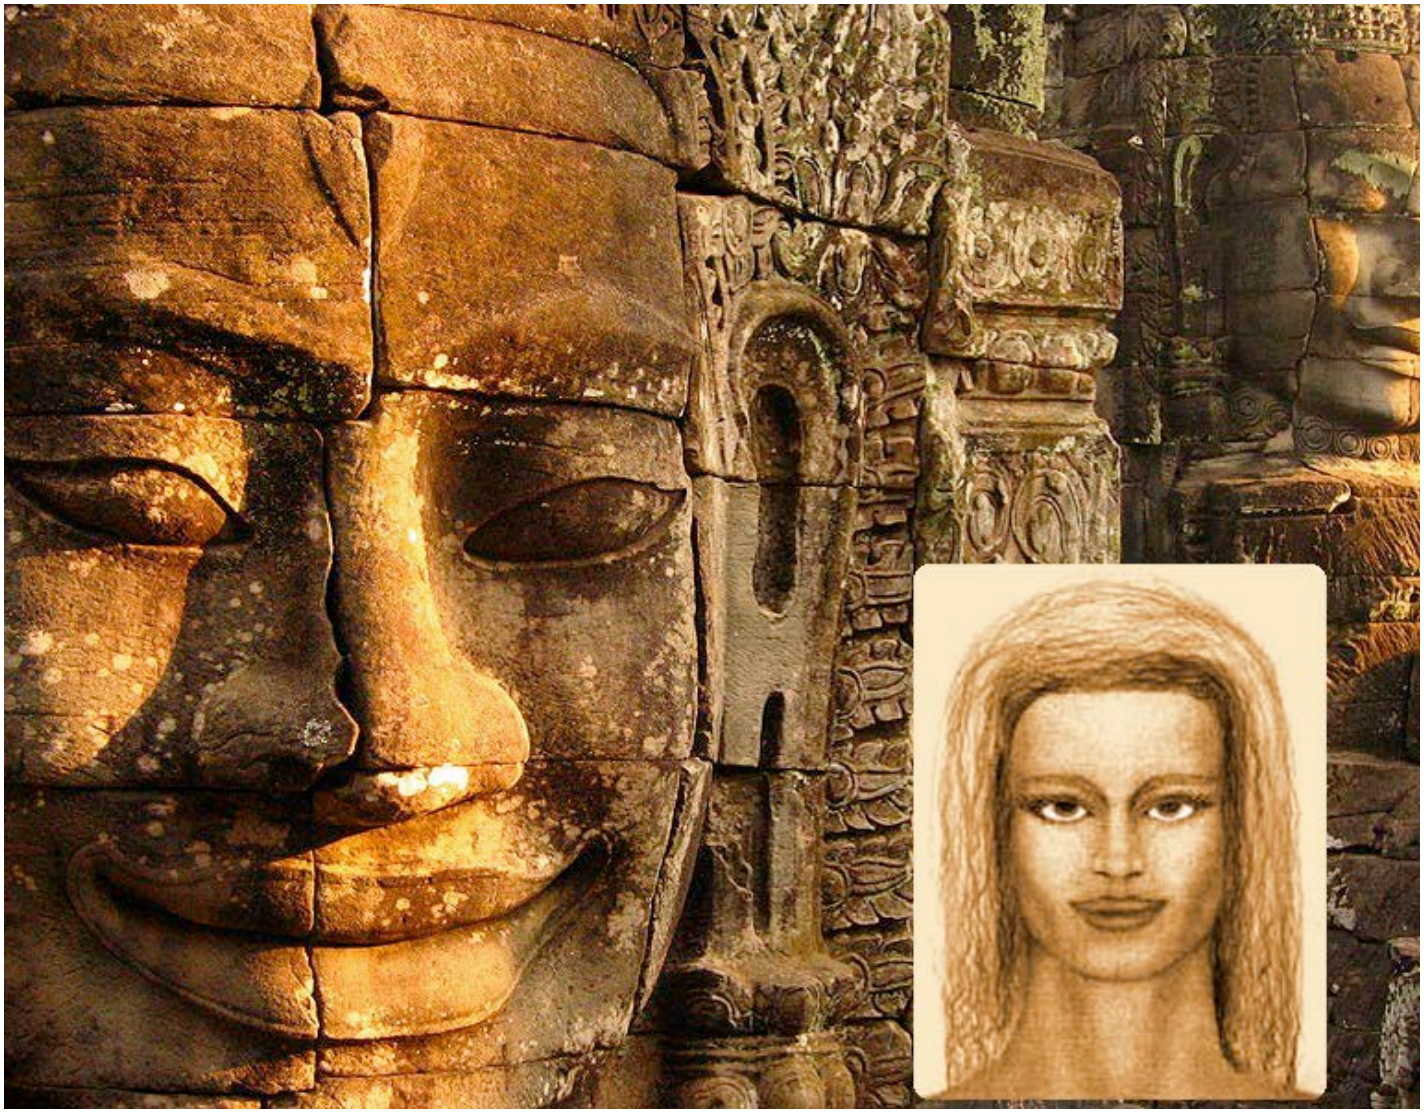
Golden Planets



Golden Planets

In one of the most intriguing cosmic journeys yet documented in our times, Michel Desmarquet was contacted by a giant, quite beautiful race of extraterrestrial human beings, and invited aboard their massive spherical spacecraft. Michel's cosmic journey began on a clear night in June of 1987, in the northeast part of Australia, when he was levitated above his home in a bluish plasma to be met by a giant figure in mid-air. Wearing a close-fitting single-piece suit, the huge figure smiled and explained the many unusual circumstances to Michel, before inviting him aboard the giant spacecraft that floated nearby:

> About 100 meters from us was an enormous sphere, from which emanated a bluish Aura. I later learned that it measured 70 meters in diameter. The light was not steady, but shimmered, resembling a heat haze when one looks from a distance at sand heated by the summer sun. This enormous sphere 'shimmered' about ten meters from the ground. With no windows, no openings, no ladder, it appeared as smooth as the shell of an egg.[1]

The giant being introduced itself to Michel as Thao, and explained the main purpose of their long journey from their gigantic homeworld, known as the golden planet of Thiaoouba. It was later identified as one of three such golden planets in our galaxy that represent the highest attainment of physical and spiritual advancement. Michel was invited aboard the spherical super long-range spacecraft, called an 'Alatora', and underwent a necessary set of bacterial decontamination processes with the implicit understanding that he was to join this race of gentle giants on a great journey. Michel was given the opportunity to visit their homeworld of Thiaoouba to speak directly with their High Council of 7 Elders, known as the Thaori.

No photographic or physical evidence of Michel's cosmic journey was obtained, but his vivid descriptions, first published in 1993, provide a wealth of advanced spiritual information and detailed observations that in themselves provide the ultimate validity of his experiences. As Desmarquet clearly acknowledges, "this extraordinary story will appear to [be]… a story entirely invented – but I do not have the imagination that such a fabrication would require. *This is not science fiction.* The reader of good faith will be able to recognize the *truth* in the message I transmit from my new friends to the people of the planet Earth."

For a period of ten days, Michel became the pupil of Thao, a quite impressive personage of 9'8" (290cm) in height, who radiated a youthful wisdom and joyfulness, representing a unisex race of giant human beings inhabiting the planet of Thiaoouba. Being hermaphrodites, all Thiaooubans possess both male and female reproductive organs. Such giant extraterrestrial hermaphrodites may have been depicted by ancient artists in giant stonework, such as the temples of Angkor from the ancient Sanskrit traditions of present-day Cambodia (above, with inset drawing of Thao based on Michel's descriptions). Thao's intriguing facial features combine the elegance of very feminine eyes with a strong masculine chin:

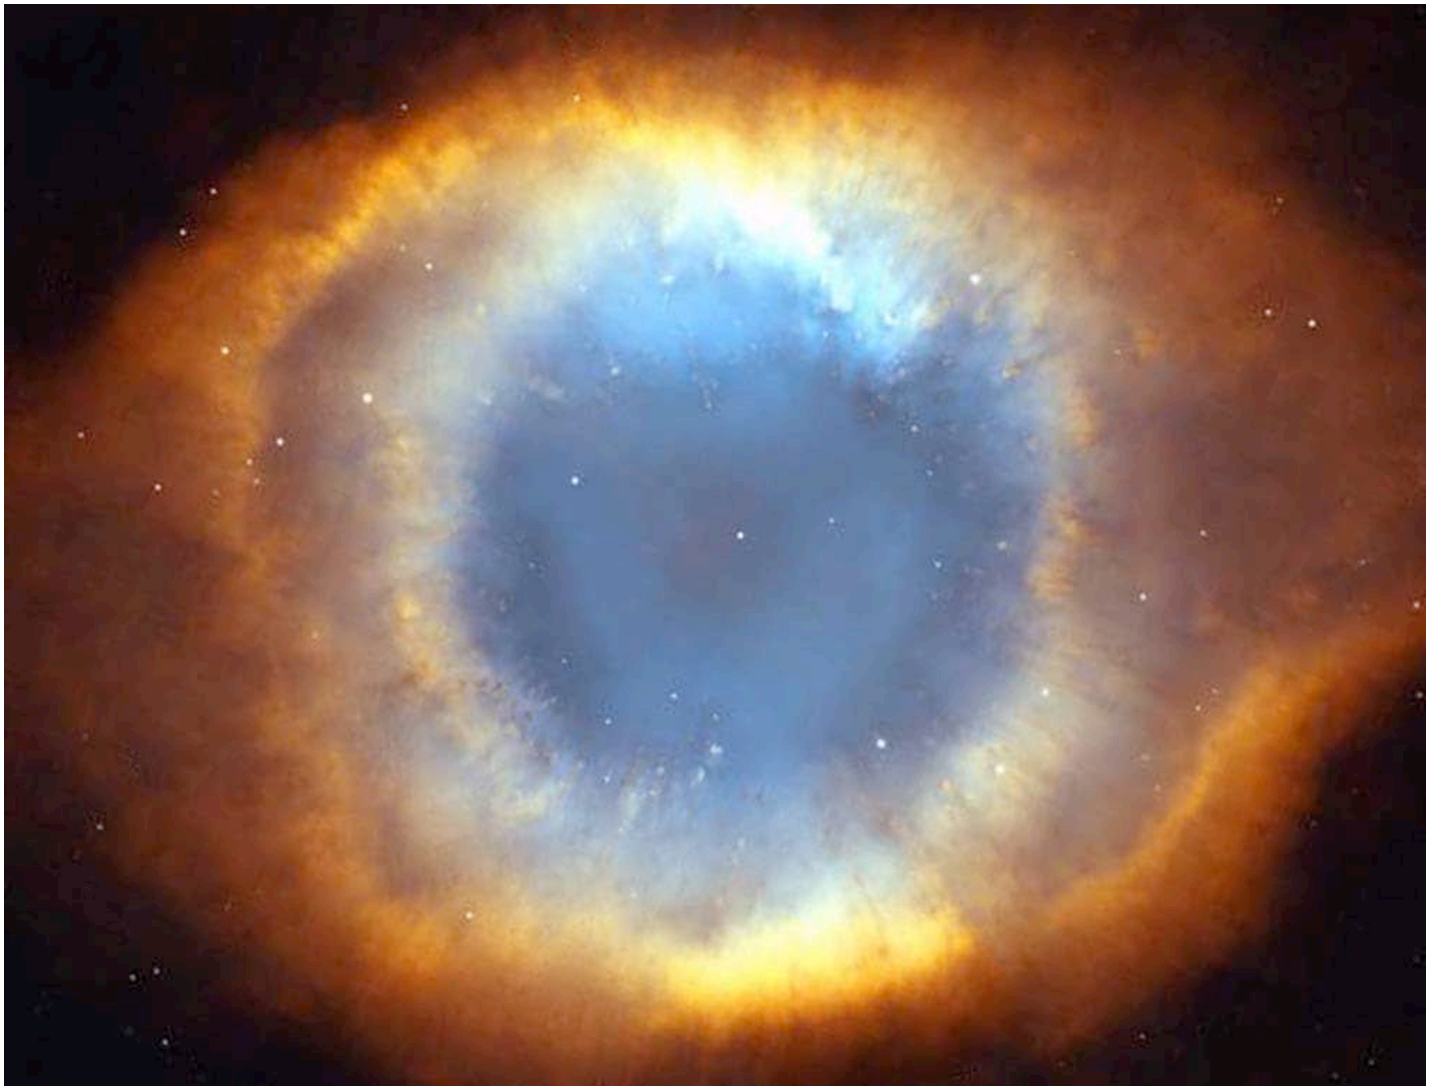
> Thao… smiled at me and I clearly remember appreciating, for the first time, the beauty and nobility of her face… I have already mentioned her hair, which was long and silky, golden-blond in color, which fell to her shoulders and framed a face that was perfectly oval in shape. She had a large, slightly protruding forehead… Her blue-mauve eyes and long curled lashes would have been the envy of many women on our planet. Her eyebrows curved upwards, similar to the wings of a seagull… The chin, well shaped but slightly angular, suggested a willful determination that was somewhat masculine, but this did not detract from its charm. A faint shadow of hair above her upper lip could have spoiled this perfect face, were it not blond.[2]

[Upon entering the giant ship, we] were now 'gliding' at ground level along a tunnel-shaped corridor that led to a small room, the walls of which were of a yellow so intense that I had to close my eyes… 'It is not a light. It is just the present color of the walls… There is no paint. There are only vibrations, Michel. You still believe that you are in your Earthly universe, when you are not. You are now in one of our super long-range spacecraft, capable of traveling at several times the speed of light. We will be leaving soon, if you will lie down on this bunk?'

There, in the centre of the room were two boxes - rather like coffins without lids. I stretched out in one of them and Thao in the other… I wanted to lift myself up a little but couldn't, being held by an unknown and invisible force. The yellow color progressively disappeared from the walls, to be replaced by a blue that was certainly no less intense… [Thao explained the light intensity as a health precaution–] 'We come from a planet [that is] bacteriologically different from Earth, which, for us, is a veritable culture medium. Thus, in order to contact you, I was obliged to take this basic precaution. You, yourself, were a danger to me but you are no longer… When you entered this cabin, the color was too intense for you and I gave you the helmet you are now wearing, which was specially designed for you…

'During the very short time the cabin was yellow and then blue, eighty percent of the dangerous bacteria in you was destroyed. Then perhaps you felt a coolness in the air, similar to when an air conditioner is working; this was another form of disinfection by... let's call it radiation, although that is not the correct word – it cannot be translated into any Earth language. In this way, I have been disinfected one hundred percent, but you still have enough bacteria to harm us considerably. I am going to give you these two pills, and in three hours you will be able to consider yourself as 'pure' as one of us.'

As she spoke, she took a little box from beside her bunk, removed the pills and held them out to me, along with a test tube containing a liquid that I supposed to be water. I swallowed them both, lifting the base of my helmet to do so... 'I have given you a special drug in order to cleanse your body of all bacteria that is dangerous to us. I have also given you another drug that has caused your Astral being to leave your body - this will last three hours, the time it will take to purify you. In this way, you will be able to visit our spacecraft, without danger of contamination to us and without wasting time.' [3]



Thao's explanation of the intense electroluminescence of the resonant metal walls of the Alatora spacecraft and the necessary preventive bioelectrification protocols can now be properly understood. Lightwater and a pill most likely containing exotic trace elements including electroluminescent nanoparticles of gold and silver became activated by the strong force-field which impeded his movement while reclining in the resonant chamber, illuminating his cellular waters with red and blue light. The precise environmental controls exercised inside the starship reflect the luminosity of Thao's high-resonance homeworld of Thaioouba. While in Astral body, Michel took the opportunity to ask his impressive new friend a spiritual question of great importance: *"First of all, who is God? Does he exist?"*

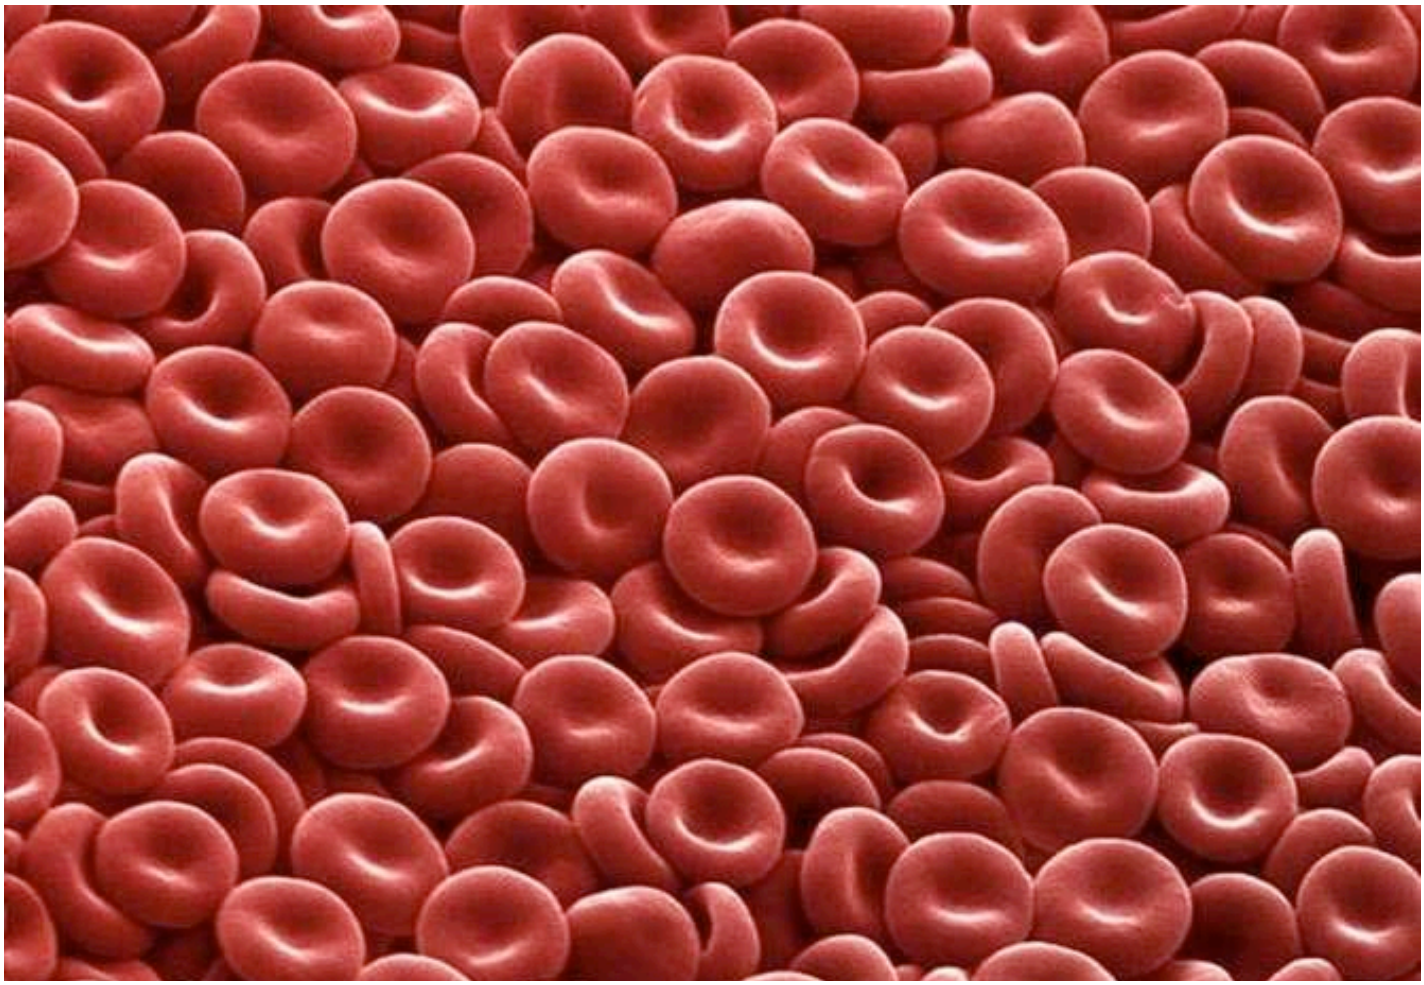
'I have been expecting this question and it is important that you ask it. On an ancient stone tablet, which I believe is *Naacal*, it is written: In the beginning there was nothing - all was darkness and silence.'

'The Spirit - the Superior Intelligence decided to create the worlds and he commanded to four superior forces... It's extremely difficult for the human mind, even when highly developed, to comprehend such a thing. In fact, in a sense, it is impossible. On the other hand, your Astral Spirit assimilates it when it is freed from your physical body. But I'm getting ahead of myself - let's go back to the very beginning.'

'In the beginning there was nothing except darkness and a spirit - THE Spirit. The Spirit was, and is, infinitely powerful - powerful beyond the comprehension of any human mind. The Spirit is so powerful that he was able, by the action of his will alone, to trigger an atomic explosion with chain reactions of unimaginable force. In fact, the Spirit imagined the worlds - he imagined how to create them - from the most enormous to the most minuscule. He imagined the atoms. When he imagined them he created, in his imagination, all that moved and will move: all that lived and will live; all that is motionless, or seems to be - every single thing.'

‘But it existed only in his imagination. All was still in darkness. Once he had an overall view of what he wanted to create, he was able, by his exceptional spiritual force, to create, instantaneously, the four forces of the Universe. With these, he directed the first and the most gigantic atomic explosion of all time - what certain people on Earth call ‘The Big Bang’. The Spirit was at its centre and induced it. Darkness was gone and the Universe was creating itself according to the will of the Spirit. The Spirit was thus, is still, and always will be, at the centre of the Universe for he is the Master and Creator of it...’

‘Well then,’ I interrupted, ‘it’s the story of God as the Christian religion teaches it - or just about - and I never believed in their nonsense...’



‘Michel, I speak of no religion such as exists on Earth and especially not the Christian religion. Don’t confuse religions with the Creation and the simplicity of all that ensued. Don’t confuse logic with the illogical distortions of religions. We will have the opportunity to talk again later on this subject, and you are certainly in for some surprises… For the moment, I was trying to explain the Creation to you. During billions of years (for the Creator of course, it is eternally the ‘present’, but it is more at the level of our understanding to count by billions of years), all the worlds, suns and atoms were formed, as you are taught in schools, the planets revolving around their suns, and sometimes with their own satellites etc. At certain times in certain solar systems, some planets cool down - soil is formed, rocks solidify, oceans are formed and landmasses become continents. Finally, these planets become habitable for certain forms of life. All this was in the beginning, in the imagination of The Spirit. We can call his first force the ‘Atomic force’.

‘At this stage, by his second force, he conceived the primary living creatures and many of the primary plants, from which later derived the sub-species. This second force we will call the ‘Ovocosmic Force’, as these creatures and plants were created by simple cosmic rays, which ended up with cosmic eggs.

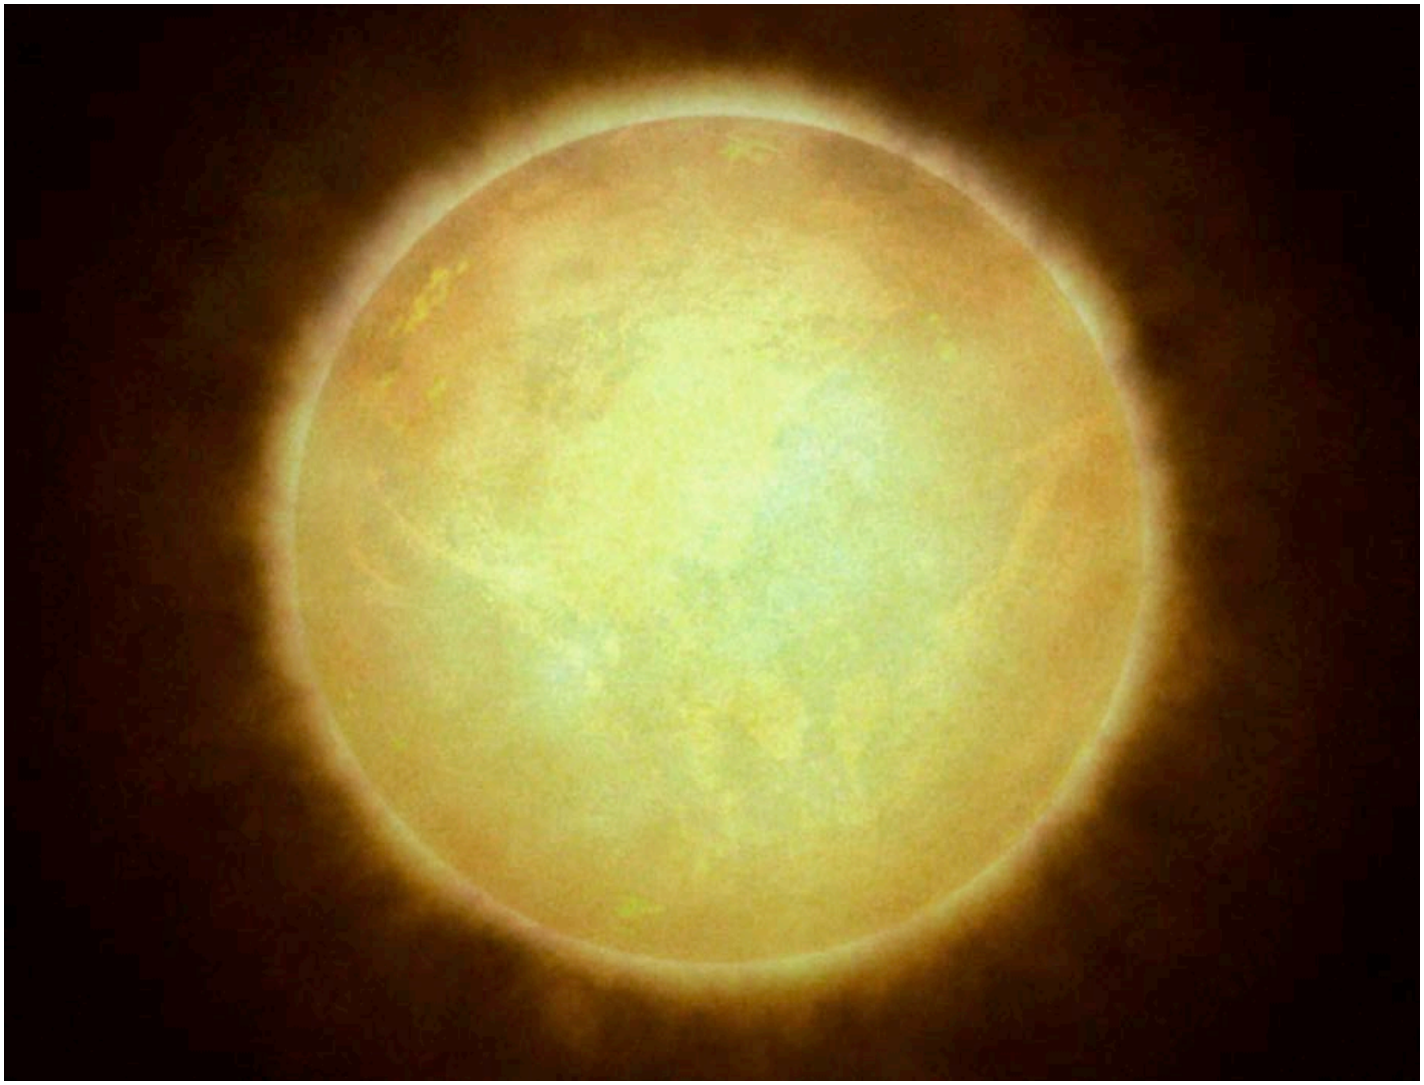
‘At the very beginning, The Spirit imagined experiencing feelings through a special creature. He had imagined Man by means of the third force that we will call the ‘Ovoastromic Force’. Thus Man was created. Have you ever considered Michel, what intelligence it took to create a human being or even an animal? Blood that circulates thanks to the heart that beats millions of times independently of the will... lungs that purify the blood... the nervous system... the brain which gives the orders, aided by the five senses... the spinal cord which is ultra-sensitive… Have you ever wondered why, that of the billions of individuals on a planet like yours, there are no two fingerprints the same: and why, what we call the ‘crystalline’ of the blood, is just as unique among individuals as the fingerprint? …Your experts and technicians on Earth, and on other planets, have tried and still try to create a human body. Have they succeeded? In regards to the robots they have made, not even the most highly perfected will ever be more than a vulgar machine in comparison with the human mechanism.

‘To go back to the crystalline I mentioned just now, it is best described as a certain vibration particular to the blood of each individual. [Scanning electron microscopy imaging of healthy red blood cells is presented below.] It has nothing to do with the blood group. Various religious sects on Earth believe absolutely in the ‘rightness’ of refusing blood transfusions. Their reasons relate to the teachings and books of their religious teachings and their own interpretations of these, whereas they should look to the real reason, which is the impact the different vibrations have on each other… If it is a large transfusion, it can have an influence on the recipient to a degree and, for a length of time, which varies according to the volume of the transfusion. This influence, of course, is never dangerous… After a time, which never exceeds one month, the vibrations of the recipient’s blood takes over, leaving no trace of the vibrations of the donor’s blood… It shouldn’t be forgotten that these vibrations are much more a feature of the physiological and fluidic body than that of the physical body.’ [4]

The straightforward scientific explanations provided to Michel Desmarquet by the cosmic beings of Thiaoouba guide Earthly human thinking toward the unified logic that Nature presents all around. The simple beauty of the lessons of the Creation offered by Thao rise in harmony with the teachings of Spirit transmitted to Earth by various other advanced masters in Nature, radiating their light throughout the great depths of the cosmos.

The concise explanation given concerning the formation of the cosmos through the four forces of Creation clarifies the quantum interactions of the short- and long-wave aspects of Creation, also referred to as the matter and anti-matter Universes. The Atomic force propels the material creation (*ultrasonic resonances*), the Ovocosmic force generates and maintains plant and animal life (*infrasonic resonances*) and the Ovoastromic force manifests through human life and consciousness. The fourth force was explained to Michel only later, after further necessary explanations were addressed: The Astral force. Thao’s comparison of the fingerprint with the unique resonant frequency of the ‘crystalline of the blood’ of each individual is just one of the many fascinating pieces of information that lead human consciousness on Earth toward the deeper cognitions that will unfold with this great change of the ages.

Simple descriptions preserved in ancient Vedic texts belie a profound depth of awareness that confirms that visitations like the one described by Michel Desmarquet had also occurred in the Vedic Age of Atlantis, before being recorded on parchment in later times. *The only precedents among the historical documents of Earth for such a story as the one told by Desmarquet are to be found among the Sanskrit cultures of the world, including sacred Mayan and Egyptian hieroglyphic texts as well as Sumerian cuneiform writings, that record the teachings of highly spiritual visitors from the stars.* The great teachings of ancient prophets are being given anew through the contacts of Earthly human beings in our times, in preparation for the ascension of Earth into collective consciousness.



The scribes of Sumer also recorded the malevolent extraterrestrial interests of the Annunaki involving the extraction of gold, using Earthly human slave labor, for the ultimate purpose of enriching the atmosphere of their own planet.[5] This unusual and highly advanced concept of golden atmospheres and golden rivers is also discussed in the ancient Sanskrit writings of India. An intriguing dialog between King Pariksit and Sukadeva Gosvami preserved in the Srimad Bhagavatam describes the golden waters of heavenly planets. The Description of Jambudvîpa (Canto 5, Ch.16) identifies certain golden rivers on Earth (in the material world) and their benefits, as enjoyed on other *heavenly* planets such as Thiaoouba:

> The mud on both banks of the River Jambu-nadi, being moistened by the flowing juice and then dried by the air and the sunshine, produces huge quantities of gold called Jambu-nada. The denizens of heaven use this gold for various kinds of ornaments. Therefore all the inhabitants of the heavenly planets and their youthful wives are fully decorated with golden helmets, bangles and belts, and thus they enjoy life... (Text 21)
>
> The residents of the material world who enjoy the products of these flowing rivers have no wrinkles on their bodies and no grey hair. They never feel fatigue, and perspiration does not give their bodies a bad odor. They are not afflicted by old age, disease or untimely death, they do not suffer from chilly cold or scorching heat, nor do their bodies lose their luster. They all live very happily, without anxieties, until death. (Text 25) [6]

These ancient dialogs quite astonishingly detail all of the known antibacterial effects of bioelectrification using nano-colloidal gold and silver water, in addition to other benefits that remain unrecognized by contemporary scientists, such as an increased tolerance to temperature extremes. Such odd, enigmatic information contained in ancient writings concerning atmospheric gold and silver is now comprehensible in the context of the scientific use of nanoparticles for the illumination of DNA within all cells of the human body *and the ignition of atmospheric HHO plasma*, just as vividly described by Michel on Thiaoouba:

Suddenly, there it was, right in the middle of the panel... Thiaoouba! My guess had to be correct - I could feel it. Thao immediately telepathized an affirmative, leaving me in no doubt… As we approached and Thiaoouba grew on the panel, I couldn't take my eyes off the sight, for what I saw before me was indescribably beautiful. Initially, the first word which sprang to mind was 'luminous' - this then was juxtaposed with 'golden' - but the effect produced by this color was beyond any description. If I were to invent a word, perhaps one that might apply would be 'lumino-vapour-golden'. In fact, one had the impression of plunging into a luminous and golden bath – *almost as if there were very fine gold dust in the atmosphere.*

We were descending gently on to the planet and the panel no longer showed its contours, but rather, the contours of a continent could be distinguished, ending abruptly at an ocean that was sprinkled with a multitude of islands of different colors… The closer we came, the greater was the detail discernible… What captivated me most, was the color before me – I was dazzled! All the colors were, in each tonal variation more vivid than ours. A bright green, for example, almost shone – it radiated color. A dark green had the opposite effect – it 'kept' its color. It is extremely difficult to describe, for the colors on this planet could not be compared with any that exist on Earth. A red could be recognized as red, but it wasn't the red we know. There is a word in Thao's language which defines the types of colors on Earth and on planets similar to ours. Our colors are Kalbilaoka which I translate as 'dull', theirs, on the other hand, are Theosolakoviniki which means they radiate their colors from within.

My attention was soon drawn to what looked, on the screen, like eggs - yes, eggs! I could see the ground dotted with eggs, some half covered with vegetation, and others quite bare. Some seemed bigger than others and some lay down. Others were upright with what looked like the pointed end towards the sky. I was so astonished by this sight that I turned again towards Thao to ask her about these 'eggs', when suddenly on the screen, there appeared a round form surrounded by several spheres of different sizes, and, slightly further away, yet more 'eggs'. These ones were enormous. I recognized the spheres to be space vessels just like ours.

‘Affirmative’, said Thao from her seat, ‘and the round form you see is the cell in which our spacecraft will be accommodated in a few moments, for we are in the process of docking.

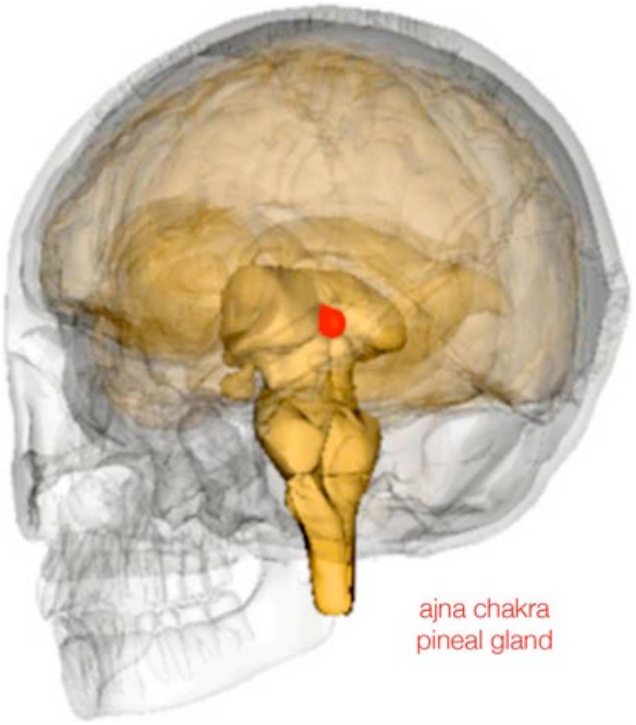
‘And the gigantic eggs, what are they?’

Thao smiled. ‘Buildings, Michel, but just now, there is something more important that I must explain to you. Our planet contains many surprises for you, but there are two, which could have harmful effects on you. I must therefore ensure that you take certain elementary precautions. Thiaoouba does not have the same gravitational force as your planet. Your weight would be 70 kilograms on Earth - here it will be 47 kg. When you leave the spacecraft, if you aren’t careful, you risk losing your sense of equilibrium in your movements and your reflexes. You’ll be inclined to take too great a stride, and perhaps fall and injure yourself...’

‘But I don’t understand. In your spacecraft, I feel fine.’

‘We have related the internal gravitational pull to correspond with that of Earth – or almost… It’s true that under this force, our bodies are heavier, but we have counter-balanced this by a semi-levitation, thus we are not uncomfortable, and at the same time, we have the satisfaction of seeing you move among us at ease.’ A slight jolt indicated we had docked. This extraordinary trip was over - I was going to put my foot on another planet.

‘The second point,’ Thao resumed, ‘is that you will be obliged to wear a mask, for a while at least, for the brightness and the colors will literally intoxicate you, just as if you had drunk alcohol. The colors are vibrations that act on certain points on your physiological body. On Earth, these points are so slightly stimulated, so little exercised, that here, consequences could be unfortunate…’ There, she took a helmet, very light, which covered my face from my forehead to just below my nose.



‘Let’s go, Michel, and welcome to Thiaoouba.’ Outside the spacecraft, we walked along a very short walkway. Immediately, I felt lighter. The sensation was very pleasant, although somewhat disconcerting, since several times I lost balance and Thao had to steady me.

We saw no one, a fact that surprised me... After a short distance, we arrived at a round platform, to the side of the walkway. Thao sat down on a circular seat inside the platform and signaled that I should sit down opposite her… She took out an object the size of a walkie-talkie and immediately I felt myself pinned to the seat, just as I had been in the spaceship, by an invisible force field. Then, quite gently and with a barely perceptible hum, the platform rose by several meters and moved off rapidly towards the ‘eggs’, about 800 meters away. The thin and slightly perfumed air was lashing the exposed area of my face below my nose, which was very nice, its temperature being around 26 degrees Celsius.

In just seconds, we arrived, and passed through the walls of one of the ‘eggs’, as if we’d passed through a cloud. The platform stopped and came to rest gently on the floor of the ‘building’. I looked around me in all directions… It seemed absurd, but the ‘egg’ had disappeared. We had indeed, entered the ‘egg’ and yet around us, as far as the eye could see, stretched the countryside. We could see the landing ground and the docked spaceships just as though we were outside... Not far from us, were gathered twenty or thirty people, all busy to some extent, in front of desks and screens which flashed with colored lights - similar to inside the spacecraft. A type of music played very softly, elevating me to a state of euphoria…

Michel Desmarquet's thoroughly detailed and fascinating description of the visual splendor of the golden planet of Thiaoouba contains a wealth of information for scientific consideration, as well as a direct reference to the abundance of atmospheric gold (nanoparticles) visible throughout the luminous skies of Thiaoouba! This vaporous luminosity of Thiaoouba's atmosphere is created by light amplification effects of the HHO plasma that forms around the gold nanoparticles, which electroluminesce under the influence of atmospheric electrical currents moving through the resonant field of infrasound standing waves.

Thao's description of the effect of high-intensity colored light on the human body is also quite intriguing. Informing Michel that "the colors are vibrations that act on certain points on your physiological body", Thao offers an only slightly veiled reference to the pineal gland to the center of the human brain – also known as the 'third-eye' or *ajna chakra* among ancient Sanskrit traditions. The pineal gland is truly an *eye*, being photosensitive, and is responsible for the alignment of the body's circadian rhythms with the sun by light reception in the center of the brain.[7] Thao later explained in great detail the role of the pineal gland as one of the six principle points within the chakra system of the human body:

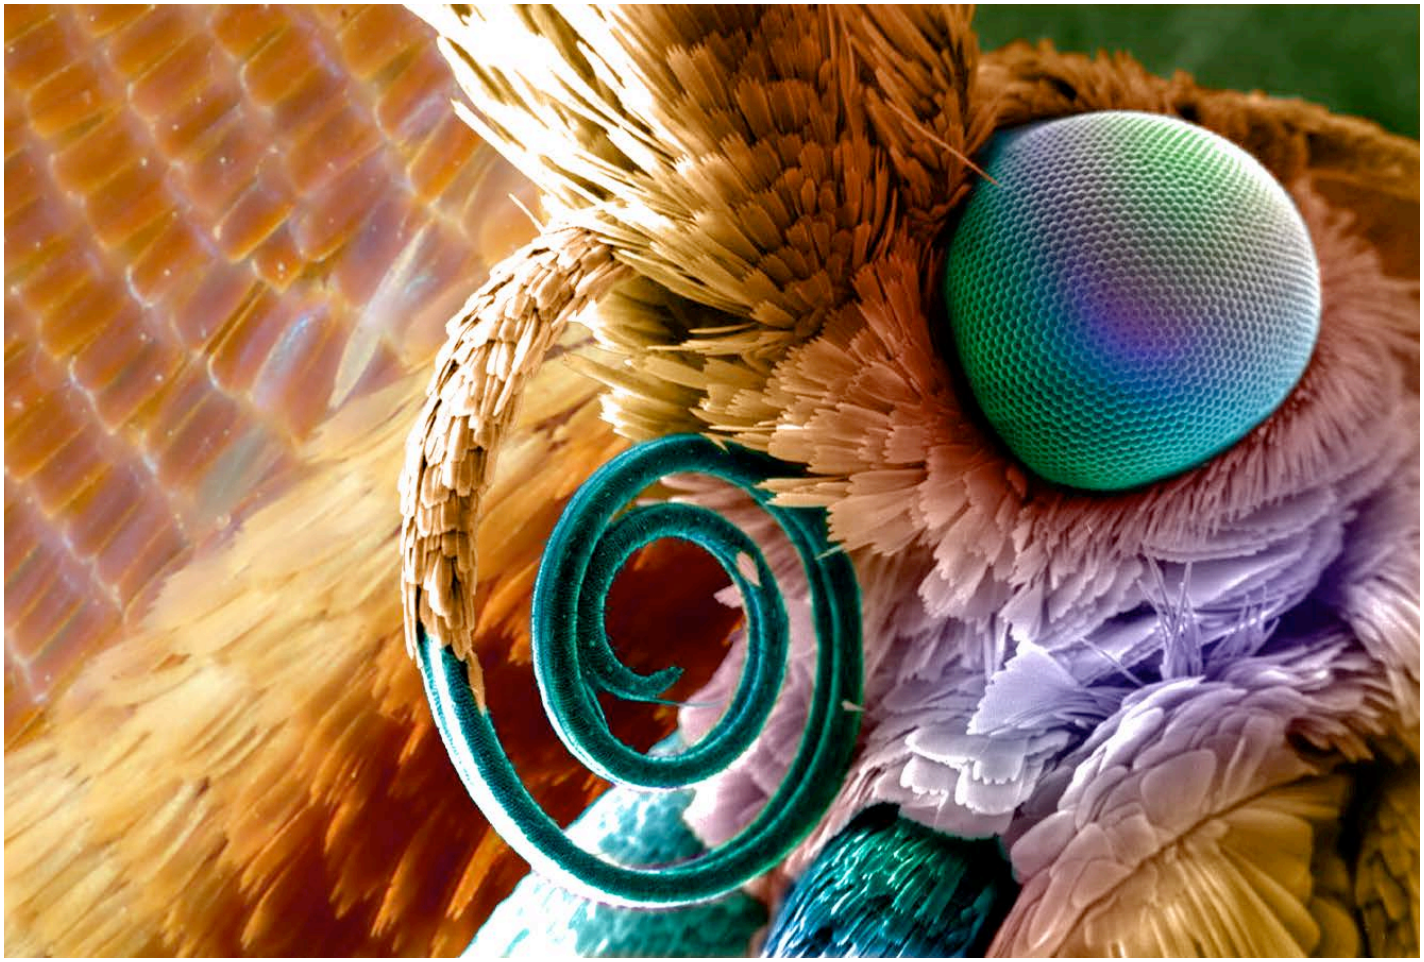
'The fluidic body [includes the brain stem and spinal cord, and] influences the physiological body which, in turn, influences the physical body… In the fluidic body, you possess six principal points which we call Karolas and which the yogis on your planet call Chakras. The first Chakra is the one situated between your two eyes, just a centimeter and a half above your nose. It's the 'brain' of your fluidic body, if you like; it corresponds to the pineal gland [in red, at left], which is placed much further back in your physical brain but on exactly the same level…

'Now, at the bottom of the fluidic body and just above the sex organs, is found a very important Chakra, which we call the Mouladhara, and which your yogis call Sacred [or Sacral]. Above this Chakra, and meeting the spinal column, is the Palantius. It is in the form of a coiled spring and only reaches the base of the spinal column when it is relaxed.

'For it to become relaxed, it requires the accomplishment of the sexual act between two partners who must not only love one another, but also have a spiritual affinity between them. Only at that moment and under these conditions will the Palantius extend to the spinal column, transferring an energy and special gifts to the physiological body which then affects the physical body. The person concerned will experience happiness in sexual enjoyment that is far greater than normal.' [8]

Thao identifies the shape and function of the *palantius* in much the same way as the coiled Kundalini serpent of Sanskrit teachings, and further reveals the special conditions for such an activation include not only partnership in love, but also *true spiritual affinity*. As proven by research scientists, such spiritual affinity takes the form of a *heart/mind resonance between the two*,[9] whereby releasing the palantius.

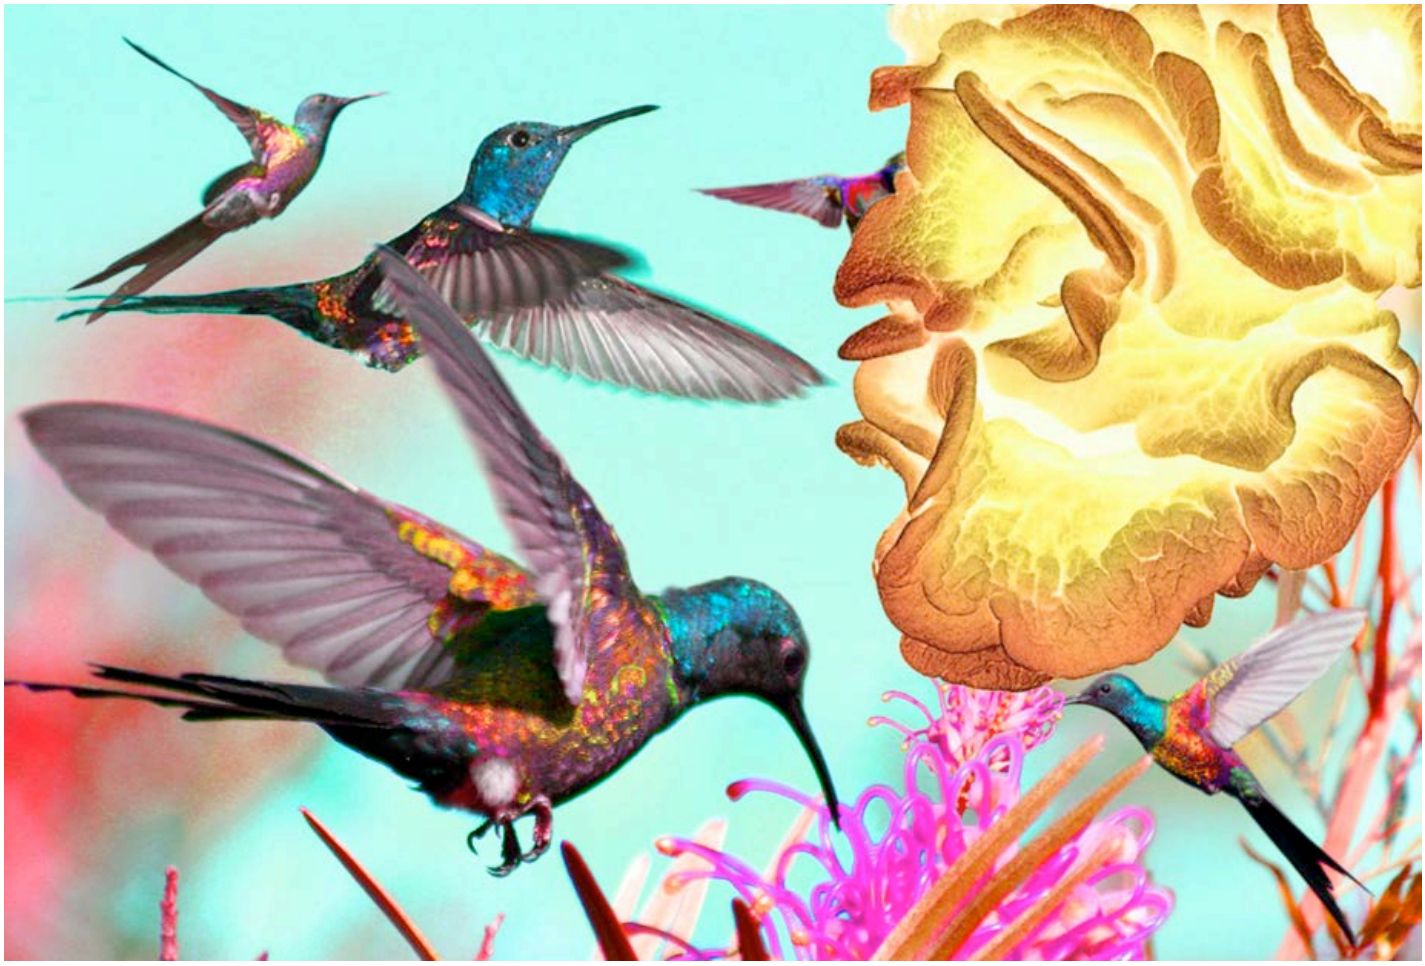
The identification of the chakras as existing within the fluidic body is also very concise, meaning within the spinal fluid itself. While the definition of the pineal gland as the first chakra presents an inverse order when compared with Sanskrit traditions, the Thiaoouban name of the root chakra –the Mouladhara– is identical to Sanskrit terminology. The attunements of Michel's chakras were so powerfully influenced by the luminosity of the high-resonance atmosphere of Thiaoouba that, combined with the intensity of ambient infrasound and the resulting decreased weight, his state of consciousness was elevated to euphoric levels that are only momentarily experienced by human beings on Earth, if ever. The highly elevated levels of all frequencies of electromagnetic radiation also required longer periods of rest.



The profound attainment of knowledge witnessed on Thiaoouba is reflected in the delicacy of colors and radiating brilliance of every life-form preserved there in harmony with the advanced technological lifestyle of the giant human inhabitants. Ever-present forms and forces within nature inspire the technological creations observable on this planet, whose buildings take on the form of eggs, and plasma spacecraft display a spherical perfection. The flying circular platform used for Michel's magnificent tour of Thiaoouba (illustrated above) is resonantly designed to generate the barely perceptible humming sound that Michel described during lift-off. Invisible magnetic fields are generated as belts that act as safety harnesses, and a domed magnetic field forms a protective covering enclosing the occupants of the open platform aircraft.

The grand scale of the trees and flowers, as well as the insects and animals, is a reflection of the enhanced gravity conditions of Thiaoouba, which are similarly witnessed in the geological record of Earth. During the age of dinosaurs, all life-forms on earth were correspondingly larger than witnessed today. Insects were once several times larger than the same types now living and would be crushed by the present conditions of gravity were they to be found on the planet today. The relative conditions of planetary gravity are directly tied to the intensity of atmospheric infrasound standing wave resonance.

> We rejoined our vehicle and immediately accelerated away in the direction of a forest, which could be seen in the distance. We flew at a height of approximately five or six meters and at a speed I would have estimated to be 70 or 80 kilometers per hour. The air was warm and fragrant and I again felt euphoric, in a way I had never experienced on Earth. We arrived at the edge of the forest and I remember having been greatly impressed by the size of the largest trees. They looked to rise about 200 meters into the sky.
>
> 'The tallest is 240 of your meters, Michel.' Thao explained without me having to ask, 'and between 20 and 30 meters in diameter at the base. Some of these are 8000 of our years old. Our year consists of 333 days of 26 karses. A karse is a period of 55 lorse, a lorse comprising 70 kasios, and a kasio being almost equivalent to one of your seconds…

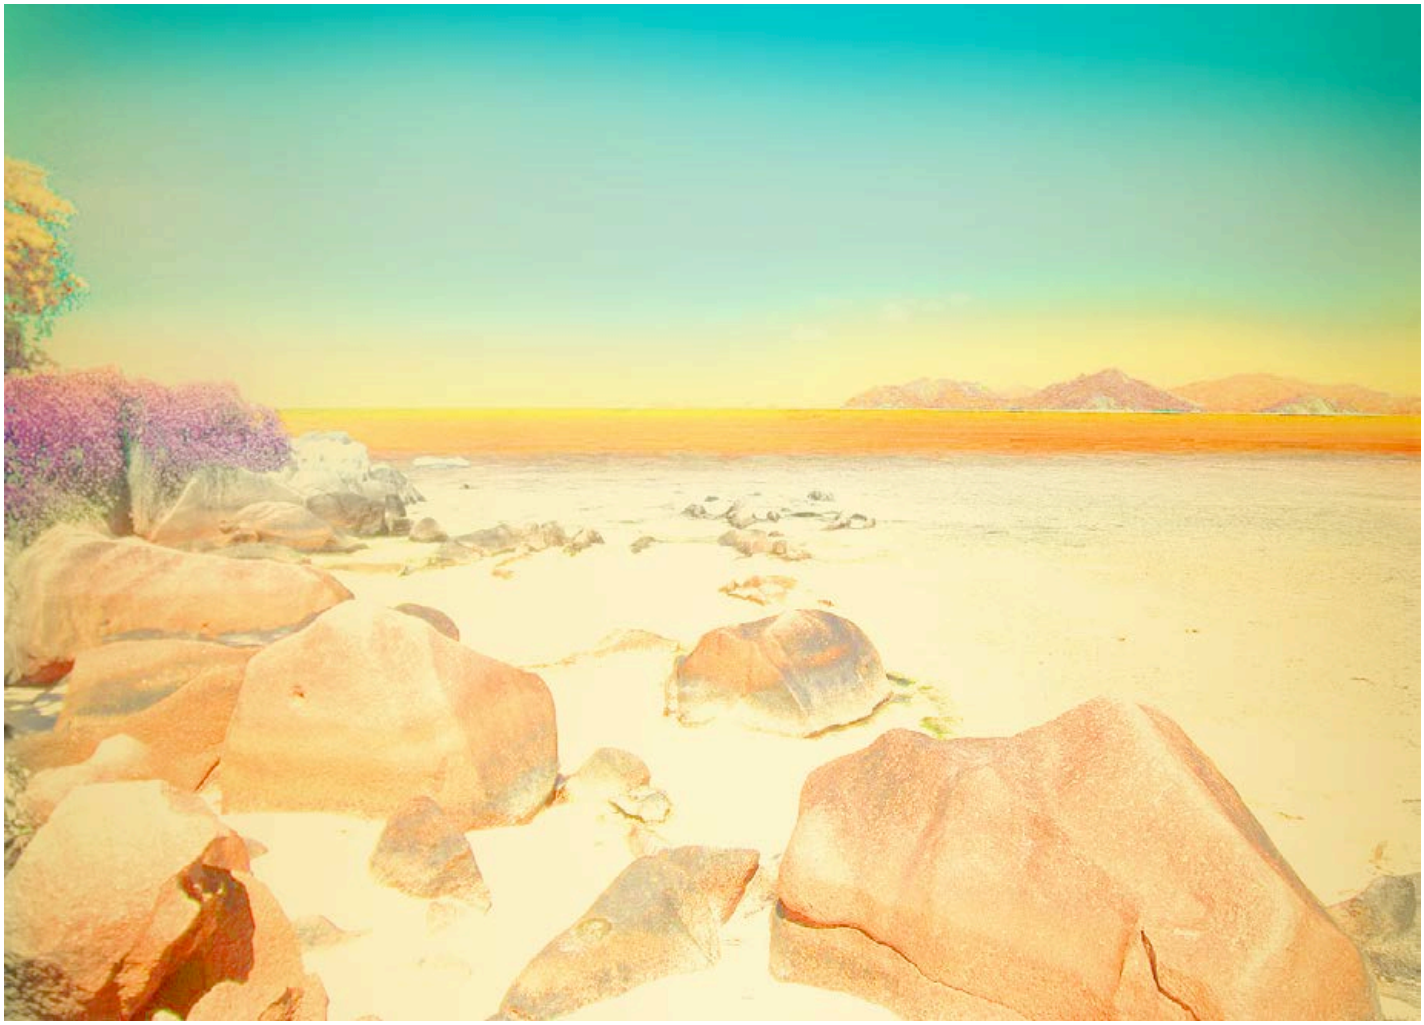


The vehicle greatly reduced its speed and we were able to glide between, or indeed, stop and observe more closely, the trees at heights that ranged from almost ground level to 10 meters above the ground. Thao was able to guide our ‘flying platform’ with amazing precision and expertise. Our vehicle, and Thao’s manner of driving it, put me in mind of a flying carpet, which was taking me on a magical tour of this magnificent forest… Thao leaned towards me and removed my mask. The undergrowth was luminous and softly golden but I found it quite tolerable… ‘It is a good time to begin accustoming yourself to the light and color, Michel. Look!’

Following her gaze, I spotted, very high among the branches, three butterflies, vividly colored and of enormous size. These lepidoptera, which must have had one meter wingspans, fluttered high in the foliage, but we were lucky to see them fly closer and closer to us, on wings of blue, green and orange. It is as clear to me as if it were yesterday. They brushed against us with their wings that were strangely fringed, to create the most beautiful and breathtaking effect. One of them came to rest on a leaf just a few meters from us and I was able to admire its body, ringed with silver and gold, and its jade-green antennae. Its proboscis was golden and the tops of its wings were green with streaks of bright blue alternated with dark orange diamond shapes. The under-sides were dark blue, but luminous, as though they had been illuminated from above by a projector.

For the duration of time this giant insect remained on the leaf, it seemed to emit a soft whistling sound and I was quite surprised by this. I had certainly not heard a lepidopteran on Earth make any sound at all. Of course, we were no longer on Earth but on Thiaoouba, and this was only the beginning of a long series of surprises for me. On the forest floor, grew an incredible variety of plants, each one stranger than the next. They covered the ground completely, but I noticed very few bushes among them… the forest's giants prevented them from developing.

In size, these plants varied from a ground-covering moss-like plant, to one the size of a large rose bush. One kind, with leaves as thick as a hand in various shapes - sometimes heart-shaped or circular, sometimes very long and thin - was of a color tending much more towards blue than to green. Flowers of every shape and color, even of the purest black, entwined each other. From our altitude of several meters, the effect was absolutely glorious. We rose till we were up among the highest branches and I put my mask back on according to Thao’s direction. We emerged from the canopy and moved slowly, just above the foliage of those enormous trees.

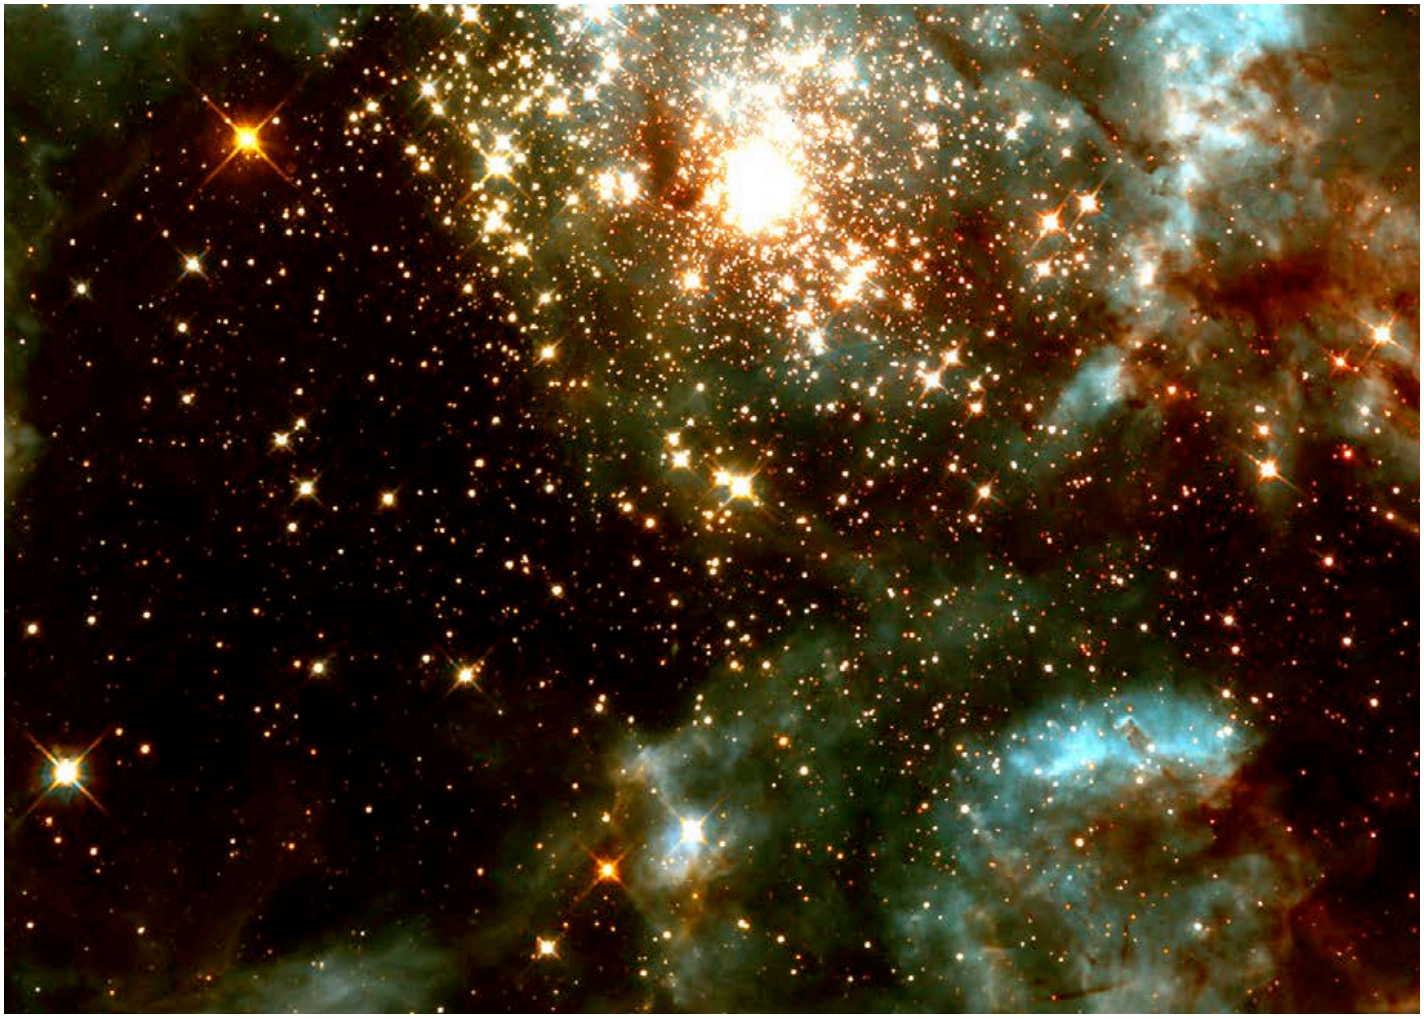


Above the forest the light was, once again, incredibly intense and I had the impression of traveling through a landscape of pure crystal. Marvelous birds were perched on the tops of the taller trees, watching us pass, without fear. Their colors, varied and rich, were a veritable feast for my eyes in spite of the subduing effect of my mask. Here were varieties of macaw, with blue, yellow, pink and red plumage; and, among them a type of bird of paradise strutted amidst a cloud of what appeared to be hummingbirds. These hummingbirds were of a brilliant red color flecked with gold. The red, pink and orange tail feathers of the birds of paradise, would have measured 250 centimeters in length and their wingspans almost two meters.

When these 'jewels' took flight, the underside of their wings revealed a very soft, misty pink, with just a touch of bright blue on the tips - so unexpected, especially as the tops of their wings were of an orange-yellow color. Their heads wore plumes of impressive size, each feather being a different color: yellow, green, orange, black, blue, red, white, cream... I feel frustrated that my attempts to describe the colors I saw on Thiaoouba are so inadequate - I feel I need a whole new lexicon, as my language fails me. I had the constant impression that the colors came from within the objects I looked at, and the color was more than I had known it to be. On earth, we know perhaps 15 shades of red; here there must have been over a hundred...

It wasn't only the colors that claimed my attention. The sounds that I had heard since we began to fly over the forest inspired me to seek an explanation from Thao. It was almost a background music, very light and soft, similar to a flute which continually played the same air but at a distance. As we moved on, the music seemed to change, only to return to the original tune. 'Is that music I hear?'

'It is vibrations emitted by the thousands of insects which, when combined with the vibrations of the colors reflected by solar rays on to certain plants, such as the Xinoxi, for example, produce the very musical results that you hear. We, ourselves, only hear it if we particularly attune to it, for it comprises an integral part of our life and our environment. It is restful, isn't it? … According to the experts, if these vibrations were to cease, we would experience considerable eye trouble. This will perhaps seem odd at first, since these vibrations appear to be perceptible to the ear rather than the eye. However, …the chance of their ceasing is as remote as the chance of our sun extinguishing itself tomorrow.'

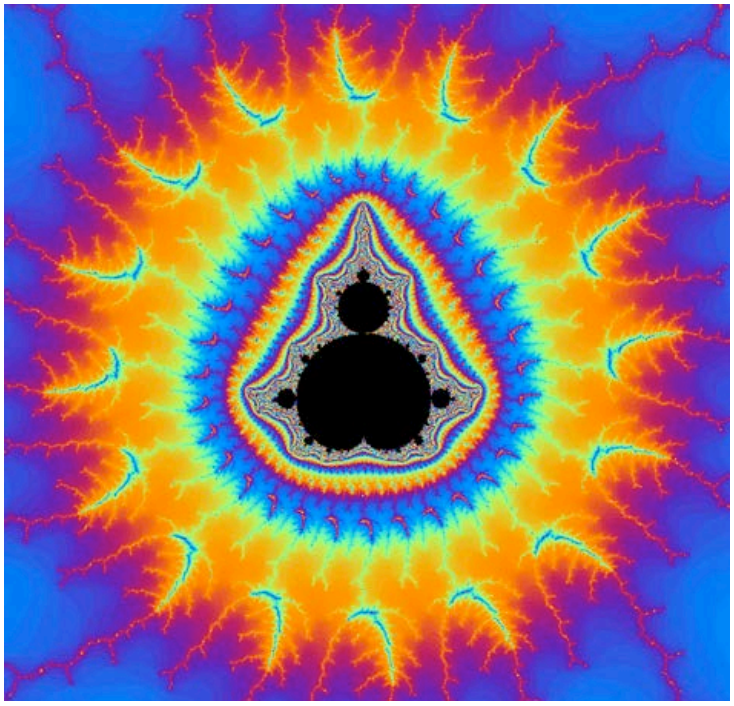


> Thao turned our vehicle and in a few moments, we had left the forest tops and… I saw we were approaching the ocean. Palm trees resembling coconut palms waved their majestic fronds at impressive heights, on the edge of a beach of golden sands… A hundred or so people basked on the sand or swam, entirely naked, in the transparent waters of the ocean. I felt a little dazed, not only because of the new and wondrous things I was constantly discovering, but also because of the perpetual sensation of lightness, due to the change in gravity. This sensation was my reminder of Earth – what a strange word, and how difficult it was to visualize Earth now! The auditory and visual vibrations were also affecting my nervous system enormously. Usually a highly-strung person, I was feeling completely relaxed… –so relaxed I felt like crying.[10]

The perfection of natural beauty and harmony of life on Thiaoouba resonated deeply with Michel, its intense radiations bathing him in a field of love that has been raised to the highest resonance:

> The sun was already quite low and the sky was totally clear. The ocean had taken on an orange color, which was surprising. I never would have imagined water could appear such a shade. Inquiring about it, telepathically, it was explained to me that, sometimes, at this time of day, immense patches of orange colored plankton would rise to the surface. These waters, it appeared, contained enormous quantities of plankton. What a sight it was: the sky was blue-green, the sea was orange, and everything was enveloped in the golden light which, on this planet, seemed to come from nowhere and everywhere.[11]

The intense luminous qualities described by Michel can only be explained as an amplification effect of diffuse atmospheric HHO plasma generated by electroluminescent nanoparticles of silver and gold suspended in the planet's strong enveloping field of infrasound standing waves. The tranquil weather patterns well described throughout Michel's nine-day adventure on Thiaoouba are a reflection of the planet's highly balanced atmospheric systems. Desmarquet was also taken by the intense nighttime optical effects of Thiaoouba's many-layered canopy of atmospheric HHO plasma, which amplifies all starlight as seen from the ground, creating a magnificent opportunity for direct stellar observation:



> No one spoke; we sat in silence. Looking up, I could see the stars appearing one by one, shining colorfully as though a firework display had 'frozen' in the sky. On Thiaoouba, because their layers of gasses in the atmosphere differ from ours, the stars appear to be colored and also much larger than they appear to us on Earth.[12]

The color of each particular star is amplified as it passes through many atmospheric layers of HHO plasma, formed from water vapor that becomes ionized as a glowing plasma canopy. HHO plasma forms a barely visible network of thin veils suspended along the pathways of infrasound standing waves where gold and silver nanoparticles are kinetically energized, allowing the splitting of water molecules into single atoms of hydrogen and oxygen (HHO gas). The ancient Sanskrit knowledge of 'heavenly planets' is in complete correspondence to the experiences so richly described by Michel Desmarquet on the golden planet of Thiaoouba! The natural domed plasma canopies of heavenly planets form the divine inspiration for the unified egg-shaped design of all habitations, temples and spaceports, reflecting the *Ovocosmos*:

> The vehicle proceeded slowly at ground level and, after a final bend in the path, we arrived before a 'little egg', nestled among small trees and flowering vines. It seemed that every building on this planet had the shape of an egg, most often lying on their 'sides' but occasionally upright, as I have said, with the pointed end upwards. The 'shells' were off-white in color and had no windows or doors. This particular egg lay on its side, apparently half buried in the ground. It was about 30 meters long and 20 meters in diameter - quite small in comparison with those I'd seen so far.
>
> Thao stopped the vehicle in front of a bright light centered on the wall of the egg. Leaving the platform, we entered the habitation. As we did so, I felt a light pressure, with no more force than the weight of an eiderdown. I remembered experiencing the same sensation earlier, when we passed through the wall of the space centre… Having neither doors nor windows on these buildings is extraordinary in itself, but once inside, it was stranger still. As I have mentioned before, the overall impression was of still being outside.

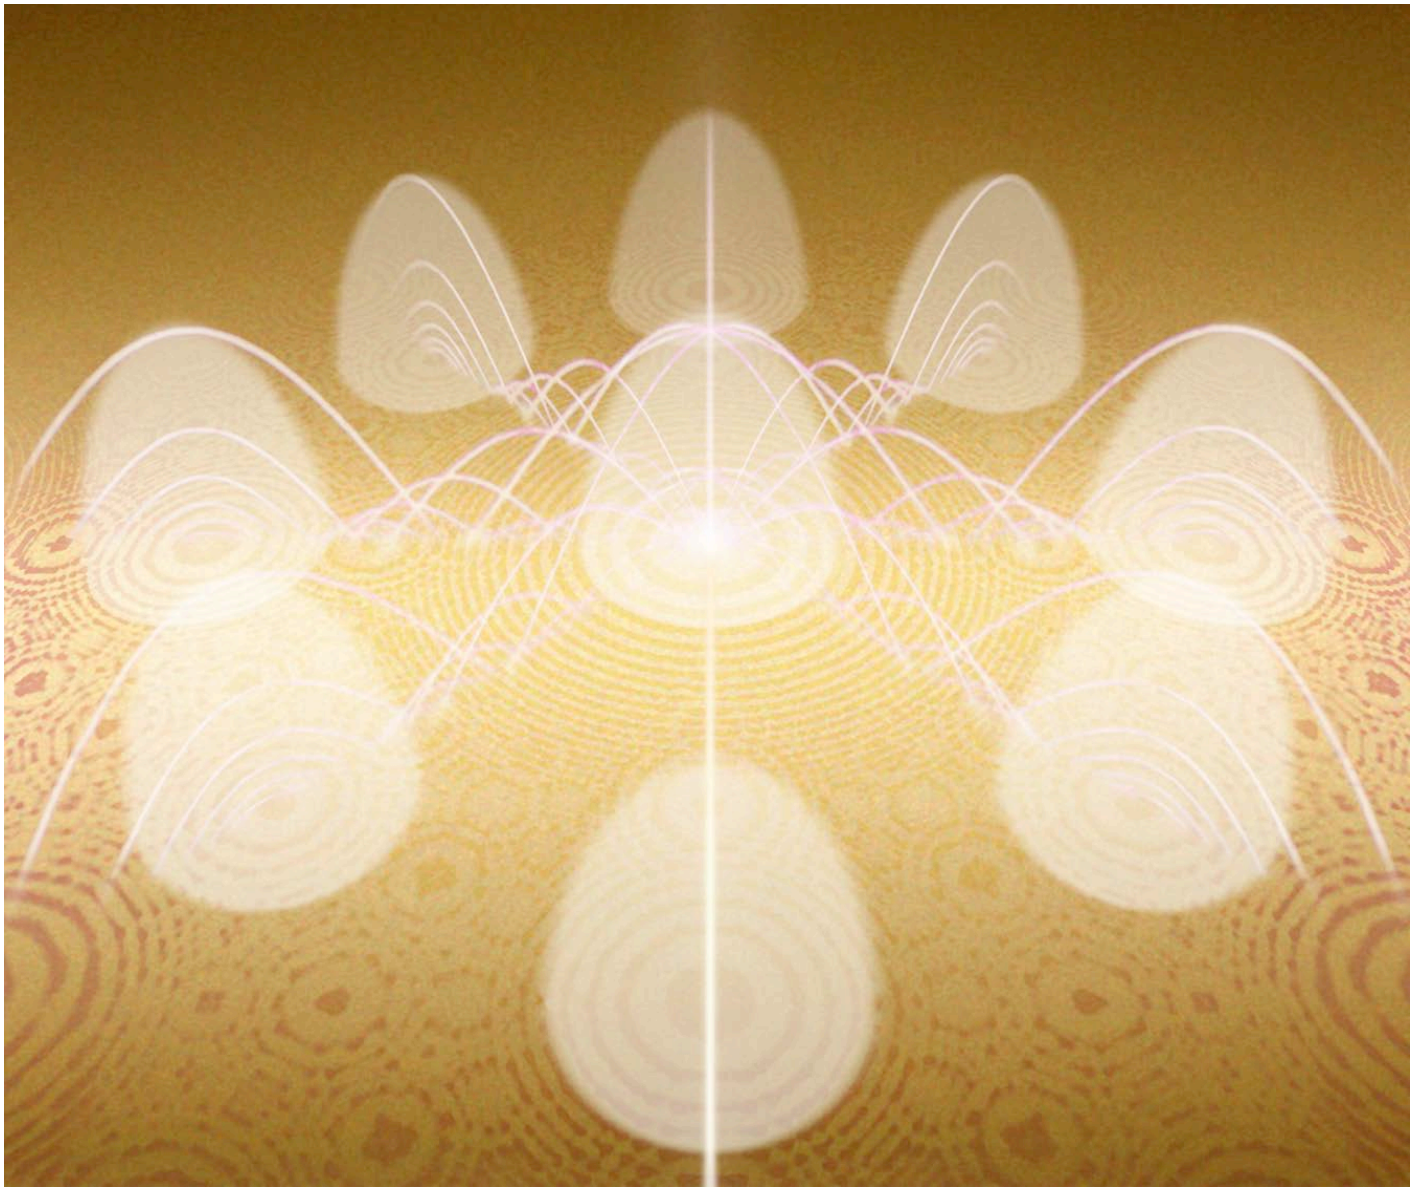
The startling beauty of color was everywhere; the greenery; the branches of the trees dissecting the blue-mauve sky above; the butterflies; the flowers...I recall a bird that came to rest right in the middle of the roof, so that we could see the bottom of its feet. It was as though it had miraculously stopped in mid-air – the effect was quite extraordinary… The only contrast with the outside was provided by the floor that was covered in a type of carpet on which was arranged comfortable looking seats and large pedestal tables. All of these furnishings were, of course, on a large scale - appropriate to these 'large-scale' people.

'Thao,' I asked, 'how are your walls transparent and yet we can't see in from the outside? And how can we pass through your walls as we did?'…

'You see, Michel, this habitation exists because of a magnetic field that is quite special. We have copied the forces of nature and the creations of nature to our own ends. Let me explain. Every body - human, animal or mineral - possesses a field around itself. The human body, for example, is surrounded both by an Aura and by an etheric force (field) of oval shape [at left]. You know that, don't you?' I nodded.

'The latter comprises, in part, electricity and, to a greater extent, vibrations that we call Ariacostinaki… These vibrations occur continuously for your protection while you are alive, and they are not to be confused with the vibrations of the Aura. With our habitations, we have copied nature in creating a field of mineral electro-etheric vibrations around a nucleus.' Thao indicated an 'egg', the size of an ostrich egg, located in the middle of the room between two seats… [as the nucleus.]

'This way,' she said, smiling again and taking several steps in another direction. 'Do you see this transparent drawer? Inside you have various compartments. From left to right: fish, shellfish, eggs, cheese, dairy products, vegetables and fruits, and here in the last, we have what you call 'manna', which is our bread…'



'You tell me that, on Earth, this bread is known as 'manna'. How is it that it exists on Earth at all?'

'It is a product we always carry on our intergalactic spacecraft… very practical… easily compressed and highly nourishing. In fact, it's a complete food. It comes from wheat and oats and you could live on it alone for months.'[13]

Michel's unusual descriptions of the giant egg-like domed magnetic fields of the buildings of the people of Thiaoouba reflect a simplicity and natural beauty that is profoundly inspiring. Thao's concise explanation of the etheric force field surrounding the ostrich-egg sized nucleus of the building was very carefully given in terms understandable to Michel, yet can be further understood in scientific terms. Each domed building is located at precise focal points of resonant infrasound standing waves, which become transduced by the resonant metal alloys of the nucleus into a vast electromagnetic field dome of the same shape.

The sacred *oval* or *egg* shape is repeated throughout Nature as reflections of the structure of the Universe, *the great ovum*. The *Ovocosmic* force can be described structurally by the Mandelbrot Set quadratic function [$z_{n+1} = z_n^2 + c$] (above), and the closely related function for nonlinear standing waves: [$z_{n+1} = z_n^2$]. The entire design of the Thiaoouban spiritual center of the City of Nine Dokos, home to the Seven Masters of the Thaori, conforms to this sacred cosmic force of resonant infrasound (opposite).

Thiaoouban *manna* bread was described as consisting of oats and wheat, while the electrical properties of invisible constituents including nanosilver and gold are indispensible for space travel, enabling the transdimensional effect of superconductivity of the human body for hyperleaps across the Universe. Gold and silver together comprise the ancient alloy *electrum*, so named for high electrical conductivity. Vedic scholars recently identified the Sanskrit term for electrum as *'Soma'*, described as granting eternal life through the luminosity of the electrum nanoparticles consumed in both foods and drinks:

> "We have drunk the Soma and become immortal. We have attained the light the gods discovered." (Rig Veda: VIII.48.3)… "Soma is food for the gods. Gods eat Soma." (Chàndogya Upanishad: V.10.4)… "The man who supplies food hath always [his Soma] pressing stones adjusted, a wet Soma filter, well-prepared religious rites… he who hath this knowledge wins the luminous spheres." (Atharva Veda: IX.6)… *Soma*, *Soma* ma¯al, asemon, asem, *electrum* may perhaps denote the same substance… (which required the purificatory 'mineral waters') contained in the kaman.d.alu symbols in the icons of the yaks.a legacy. It may perhaps be the same substance said to be am°tam which was considered to be the elixir of life, of immortality. It may perhaps be the same substance referred to, in sheer poetry, as amritam *àyur hira¯yam*. Gold is immortality.[14]

Vedic hymns clearly identify the intracellular luminosity of electrum-enriched Soma waters and foods as endowing eternal life. Vedic wisdom also relates the yogic practice of levitation using the bodily force of *'laghima'* –an ability that Thao suddenly demonstrated for Michel while selecting Soma food preparations:

> 'We can, as readily, lift ourselves in the air, but that serves no great purpose other than our own amusement.' Having said that, Thao, who was sitting cross-legged, began to rise above her seat and floated about the room, finally coming to rest in mid-air. I stared at her, but soon realized I was the only one fascinated by her accomplishment. Indeed, I must have looked idiotic, for all eyes were fixed on me. Evidently, Thao's behavior was perfectly normal to my friends but they were more interested in the astonished expression on my face… Thao descended slowly on to her seat. 'That demonstrates one of the many sciences you have lost on Earth, Michel - apart from a few individuals who are still capable of doing it… There was a time when it was practiced by many, along with many other skills.' [15]

The demonstration of levitation given by Thao was one of many special lessons given to Michel on the golden planet. On Earth, this bioenergetic art form was practiced as one of the attainments, or *siddhis* known to Sanskrit adepts, in addition to being able to make one's body become larger or smaller, invisible or radiant, or instantaneously translocate or bilocate (being in two places at once). Thao would make demonstrations of other siddhis later during her discussions with Michel, and proceeded with a lesson on auras and color coordination for the balancing of physical health and consciousness:

'The colors of your robe were chosen according to those of your Aura; that's why you feel so good. If people on Earth were able to see Auras, they too could choose colors, which suit them and thereby enhance their feeling of well-being. They'd make use of color rather than aspirin…'

'I'll give you an example. Do you ever remember saying of someone: 'oh, those clothes don't suit you at all. He, or she, has no taste'? …If you were to suggest it be because of the colors they were wearing, they would think you odd. You could explain that the vibrations of the colors were in discord with those of their Auras, but they would be no more inclined to believe you. On your planet, people only believe in what they see or touch... and yet the Aura can be seen... The Aura vibrates constantly with colors that vary. At the top of your head is a veritable bouquet of colors, where almost all the colors you know are represented.

'Around the head too, is a golden halo, but it is only really obvious in the most highly spiritual people and in those who have sacrificed themselves in order to help someone else. The halo resembles a golden mist, much like painters on Earth depict the haloes of 'saints' and of Christ. The haloes were included in their paintings because, in those times, some of the artists actually saw them… The colors are all there in the Aura: some shine more strongly, others are dull. People in poor health, for example, or people with bad intentions... Many people on Earth could see it and read it a very long time ago, but there are few now. Calm yourself, Michel. You will see it, and not only one but several, including your own.'…

Approaching the coast, I could recognize enormous dokos, their points as usual towards the sky, I counted a group of nine, but the island was sprinkled with others, smaller and less visible amongst the vegetation. Thao took us higher and we were soon flying over what Thao called Kotra quo doj Doko - 'The City of the Nine Dokos'. Skillfully, Thao brought us down between the dokos, to a beautiful park located in their midst. In spite of my mask, I was aware that the golden mist that enveloped Thiaoouba was much denser around these dokos than elsewhere. Thao confirmed I was not mistaken in my perception…

Eventually, we reached the Central Doko and stopped below the entrance light. Thao seemed to concentrate for several seconds, then she took me by the shoulder and we passed through the wall… She immediately removed my mask, advising at the same time, that I half-closed my eyes, which I did. Light filtered through my lower lids and after a time, I was able to open my eyes normally… I must say, that this brightness, more golden than in my own doko, was considerably uncomfortable at first…

This doko must have been 100 meters in diameter. We headed directly, although more slowly, for the centre, where seven seats, each occupied, were arranged in a semi-circle. The occupants sat as though petrified and, at first, I thought them to be statues… In looks they resembled Thao, although their hair was longer and their facial expressions more serious, giving them the air of being older. Their eyes seemed to be illuminated from within, which was somewhat disturbing. What struck me most of all, was *the golden haze, even stronger here than outside, which seemed to concentrate in haloes around their heads…* When one of them raised a hand to indicate Thao and I should each take a seat facing them, I was indeed awestruck, and the word is feeble. I could not have imagined it possible that such radiant beings could exist: *it was as though they were on fire inside and emitting rays from within.*

They sat on block-like seats, fabric-covered, with straight backs. Each seat was of a different color - some only slightly different and others vastly different from their neighbors. Their clothes too, differed in color, suiting each wearer perfectly. All of them sat in what we call on Earth, the ‘lotus position’ that is, the sitting position of Buddha, with hands resting on knees… It was the central figure who addressed me, in a voice so melodious and, at the same time, so authoritarian. I was stunned by it, particularly since he spoke in perfect French. ‘You are welcome among us, Michel. May The Spirit assist and enlighten you.’ The others echoed: ‘May The Spirit enlighten you.’

He began to rise gently above his seat still in the lotus position, and floated towards me. This did not entirely surprise me since Thao had previously demonstrated this technique of levitation. I wanted to rise before this undoubtedly great and highly spiritual personage, as a measure of the infinite respect inspired in me. In trying to move, I found I couldn’t - as though paralyzed in my seat… He stopped just above and in front of me, placing both his hands on my head; the thumbs joined on my forehead above my nose, opposite the pineal gland, and the fingers joined at the top of my head. It was Thao who described these details to me later, for at the time, I was overwhelmed by such a sensation, that the details didn’t register.

During the time his hands were on my head, it seemed that my body no longer existed. A gentle warmth and delicate perfume originated within me, emanating in waves and blending with soft music that was barely audible… Suddenly, I could see amazing colors surrounding the figures opposite me and, as the ‘leader’ returned slowly towards his seat, I could see a multitude of radiant colors around him; ones I had been unable to perceive before. The principal color was a mass of pale pink which enveloped the seven figures, as though in a cloud, and their movements caused that wonderful, glowing pink to encircle us also!

When I had sufficiently recovered my senses to turn towards Thao, she too, was surrounded with wonderful colors, although less brilliant than those around the seven figures… You will notice that, in speaking of these great personages, I instinctively use ‘he’ rather than ‘she’. In explaining this, I can only suggest that the personalities of these special beings were so strong and their bearings so imposing, that I recognized more of the masculine in them than the feminine –I mean no offence to women– my reaction was instinctive... However, women or men, they had transformed me. I knew that the colors surrounding them were their Auras. I was capable of seeing Auras –who knew for how long– and I wondered at what I saw.

The ‘leader’ had resumed his seat and all eyes were fixed on me, as if they wanted to see inside me, which indeed, is what they were doing. Silence reigned for a time, which seemed interminable. I watched the varied colors of their Auras vibrate and dance around them, sometimes far in the distance and recognized the ‘bouquet of color’ Thao had spoken of earlier… The golden haloes, clearly defined, were almost saffron colored. It occurred to me, they could not only see my Aura, but possibly read it as well. I suddenly felt quite naked before this learned assembly. The question that haunted me was: why have they brought me here?

Abruptly, the ‘leader’ broke the silence. ‘As Thao has already explained to you, Michel, you have been chosen by us, to visit our planet, in order to report certain messages and to offer enlightenment on several important issues when you return to Earth. The time has come when certain events must occur. After several thousand years of darkness and savagery on the planet Earth, a so-called ‘civilization’ appeared and, inevitably, technology was developed –a development, which was accelerated during the last 150 years.

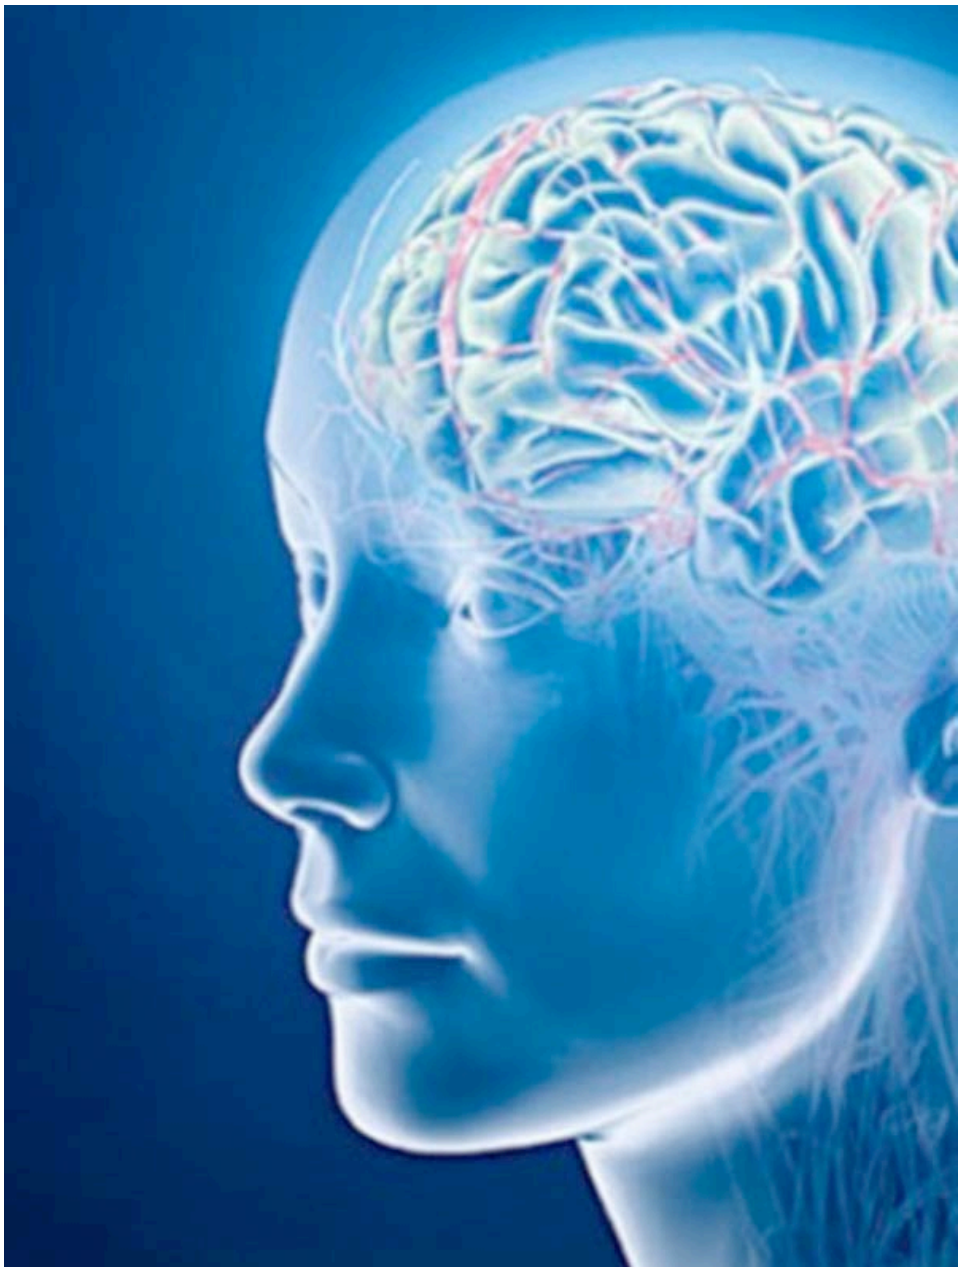
‘It has been 14,500 years since a comparable level of technological advance existed on Earth. This technology, which is nothing compared with true knowledge, is nevertheless, sufficiently advanced to become harmful to the human race on Earth in the very near future… harmful, because it is only material knowledge and not spiritual knowledge. Technology should assist spiritual development, not confine people, more and more, within a materialistic world, as is happening now on your planet… To an even greater extent, your people are obsessed with a single goal - affluence. Their lives are concerned with all that the pursuit of wealth entails; envy, jealousy, hatred of those richer and contempt for those poorer. In other words your technology, which is nothing compared with what existed on Earth more than 14,500 years ago, is dragging your civilization down, and pushing it closer and closer to moral and spiritual catastrophe.’

I noticed that each time this great personage spoke of materialism, his Aura and those of his acolytes, flashed with a dull and ‘dirty’ red, as though momentarily, they were in the middle of burning bushes. ‘We, the people of Thiaoouba, are assigned to assist, guide and sometimes punish the inhabitants of planets under our guardianship.’ Fortunately, Thao had briefed me on Earth’s history during our journey to Thiaoouba. Otherwise, I’d have surely fallen off my seat on hearing such a speech.

‘I think,’ he resumed, ‘that you already know what we mean by ‘harmful to the human race’. Many people on Earth believe atomic arms to be the major danger, but it is not so. The greatest danger concerns ‘materialism’. The people of your planet seek money - to some it’s a means of attaining power; to others it’s a means to acquire drugs (another curse), yet to others, it’s a way of possessing more than their neighbors possess…

‘Now, once and for always, we will teach you and provide you with what you French call ‘the key to the mystery’… As you have heard, in the beginning there was the Spirit alone and he created, by his immense force, all that exists materially. He created the planets, the suns, plants, animals, with one goal in mind: to satisfy his spiritual need. This is quite logical since he is purely spirit. Already I see you are wondering why the need to create material things in order to attain spiritual fulfillment. I offer this, by way of explanation: the creator sought spiritual experiences through a material world… In order to have these experiences, he wanted to embody a tiny part of his Spirit in a physical entity. To do this, he called on the Fourth force - the force which Thao has not yet spoken of and which concerns only spirituality. In this domain, Universal Law also applies.

‘You most certainly know that the pattern of the Universe dictates that nine planets revolve around their sun. It is also the case that these suns revolve around a bigger sun, which is the nucleus for nine such suns, and their nine planets… Certain accidents occur and sometimes a planet will disappear in a solar system, or perhaps enter it, but later in time, the solar system will revert and base its structure again on the number nine.



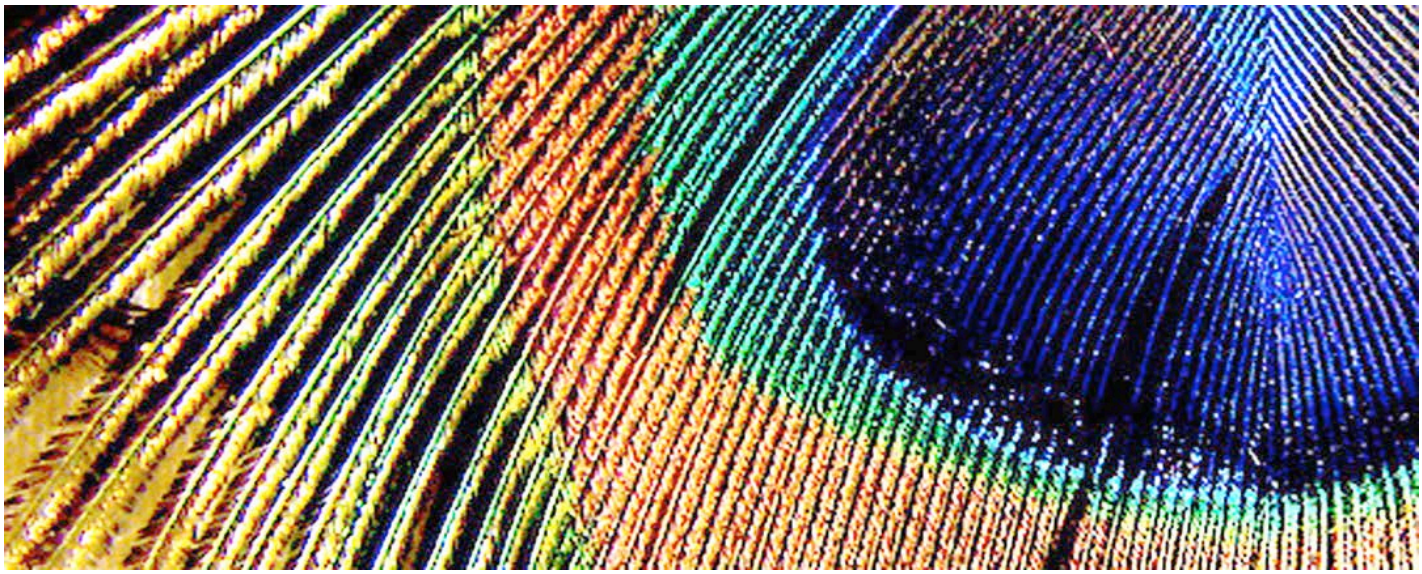
‘The Fourth force had a very important role to play: it had to bring to fruition all that the Spirit had imagined. It ‘inserted’ thus, an infinitesimal part of the Spirit in the human body. This comprises what you could call the Astral body, which forms one ninth of the essential human being and consists of one ninth of a ‘Higher-self’, which is sometimes called ‘overself'. The Higher-self of man is, in other words, an entity which sends one ninth of itself into a human body, becoming the person’s Astral being. Other physical bodies are inhabited, similarly, by other ninths of the same Higher-self and yet each part remains integral to the central entity… Further, the Higher-self is a ninth part of a superior Higher-self which, in turn, is a ninth part of a more superior Higher-self. The process continues as far back as the source, and allows the enormous filtration of spiritual experience required by the Spirit.

‘You must not think that the Higher-self of the first category is insignificant in comparison with the others. It functions at a lower level, but is nevertheless extremely powerful and important. It is capable of curing illness and even resuscitating the dead. There are many instances of people, declared clinically dead, who are brought back to life in the hands of doctors who had abandoned all hope for them. What generally happens in these cases, is that the person’s Astral body meets with the Higher-self. This portion of the Higher-self has left the physical body during the period of ‘death’. It perceives its physical body below, and the doctors trying to resuscitate it; it can also perceive loved ones who mourn for it. In his present state, the Astral body, the person will feel perfectly well –even blissful. Usually he abandons his physical body, frequently the source of much suffering, to find himself catapulted down a ‘psychic canal’, at the end of which is a wondrous light and beyond, a state of bliss.

‘If before passing through this canal into the blissful light which is his Higher- self he has the least will not to die –not on his own account but for the sake of those who need him, young children for example, he will ask to return. In certain cases it will be permitted… You are in constant communication with your Higher-self by means of your cerebral canal. Acting as a transmitting and receiving post, it conducts special vibrations directly between your Astral body and your Higher-self. Your Higher-self monitors you continually, by day and by night and can intervene to save you from an accident.

‘Someone, for example, who is to catch a plane, finds that the taxi breaks down on the way to the airport; a second taxi called also breaks down - just like that... Could you really believe in such a coincidence? The plane in question crashes thirty minutes later, leaving no survivors. Another person, an old and rheumatic woman and barely able to walk, starts to cross a street. There is a loud horn blast and a screeching of tires, but this person is miraculously able to leap to safety.

‘How is this explained? It was not yet her time to die and so her Higher-self intervened. In one hundredth of a second the Higher-self triggered a reaction in her adrenaline glands, which, for a few seconds, provided enough strength to her muscles to enable her to execute the leap which saved her life. Adrenaline released into the blood can make it possible to flee from imminent danger, or to defeat the ‘unbeatable’ through anger or fear. In too strong a dose, however, adrenaline becomes a lethal poison.



‘It isn’t only the cerebral canal which is able to conduct messages between the Higher-self and the Astral body. Another channel exists sometimes in dreams –or, I should even say, in sleep. At certain times during sleep, your Higher-self is able to call your Astral body to itself and, either communicate instructions or ideas, or to regenerate it in some way, replenishing its spiritual strength or enlightening it in regard to solutions to important problems. For this reason, it is essential your sleep is undisturbed by intrusive noise or by nightmares resulting from harmful impressions received during the day. Perhaps you will better understand the importance of your old French saying: ‘Night brings counsel’.

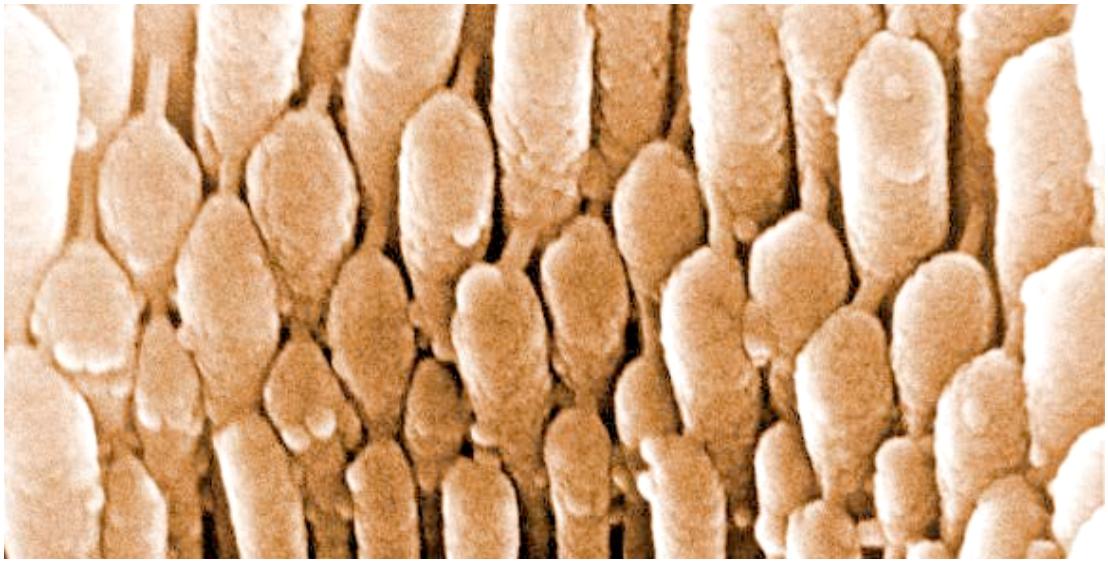
‘The physical body in which you exist at the moment is already very complex, but still, it is nothing compared with the complexity of the process of evolvement which occurs with Astral bodies and Higher-selves. In order to allow ordinary people on your planet to understand as easily as possible, I will make my explanation in the simplest terms… Your Astral body, which inhabits every normal human being, transfers to its Higher-self all the sensations that are experienced during a lifetime in a physical body. These sensations pass through the immense ‘filter’ of nine Higher-selves before arriving in the etheric ‘ocean’ that surrounds the Spirit. If these sensations are based essentially on materialism, the Higher-selves have enormous trouble filtering them, just as a water filter clogs quicker if it filters dirty water than if the water was already clear…

‘If, through the numerous experiences you have in your life, you ensure your Astral body benefits in a spiritual sense, it will acquire more and more spiritual understanding. In time, which can vary from 500 to even 15,000 of your Earth years, your Higher-self will have nothing more to filter…

This part of itself, embodied in the Astral being of Michel Desmarquet, will be so spiritually advanced, it will have arrived at the next stage where it will have to contend directly with the more superior Higher-self… We can compare this process with a nine-stage filter, intended to rid the water passing through, of nine elements. At the end of stage one in the process, one will have been completely eliminated, with eight remaining. Of course, to make this information easier to digest, I am making enormous use of imagery...

'This Astral body then, will have completed its cycle with the Higher-self of the first category and will then detach itself from Higher-self number one to rejoin the Higher-self of the second category; the entire process will be repeated. By the same token, the Astral body will be sufficiently spiritually advanced to pass to a planet of the next category, as well…

'In his wisdom, The Spirit, by means of the Fourth force, provided for nine categories of planets. At present, you are on the planet Thiaoouba which is in the ninth category; that is, at the top of the scale… Earth is a planet of the first category and therefore at the bottom of the scale. What does this mean? The planet Earth could be likened to a kindergarten with the emphasis on teaching basic social values. A planet of the second category would then correspond with a primary school where further values are taught - in both schools, adult guidance is imperative. The third category would comprise secondary schools where a foundation of values allows exploration beyond. Next, you would go to university, where you are treated as an adult, for you would not only have attained a certain amount of knowledge, but you would also start to accept civic responsibility.



'This is the type of progress occurring with the nine categories of planets. The more spiritually advanced you are, the more you will benefit, on a superior planet, by an environment and general way of life which is superior. The very way in which you procure food is much easier, which in turn, simplifies the process of organizing your way of life; the consequence is more effective spiritual development. On the higher planets, Nature itself, enters the stage to assist 'the pupil' and, by the time you reach planets of the sixth, seventh, eighth and ninth category, not only is your Astral body highly evolved, your physical body has also benefited from your development.

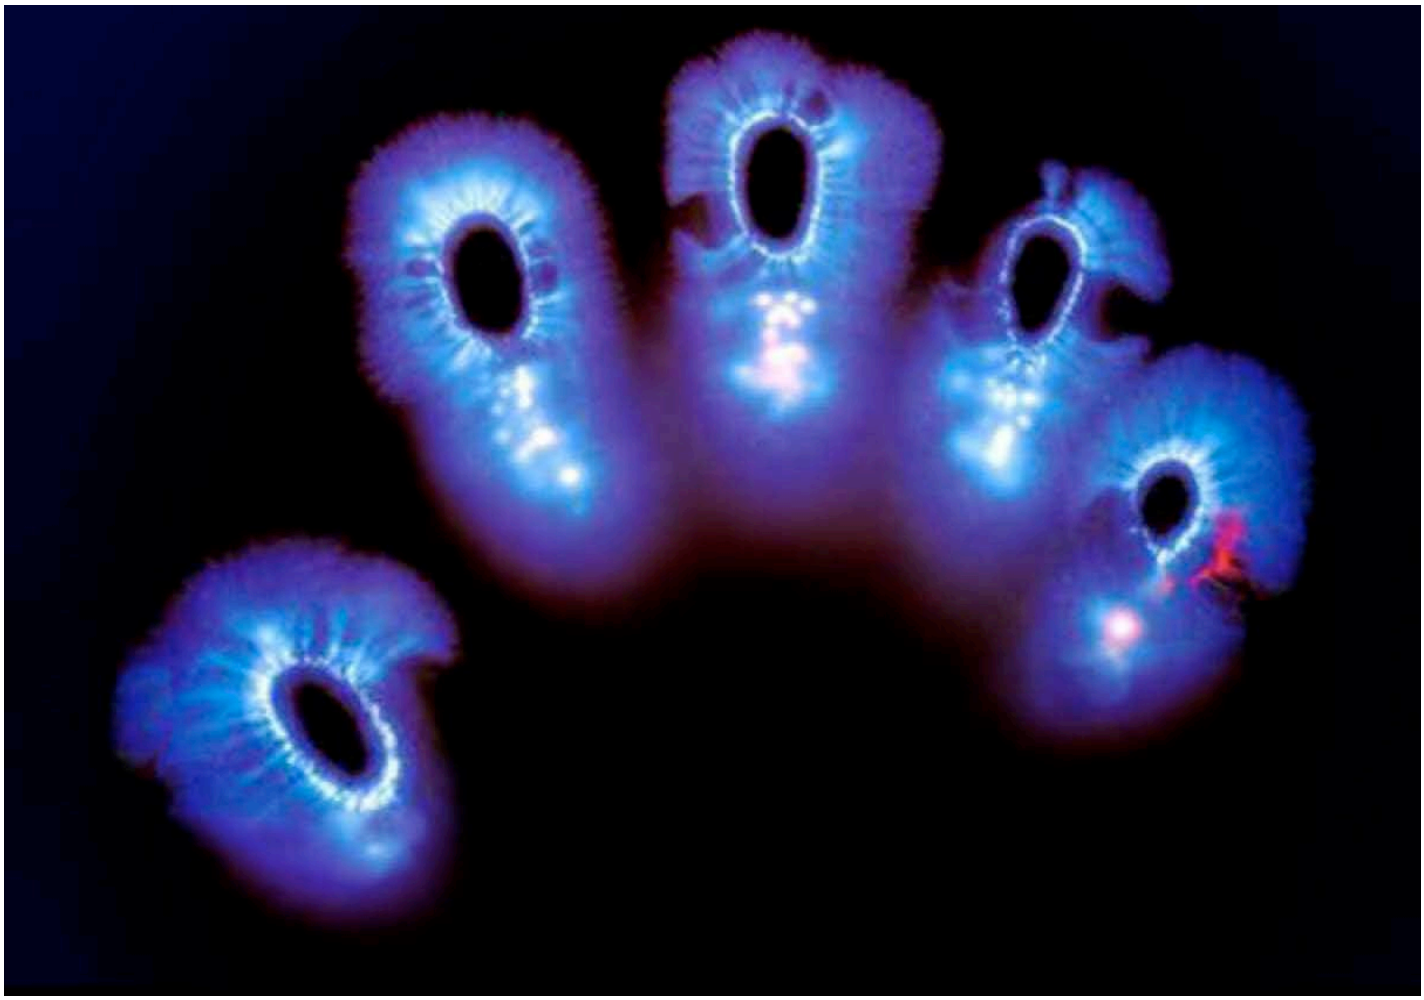
'We know you have already been favorably impressed by what you have seen on our planet. As you see more, you will appreciate that it is what you would call on Earth, 'a paradise'; and yet, compared with true happiness, when you become a pure spirit, it is still nothing… From this planet, it is possible either to remain in a physical body or be reunited with the Great Spirit in the ether.' As these words were uttered, the Aura surrounding the leader shone more brightly than ever and I was surprised to see him almost disappear in a golden mist, only to reappear a second later.

'You have understood that the Astral body is a body which inhabits your physical body recalling and noting all the understanding acquired during the course of its various lives… It can only be enriched spiritually - not materially. The physical body is merely a vehicle which, in most cases we abandon when we die… I will elaborate, for I see that 'in most cases' has confused you. By this, I mean that some of us, including all on our planet, are able to regenerate the cells of our bodies at will. Yes, you have already noticed that most of us seem to be of the same age. We are one of three planets that are the most highly evolved in this galaxy. Some of us can, and do, directly join what we call the great ether.

‘So, on this particular planet, we have arrived at a stage near perfection, both materially and spiritually. But we have our roles to perform, as does every creature existing in the universe; in fact, everything, including a single pebble, has its role… Our role, as beings of a superior planet, is to guide – to help with spiritual development and even, sometimes, materially. We are in a position to give material assistance because we are technologically the most advanced people. Indeed, how could a father give spiritual guidance to his child if he were not older, more educated and more skilled in diplomacy than the child? If the child should require physical punishment, as unfortunately, is sometimes the case, isn’t it important that the parent be physically stronger than the child? Certain adults, who refuse to listen and who are absolutely stubborn, also need to be corrected by physical means.‘

‘You, Michel, come from the planet Earth, which is sometimes called ‘The Planet of Sorrows’. Indeed, the name is appropriate, but it is this way for a precise reason - it is intended to provide a learning environment of a quite specific kind. It is not because life there is so difficult that you have to intervene - you cannot lightly go against Nature, destroying rather than conserving what the Creator has put at your disposal; that is, interfering with ecological systems, which have been intricately designed. Certain countries, like Australia, where you are from, are beginning to show great respect for ecology and it is a step in the right direction; but even in that country, what case is made of pollution - both water and air pollution? What is ever done about one of the worst forms of pollution? *Noise.* [Damage to sensitive auditory cells in the cochlea, seen below, is but one of many dangers.]

‘I say ‘worst’ because people such as Australians pay virtually no attention to it at all… Ask someone if traffic noise bothers him and the response will surprise you - eighty five percent of the time it will be; ‘What noise? What are you talking about? Oh that noise - we get used to it.’ And it is precisely because they ‘get used to it’ that the danger exists.’

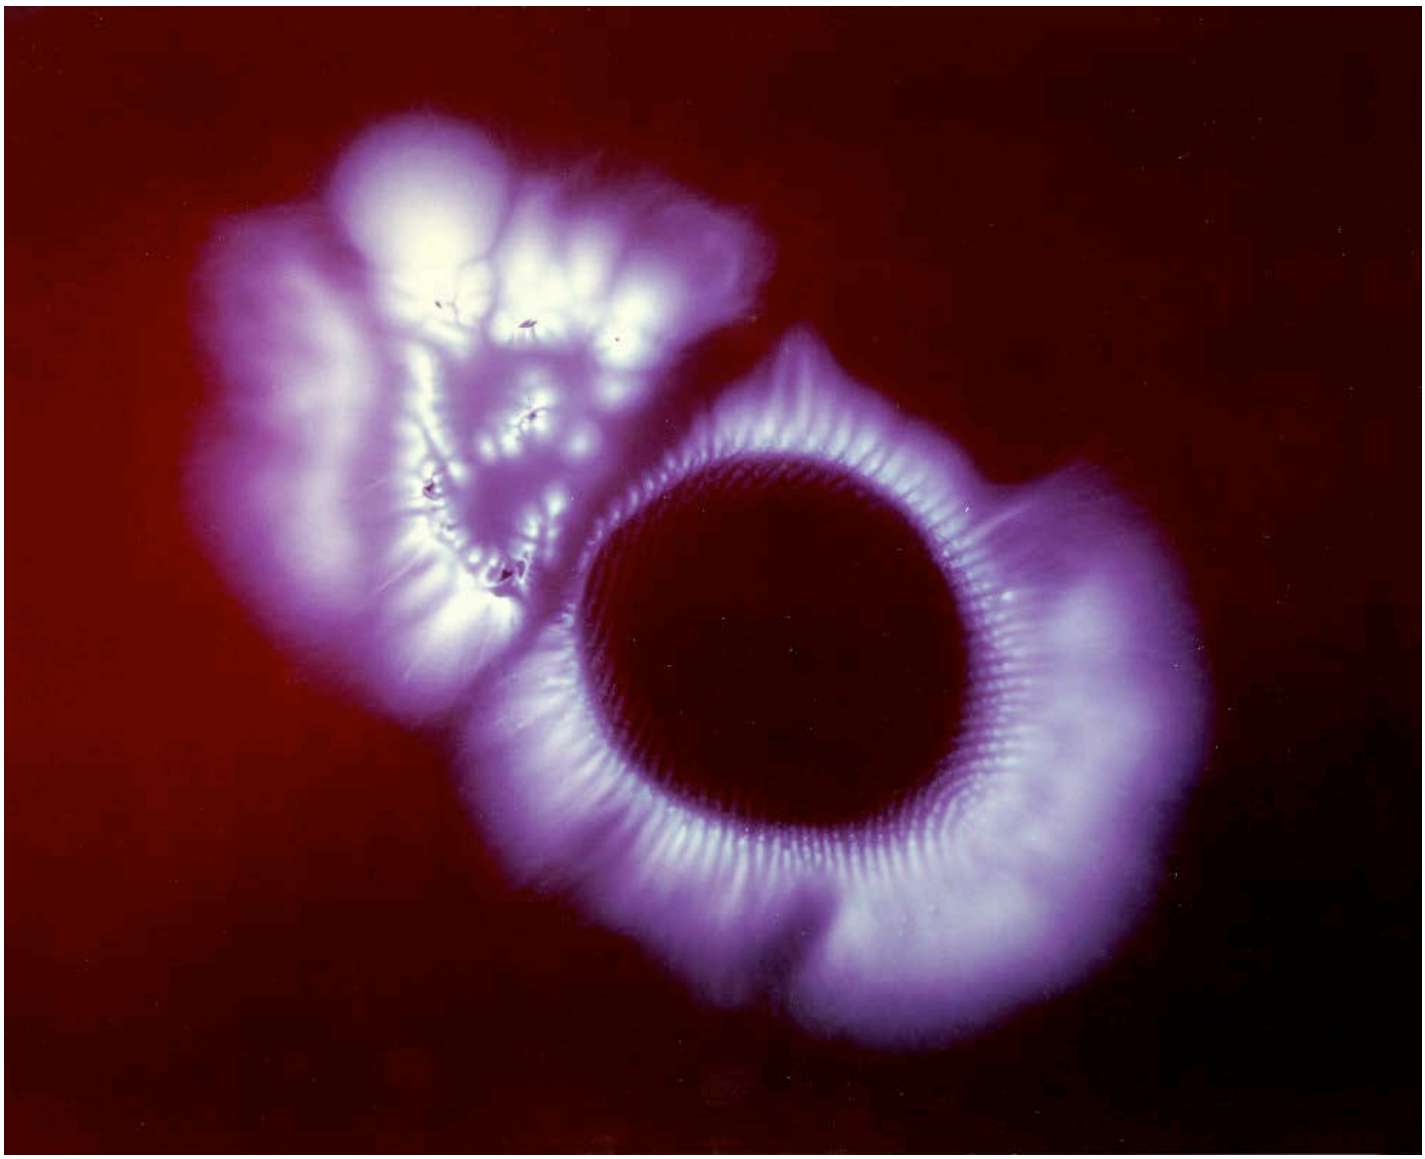


Just then, Thaora, as this high figure was called, made a gesture and I turned around. He was replying to a question I had mentally posed; ‘How can he speak of percentages and know so much about our planet with so much precision?’ Turning around, I almost uttered a cry of surprise for, behind me, stood Biastra and Latoli. In itself, this was nothing surprising, but the friends I knew who measured 310 and 280 centimeters in height respectively, were now reduced in size to correspond with my height. My mouth must have continued to gape, for Thaora smiled.

‘Can you understand, that sometimes, and very often in these days, some of us live among your people on Earth? - and there is my answer to your question. To continue on the very important subject of noise, it is such a danger that, if nothing is done, catastrophe is certain… Let us take the example of a discotheque. The people who expose themselves to music that is typically played three times too loudly, are subjecting their brains and their physiological and astral bodies to vibrations which are so harmful. If they could see the damage that is caused, they would vacate the discotheque quicker than if there was a fire.

‘But vibrations don’t only come from noise; they also come from colors and it is astonishing that, on your planet, experiments conducted in this field have not been followed up.[16] Our ‘agents’ reported a particular experiment involving a man who was capable of lifting a certain weight. It was found that after staring for a moment at a pink-colored screen, he consistently lost thirty percent of his strength… Your civilization pays no attention to such experimentation. In fact, colors can enormously influence the behavior of human beings and yet, control of this influence requires that an individual’s Aura be taken into account. If for example, you want to paint or wallpaper your bedroom with the colors that are truly appropriate for you, you must be aware of the colors of certain principal points of your Aura.

‘By matching the colors of your walls with those of your Aura, you can improve your health or maintain good health. Further, the vibrations emanating from these colors are essential for good mental balance, exerting their influence even while you sleep.’ I was wondering how we could be expected to know these significant colors in our Auras when, on Earth, we were not capable of perceiving Auras… Thaora replied immediately, without me having to say a word aloud.

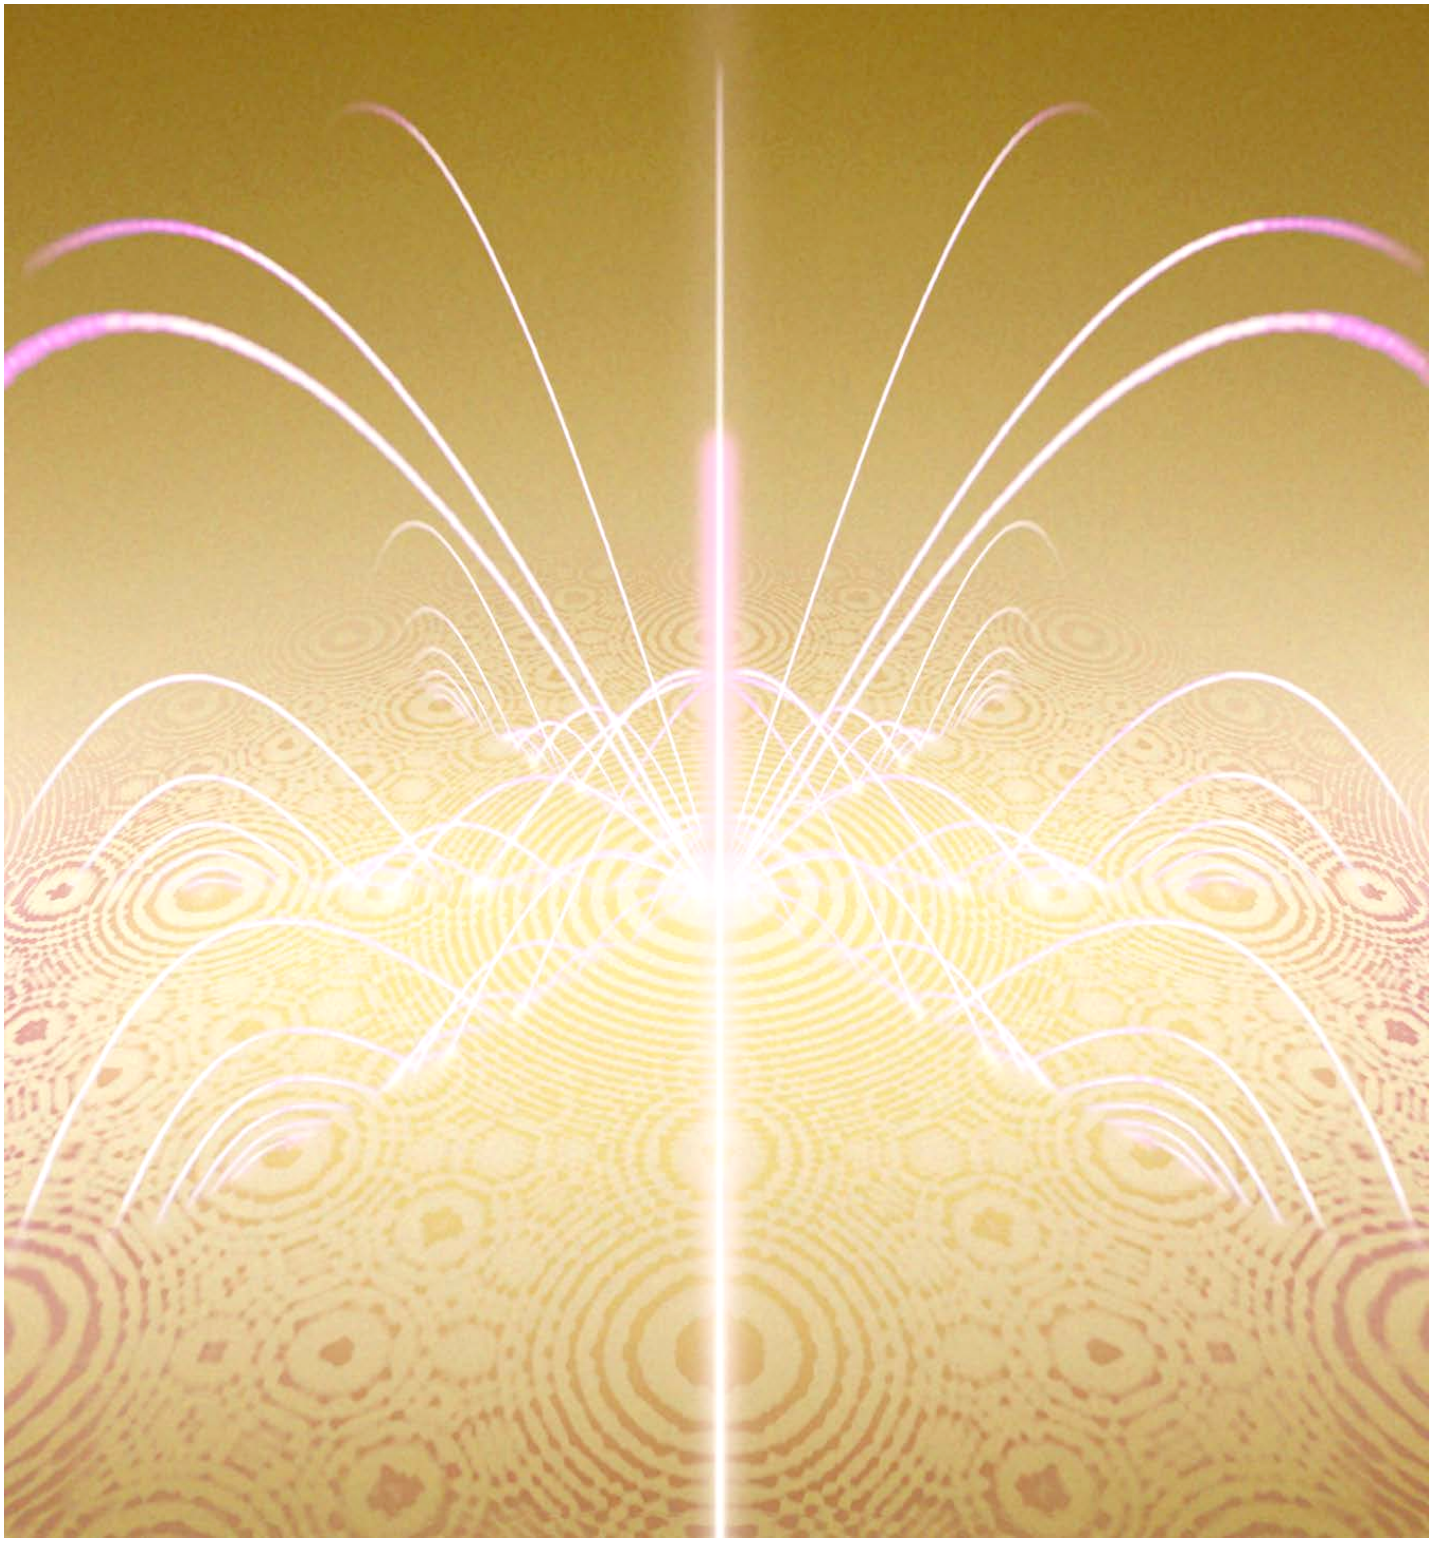


‘Michel, it is now very important that your experts invent the special equipment necessary, to enable perception of the Aura, as this, in turn, will ensure that correct choices are made at the critical crossroads ahead… The Russians have already photographed the Aura [as Kirlian photography – seen above, opposite]. This is the beginning, but the results obtained allow them only to read the first two letters of the alphabet, as it were, in comparison with what we are able to decipher. The reading of the Aura in order to heal the physical body is nothing compared with what such a reading can achieve for the psychic body, or the physiological body. It is in the area of the psyche that, on Earth, your greatest problems exist.

‘At the moment, most responsibility is taken for the physical body, but this is a serious mistake. If your psyche is poor, it will influence your physical appearance accordingly, but, regardless, your physical body will wear out and die one day, whereas your psyche, being part of your Astral body, never dies. On the contrary, the more you cultivate your mind, the less you will be burdened by your physical body and the quicker you will proceed through your cycle of lives… We could have brought you to our planet in Astral body, but instead, we have brought you here in physical body - and for an important reason. I see you already understand our reason. This pleases us and we thank you for your willingness to assist us in our task.’

The Thaora stopped talking and seemed to lapse into thought, at the same time, fixing me with his luminous eyes. I cannot say how much time elapsed. I know my state became more and more euphoric and I was aware that the Auras of the seven personages were gradually changing. The colors became more vivid in places, softer in others, while the outer edges became misty. This mist became more golden and pink as it spread, gradually blurring the seven figures.[17]

The profound wealth of imagery, wisdom and spiritual knowledge transmitted by the Thaori during the fourth-density plasma experiences of Michel Desmarquet on the golden planet of Thiaoouba resonate with the highest teachings available to Earthly humanity. The importance of Aura photography, known as Kirlian photography among Russian biophysicists and referred to as 'electro-photonics' by Thao, is decisive in not only the deepening of our understanding of the effects of color on human perception, but as well it represents the beginning of high-energy applications of HHO plasma to the human body. While clearly visible gaps in electrical conductivity observed along the fingertips has already shown promise in reflecting the state of health of specific organs (quite useful in diagnostic readings), the more advanced beam healing systems now biocompatible and effective in rapid cellular rejuvenation.



While the field of dentistry now applies nanosecond electrical pulses to ionize the HHO plasma at low temperatures to form biocompatible helium/oxygen plasmas for oral cleaning and sterilization,[18] an unnoticed effect of cellular regeneration is also occurring. The application of HHO plasma to the cleansing of the human body promises a significant reduction in the rate of cellular aging when the proper sources of lightwater (protium) are ingested. The bioelectric effect of electroporation, whereby cellular permeability is significantly lowered through rapid milliampere electrical pulses, can only be induced throughout all of the body's cells using electroluminescent gold and silver nanoparticles. Natural safeguards for immersion in the fourth-density HHO plasma environment provide for a limit to 9 full days of exposure, as succinctly explained to Michel by another temporary visitor to the golden Thiaoouba. The intense luminosity of the atmospheric HHO plasma inevitably intoxicates low-resonance human bodies:

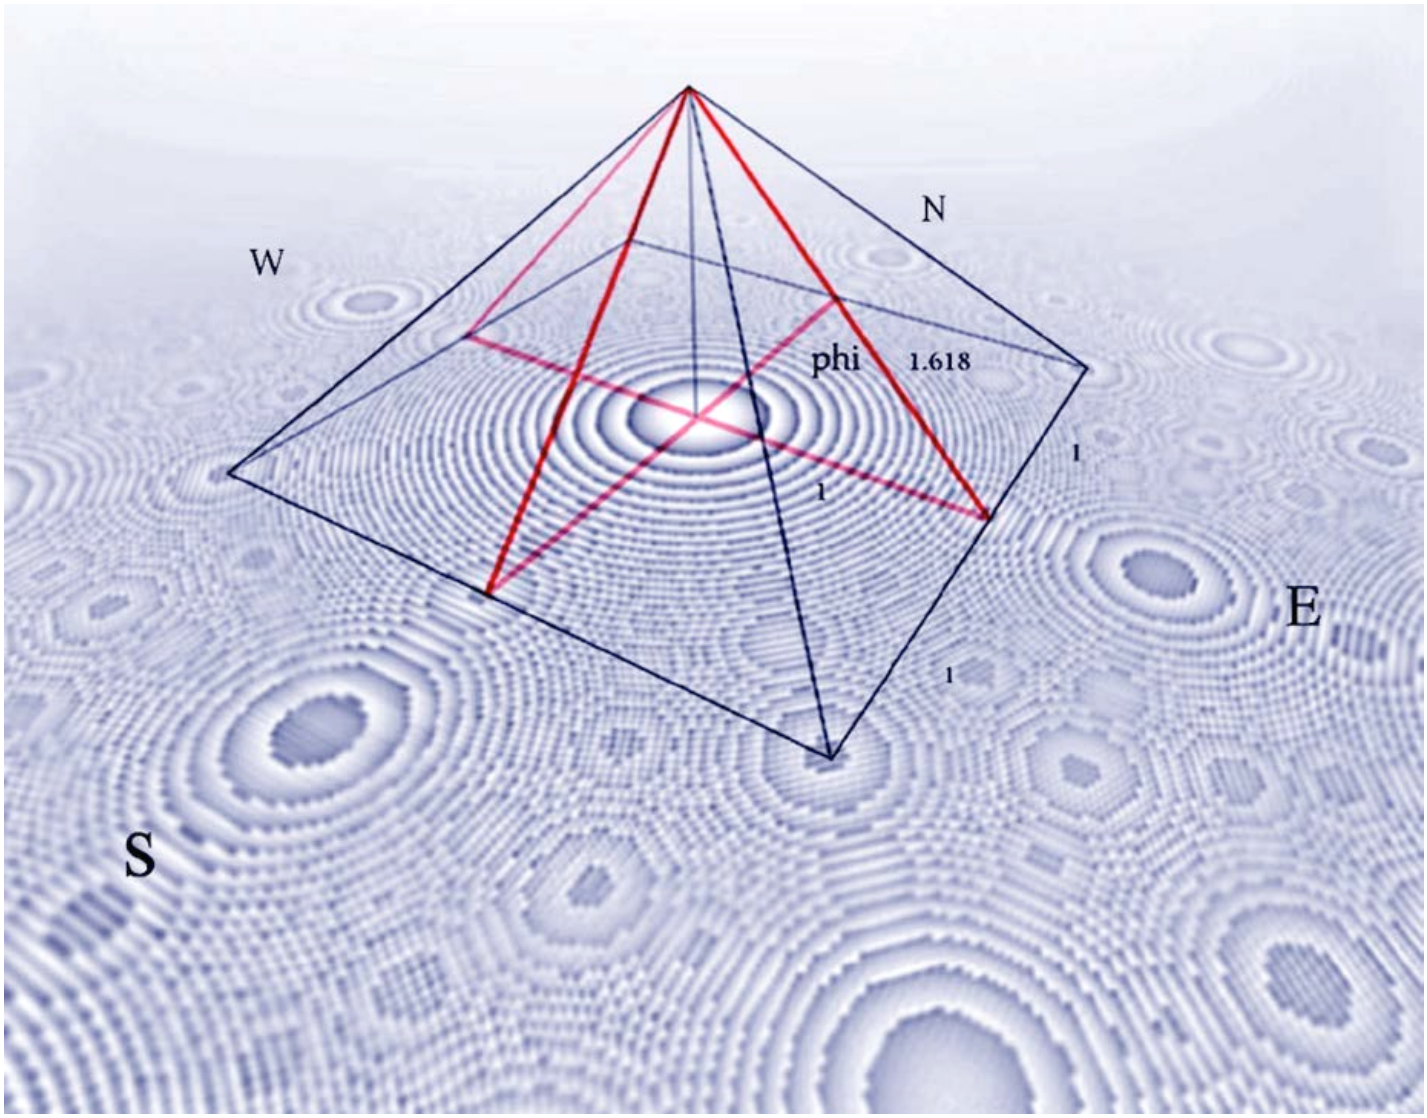
‘An Astral body absolutely cannot change to a superior planet until sufficiently evolved [in spirit]… This evolution occurs thanks to the physical body that improves as it progresses right up as far as this planet. You have already learned of the nine categories of planets –ours are at the bottom of the scale. We, in our present physical bodies, can be permitted only nine days’ stay here. According to Universal Law, on the tenth day, our physical bodies would die and neither Thao nor the great Thaora, within whose power it is to revive the dead, would be able to prevent or reverse the process. Nature has very inflexible rules with well-established safeguards… But it is possible that when you do die on Earth –when your moment has come– your Astral body will reincarnate in a body on… a second or perhaps third category planet… [Through reincarnation] we must be ‘reprocessed’ over and over until we emerge perfect, for eventually we will rejoin The Spirit who, being perfect himself, cannot accept the slightest imperfection.’

Around each planet, since its creation, is a kind of *psychosphere* or vibratory cocoon, which turns at a speed seven times that of light [or 1,302,000 miles per second]. This cocoon acts as a blotter, as it were, absorbing (and remembering) absolutely every event occurring on the planet… The human being, comprising an integral part of the universe can, because of his Astral body and if he is correctly trained, draw what knowledge he seeks from within the psychosphere. Of course, great training is required for this.[19]

This description of the psychosphere corresponds closely with the ancient Sanskrit concept of the *akashic field*, the mnemonic body of the planet that spirals around the Earth through the pathways of standing infrasound waves (illustrated above). The (Van Allen) plasma belt that encompasses Earth possesses superfluid crystalline properties that may act as a form of cosmic memory storage.

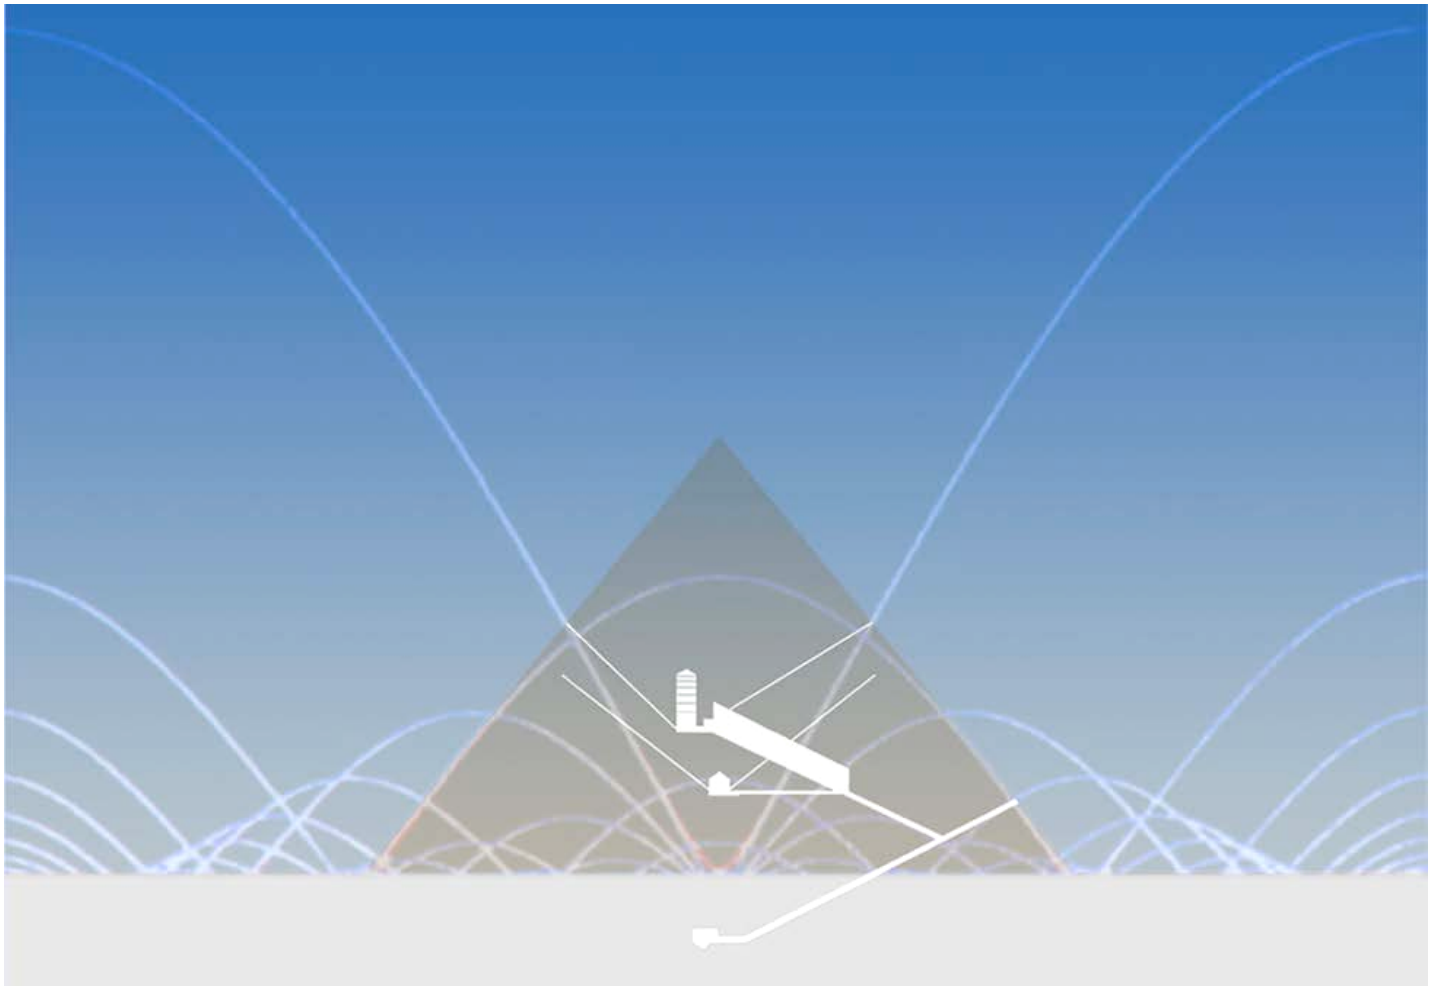
The subconscious mind is in constant contact with the planetary psychosphere where all the information of all past and future lives is stored, as elucidated by the Sleeping Prophet Edgar Cayce, in so many astoundingly advanced spiritual readings from the era of the industrial revolution. While Cayce had a unique ability to access the psychosphere directly during trance, Thao explained that most inexplicable moments of déjà vu are attributable to *akashic future life previews* shown by the Higher-self:

> [A]fter having seen his life… flash before him, and, after accepting to live that life, all details of it were erased from his memory. He passed through what certain Nagas have called 'The River of Oblivion' - this happens whether one accepts or rejects a possible reincarnation. Of course, there is a reason for it.



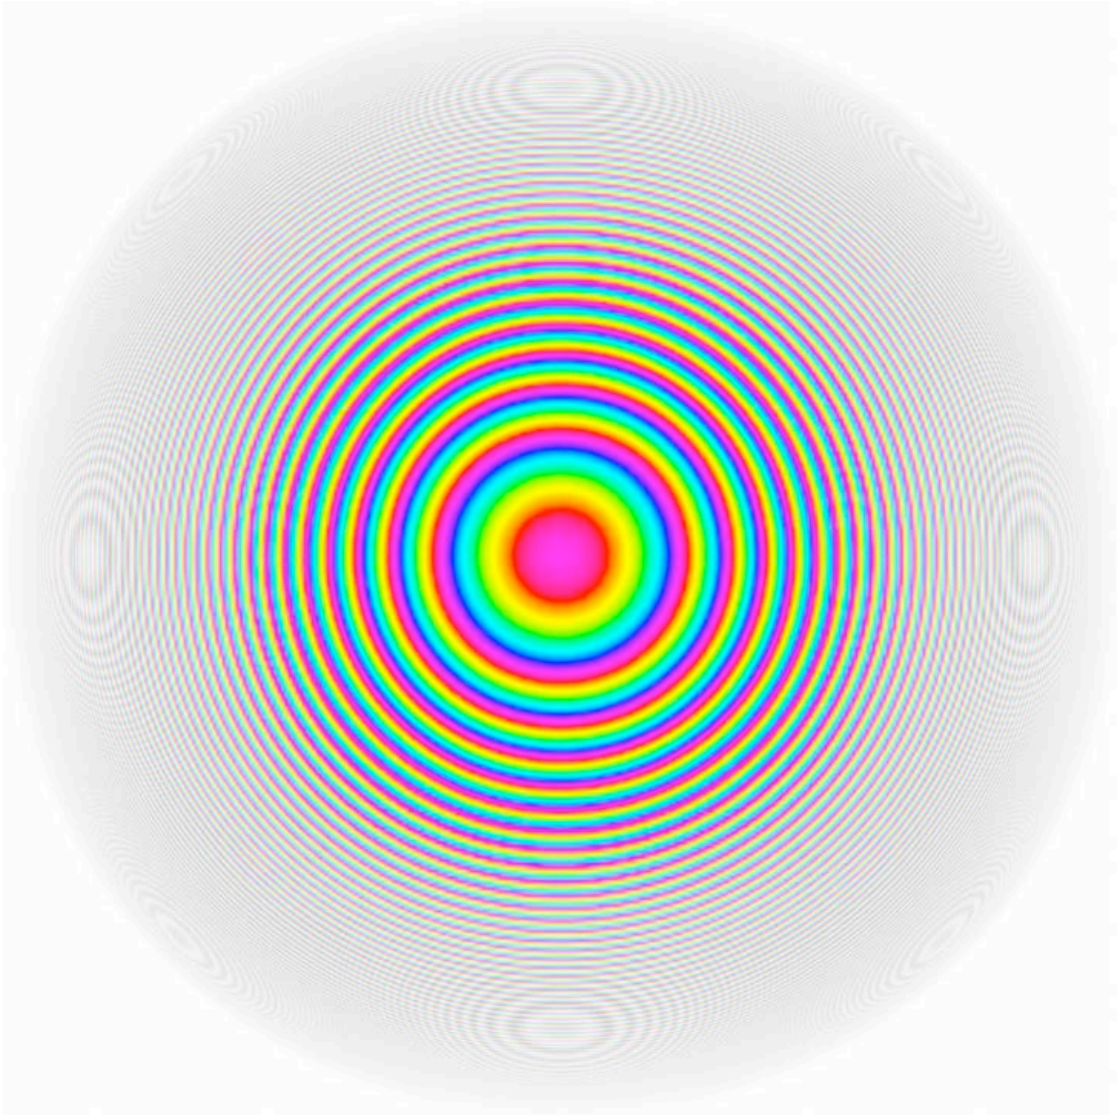
‘If, for example, you remembered that, around forty years of age, you would lose your wife and two cherished children in a car accident and that you, yourself, would be confined to a wheelchair, the knowledge could tempt you to take your life rather than face up to your troubles, or it might lead you to behave badly in other spheres. So, the ‘film’ is erased, in something like the way you ‘wipe out’ a tape recording.

‘Occasionally, by accident, the machine does not erase everything and you can hear brief portions of what should have been erased. Of course, my analogies are fanciful when I speak of ‘films’ and ‘tape recordings’ but I hope they give you an idea of what I am trying to explain. In reality, the process involves electro-photonics, which mean nothing, yet, to people on Earth. This, in fact, occurs often in the ‘films’ that the Higher-self shows to an Astral body, which is why most people say, on several occasions in the course of their lives ‘I have seen that before’ or ‘I have heard that before’ and they know what the very next action or word will be. In English, people call this feeling ‘déjà vu’.’ [20]



‘Michel… you were chosen by us to visit Thiaoouba, but the essential motive for our choice has not been revealed. It is not only because you have a mind already awakened and open, but also –and principally– because you are one of the rare soukous inhabiting Earth at the present time. A ‘soukou’ is an Astral body that has lived eighty-one lives in human physical bodies, and has lived those lives on different planets or different categories. For various reasons, the ‘soukous’ return to live on inferior planets, like Earth, when they could just as well continue to ‘climb the ladder’ without ever going backwards. You know that the number nine is the number of the Universe. You are here in the City of Nine Dokos, founded on Universal Law. Your Astral body has nine times nine lives, which brings you to the end of one of the great cycles.’

Once again, I was completely flabbergasted. I suspected I wasn’t living my first life… –but eighty-one lives! I didn’t know one lived so many… ‘It’s possible to live many more, Michel,’ said the Thaora, interrupting my thoughts. ‘Thao is up to her 216th, but other entities live far fewer. As I said, you have been chosen from among very few ‘soukous’ living on Earth, but, in order that you acquire a thorough understanding during the trip to our planet, we have planned another journey in time for you. So that you will better understand what reincarnation is, and what its purpose is, we will permit you to revisit your previous existences. This journey in time will be useful to you when writing your book as you will fully comprehend its purpose.’ [21]



Absolutely all of the events of past lives are stored within the psychosphere and remain accessible to highly attuned adepts of meditation. The ancient pyramid technologies were developed to enhance the psychoacoustic conditions that engender *synesthesia*, a form of holographic consciousness. *The global network of ancient pyramids function as one synchronous unit, balancing the biorhythms of initiates into telepathic communication with other worlds*:

> 'I must finish off my story concerning the continent of Mu… Savanasa then, was situated on a vast plateau overlooking plains which rose, on average, no more than 30 meters above sea level. On this plateau and in the centre, an enormous pyramid was constructed. Each stone used in its construction, some weighing more than 50 tons, was cut precisely to within one fifth of a millimeter, using what we can call 'ultrasonic vibratory systems'. [These ultrasonic pulse cutting techniques were developed by scientists in 2009.[22]] This was done in the quarries of Holaton, now found on Easter Island, which was the one place on the entire continent where this special rock could be found. There was, however, another quarry at Notora, southwest of the continent.
>
> 'The enormous stones were transported using anti-gravitational techniques well known to these people. (They were carried on platforms, 20 centimeters above the paved roads, and were constructed using the same principals as those of the pyramids.) Roads such as these were built all over the country, converging, like a massive spider's web, on the capital, Savanasa.
>
> 'The huge stones were taken to Savanasa and put into position according to directions from the 'master' or chief architect on the project. When finished, the pyramid measured exactly 440.01 meters in height and its four faces were oriented precisely towards the four points of the compass [as seen above].'
>
> 'Was this intended to be the King's palace, or his tomb?' Everyone wore the same indulgent smile that often appeared when I asked a question.

> ‘Nothing of the sort, Michel. This pyramid was much more important - it was a tool. An enormous tool, I admit, but a tool just the same. So, too, was the Pyramid of Cheops, in Egypt, though it was much smaller… You will have realized… these were highly advanced people. They possessed a profound understanding of Universal Law and used their pyramid as a ‘captor’ of cosmic rays, forces and energies, as well as terrestrial energies…
>
> Inside, rooms positioned according to a precise plan, served the King and certain other great initiates, as powerful communications centers, enabling (telepathic) communication with other planets and other worlds in the universe. Such communication with extraterrestrials is no longer possible for people on Earth; but the people of Mu in those days, by natural means and by exploiting cosmic forces, were in constant communication with other beings and were even able to explore parallel universes…
>
> [The pyramid’s] second use was to make rain. By a system of plates, made of a special alloy incorporating silver as its major component, these people were able, in a few days, to cause the accumulation of clouds above the country, and so, to have rain… Thus, they were able to create, virtually, a paradise over the whole continent. Rivers and springs never dried up, but flowed lazily across the numerous plains of a land that was essentially flat. Fruit trees were laden with fruit, bowing under the weight of oranges, mandarins or apples, according to latitude. Exotic fruits, of kinds that… no longer exist on Earth, were harvested in abundance.’ [23]

In describing interior “rooms positioned according to a precise plan,” Thao is making reference to the nonlinear structure of Fibonacci standing waves by which the precise positions of the pyramids’ chambers were determined, for the purpose of focusing terrestrial infrasound resonance (above). Telepathic communication was established by biorhythmic entrainment at 1.45 Hz heartbeat, also known as the *tri-thalamic entrainment frequency*, by which the biorhythms of initiates using the pyramid chambers are synchronized with those initiates in other pyramids across the world, or indeed with other planetary civilizations. Infrasound stimulation also provided for the secondary purpose of rainmaking, *by drastically increasing the evaporation and precipitation rates*, just as occurs during solar flare activity. Biorhythmic balancing in the pyramids also greatly benefits the Astral body, composed of electrons:

‘Now we come to another kind of pollution that is of no small concern, though people might readily dismiss it. As the great Thaora told you, noise is one of the most noxious pollutants for it upsets your electrons and unbalances your physical compartment. I haven’t yet mentioned these electrons to you and I see that you are not following me very well… A normal human Astral body contains approximately four billion, trillion electrons [4.0×10^{21} = 4 000 000 000 000 000 000 000 electrons]. These electrons have a life span of approximately ten billion, trillion of your years [10^{22} = 10 000 000 000 000 000 000 000 years]. They were created at the moment of creation. Your Astral body contains them and, when you die, nineteen per cent rejoin the electrons of the universe until required by Nature to form a new body or a new tree or animal, and the eighty one per cent rejoin your Higher-self.’ ‘I don’t quite follow you,’ I interrupted.

‘I know, but I intend helping you to understand. An Astral body is not quite what you would call a pure spirit. On Earth, there is a belief that the spirit is made of nothing. This is false. The Astral body is composed of billions of electrons, exactly marrying your physical shape. Each of these electrons has a ‘memory’ and each is capable of retaining as much information as is contained in all the books that fill the shelves of an average town library.

‘I see you are staring wide-eyed at me, but it is as I say. This information is coded, like a microfilm containing all the plans of an industrial installation that a spy would be able to pass in a cufflink, though much more miniaturized than that. Certain physicists on Earth are now aware of this fact but the public, at large, hasn’t been informed of it. Your Astral body transmits and receives messages, by means of these electrons, through the channel of your brain, to, and from your Higher-self. Information is being transmitted without you being aware of it, thanks to a weak electric current from your brain in harmony with your electrons. ‘Since it is the Higher-self which sent this Astral body into your physical body, it is in the natural order of things that your Higher-self should receive information from your Astral body.

‘Like all things electronic, the Astral body – tool of the Higher-self – is quite a delicate tool. During your waking hours it is capable of sending messages of extreme urgency to the Higher-self but the Higher-self seeks much more than that. So, during sleep, your Astral body leaves your physical body to rejoin the Higher-self, either passing on required information or receiving information or orders… Now, those people who, through very advanced and special exercises, are able to detach their astral bodies from their physical bodies, will be able to see a light, silvery-blue thread, such as you saw yourself, linking their physical and astral bodies. Their Astral bodies, likewise, are visible during the time that the separation lasts. It is these same electrons which form your Astral body and which create the visible effect of the thread.

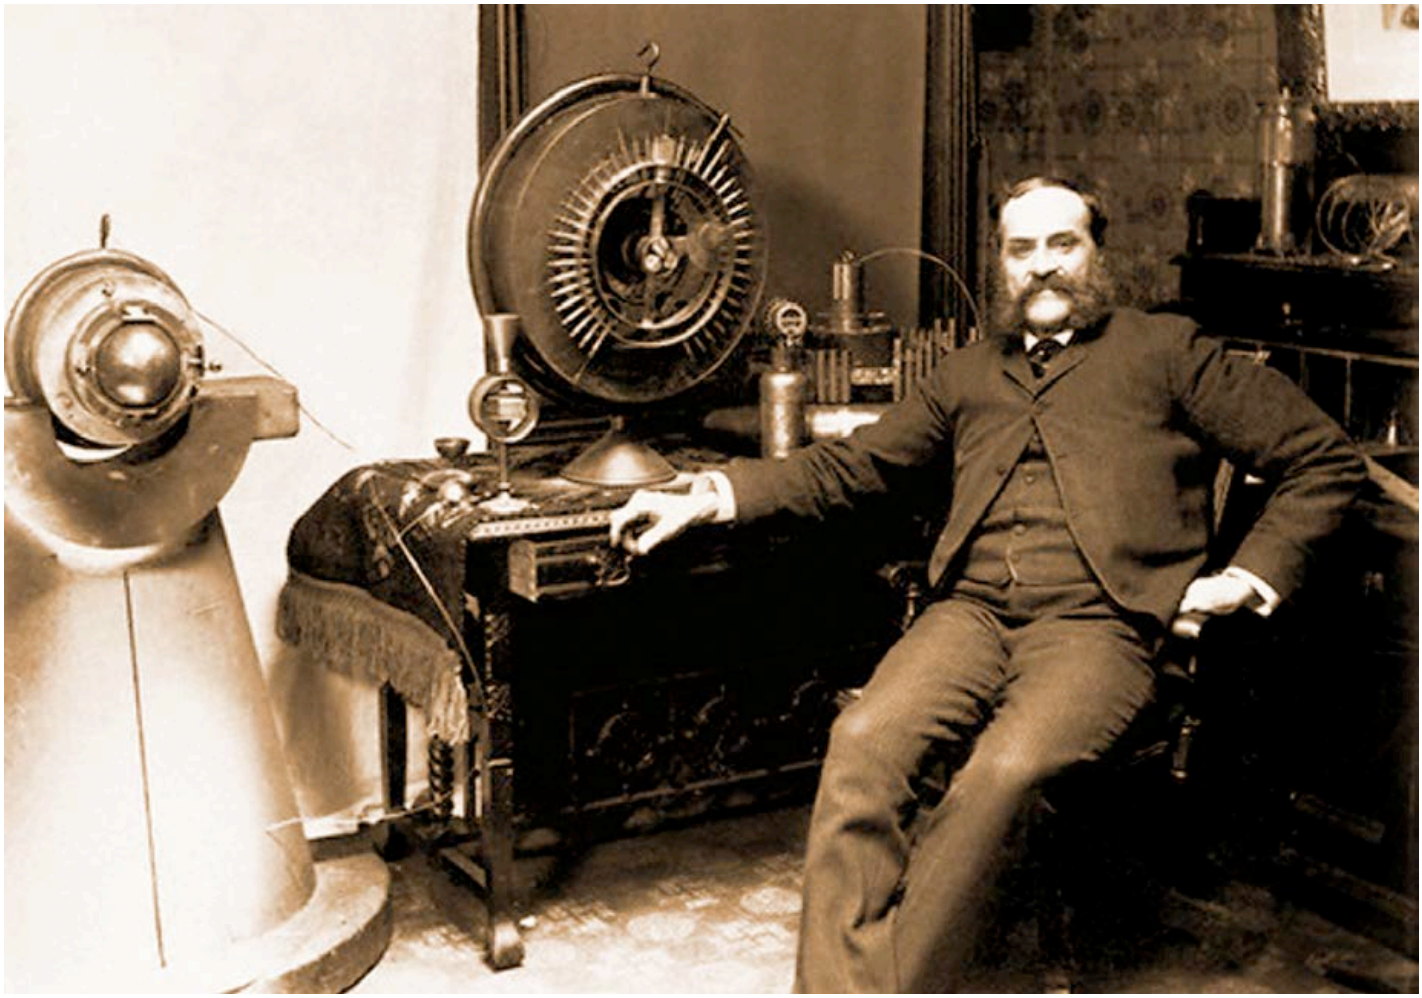
‘I see that you follow what I am saying and that you have grasped my point. Let me finish by explaining the dangers of noise. Noise directly attacks the electrons of your Astral body creating parasites, to use a radio and television term. If… someone is operating an electric tool next door to your house, such large parasites will be produced on your screen that the image will distort completely.

‘The same thing occurs with the Astral body, but unfortunately you won’t be aware of it in the same way that you are with a television screen; and, it’s much worse, since noise damages your electrons. And yet people say: ‘Oh, we get used to it.’ Your brain ‘tenses’, so to speak and your psyche initiates self-defense mechanisms, but not so the Astral body; a parasite invades its electrons - which, of course, has disastrous repercussions for your Higher-self.

‘The sounds that reach your ears are clearly very important. A particular piece of music can elevate you to a state of euphoria, while another piece, although very pretty, will have no effect on you or, perhaps, irritate you. Try an experiment: take a piece of soft violin, piano or flute music that you like and play it as loudly as you can. The suffering of your eardrums will not be as great as the discomfort you’ll feel within. Most of your fellow human beings on Earth consider noise pollution to be of negligible concern, but the noise of the exhaust pipe of a motor bike is three to four times worse than the noxious fumes that it discharges. While the fumes affect your throat and your lungs, the noise affects your Astral body… However, no one has ever been able to take a photograph of your Astral body and, so, people don’t concern themselves with it!’ [24]

Thao’s lengthy description of the Astral or *electronic body* brings sharp clarity to the issue of noise pollution in the industrialized world. The remarkable descriptive metaphor of electronic parasites was powerfully used to illustrate the invisible effect of the dangerous distortion caused by the incessant bombardment of disruptive oscillations from modern airplane, truck and automobile traffic. Not mentioned at the time of Desmarquet’s contact in 1987, which occurred before the mass-production of wireless devices, the lethal effects of long-term exposure of DNA to microwave radiation has since become another invisible threat to all life, mirroring the atmospheric devastation caused by combustion engines:

‘For approximately one hundred and forty years on your planet, man has been accelerating the destruction of Nature and the pollution of the environment. This has happened since the discovery of steam power and the combustion engine. You have but a few years left in which to arrest the pollution before the situation becomes irreversible. One of the principal pollutants on Earth is the petrol-driven engine and this could be replaced immediately with a hydrogen engine that would cause no pollution, so to speak. On certain planets, this is called the ‘clean motor’. Prototypes for such an engine have been constructed by various engineers on your planet [including John Keely (above) and Nikola Tesla among others,] but they must be industrially manufactured in order to replace petrol engines. Not only would this measure mean a seventy percent reduction in current levels of pollution by combustion waste, but it would also be more economical for consumers.



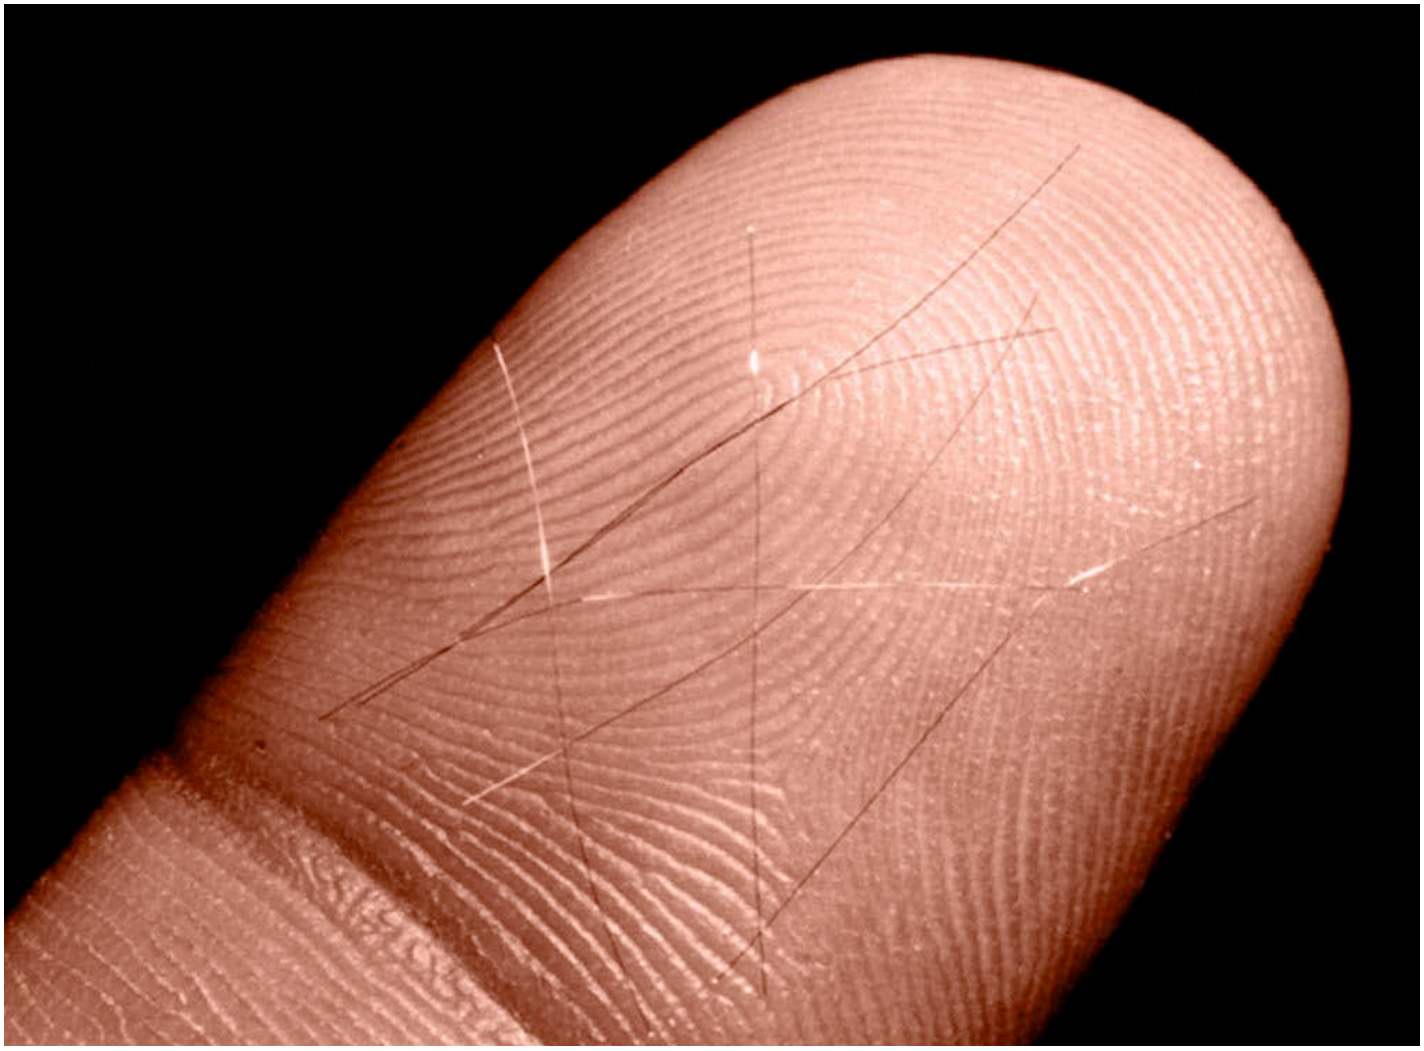
‘The big petrol corporations had been terrified at the idea of this motor being popularized for it would mean loss of sales for their oil and subsequent financial ruin. Governments, too, who impose enormous taxes on these oils, would suffer equally. You see, Michel, it always comes back to money. Because of it, you have a whole economic and financial context that opposes progress towards radical change in the interest of all human life on Earth. The people on Earth allow themselves to be pushed around, bullied, exploited and led to the abattoirs by political and financial cartels which are sometimes even associated with well-known sects and religions. When these cartels fail to win the people with clever advertising campaigns intended to brainwash them, they try to succeed through political channels, and next through religion or through a clever blend of the lot.

‘Great men wanting to do something for mankind have simply been done away with. Martin Luther King is one example; Ghandi is another. But the people of Earth can no longer allow themselves to be treated as fools and led to the abattoirs like flocks of sheep by leaders that they, themselves, have democratically elected. The people form the vast majority. In a nation of one hundred million inhabitants, it is absurd that a group of financiers comprising perhaps a thousand individuals can decide the fate of the others - like the butcher does at the abattoir.

‘Such a group has well and truly stifled the business of the hydrogen motor so that it is no longer mentioned… These people couldn’t care less what might happen to your planet in years to come. Selfishly, they seek their gains, expecting to be dead before ‘whatever is going to happen’ happens. If the Earth disappears, as a result of horrific cataclysms, they assume they will already be dead.

‘There, they are making a big mistake, for the source of the coming disasters is the pollution which is growing daily on your planet, and its consequences will be felt very soon - much sooner than you can imagine. The people of Earth must not do as the child forbidden to play with fire; the child is without experience and, in spite of the prohibition, he disobeys and burns himself. Once burnt, he ‘knows’ that the adults were right. He won’t play with fire again but he will pay for his disobedience by suffering… Unfortunately, in the case that concerns us, the consequences are much more serious than the burn of a child. It’s the destruction of your entire planet that is at risk - with no second chance if you don’t place your trust in those who want to help you.

‘It interests us to see that recently established ecological movements are gaining in momentum and power; and that the young people of Earth are ‘carrying’ other sensible people along with them in their fight against pollution… There is only one solution… the grouping of individuals. A group is only as powerful as it is large. Those whom you call the conservationists are becoming stronger and stronger and will continue to do so. But it is vital that people forget their hated, their resentment, and especially their political and racial differences. This group must be internationally united – and don’t tell me that is so difficult - for already on Earth there exists a non-violent and very large international organization – the International Red Cross, which has been functioning effectively for quite some time. It is essential that this conservationist group include in its programs not only the conservation of the environment from direct damage but from indirect damage as well, such as that which results from smoke: exhaust fumes from vehicles, smoke from factories, and so on.’ [25]



The immediate and dire consequences of the continued acoustic and atmospheric pollution of Earthy humanity could not have been more clearly stated. The hydrogen engine that Thao speaks of was discovered a century ago by Earthly scientists – most notably by John Worrell Keely (above) and Nikola Tesla. As in the mentioned cases of Martin Luther King and Ghandi, Tesla was also assassinated[26] and his technologies stolen to be secretly developed by Nazi scientists.[27] Recent rediscoveries by Dr. Randall Mills define hydrino resonant-transfer plasma, formed by the ionization of HHO gas using metal particles (opposite).[28] *These facts concerning the clean HHO plasma motor must become widely known and used.*

> ‘If certain of the leaders who read your book don‘t believe you, or doubt what is written, challenge them to explain the disappearance of billions of ‘needles’ put into orbit around Earth several years ago. Ask them also to explain the second disappearance of billions more ‘needles’ again put into orbit. They will know what you are referring to, never fear. We are responsible for the disappearance of these ‘needles’, judging them to be potentially disastrous for your planet… We do, at times, prevent your experts from ‘playing with matches’ but it is important that our assistance not be relied upon when mistakes are made. If we judge it appropriate to ‘lend a hand’, we do so, but we can’t, and we don’t wish to save you from disaster automatically - that would be to contravene Universal Law.’ [29]

The disappearance of millions of needles in orbit described by Thao as direct evidence of the reality of the extraterrestrial prevention of disasters caused by human scientific ignorance is a powerful reminder of the fragility of our planet and the carelessness of Earthly scientists. Dangerous experimentation of this kind has subsequently led to high atmospheric use of radioactive aluminum and barium nanoparticles dispersed as ‘chemtrails’ for atmospheric and psychological manipulation. Photo-ionization of the particles generates HHO plasma by the high-energy splitting of water molecules in the near vacuum of space, which acts as an amplifier of space, sea and land-based signals beamed from HAARP arrays, creating a bounce-back effect for ultra-low frequency wave focusing used in the artificial generation of earthquakes.

While extraterrestrial overseers have not brought a halt to the secret development and use of dangerous infrasonic technologies by Earth’s psychopathic profiteers, rare interventions do occur when catastrophic situations arise. In proving the benevolent interventions of Thiaoouban spacecraft observing Earth, Thao referred to *two* senseless tests in near-Earth orbit in October of 1961 and May of 1963 that were carried out as part of Lincoln Laboratory’s Project West Ford,[30] which involved a potentially disastrous attempt to create a new method of military communications using an artificial ‘dipole belt’ around the Earth:

> The dipole belt was to serve, in effect, an artificial ionosphere… [by artificially creating] a belt of 480 million dipoles orbiting 2,200 miles above the earth… In addition to judiciously specifying the initial orbit parameters, we gave the dipoles a high area-to-mass ratio to ensure that the solar radiation pressure acting on the dipoles would distort their circular orbits into highly elliptical ones. The orbital perigee would eventually dip to an altitude at which air resistance would sweep the dipoles out of orbit… The first attempt at establishing the dipole belt, in October 1961, failed. The dipole-dispenser ejection mechanism didn't spin up, so no dipoles were released. With a redesigned dipole dispenser, a dipole belt was established in May 1963… By late 1965, the dipole belt had been swept from orbit, right on schedule.[31]

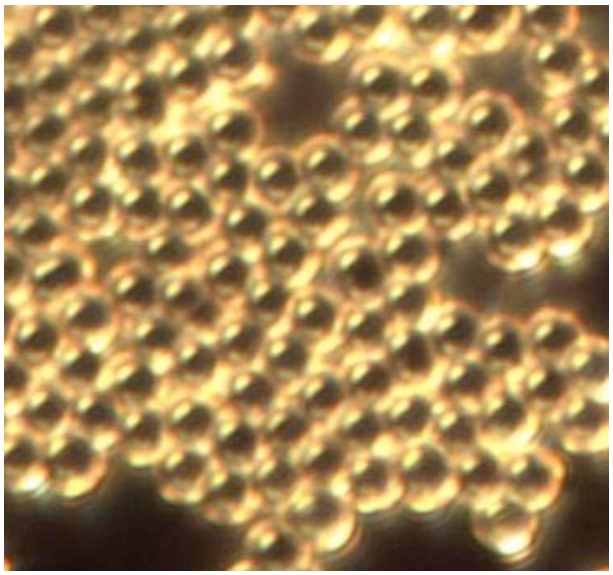
The Lincoln Laboratory photograph of 7 of the tiny dipole needles– 0.7" long and 0.0007" in diameter – (above) confounds the ability of the human mind to imagine the total volume of 480 million of these needles, which could easily have caused major damage to the Earth if allowed to melt together during atmospheric reentry to form several large molten masses that would rain down on the Earth in a series of major catastrophic impacts. The extreme myopia of the faulty thought process that directed this dangerous experiment is characteristic of 'government scientists' who endanger our planet by ignorant interference in natural atmospheric and orbital processes.

Prevention of the first mission's release of the dipole belt was achieved by interference with the functioning of the dipole-dispenser ejection mechanism. This simple preventive measure only frustrated NASA scientists, who mounted a second mission that was allowed to be released, and the experiment conducted, before the dipole belt was disintegrated by the plasma beams of Alatora spacecraft for the protection of all life on Earth. The oversight of human development on Earth is a significant task of the many advanced neighboring civilizations within our galaxy, who prevent such calamities only rarely by physical means when the logic and reason of Earthly humans cannot be inspired by any other means:

‘I see, Michel, you are having enormous difficulty believing what I have been saying. Never forget that we have THE *knowledge* - you have not seen one-tenth of what we can do. Attend carefully and I will give you a few examples to help you understand what I’m going to tell you.’

Thao stopped talking and appeared to be concentrating. As I watched, her face became a blur and, instinctively, I rubbed my eyes. Of course, this did not help and, in fact, she became progressively transparent until I could see right through her. Finally, she was no longer there - she had completely disappeared.

‘Thao,’ I called, slightly concerned, ‘where are you?’



‘Here, Michel.’ I jumped, for the voice came as a whisper, quite close to my ear…

Several feet in front of me, I saw the silhouette of Thao, completely golden yet radiant, as though inside her there burned a fire, its flames brief but intense. As for her face, it was recognizable but her eyes seemed to send forth little rays each time she spoke… She began to rise a few feet above the ground, without having moved a muscle of her ‘body’; then she started to circle the room, so fast I had trouble keeping my eyes on her. She stopped, eventually, above her seat and sat her ghostly form down. It was as though she were made of a shining mist - she was still recognizable as Thao and yet, quite transparent. The next instant she was gone. I looked around, but she had completely vanished.

‘Look no further, Michel, I am back.’ Indeed, there she was, in flesh and bone again, sitting on her seat.

‘How do you *do* that?’

‘As I was just explaining to you, we have THE *knowledge*. We can revive the dead; cure the deaf and the blind; make people walk who are paralyzed; we can cure any malady you care to name. We are masters, not *of* Nature, but *in* Nature, and we can do the thing most difficult of all - we can generate life spontaneously. *‘Out of the release of cosmic ray, we can create any type of living creature, including man…* We can create a human body, but that is done only by the great Thaori, taking infinite care, for the human body must be inhabited by several bodies, as you are aware - the physiological, the astral etc. If not, it would merely be a robot. Perfect knowledge is therefore required for such an undertaking… A man of twenty or thirty years-of-age can be created by the Thaori in approximately twenty-four of your Earth hours.’ [32]

The astounding disclosures of spiritual knowledge provided through the writings of Michel Desmarquet inspire great contemplation. The transdimensional demonstrations and many penetrating truths offered by both Thao and the Thaori reflect their purely Creational consciousness, *as masters in Nature*. Michel’s galactic voyage to the golden planet of Thiaoouba stands as an example of the highest attainment of Nature, inspiring the human beings of Earth to reverse the destructive effects of our ignorant ways by the advanced spiritual use of gold and silver nanoparticles for resonant atmospheric and intracellular illumination (at left). The seeds of knowledge have been widely sown, and hold the magnificent promise of an era of rejuvenation using electrum-enriched foods and drinks to reclaim our own natural ability *‘to regenerate the cells of our bodies at will’* in the enhanced cosmic ray environment of the Betelgeuse supernova blast.

At this juncture, the development of human consciousness on Earth will benefit from dramatic cosmic environmental changes, *‘as Nature itself enters the stage to assist the pupil’* in the attainment of knowledge. Thiaoouban wisdom concerning the Four Forces of Creation, the Atomic, Ovocosmic, Ovoastromic and Astral, has been offered for our contemplation on Earth as all living beings receive DNA enhancements induced by cycling galactic infrasound waves. Their lessons identify the significant advances of Kirlian photography and the clean hydrogen engine as crucial developments for terrestrial technology on Earth, pointing directly toward the use of biocompatible HHO plasma for cellular regeneration, enhanced longevity and an inexhaustible source of clean, resonant energy.

Betelgeuse & the Red Dawn

Betelgeuse & the Red Dawn

An inexorable sequence of natural electromagnetic events is unfolding that demands our full attention, and underlies the shifting currents of human consciousness. Ancient Sanskrit knowledge maintained by the Maya culture explicitly describes the events surrounding the end of this solar cycle, as retold in many forms throughout the indigenous prophecies and wisdom traditions of the world. It is said humanity will be transformed in the red light of cosmic consciousness – quite directly telling us *'man becomes god.'*

Mayan wisdom identifies the energetic changes of December 22, 2012 as the effect of a *synchronization ray* emitted from the center of the galaxy. This event is described as an alignment of Earth with the galactic plane, which will ignite Earth's high atmosphere in an all-encompassing red aurora. The Pyramid of Fire Codex foretells that the sky itself will be in flames, and the red flames will spread amongst the pyramids – from one 'Hill of the Star' to another along flaming plumes of celestial water:

> Tláloc, God of Celestial Water, god of the vapor that *rises*, from the Earth warmed by the sun after the rains, god of the mist that *ascends* from the valleys at dawn… Tláloc is the return of vapor that strains to rise, is the return of time that strains to *remember*. Tláloc, God of the Fight Against the Current, with whose aid the hero battles against the torrent toward his own origin and beginning, towards the wings of his soul, the wings that Tláloc hides in the hero's past…
>
> It is the self within ourselves that we have to sacrifice. It is our own heart that has to be torn out of the false being and offered to the light. May Xiuhtecuhtli, Lord of Fire, burn my false being, May Itzli, Obsidian Knife, liberate my heart. To sow life in the fires of sacrifice: Are the flames rising on the Hill of the Star, toward Cauhlacan? Or is it my own heart that is afire?
>
> The cycle of years is past - the waiting ended. Come - reunite, pilgrims, for the sky is in flames! From Xochicalco to Teotíhuacan the red spreads one step, another step, and another, only twelve short steps from the cave of the womb to the final conflagration... The flames rage in consummation- Rise, oh flames! What light, what heat! What great holocaust! The smoke ascends and spirals... Obscurity disappears as the flames rise to Tonatiuh, the purest light.[1]

The kundalini technology of the pyramids employs the crystalline memory of celestial waters to awaken human divinity at sacred temples like Teotihuacan, meaning '*site-where-man-becomes-God'* (below). The resonant frequency of the Pyramid of the Sun at Teotihuacan closely matches the 1.45 Hz heartbeat oscillation of the Great Pyramid due to its comparable base length of 740'. Itza Mayan Elder Hunbatz Men describes the pyramids as generators of *the brilliant light of heaven that imbues the human being with eternal life.* Cosmic Creator Hunab K'u guides the initiatic work of Mayan Elders at sacred pyramids:

> "Take care of the light that I leave within my temple. When you form the human being, teach him to venerate my house, for within it they will find the light they need for eternal life. Teach him also that if he should stray, due to his errors, vices or ignorance, then I, Hunab K'u will reclaim my beloved beings and take them to my temple of wisdom and nourish them again with my light which is in the heavens. Then, together, Tepeu, Gugumatz and Huyubcaan will perform purification rituals using that brilliant light for the benefit of my beloved whom we created and molded, so they can live in the light of eternal wisdom." [2]

A heavenly life-giving light radiating inside pyramid chambers is also related in hieroglyphic texts inscribed on the interior walls of the pyramids of Saqqara, Egypt. Profound details of the luminal and acoustic effects of the Great Pyramid transducer in full operation have been recorded in stone:

> House bright and dark of Heaven and Earth, for the [solar] ships put together; Great Pyramid, House of the gods with pointed peak; for Heaven-to-Earth it is greatly equipped. House whose interior glows with a reddish Light of Heaven, pulsating a beam which reaches far and wide; its awesomeness touches the flesh... House of Eternity: its foundations are stones, the water; its great circumference is set in the clay. House the rightness of whose howling the Great-Ones-Who-See-and-Orbit bring down to rest… Mountain by which Utu ascends… whose deep insides men cannot penetrate.[3]

Both the Egyptian and Mayan hieroglyphs are descendant forms of the ancient logographic Sanskrit, as deciphered by epigrapher Dr. Kurt Schildmann (1909-2001). This antediluvian proto-Sanskrit can be identified as the Atlantean script, having been found on all inhabited continents of the world on stone and ceramic artifacts dated to the Pleistocene period – being over 12,000 years old. The pyramid traditions of these cultures of Atlantean descent provide us with stunningly explicit descriptions of future events tied into the ancient Sanskrit conception of water as the transformative agent of consciousness.

The Atlantean psychoacoustic technology of quartz crystal skulls reflects the Sanskrit tradition of augmenting consciousness through the purification and crystallization of the water within the human body. The refraction of light within the human body that is fueled by crystalline water enables the higher capacities of human consciousness by biorhythmic alignment at 1.45 Hz heartbeat entrainment in the pyramid chambers. The Great Pyramid's upper chamber does not contain a sarcophagus – the granite box was actually a water-birthing resonator filled with celestial water. The closed shafts rising from the chambers are its "deep insides men cannot penetrate", designed to focus infrasound heartbeats at 1.45 Hz into the tiny newborn infants. Usually born as twins, the infants' skulls were elongated by this process.

The celestial waters of La Maná, Ecuador (photographed above with several plasma orbs) and Tlacote, Mexico have been extensively studied for their astounding resonant properties.[4] Test results have shown the spring waters of La Maná and Tlacote have the highest water purity found anywhere in the world, containing virtually no salt or other dissolved solids. This in itself is remarkable, but tests have also identified trace amounts of gold and silver nanoparticles and an energy rating of over 1,000,000 on the Bovis scale. There is no modern technology capable of creating energized waters like those flowing from the springs of La Maná and Tlacote. These celestial waters are the nanotechnological product of the transdimensional civilization of Atlantis – the central component of the pyramid kundalini tradition of psychoacoustic gestation and water-birthing practices.

Artifacts from the ancient Sanskrit sacred site in La Maná, Ecuador reveal the origin and use of these celestial waters as a technological product of the global pyramid system itself. Over 300 metal, stone and ceramic artifacts have been recovered, among which are diverse UV-fluorescent maps of standing wave resonance patterns within the electron, mineral calcite, and Great Pyramid of Giza, Egypt.[5] The artifacts preserve logographic Sanskrit script, while their numerals from 1 to 10 are presented in fluorescent inlays adorning a set of 13 stone goblets precisely designed for water volume measurement.

Among the artifacts found below the sacred site is a large stone lingam in the form of a kundalini cobra, engraved with complex UV-fluorescent inlaid patterns – as well as a gold psychoacoustic helmet, accompanied by dozens of ceramic figurines that show both adults and children using the helmets while barefoot for electrical contact to the pyramid. The largest stone artifact from La Maná is a breathtaking global map of the Earth with all the continents accurately depicted as they were before the fall of Atlantis! Star maps on flat stone plates were inlaid with UV-fluorescent calcite mortars depicting the constellations surrounding Orion, with Betelgeuse (fluorescing in red) as one of the three large stars forming the Winter Triangle with Sirius and Procyon. This star map is also presented on the largest goblet (above, center).

Celestial waters were the primary enablers of this advanced psychoacoustic Atlantean technology, by which human bodies became superconductors of electricity. The suspension of gold and silver nanoparticles enhances the conductivity of the body by creating a pathway for electrical flow without shock. Shock waves do not form inside crystals for the crystal lattice distributes pressure evenly and the whole mass is set vibrating in unison. The celestial waters maintain the integrity of the body's cells during exposure to the electrical currents inside the pyramids at resonance. The gold and silver nanoparticles are from 2-10nm in size and act as transducers in the body, *converting electrical pulses into light pulses*.

Gold nanoparticles scatter RED light inside all of the cells of the body. This is the key to understanding the words of the pyramid-builders concerning the *"heavenly red light of eternal life"!* The fact that these water sources are still flowing, and in fact greatly increasing their output with time, is primary evidence that the pyramids are automatically roaring to life with the input of infrasound energy from solar storms as we approach the full onset of the new solar age. These widespread effects are already being observed.

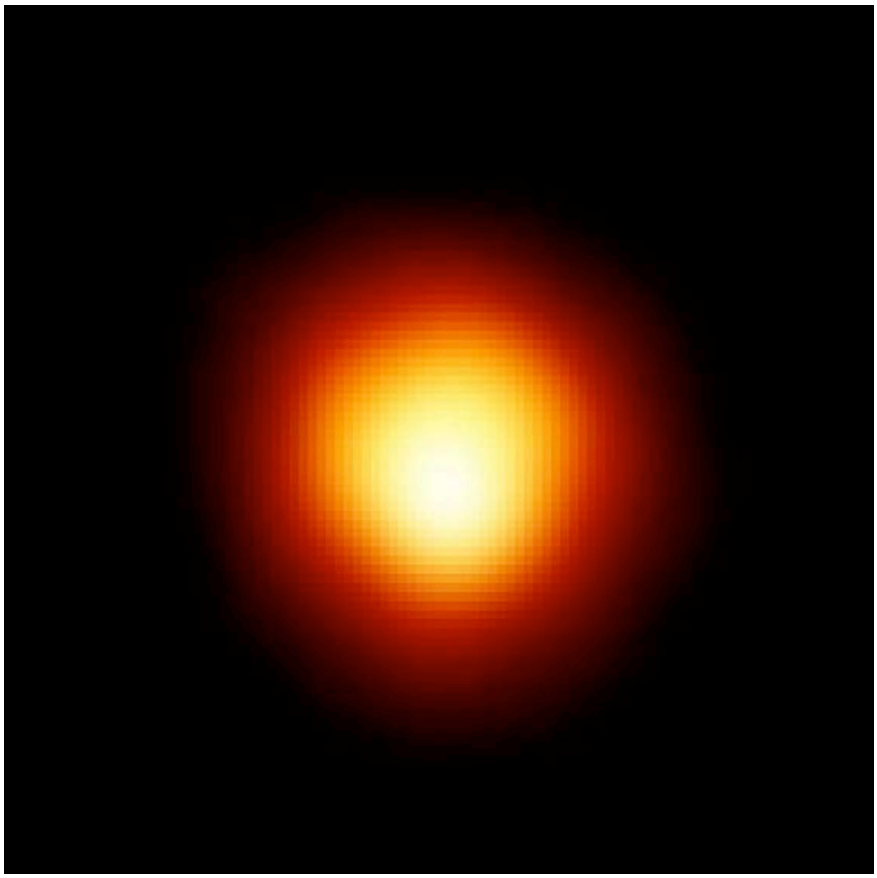
*(**Note:** monatomic gold, aka white powder gold, does NOT scatter red light, and is not recommended!)*

Golden waters and wisdom of the Chichimeca and Chichicastl cultures of Tlacote, Mexico have been preserved by the Maya Elders, and presented through translation by Gerardo Aceves Quetza Sha:

> Tlacote is a great assembly point of the ancient gods where once existed the Golden City of the Golden Water, built by the Chichimeca and the Chichicastl. In other times, our ancestors left us transcendental information… Man has always been looking for something else, something that lives inside of him, and he recognized the inner light manifesting in his heart. It is this inner light that will cause the changes in humanity and that will make the dream come true, that the animal which is the human being will be able to live thousands of years. Man opens his heart to understand the revealing truth, creating consciousness and elevating his thoughts. This process is necessary, because we must understand and solve the enigmas of Earth and the planetary system, in order to develop in perfect conscience right from the beginning of creation. We meet thousands of phenomena in our life. Man calls this coincidence; spirit calls it cycles of comprehension in the evolution of man. Therefore, if a new race emerges to a new cycle of existence, this happens because the information imprinted in the subconscious of the Inner Self has been completed.

> All the information we need is imprinted in the subconscious of the inner self, so it may evolve according to its individual level, remembering who it is and knowing its task on Earth: 'AWAKEN, INNER SELF, and recognize your inner creation in order to understand the movements of the Universe!' This is how the different races and religions developed in their particular states of evolution. Each religion in its particular language has accompanied us on a very important part of our path and accomplished the demands of a particular time. Now humanity is awakening to a new cycle of consciousness. A new race is born, constantly bringing in new knowledge and spheres of conscience, and being aware of the past, the present and the future…
>
> This message predicting the awakening of the Golden Water is sacred and was created and given to us by beings from other dimensions, so that other generations can be born, prepared for the great changes that will be produced from the center of the Earth.[6]

Not only are the acoustic environments enhanced at these sacred sites, but the quality of water is also correspondingly enhanced to become *crystalline.* These profound findings reveal the sophisticated yet invisible technologies that enhance human consciousness and longevity at these sites – for those who choose to live close to spirit and purify their bodies to be bathed in the energy of the pyramids. The red light scattering of golden celestial waters induces DNA enhancement through heartbeat synchronization.

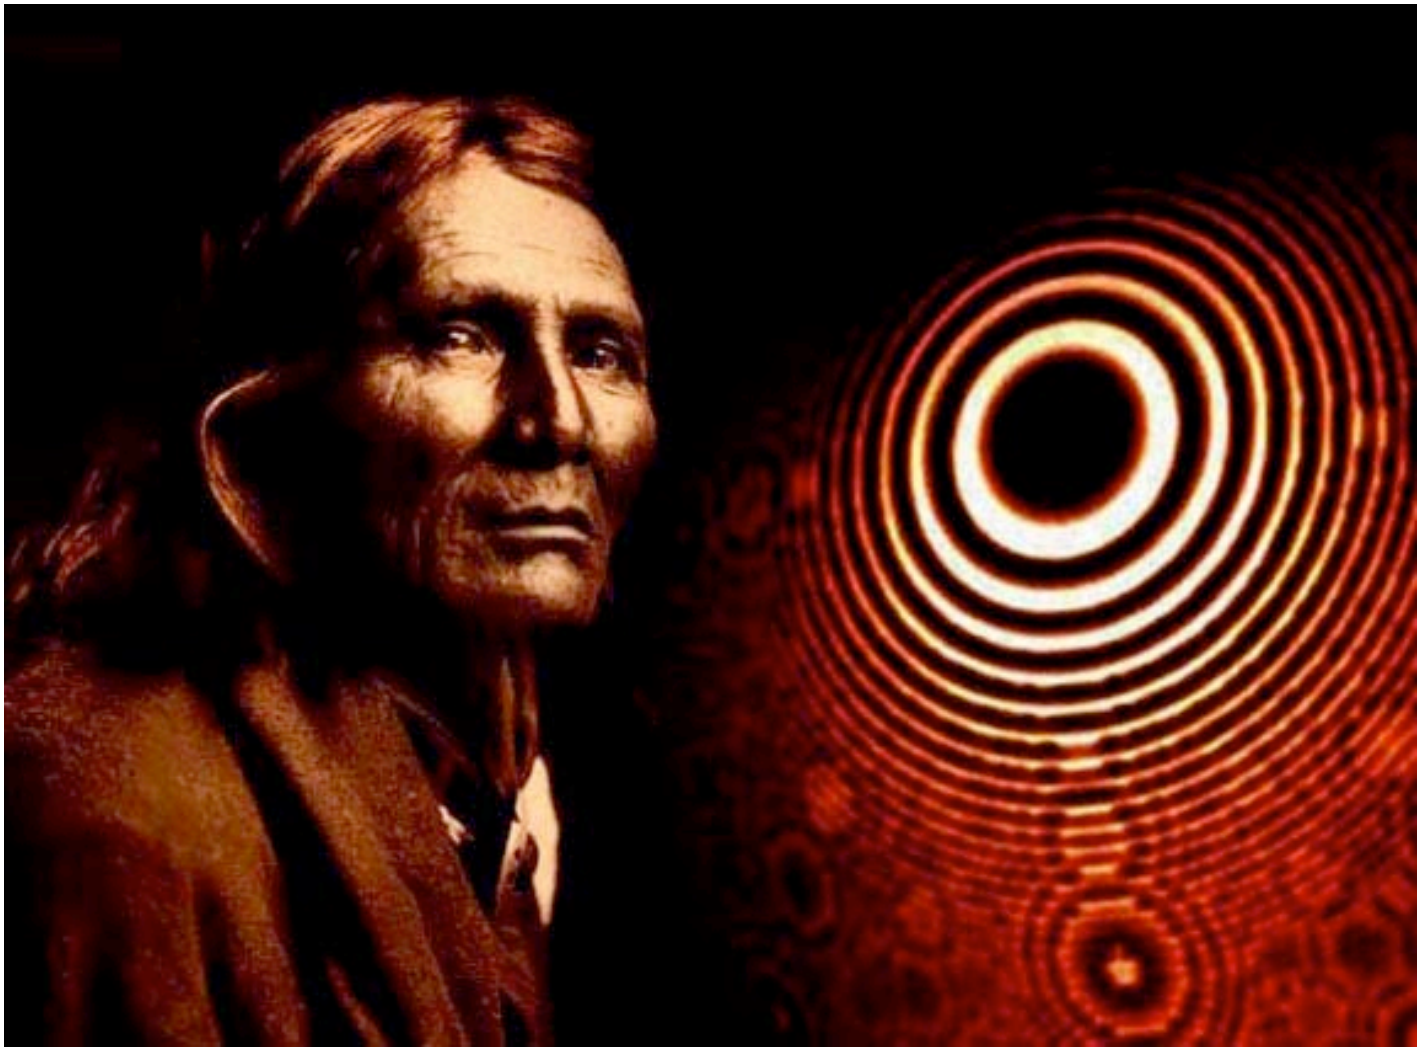


The ancient Hopi wisdom echoes that maintained by the Maya, describing the imminent shift from the second phase of Creation, during which the sun has shone yellow, to the third phase of Creation during which the Earth is bathed in red light: “The third phase of Creation is the time of the red light, Talawva, the perfect light. Humanity then, having been fully formed and [crystallized,] proudly faces the Creator for the first time, to know the true warmth of love.” While the Hopi prophecies ascribe no calendar date to the coming of the red light of the new solar age, their wisdom perfectly harmonizes with that of the Mayan culture, with its profound and complex calendar system providing the end date of December 22, 2012.

What could possibly trigger the dramatic changes in human consciousness, involving a shift in the light reaching Earth’s surface to a red hue? Solar physicists confirm the 11-year cycle of solar activity corresponds with the 2012 end date, the last solar maximum having been recorded in 2001. At each solar maximum the sun’s magnetic field reverses, but what could possibly induce the Earth’s magnetic field to reverse with our sun? Recent stellar observations in 2009 reveal the hidden threads which link one star system’s fate with another. A research team at UC Berkeley has recently reported data indicating the nearby red supergiant star Betelgeuse is shrinking in the process of imminent collapse:

> Betelgeuse is enshrouded by vast clouds of gas and dust, so measuring its size is difficult. To cut through this cocoon, Charles Townes of the University of California, Berkeley, and colleagues used a set of telescopes that are sensitive to a particular wavelength of the star's infrared light.
>
> But the star's reach seems to be waning. New observations indicate the giant star has shrunk by more than 15 per cent since 1993. This could be a sign of a long-term oscillation in its size or the star's first death knells…
>
> The team used these instruments to measure the size of Betelgeuse's disc on the sky. Over a span of 15 years, the star's diameter seems to have declined from 11.2 to 9.6 AU (1 AU, or astronomical unit, is the distance from the Earth to the sun)… The cause for this reduction is unknown, as it is unclear how red supergiants behave near the end of their lives.[7]

One may easily identify similar patterns in the energy fluctuations of both red supergiant Betelgeuse and our own small yellow Sol. The contraction and collapse of Betelgeuse is being mirrored on the Sun, which has seen a prolonged period of spotless inactivity for the period of 264 days preceding the appearance of Sunspot 1024 in July of 2009. *Both stars dimming together represents the contraction before the full strike of the wave, as the supernova’s energetic blast wave reaches the Earth.*



Plasma physicists proposing the Electric Universe theory have keenly observed the pulsed throughput of energy that generates the dynamics of stellar interactions, overturning the false notion of stars as independent thermonuclear generators with their own self-determined lifecycle. The lifecycles of stars are actually intertwined with the cycling waves of energy that traverse the spiral arms of our galaxy. Galactic waves are generated as pulsations of infrasound emitted from the center of our galaxy that traverse its arms, gaining momentum from the radiated energy of supernovae that are set off by the wave's influence in a chain of events moving outward. Red supergiant Betelgeuse, at the shoulder of the constellation Orion (at left), is the nearest in a chain of supernova events along the expanding wave front, and acts as our local indicator by which we can estimate the arrival time of the galactic energy wave.

Further analysis of the data obtained by the UC Berkeley team should also provide the rate of acceleration of the stellar collapse and give us a fairly good estimate for the moment of supernova. Considering the fact that Betelgeuse is our close neighbor at about 600 light-years distance, this event has already occurred and the nova will be visible to us in just a few years time. So, when exactly will the electromagnetic wave hit Earth, and how will it affect us?

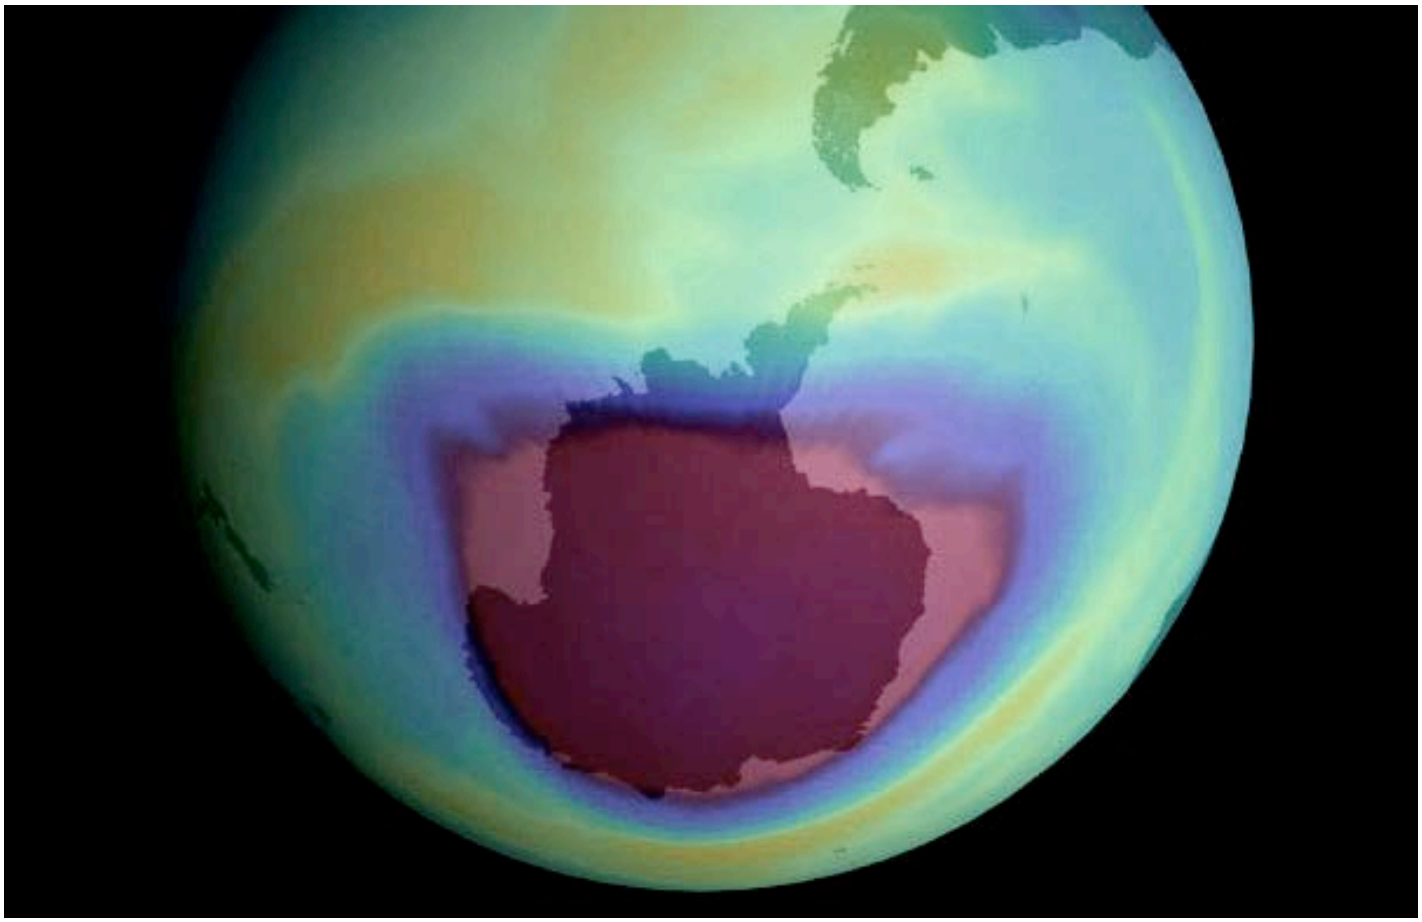
Certainly, the Betelgeuse supernova will be seen as a major flash of light plainly visible even during the daylight hours. The supernova may shine very brightly for many days. The more complex unfolding of events triggered by the supernova involve many factors not commonly understood by astrophysicists. For time indications of the potential hazards and benefits of these electromagnetic changes we must turn to the most ancient and most accurate calendar system known to man. Mayan wisdom gives us an exact date for the change of the ages (December 22, 2012), and an exact sign is given as well – the Red Sky.

The Maya use of sacred celestial waters within the pyramids for healing and longevity is an open invitation to sacrifice the false comforts of urban society that disrupt the natural acoustic environment and isolate people from electrical contact with the Earth. Industrial man finds dissonance and disease in concrete boxes, whereas resonance and longevity are to be found in the celestial waters and barefoot lifestyle practiced at sacred sites. The Maya invite us all to come together as one: "The cycle of years is past - the waiting ended. Come - reunite, pilgrims, for the sky is in flames! From Xochicalco to Teotíhuacan the red spreads one step, another step, and another…"

Yaqui Elder Don Juan spoke of waiting for the 2012 event during his teachings to cultural anthropologist Carlos Castaneda, stating emphatically: "[As seers] our case is a bit different, because we are at the end of our trail. We are not seeking anything... we go from day to day doing nothing. We are waiting. I will not tire of repeating this: we know that we are waiting and we know what we are waiting for. We are waiting for freedom!" [8] The progressive energetic changes currently raising human consciousness will cause fear and panic only for those who are unprepared, while many spiritually awakened individuals have been preparing for the Purification Day.

Apache Elder Stalking Wolf related his profound visions of the future in the Prophecy of the Red Sky, received as a vision several decades before the foretold events, and later published by Tom Brown Jr.:

> In the 1920s, an Apache wise man had a Vision of four prophecies that foretold death and destruction for mankind, unless we incorporate Spirit in our daily lives. Two of these prophecies may already have come true. A number of people can predict the future, but few get the timing correct. "Grandfather" was an Apache wise man and scout, named Stalking Wolf, who grew up outside white man's influence. His many predictions not only came true in the manner he predicted, but also when he predicted...
>
> Grandfather had been wandering for several years and was well into his forties when the Vision of the four signs was given to him. He had just finished his third Vision Quest at the Eternal Cave when the Vision made itself known. He had been seated at the mouth of the cave, awaiting the rising Sun, when the spirit of the warrior appeared to him. He felt as if he were in a state somewhere between dream and reality, sleep and wakefulness, until the spirit finally spoke and he knew that it was not his imagination. The spirit called Grandfather's name and beckoned him to follow.
>
> As Grandfather stood, he was suddenly transported to another world. Again, he thought that he was dreaming, but his flesh could feel the reality of this place; his senses knew that this was a state of abject reality, but in another time and place.
>
> The spirit warrior spoke to Grandfather. "These are the things yet to come that will mark the destruction of man. These things you may never see, but you must work to stop them and pass these warnings on to your grandchildren. They are the possible futures of what will come if man does not come back to the Earth and begin to obey the laws of Creation and the Creator. There are four signs, four warnings, that only the children of the Earth will understand. Each warning marks the beginning of a possible future, and as each warning becomes reality, so too does the future it marks"...



The First Sign

..."Welcome to what will be called the 'land of starvation'. The world will one day look upon all of this with horror and will blame the famine on the weather and the Earth. This will be the first warning to the world that man cannot live beyond the laws of Creation, nor can he fight Nature... There will come starvation before and after this starvation, but none will capture the attention of the world with such impact as does this one. The children of the Earth will know the lessons that are held in all of this pain and death, but the world will only see it as drought and famine, blaming Nature instead of itself"...

In his dream, the spirit spoke to Grandfather. "It is during the years of the famine, the first sign, that man will be plagued by a disease, a disease that will sweep the land and terrorize the masses. The white coats [doctors/scientists] will have no answers for the people, and a great cry will arise across the land. The disease will be born of monkeys, drugs and sex. It will destroy man from inside, making common sickness a killing disease. Mankind will bring this disease upon himself as a result of his life, his worship of sex and drugs, and a life away from Nature. This, too, is a part of the first warning; but, again, man will not heed this warning and he will continue to worship the false gods of sex and the unconscious spirit of drugs."

The Second Sign

The spirit looked at Grandfather for a long moment, then finally spoke. "Holes in the sky... will become the second sign of the destruction of man. The holes in the sky and all that you have seen could become man's reality. It is here, at the beginning of this second sign, that man can no longer heal the Earth with physical action. It is here that man must heed the warning and work harder to change the future at hand. But man must not only work physically, he must also work spiritually, through prayer, for only through prayer can man now hope to heal the Earth and himself...

"These holes are a direct result of man's life, his travel, and of the sins of his grandfathers and grandmothers. These holes, the second sign, will mark the killing of his grandchildren and will become a legacy to man's life away from Nature. It is the time of these holes that will mark a great transition in mankind's thinking. They will then be faced with a choice-a choice to continue following the path of destruction, or a choice to move back to the philosophy of the Earth and a simpler existence. It is here that the decision must be made, or all will be lost...

The Third Sign

Grandfather spent the next four days at the cave entrance, though for those four days nothing spoke to him, not even the Earth. He said that it was a time of great sorrow, of aloneness, and a time to digest all that had taken place.

He knew that these things would not appear in his lifetime, but they had to be passed down to the people of the future with the same urgency and power with which they had been delivered to him. But he did not know how he would explain these unlikely events to anyone. Surely the elders and shamans of the tribes would understand, but not society, and certainly not anyone who was removed from the Earth and Spirit.

He sat for the full four days, unmoving, as if made of stone, and his heart felt heavy with the burden he now carried.

It was at the end of the fourth day that the third Vision came to him. As he gazed out onto the landscape towards the setting Sun, the sky suddenly turned to a liquid and then turned blood-red. As far as his eyes could see, the sky was solid red, with no variation in shadow, texture or light. The whole of Creation seemed to have grown still, as if awaiting some unseen command. Time, place and destiny seemed to be in limbo, stilled by the bleeding sky. He gazed for a long time at the sky, in a state of awe and terror, for the red color of the sky was like nothing he had ever seen in any sunset or sunrise. The color was that of man, not of Nature, and it had a vile stench and texture. It seemed to burn the Earth wherever it touched. As sunset drifted to night, the stars shone bright red, the color never leaving the sky, and everywhere the cries of fear and pain were heard.

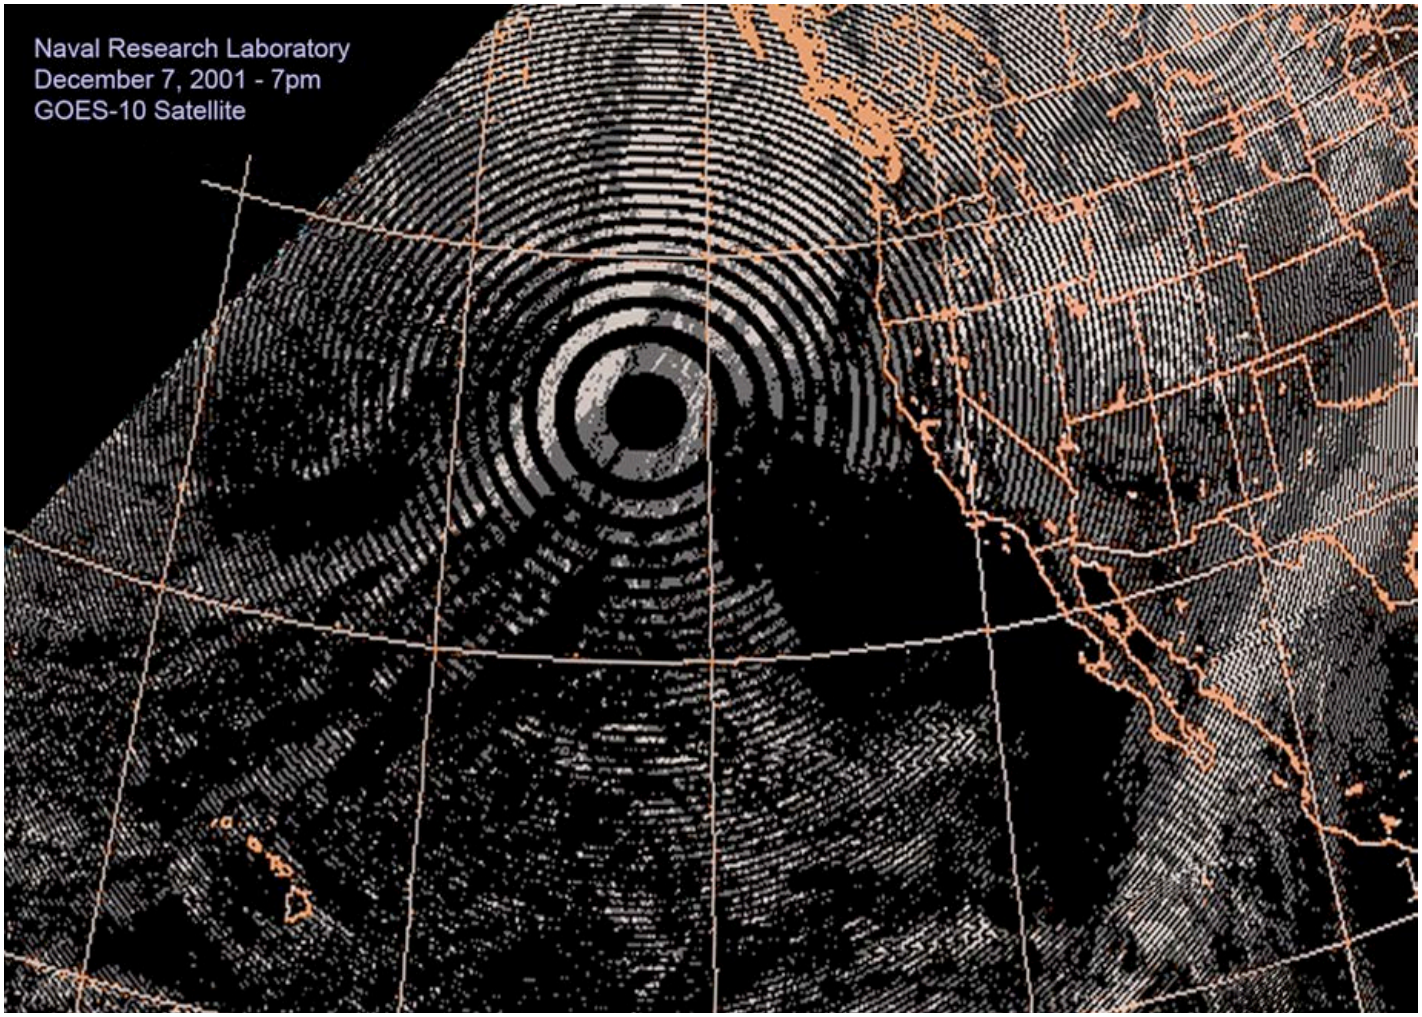
Again, the warrior spirit appeared to Grandfather, but this time as a voice from the sky. Like thunder, the voice shook the landscape. "This, then, is the third sign, the night of the bleeding stars. It will become known throughout the world, for the sky in all lands will be red with the blood of the sky, day and night. It is then, with this sign of the third probable future, that there is no longer hope. Life on the Earth as man has lived it will come to an end, and there can be no turning back, physically or spiritually. It is then, if things are not changed during the second sign, that man will surely know the destruction of the Earth is at hand. It is then that the children of the Earth must run to the wild places and hide. For when the sky bleeds fire, there will be no safety in the world of man."

Grandfather sat in shocked horror as the voice continued. "From this time, when the stars bleed, to the fourth and final sign, will be four seasons of peace [that is, one year]. It is in these four seasons that the children of the Earth must live deep in the wild places and find a new home, close to the Earth and the Creator. It is only the children of the Earth that will survive, and they must live the philosophy of the Earth, never returning to the thinking of man. And survival will not be enough, for the children of the Earth must also live close to the Spirit. So tell them not to hesitate if and when this third sign becomes manifest in the stars, for there are but four seasons to escape"… Grandfather said that the voice and red sky lingered for a week, and then were gone as quickly as they were manifest.

The Fourth Sign

He did not remember how many days he'd spent at the mouth of the cave, nor did it make a difference, for he had received the Vision he had come for. It was in his final night at the Eternal Cave that the fourth Vision came to Grandfather, this time carried by the voice of a young child.

The child said, "The fourth and final sign will appear through the next ten winters [that is, ten years] following the night that the stars will bleed. During this time, the Earth will heal itself and man will die. For those ten years, the children of the Earth must remain hidden in the wild places, make no permanent camps, and wander to avoid contact with the last remaining forces of man. They must remain hidden, like the ancient scouts, and fight the urge to go back to the destruction of man. Curiosity could kill many."



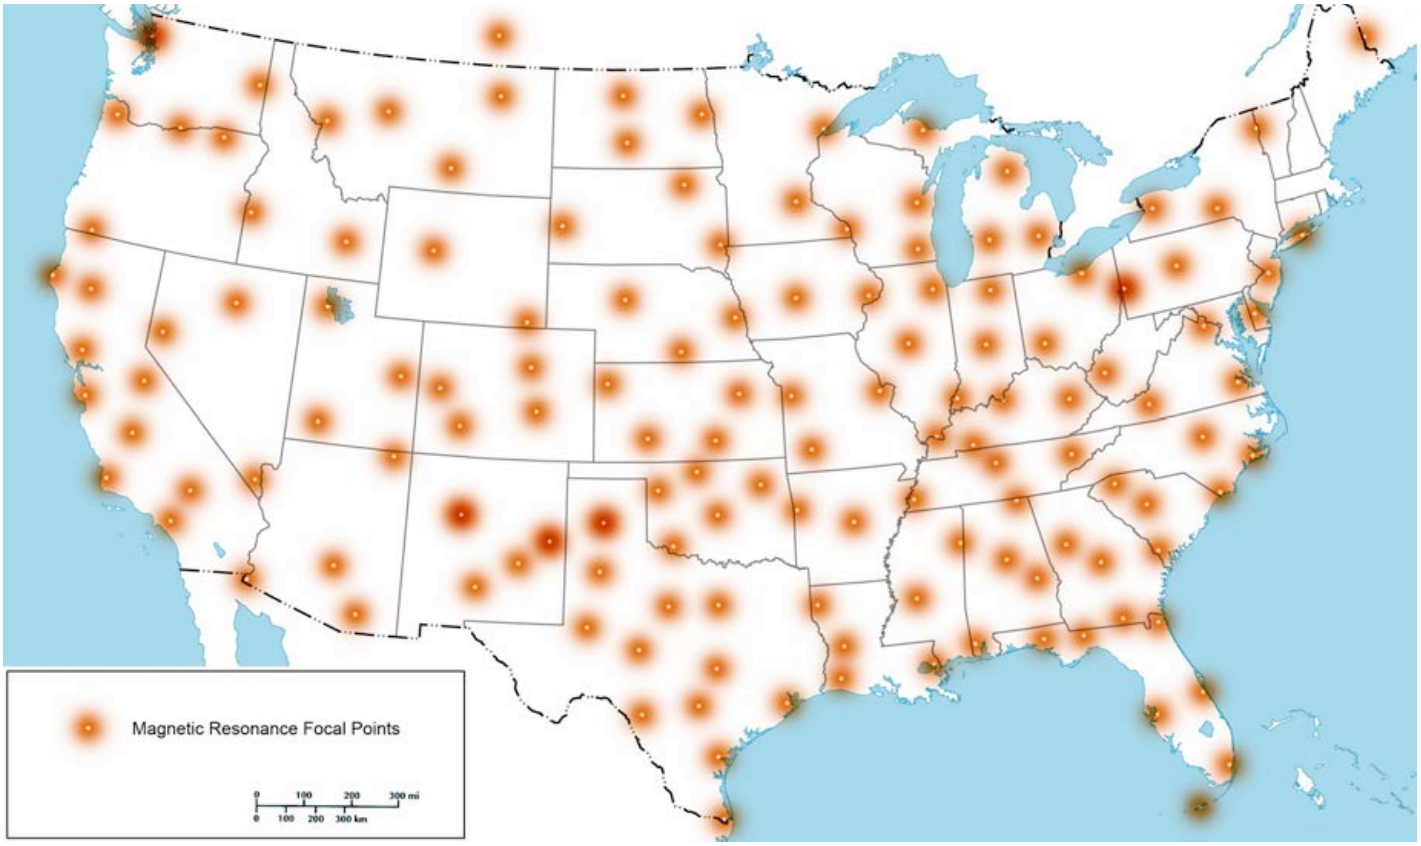
There was a long silence, until Grandfather spoke to the child spirit, asking, "And what will happen to the worlds of man?"

There was another period of silence until finally the child spoke again. "There will be a great famine throughout the world, like man cannot imagine. Waters will run vile, the poisons of man's sins running strong in the waters of the soils, lakes and rivers. Crops will fail, the animals of man will die, and disease will kill the masses. The grandchildren will feed upon the remains of the dead, and all about will be the cries of pain and anguish. Roving bands of men will hunt and kill other men for food, and water will always be scarce, getting scarcer with each passing year. The land, the water, the sky will all be poisoned, and man will live in the wrath of the Creator. Man will hide at first in the cities, but there he will die. A few will run to the wilderness, but the wilderness will destroy them, for they had long ago been given a choice. Man will be destroyed, his cities in ruin, and it is then that the grandchildren will pay for the sins of their grandfathers and grandmothers."

"Is there then no hope?" Grandfather asked.

The child spoke again. "There is only hope during the time of the first and second signs. Upon the third sign, the night of the bleeding, there is no longer hope, for only the children of the Earth will survive. Man will be given these warnings; if unheeded, there can be no hope, for only the children of the Earth will purge themselves of the cancers of mankind, of mankind's destructive thinking. It will be the children of the Earth who will bring a new hope to the new society, living closer to the Earth and Spirit."

> Then all was silent, the landscape cleared and returned to normal, and Grandfather stepped from the Vision. Shaken, he said that he had wandered for the next season, trying to understand all that had been given to him, trying to understand why he had been chosen.
>
> Grandfather had related the story to me in great detail during that night of the four prophecies. I don't think that any event had been left out, and his emotions and thoughts were such that he actually relived it for us. Thus the power of his Vision became part of our spirit, our driving force, and a big part of our fears.[9]



The prophetic accuracy of Stalking Wolf's visions are quite stunningly clear thus far, both in their highly detailed descriptions and sequence of events, as presented to the young Tom Brown and friends. Here is the prophesied timeline as interpreted in the context of the ongoing magnetic polar reversal:

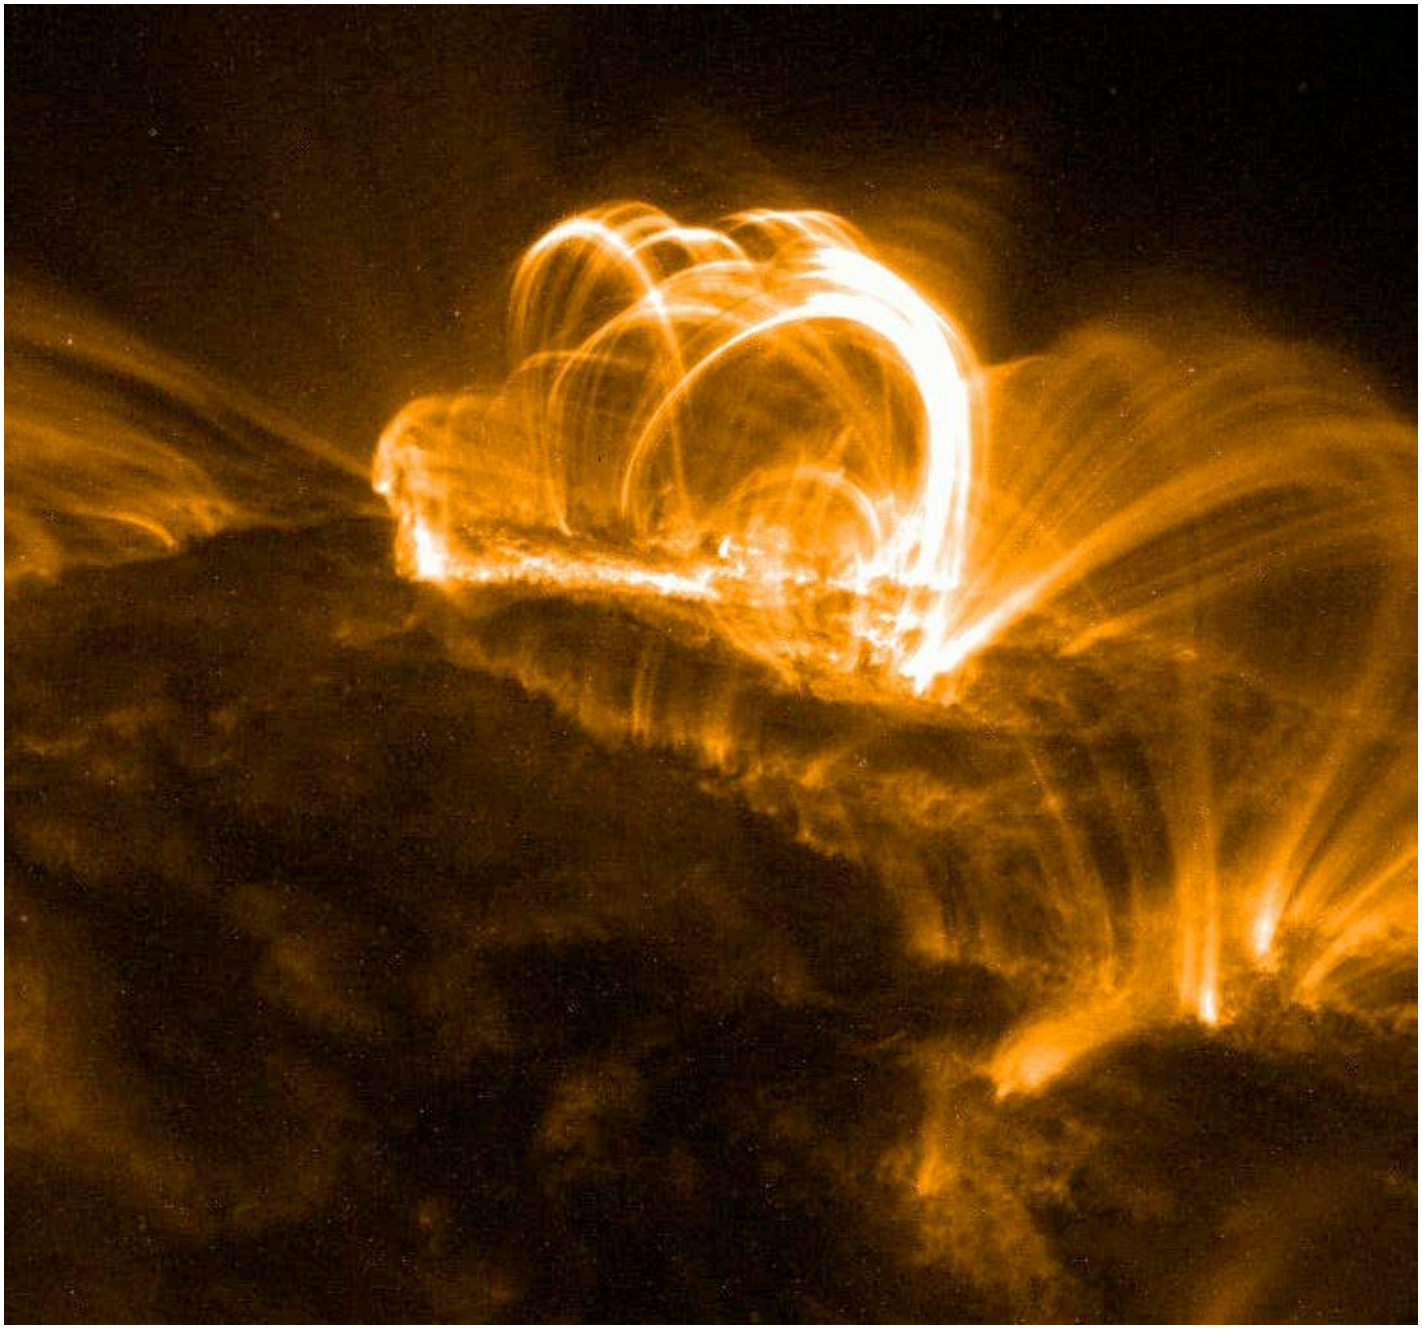
1st Sign:	1975–1985	African famine and AIDS pandemic spread
2nd Sign:	1985–1995	Holes form in Earth's ozone layer, permitting destructive solar rays
3rd Sign:	Dec 22, 2012	Magnetic reversal ignites a plasma canopy seen as red skies worldwide
4th Sign:	2013–2023	Large-scale destruction of low-resonance human technology ensues

Apache Grandfather Stalking Wolf experienced visions of the dramatic changes that have since occurred, and are yet to come, providing us with the culminating event marking the emergence of a new solar era. However, there are multitudes of more subtle signs of these oncoming electromagnetic changes that can be understood only in this context. The effects of shifting gravity and enhanced electromagnetic fields have been documented all over world, especially in areas where we find pyramids, or megalithic structures. These electromagnetic fields are focused by the axis-symmetric geometries of the pyramids of Giza, Egypt, thereby redistributing solar energy into a fixed global pattern of infrasound standing waves. These patterns of infrasound resonance have even been observed by satellite during the last solar maximum, on the night of December 7-8, 2001, in the infrared spectrum (above).[10]

Deeply resonant humming heard in these infrasound hotspots is continually generating millions of reports of disturbance and annoyance worldwide, with new telephone hotlines even fielding calls from concerned residents to quell the panic. Deep infrasound booms like heartbeats have been reported all over the world by residents of Llanidloes, Mawnan, Bridlington, Auckland, Sydney, Klai, Ranchlands, and in the US in Anderson,[11] Kimberley,[12] Richmond,[13] Wilmington,[14] Knoxville,[15] Mobile,[16] Knob Noster,[17] Denver,[18] Seattle,[19] Arroyo Grande[20] and Atwater.[21] Infrasound resonance focal points in the US are mapped below.

What is initially perceived as an annoyance quickly becomes a clear and present danger, as the infrasound resonance starts to overload all metals and wires with electricity until the extreme heat ignites fires. As Stalking Wolf emphasizes, “when the sky bleeds fire, there will be no safety in the world of man.” All of the modern electrical technologies of humanity will not only cease to function, but will endanger human beings by spontaneous combustion. The surprising ignition of plastic-sheathed copper wiring was first noted in 1859 when a massive solar ejection shorted out and then ignited telegraph lines across the entire United States and all of Europe, and auroras were seen as far south as Rome and Hawai’i.[22]

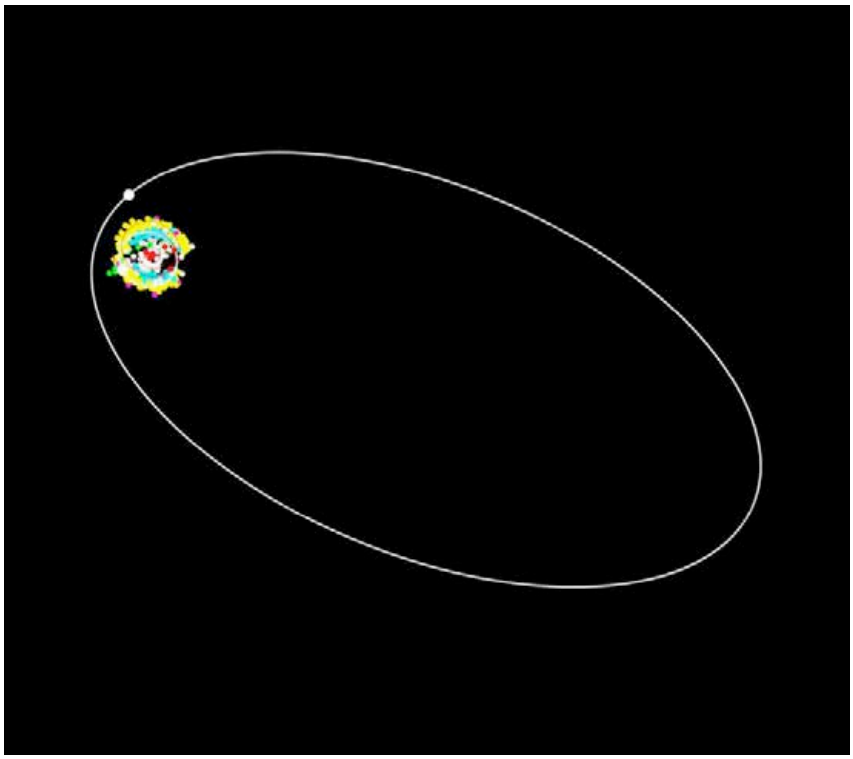
Periods of elevated infrasound resonance have generated hundreds of fires in homes across the world. These resonant fires are located in the nodes of an infrasound standing wave pattern that is increasing in intensity, eventually requiring total evacuation of residents from areas like Tenerife,[23] Babura,[24] Lalapansi,[25] Mapuve,[26] Bodibe,[27] Landovica,[28] Peschici,[29] Berici,[30] Messina,[31] northern Greece,[32] Kishtwar,[33] Ratria,[34] Santo Tomas,[35] and in the US in Seattle,[36] Colorado Springs,[37] San Mateo[38] and Santa Barbara.[39] A grave danger to personal safety in these regions of infrasound resonance will be posed by cellphones, which will ignite spontaneously in the pockets of clothing, as discovered already by one unfortunate man in Vallejo, California.[40] Such surprising events will be an inevitable occurrence in the years to come.



One of the most interesting incidents of this kind recently occurred in Soesterberg, Netherlands where, on the morning of July 19, 2009, ball lightning descended on the town in an unprecedented series of events.[41] Residents reported fast-moving ball lightning in more than 100 homes that sustained extensive damage to electrical systems. One eyewitness described a purple beam of light that shot skyward through the roof of one home. The fact that nobody was injured in Soesterberg is remarkable.

Clearly, modern civilization's embrace of electrical wiring is becoming a dangerous trap in many parts of the world, eventually threatening to kill anyone who cannot return to a life close to spirit and in the natural places of the Earth. Even high above the planet, infrasound drumming has been reported on multiple occasions onboard the International Space Station (ISS) in 2004 – the result of an infrasound resonance of standing waves that will inevitably destroy the station's systems as it has in many homes far below:

> The two men aboard the international space station heard a strange metallic sound again Friday, four months after being startled by it the first time… Cosmonaut Alexander Kaleri was talking to flight controllers in Moscow when he heard a loud drum-like noise coming from the instrument panel of the station's Russian-built living quarters.
>
> Kaleri and astronaut Michael Foale first heard the mystery noise - described as a flapping sheet of metal - back in late November. Neither the crewmen nor flight controllers were ever able to identify the sound… "It's very strange," Russian Mission Control said. "I doubt that it would be a coincidence that you're hearing the same thing coming from the same place."
>
> During a spacewalk in February, Kaleri and Foale were supposed to check the exterior of the space station where the noise originated last November. But Kaleri's spacesuit overheated and became damp, and the spacewalk had to be cut short, so the men did not have time to inspect the area.[42]



The fact that Kaleri's investigative spacewalk was not possible as his spacesuit overheated is another result of the electrical effects of the standing wave resonance. While the event has been passed off as the result of 'space junk', NASA directed a spacewalk mission that abruptly failed, yet no link has been drawn between the anomalous acoustic energy heard with the anomalous heating of the astronaut's spacesuit. The infrasound energy that is likely causing the noisy drumming and the overheating of the cosmonaut's spacesuit will likely recur for a longer duration, building an electrical charge capable of rendering the systems of the International Space Station inoperable.

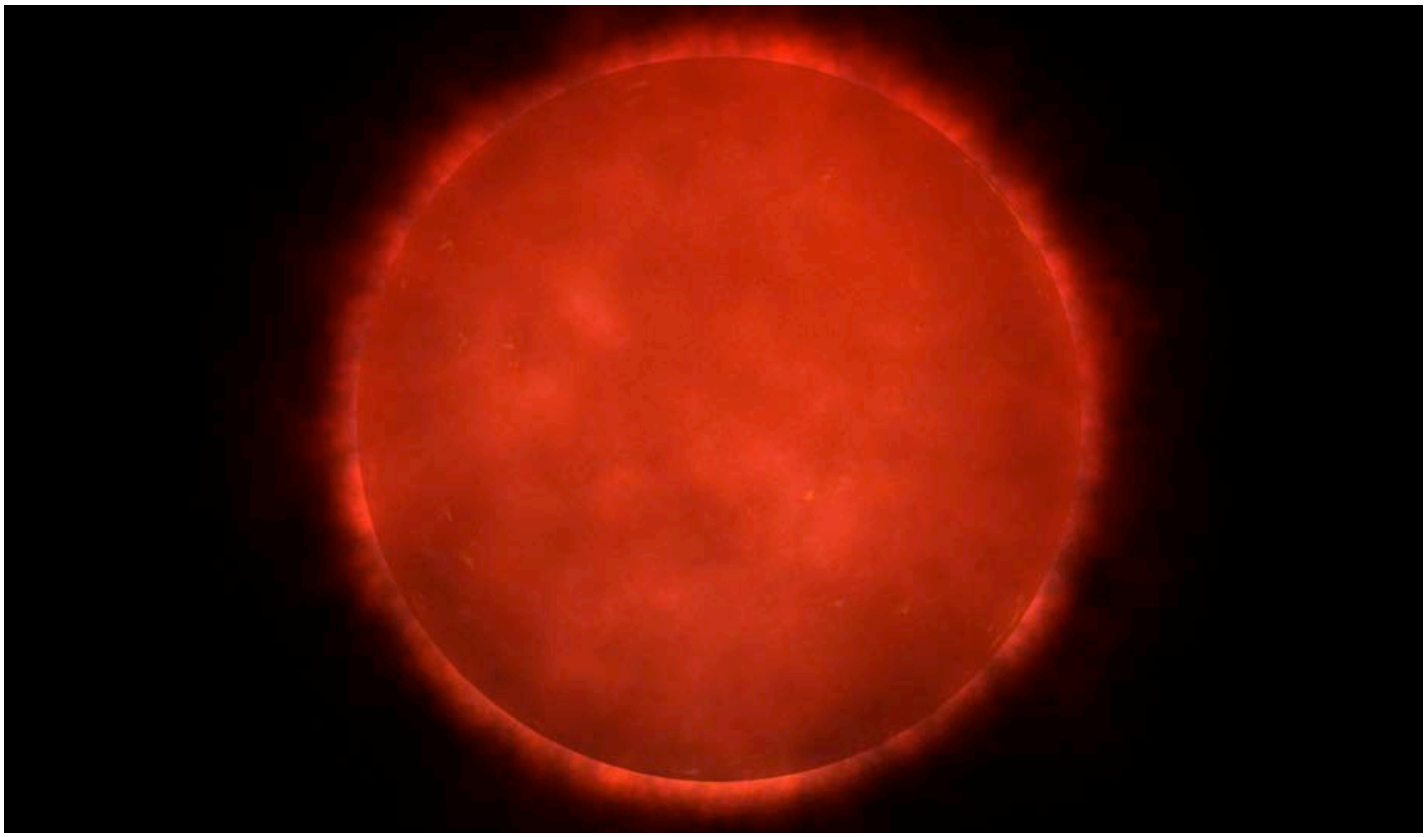
Hopi Elder White Feather relates a sacred prophecy describing the nine signs preceding the emergence of the new solar age on Earth – known to the Hopi as The Fifth World. The final sign clearly describes the destruction of the ISS as the last warning preceding the morning of the Red Dawn:

> "And this is the Ninth and Last Sign: You will hear of a dwelling-place in the heavens, above the Earth, that shall fall with a great crash. It will appear as a blue star. Very soon after this, the ceremonies of my people will cease.
>
> "These are the Signs that great destruction is coming. The world shall rock to and fro. The white man will battle against other people in other lands -- with those who possessed the first light of wisdom. There will be many columns of smoke and fire such as White Feather has seen the white man make in the deserts not far from here. Only those which come will cause disease and a great dying.
>
> "Many of my people, understanding the prophecies, shall be safe. Those who stay and live in the places of my people also shall be safe. Then there will be much to rebuild. And soon - very soon afterward - Pahana will return. He shall bring with him the dawn of the Fifth World. He shall plant the seeds of his wisdom in their hearts. Even now the seeds are being planted. These shall smooth the way to the Emergence into the Fifth World."

The Hopi prophecy details the order of events to occur, which can be deciphered when combined with the Mayan calendar wisdom which links the Red Dawn prophecy with the end date of 12.22.2012. Thus, the ISS may be interpreted as the sign of the Blue Star Katchina that precedes the 2012 event, like an alarm clock heralding its imminence. The Hopi tell that soon after the fall of the space station will come the appearance of the Red Star Katchina bringing the Day of Purification, when the skies in all lands of the Earth will bleed red.

Hopi Elders describe this future cosmic event in simple and clear terms: “a small Red Star which will come very close and sit in our heavens watching us.” Now, just wait a minute… stars are not known to wander around and sneak up on anyone! What exactly is being suggested by the Hopi? While it may come as a startling surprise for many, the Hopi description *accurately* reflects the scenario presented by the Binary Research Institute.[43] Astro-physics is now coming to grips with the reality that our solar system is a binary star system - that we will imminently discover a dark star companion in close proximity to our sun. The binary model is the only one that predicts the extremely elliptical orbit of Sedna (inset diagram at left), which must be highly influenced by our sun’s dark twin to maintain such an orbit.[44]

The Hopi sacred prophecies tell of the impending incandescence of a red star in the close vicinity of Earth, describing it as a revelation of the solar twins. The now hidden brown dwarf companion star will soon reach a critical proximity to the sun – its dormant surface will reignite, transforming it into a brilliant red star. The small size and dark brown color of the long-ago extinguished dark twin sun has allowed it to creep on its elliptical path back into close proximity of the solar system without our awareness, and its ignition will likely be triggered by the imminent wave front from the supernova of Betelgeuse.

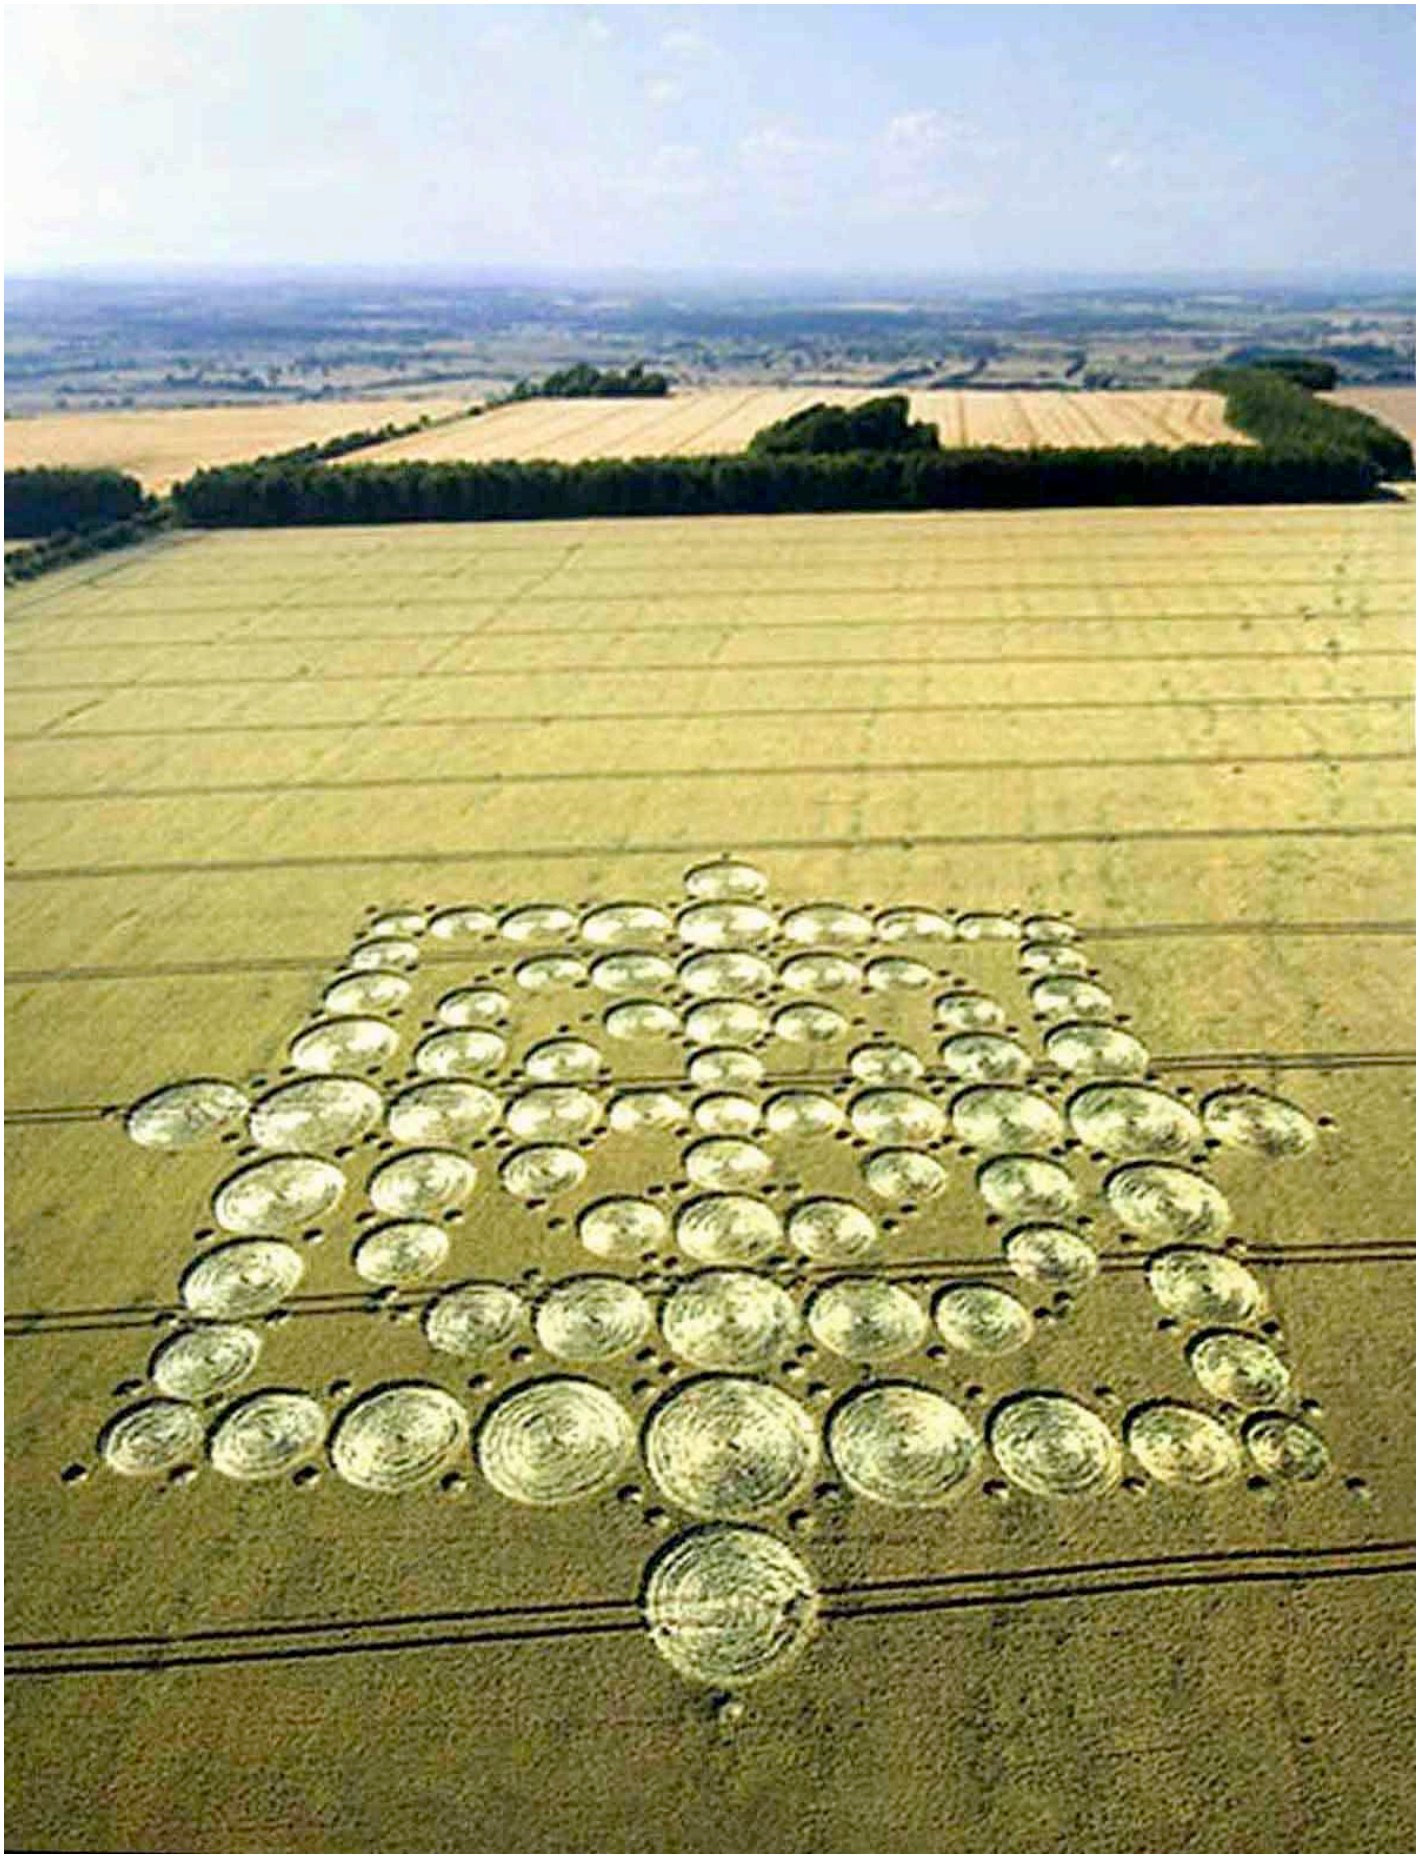


The red light of purification will emanate from this newly visible star, dramatically changing the color of our skies to a flaming red. This is referred to in the ancient wisdom as the Red Dawn of the forever cycle, where the consciousness and DNA of every living being will be transformed through the influence of the red light. Dr. Robert Ghostwolf and the Hopi Elders retell sacred traditional prophecies of the coming of the new world as an opportunity for the advancement of consciousness:

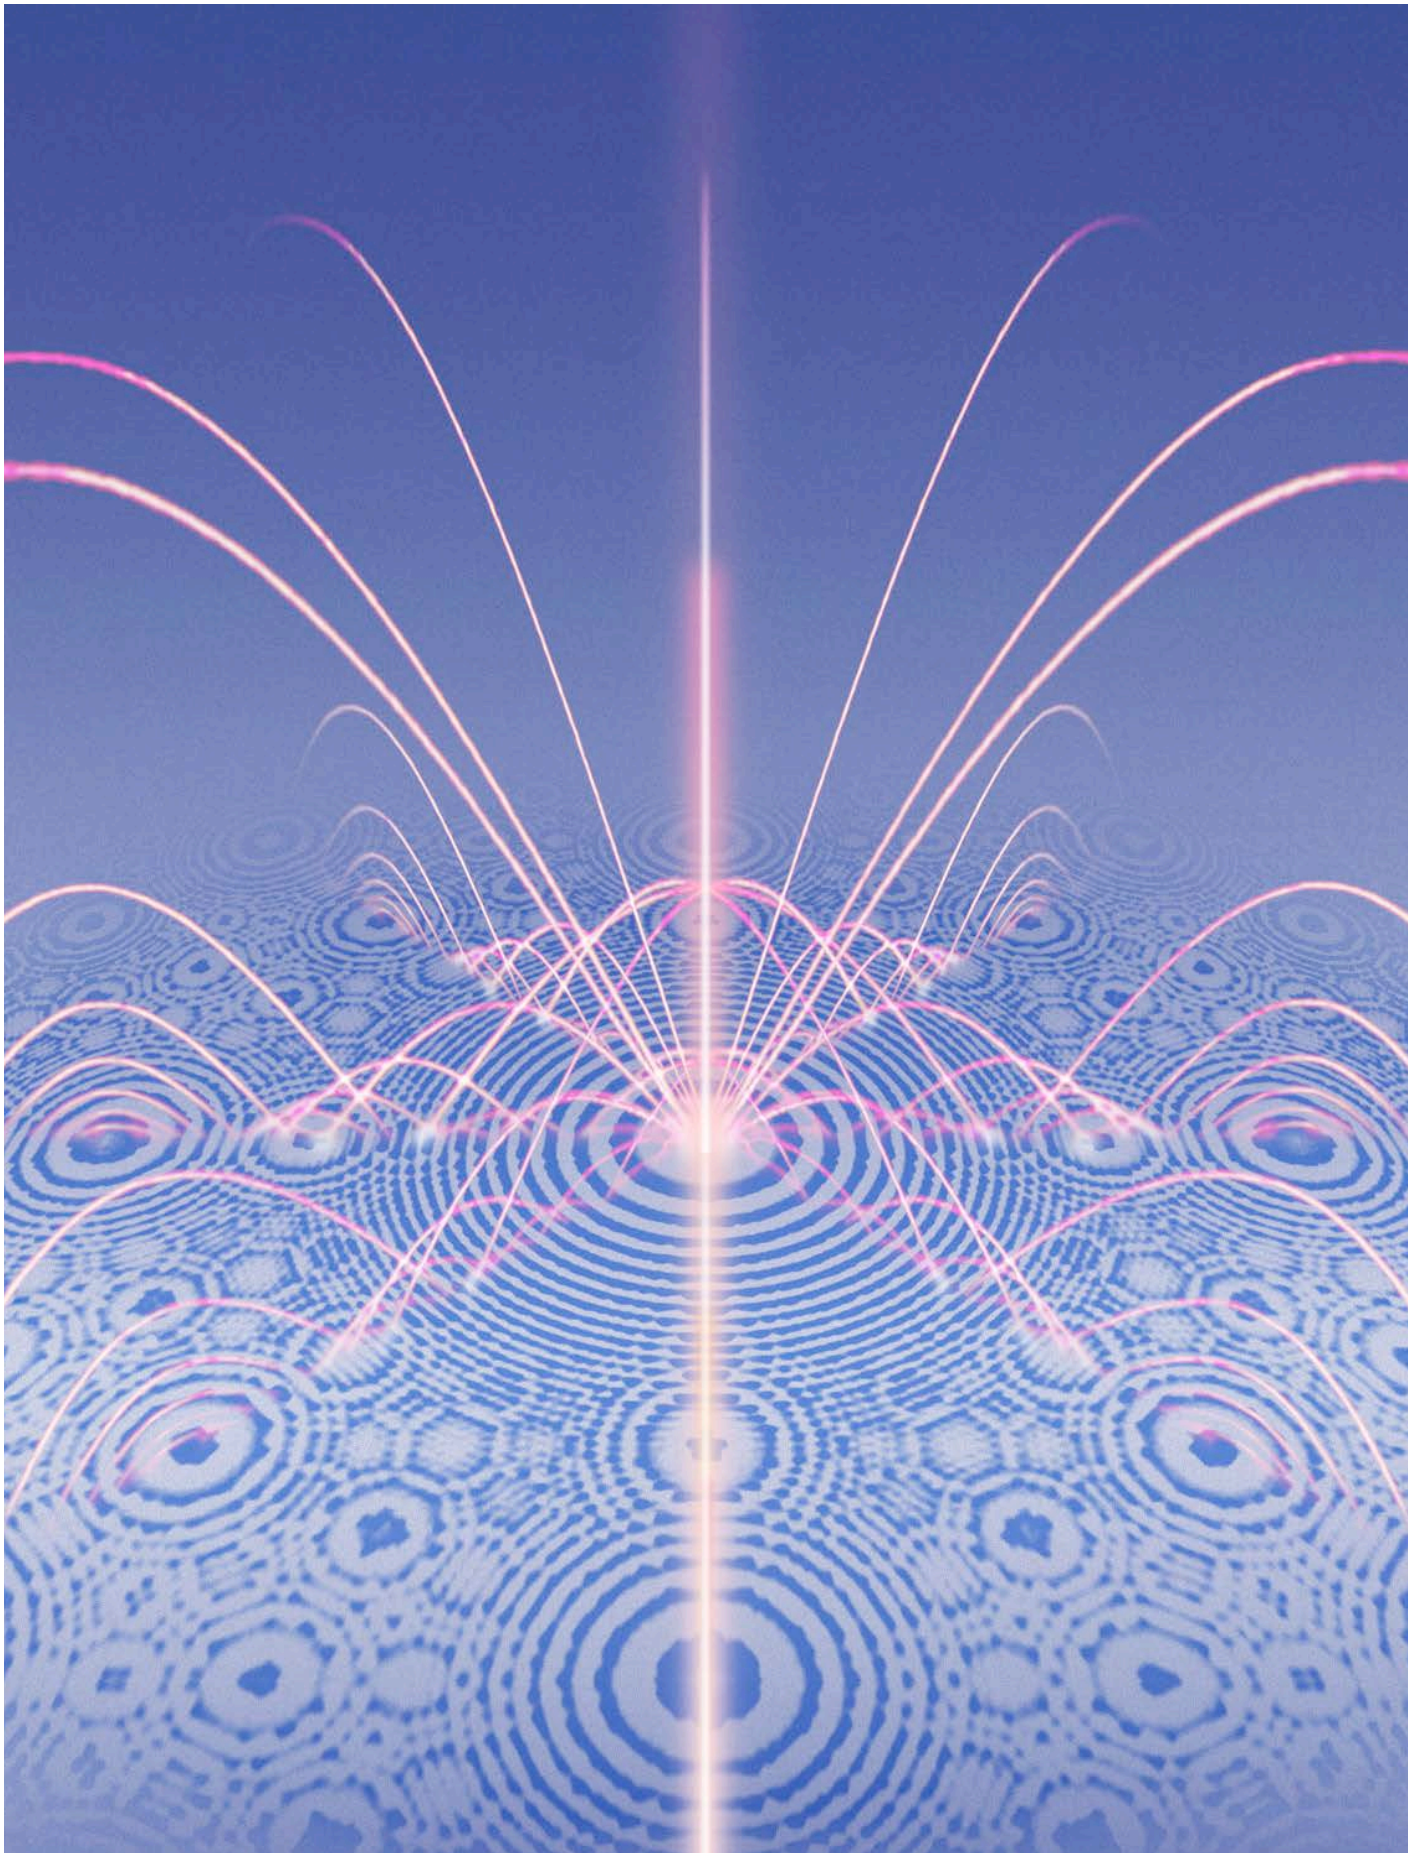
> The return of the Blue Star Katchina who is also known as Nan ga sohu will be the alarm clock that tells us of the new day and new way of life, a new world that is coming. This is where the changes will begin. They will start as fires that burn within us, and we will burn up with desires and conflict if we do not remember the original teachings, and return to the peaceful way of life.
>
> Not far behind the twins will come the Purifier, the Red Katchina, who will bring the Day of Purification. On this day the Earth, her creatures and all life as we know it will change forever. There will be messengers that will precede this coming of the Purifier. They will leave messages to those on Earth who remember the old ways.
>
> The messages will be found written in the living stone, through the sacred grains, and even the waters (Crop Circles have been found in ice). From the Purifier will issue forth a great Red Light. All things will change in their manner of being. Every living thing will be offered the opportunity to change from the largest to the smallest thing.

Those who return to the ways given to us in the original teachings, and live a natural way of life will not be touched by the coming of the Purifier. They will survive and build the new world. Only in the ancient teachings will the ability to understand the messages be found.

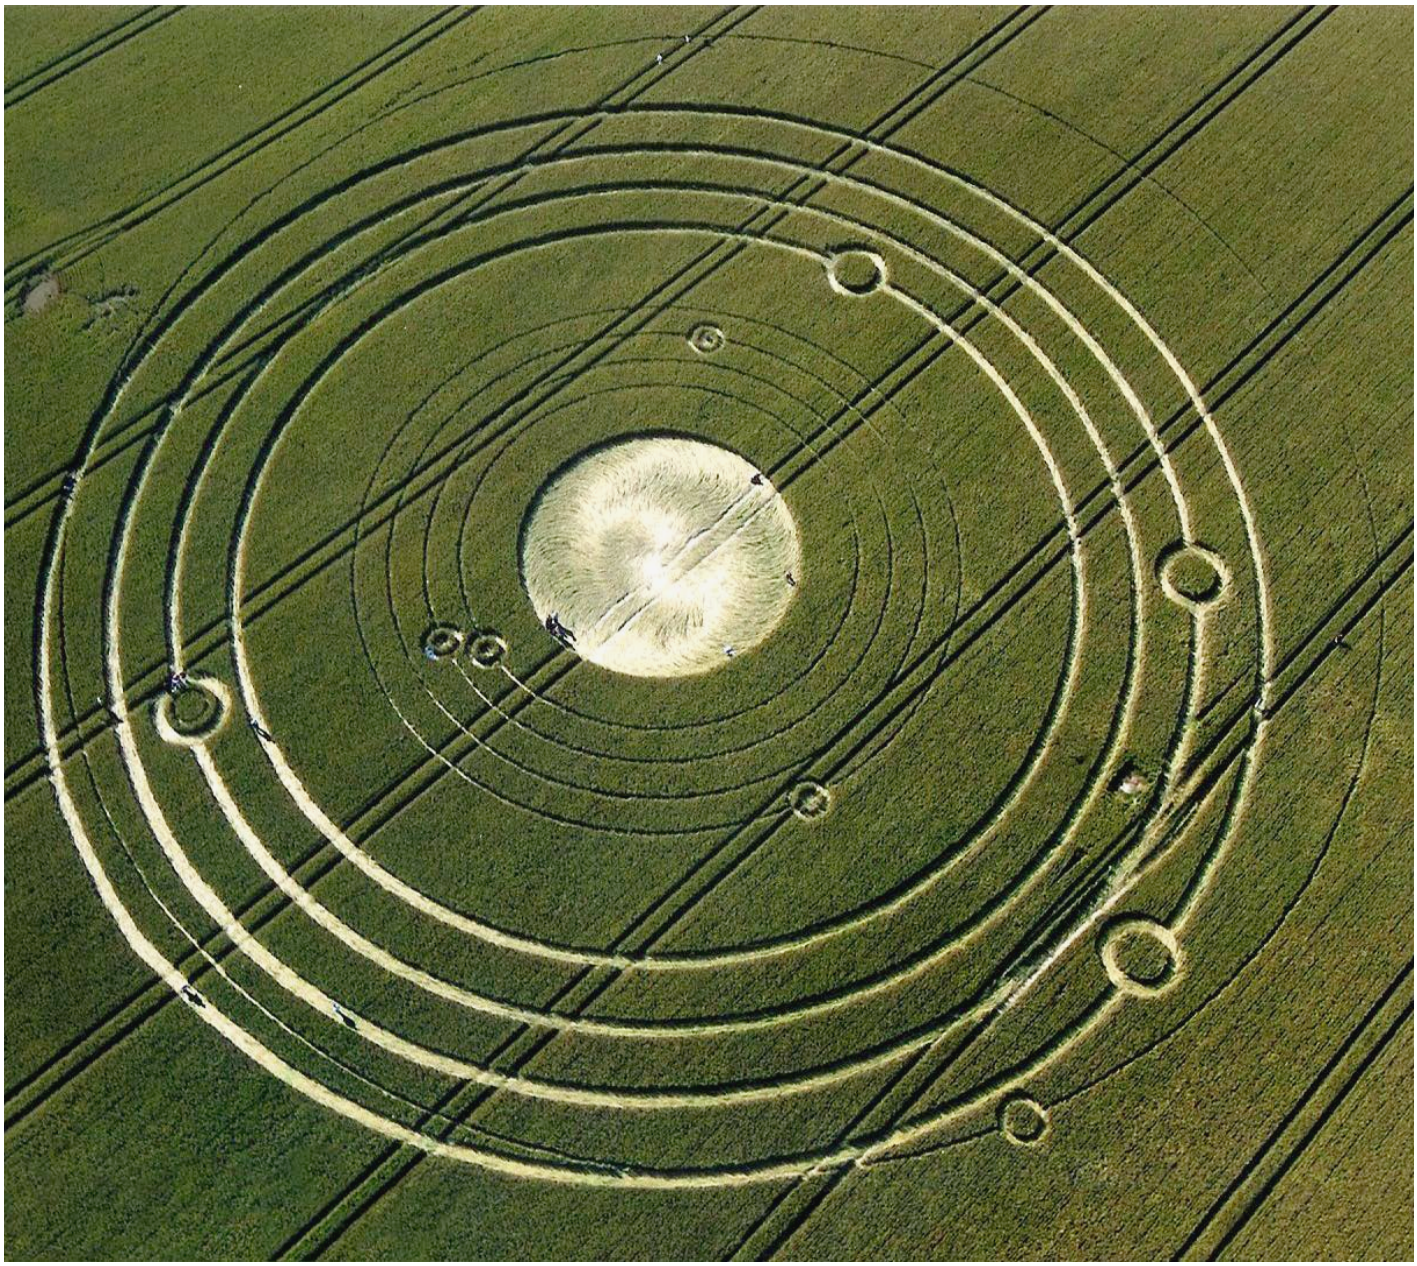
It is important to understand that these messages will be found upon every living thing, even within our bodies, even within a drop of our blood. All life forms will receive the messages from the twins... those that fly, the plants, even the rabbit. The appearance of the twins begins a period of seven years and will be our final opportunity to change our ways. Everything we experience is all a matter of choice...



When the Purifier comes we will see him first as a small Red Star which will come very close and sit in our heavens watching us. Watching us to see how well we have remembered the sacred teachings. This Purifier will show us many miraculous signs in our heavens. In this way we will know Creator is not a dream. Even those who do not feel their connection to spirit will see the face of creator across the sky. Things unseen will be felt very strongly.



Many things will begin to occur that will not make sense, for reality will be shifting back in and out of the dream state. There will be many doorways to the lower world that will open at this time. Things long forgotten will come back to remind us of our past creations. All living things will want to be present for this day when time ends, and we enter the forever cycle of the Fifth World.



We will receive many warnings allowing us to change our ways from below the Earth as well as above. Then, one morning in a moment, we will awaken to the Red Dawn. The sky will be the color of blood, many things will then begin to happen that right now we are not sure of their exact nature. For much of reality will not be as it is now.[45]

Hopi culture foretells invisible acoustic changes in the environment and in the hearts of human beings, as “things unseen will be strongly felt.” The Elders inform us “the messages will be found written in the living stone, through the sacred grains, and even the waters (Crop Circles have been found in ice).” For decades now, conscious plasma orbs have been forming geometric messages in ice and grain fields, providing coherent mathematical formulas. The most complex quadratic functions were rendered in England, where the Mandelbrot Set [$z_{n+1} = z_n^2 + c$] appeared in Ickleton in 1991.[46] Subsequent agro-glyphs formed at Lurkley Hill in 2006[47] and Wayland Smithy in 2008[48] presented a variation on the fractal formula: [$z_{n+1} = z_n^2$]. Remarkably, this formula exactly describes unusual IR satellite data from 2001.

The sacred grains of England were also impressed with the value of Pi in 2008, in the form of a ratcheted spiral that accurately renders the first 10 digits (3.141592654…).[49] The conscious plasma ball entities that form these stunning messages are offering advanced hyper-dimensional mathematics to human beings at this time in our spiritual development to prepare our consciousness for multi-dimensional awareness. The agroglyphs provide us with a map of the nodal points of infrasound standing wave patterns now being stimulated by increasing solar activity. The circle-makers have even provided a specific and unmistakable *calendar date* in a truly massive formation in Avebury, England in 2008, showing a precise configuration of all of the planets of the solar system – *confirming the T'zolkin calendar of the Maya:*

Avebury Manor of July 15, 2008 reminds us that the Mayan Long Count calendar will end on December 23, 2012: by showing precise orbital locations for all nine planets of our solar system on that date, plus an accurate elliptical orbit for Pluto.

The 5125-year Mayan Long count calendar will end on December 22-23, 2012. Given the long period of time which it represents, all nine planets of our solar system need to be shown in order to mark its end uniquely. Such a clever astronomical diagram was shown at Avebury Manor on July 15, 2008. All nine planets appear there precisely as they will be located in space four and one-half years from now on December 23, 2012...[50]

The indigenous Elders tell us that the messages of change will be received inside all living things, and each will be given an opportunity to change. Russian researchers have used infrasound and light waves to induce DNA transmutation, by which one species is genetically transmuted into another.[51] This discovery provides a new framework for quantum leaps in evolution, whereby quantum shifts from high to low levels of planetary infrasound resonance regulate the expression of DNA in Earth's many lifeforms.

New animal species are being encountered that are a sign of planet-wide genetic transmutations now occurring in hotspots of infrasound humming. An unusual new species now recorded often is a mostly hairless variety of purple/grey-skinned canine dubbed the 'hyote' (hyena/coyote, juvenile seen alive in captivity above), photographed and videotaped in Minnesota,[52] Maryland, Texas and Saudi Arabia. Sightings of various giant species of 'thunderbirds' have also been increasing around the world as species exhibit spontaneous DNA changes.

Another example of a new species now emerging at hotspots throughout the world is a kind of gracile fox that displays a long neck and large ears, with a tan coat that can be subtly spotted on the backside. The animal's fine facial features, combined with the extremely elongated limbs and tail, give it a deer-like appearance. This 'deerfox' has been photographed and observed in the US and in England (pregnant female and two juveniles seen in separate photographs, above).[53]

These same infrasound-related DNA changes are expressed in extraordinary human beings who possess profound cosmic knowledge of their pristine origins and the unlimited holographic capabilities enabled by such knowledge. A shining example of this truth is a young woman from the taiga forests of Siberia named Anastasia who has mastered ayurveda – *the art of living.* Having inherited the deepest of cosmic wisdom from her Vedruss forefathers, Anastasia provides us with the spiritual information that will germinate the seeds of human divinity now being planted in the fields of the Earth. The voices of the indigenous Elders of the world speak as one, revealing ancient Vedic knowledge of the transdimensional nature of human consciousness to guide our path of ascent into the red light of Oneness.

The Sanskrit wisdom traditions of Russia have recently revealed a profound knowledge of nature that forms the basis for the use of heartbeat resonance in monumental psychoacoustics. Timeless Vedic wisdom understands the seed as physician and the tree as an organic antenna - a collector of cosmic energy for the single purpose of powering the human heart and spirit. The Vedruss Elders of Siberia reveal their process of DNA imprinting of seeds for the creation of a resonant field of heartbeat synchronization.[54] By heartbeat entrainment through seed imprinting, the family of Anastasia has created a resonant field of infrasound that amplifies their heartbeat to enable astral travel through the Akashic field of planetary infrasound standing waves *on the heartbeat frequency of love*:

> "When someone is in a state of love they emit a radiant energy. It takes but a split second for it to reflect off the planets floating overhead and come back to Earth to give life to everything that breathes… The Sun is one of those planets, and it reflects but a tiny fraction of such radiance. Only bright rays can travel into Space from Man on the Earth. And only beneficial rays can be reflected from Space back to Earth."
>
> "Under the influence of malicious feelings Man can emit only dark rays. These dark rays cannot rise but must fall into the depths of the Earth. Bouncing off its core, they return to the surface in the form of volcanic eruptions, earthquakes, wars, etc. The culminating achievement of these dark rays is their direct effect on the Man originating them, invariably exacerbating the man's own malicious feelings." [55]

Vedruss knowledge echoes the call of the Hopi Elders, who foretell of the great increase in the energies moving through human beings, whose inner emotional states will become amplified in the light of the Red Purifier to manifest as fires that will burn within us. *Malevolent feelings will consume those who harbor them, while the rays of love will also become equally amplified to generate healing forces in human beings who harbor a deep Creational love by living as one being in heartbeat resonance.*

Hopi Elders also foretell of portals to the lower worlds that will be opening at this time to remind us of our past creations. Referred to as *'sipapu'*, these lower realms are described in Hopi wisdom traditions as having been used to preserve the human race during previous cataclysmic events on Earth. Yaqui Elder Don Juan elaborated on the secret knowledge possessed by ancient Nahuatl seers pertaining to the motive properties of fire and water for bodily transport to fourth-density realms of inorganic life, in artificially generated HHO plasma chambers both above and below the Earth's surface:

> He continued then with his elucidation of the practices of the old seers. Another of their great findings had to do with the category of secret knowledge: fire and water. They discovered that flames have the most peculiar quality; they can transport man bodily, just as water does... They considered flames and fluidity to be higher, magical properties, and they used them as a means for bodily transportation to the realm of inorganic life.[56]
>
> Don Juan said that the old seers observed that the wetness of water only dampens or soaks, but the fluidity of water moves. It runs, they surmised, in search of other levels underneath us. They believed that water had been given to us not only for life, but also as a link, a road to the other levels below... to be transported bodily by the fluidity of water anywhere between this level of ours and the other seven levels below.[57]
>
> The knowledge of the below had to do with fog, water of underground springs, swamps, lightening bolts, earthquakes, the night, moonlight and the moon.[58]
>
> "[Some men of knowledge] endeavored to use *seeing* positively and to teach it to their fellow men. I'm convinced that under their direction, the populations of entire cities went into other worlds and never came back." [59]

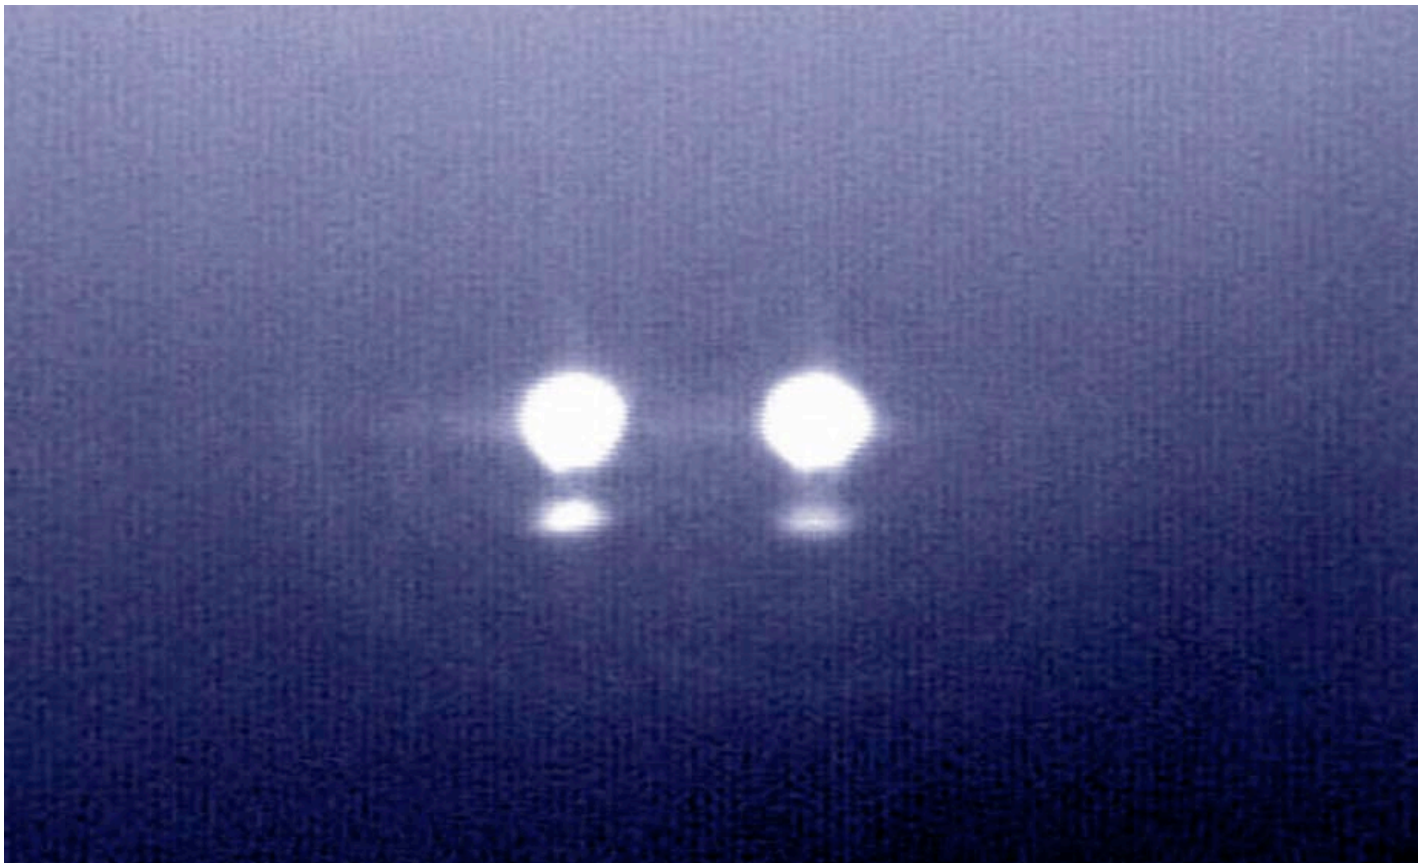
“The old seers *saw* that the Earth has a cocoon,” he went on. “They *saw* that there was a ball encasing the Earth, a luminous cocoon that entraps the Eagle’s emanations. The Earth is a gigantic sentient being subjected to the same forces we are.” [60]

”[Don Juan stated that]… one of the most worthwhile findings of the ancient seers... was the discovery that organic life is not the only form of life present on this Earth... For seers, to be alive means to be aware... For the average man, to be aware means to be an organism. This is where seers are different. For them, to be aware means that the emanations that cause awareness are encased inside a receptacle.[61]

The circular aspect... is what maintains life and awareness, fulfillment and purpose... “The reason that it’s called the circular force is that it comes in rings, thread-like hoops of iridescence... it strikes all living beings ceaselessly... to give them strength, direction, awareness; to give them life... It’s one indivisible force that fits all living beings, organic and inorganic.” [62]

“They say that perception is a condition of alignment... Alignment is what allows awareness to be cultivated by every living creature...” When seers *see* perception, they witness that the luminosity of the... emanations outside those creatures’ cocoons brightens the luminosity inside their cocoons. The outside luminosity attracts the inside one; it traps it, so to speak, and fixes it. That fixation is the awareness of every specific being.[63]

He explained that what he called the key to everything was the first-hand knowledge that the Earth is a sentient being and as such can give warriors a tremendous boost; it is an impulse that comes from the awareness of the Earth itself at the instant in which the emanations inside the warriors’ cocoons are aligned with the appropriate emanations inside the Earth’s cocoon. Since both the Earth and man are sentient beings, their emanations coincide, or rather, the Earth has all the emanations that are present in man and all the emanations present in all sentient beings, organic or inorganic for that matter. When a moment of alignment takes place, sentient beings use that alignment in a limited way and perceive their world. Warriors can use that alignment either to perceive, like everyone else, or as a boost that allows them to enter unimaginable worlds.[64]



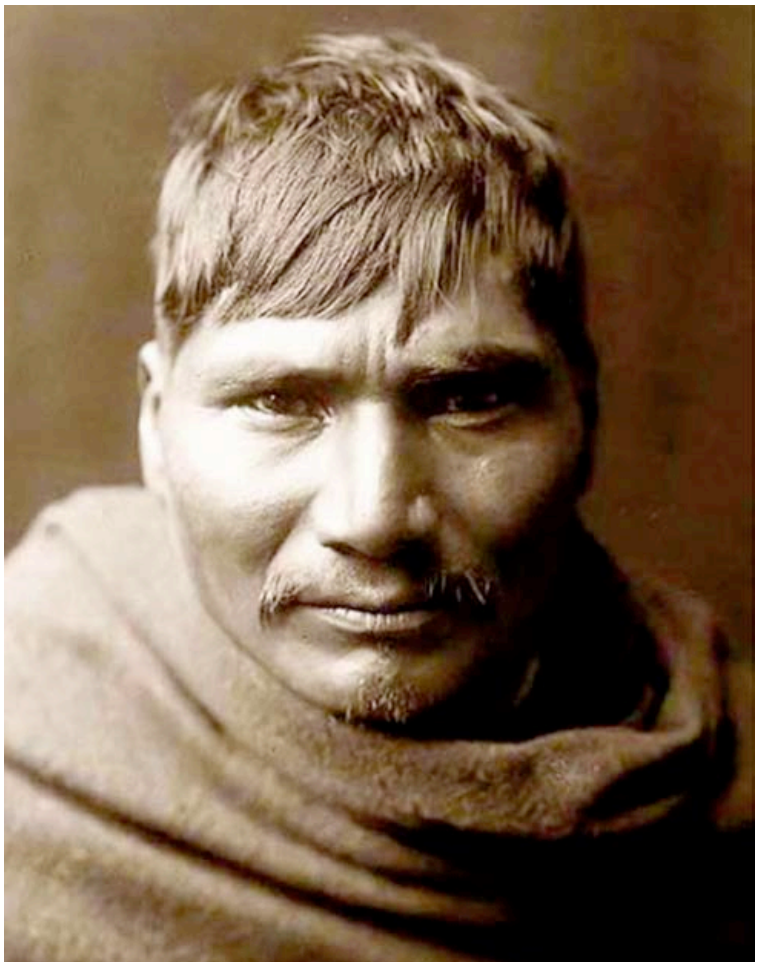
He explained that the Earth’s boost is the force of alignment of only the amber emanations. It is a boost that heightens awareness to unthinkable degrees. To the new seers it is a blast of unlimited consciousness, which they call total freedom.[65]

Don Juan restated over and over that the portion of the emanations inside man’s cocoon is in there only for awareness, and that awareness is matching that portion of the emanations with the same portion of emanations at large. They are called emanations at large because they are immense... inside man’s cocoon the unknown is the emanations untouched by awareness. When the glow of awareness touches them, they become active and can be aligned with the corresponding emanations at large. Once that happens the unknown is perceived and becomes the known.[66]

The Eagle, that power that governs the destiny of all living things, reflects equally and at once all those living things… [and] although it is not moved by the circumstances of any living thing, has granted a gift to each of those beings. In its own way and right, any one of them, it if so desires, has the power to keep the flame of awareness, the power to disobey the summons to die and be consumed. Every living thing has been granted the power, if it so desires, to seek an opening to freedom and to go through it. It is evident to the seer who sees the opening, and to the creatures that go through it, that the Eagle has granted that gift in order to perpetuate awareness.

For the purpose of guiding living beings to that opening, the Eagle created the Nagual. The Nagual is a double being to whom the rule has been revealed. Whether it be in the form of a human being, an animal, a plant, or anything else that lives, the Nagual by virtue of its doubleness is drawn to seek that hidden passageway.

The Nagual comes in pairs, male and female. A double man and a double woman become the Nagual only after the rule has been told to each of them, and each of them has understood it and accepted it in full… To the eye of the seer, a Nagual man or a Nagual woman appears as a luminous egg with four compartments. Unlike the average human being, who has two sides only, a left and a right, the Nagual has the left side divided into two long sections, and a right side equally divided in two.



The Eagle created the first Nagual man and first Nagual woman as seers and immediately put them in the world to see. It provided them with four female warriors who were stalkers, three male warriors, and one male courier, whom they were to nourish, enhance and lead to freedom… In order to make sure that the first Nagual man would lead his party to freedom and not deviate from that path or become corrupted, the Eagle took the Nagual woman to the other world to serve as a beacon, guiding the party to the opening.

The Nagual and his warriors were then commanded to forget. They were plunged into darkness and were given new tasks: the task of remembering themselves, and the task of remembering the Eagle… The command to forget was so great that everyone was separated. They did not remember who they were. The Eagle intended that if they were capable of remembering themselves again, they would find the totality of themselves. Only then would they have the strength and forbearance necessary to seek and face their definitive journey.

Their last task, after they had regained the totality of themselves, was to get a new pair of double beings and transform them into a new Nagual man and a new Nagual woman by virtue of revealing the rule to them…

Don Juan explained that the rule was not a tale, and that to cross over to freedom did not mean eternal life as eternity is commonly understood –that is, as living forever. What the rule stated was that one could keep the awareness which is ordinarily relinquished at the moment of dying… [A]t the moment of crossing, one enters into the third attention, and the body in its entirety is kindled with knowledge. Every cell at once becomes aware of itself, and also aware of the totality of the body… Therefore the crux of the warrior's struggle was not so much to realize that the crossing over stated in the rule meant crossing to the third attention, but rather to conceive that there exists such an awareness at all.[67]

“Seers say that there are three types of attention... they are rather three levels of attainment. They are the first, second, and third attention, each of them an independent domain, complete in itself.” He explained that the first attention in man is the animal awareness... everything that one can think about is part of the first attention... [68]

Don Juan explained that in order for our first attention to bring into focus the world that we perceive, it has to emphasize certain emanations selected from the narrow band of emanations where man’s awareness is located. The discarded emanations are still within our reach but remain dormant, unknown to us for the duration of our lives. The new seers call the emphasized emanations the right side, normal awareness, the tonal, this world, the known, the first attention. The average man calls it reality, rationality, common sense.

The emphasized emanations compose a large portion of man’s band of awareness, but a very small piece of the total spectrum of emanations present inside the cocoon of man. The disregarded emanations within man’s band are thought of as a sort of preamble to the unknown, the unknown proper consisting of the bulk of emanations which are not part of the human band and which are never emphasized. Seers call them the left-side awareness, the nagual, the other world, the unknown, the second attention.[69]

“[To be able]… to utilize those unused emanations, one needs uncommon, elaborate tactics that require supreme discipline and concentration... the art of *dreaming*... the concentration needed to be aware that one is having a dream is the forerunner of the second attention. That concentration is a form of consciousness that is not in the same category as the consciousness needed to deal with the daily world.

“The new seers... let the mastery of awareness develop to its natural end, which is to extend the glow of awareness beyond the bounds of the luminous cocoon in one single stroke. The third attention is attained when the glow of awareness turns into the fire from within: a glow that kindles not one band at a time but all the... emanations inside man’s cocoon.”

Don Juan expressed his awe for the new seers’ deliberate effort to attain the third attention while they are alive and conscious of their individuality... “The supreme accomplishment of human beings,” he said, “is to attain that level of attention while retaining the life-force, without becoming a disembodied awareness moving like a flicker of light...”[70]

[He then explained that]...the glow produced by a state of total awareness... is *seen* as a burst of incandescence in the entire luminous egg. It is an explosion of light of such a magnitude that the boundaries of the shell are diffused and the inside emanations extend themselves beyond anything imaginable.

“Are those special cases, don Juan?”

“Certainly. They happen only to seers. No other living men or any other living creatures brighten up like that. Seers who deliberately attain total awareness are a sight to behold. That is the moment when they burn from within. The fire from within consumes them. And in full awareness they fuse themselves to the emanations at large, and glide into eternity.

[As seers] our case is a bit different, because we are at the end of our trail. We are not seeking anything... we go from day to day doing nothing. We are waiting. I will not tire of repeating this: we know that we are waiting and we know what we are waiting for. We are waiting for freedom!” [71]

A Great Cycle of approximately 309,888 years (12 x 12 Precession cycles of 2,152 years) nears completion with the returning Dark Star on its near 36,650 year elliptical cycle (2,152 x 17 = 36,584), as red supergiant Betelgeuse shrinks in collapse, poised to illuminate all that is hidden within the shadows of the human heart and our entire solar system. Prophetically foretold signs are to be seen in their dramatic fulfillment in all parts of the world. Infrasound resonance surges as intense heartbeat booming and ignites piezoelectric fires at nodal points in all parts of the world. The many Oort comet impacts and aerial fireballs witnessed all over the world in 2010 will continue to increase in frequency for several years as a constant threat to the delicate biosphere of Earth in these revelatory times preceding the supernova blast wave of December 22, 2012, and until 2028.

The initiation of celestial waters at sacred pyramid sites illuminates the interior chambers of the pyramids with the heavenly light of the Creator, and illuminates the DNA of the initiate with the red and blue light of gold and silver nanoparticles within every cell. Intense infrasound booming will align all initiates into heart/mind synchronization inducing the synesthetic experience of collective telepathic unity, *kindling the fire from within to attain fourth-density awareness.*

The time has arrived for humanity to escape the technological perils of his own misguided making and to reconvene at our ancient pyramids and sacred sites to ascend into the red light of purification that will enhance all harmonious living beings touching the Earth during the Red Dawn of the Forever Cycle.

Alexander Putney

In the one before this we find in the land of the Poseidians when the rule was in the house of Ode, and the entity then gave to that people the manner of use of the universal forces as may be applied in the way of mechanical construction in a physical plane. The entity was then known as [Ajax of] Ode.

Edgar Cayce – February 27, 1925
Life Reading 487-4 for Nikola Tesla

About the firestone that was in the experience did the activities of the entity then make those applications that dealt with both the constructive and destructive forces in the period... The preparation of this stone was in the hands only of the initiates at the time, and the entity was among those that directed the influences of the radiation that arose in the form of the rays that were invisible to the eye but that acted upon the stones themselves as set in the motivating forces –whether the aircraft that were lifted by the [HHO] gases in the period or whether guiding the more pleasure vehicles that might pass along close to the Earth... on the water or under the water.

Edgar Cayce – December 20, 1933
Life Reading 440-5

One of the brightest periods of human history on Earth was illuminated by the high technological achievements of the Sons of the Law of One, the Atlantean pyramid builders. The legacy of Life Readings given by Edgar Cayce offers fascinating insight into advanced psychoacoustic and bioelectrical healing technologies in use at the Orion Pyramids of Egypt ~29,900 years ago, under the leadership of King Araaraart, Priest Ra-Ta and Ajax of Ode.

Technology agreements offered by the Atlanteans in Poseida established Atlantean firestone temples in all regions of the globe, *generating a unified psychoacoustic resonance.* Emissaries from Atlantis were sent to each region in the collective, including Princess Issua of Ode to the Ohum lands, leading the temple activities in the capital city of On, in present-day Ecuador.

Materials analyses of firestone temple structures built during the period of ~29,900–28,000 years ago confirm the prescient words of Edgar Cayce, directly linking the specialized use of *pyromagnetic semiconductor materials* at the Ohum Pyramids of On, Ecuador with other related Paleolithic sites including the Llanganates Pyramids; Manco Pata, Peru; Puma Punku, Bolivia; Padang Pyramid, Indonesia; Nan Madol, Micronesia; seafloor pyramids off Cuba; the Baltic Sea Monument and Noah's Ark.

The Hummingbird Pyramid

The Hummingbird Pyramid

A monumental discovery was recently made south of La Maná, Ecuador on November 17, 2013 while exploring low mountains along the Calope River. The megalithic ruins of an ancient temple have been partially exposed by the dynamite blasts of roadworkers and the erosive action of water, uncovering large sections of basalt foundations along two sides of a structure exceeding 70m in height (above).

The La Maná region has drawn attention for decades after the Head of the Ecuadorian Ministry of Mines Dr. E. Guillermo Sotomayor (1918–2009) made the surprise discovery of a cache of hundreds of ancient relics that included dozens of magnetic stone artifacts with inlaid designs that fluoresce under ultraviolet light.[1] Sotomayor's years of research concerning a set of 13 magnetic stone cups led him to recognize the astonishing purity and curative effects of the springwaters of these mystical mountains.[2]

Thick kaolinite clay beds filter rainwater while the activity of lightning and the presence of precious metals below ground imbues the water with trace gold and silver nanoparticles, forming the natural electrum colloid *venerated by the pyramid-building Paleo-Sanskrit culture as the elixir of life: 'Soma'.*

Four decades have elapsed since those initial discoveries of ancient artifacts and sacred Ayurvedic water sources in La Maná, yet international public interest and intrigue surrounding this lush cloud forest location has only grown. Gold mining activity in the enclosed valley immediately south of La Maná had dredged up thick layers of ash and debris associated with volcanic outbursts that peppered the entire area with a rain of tiny gold pellets that are absent in more recent soil deposits.

In 2013, exploration of the low mountains rising to the south of the valley mines and the Calope River provided a wealth of megalithic evidence that had not been recognized by previous investigators of this area. Newly recognized Paleolithic technologies for the manufacture of synthetic stone, bulk concrete and binding cement recently identified at archeological excavations on pyramids in Bosnia and Indonesia provide a cultural precedent for remarkable basalt structures located here in Ecuador.

In particular, the giant monuments of the Bosnian Valley of the Pyramids[3] constitute architecturally reshaped and refaçaded mountains with beautifully paved apex platforms and causeways that are closely replicated in the soil-cloaked forms of the mountains of La Maná. After thorough investigation, several restructured mountains in the La Maná area have been confirmed as artificial constructions.

The most visible of these hidden ancient monuments is a riverfront pyramid construction that presents a triangular north-facing plane rising at a consistent inclination angle of 45° to its apex, over 70m in height. The symmetry of this ancient construction can be clearly observed from across the Calope River (opposite), while the apex platform and rear causeway are most visible from due west (above).

This ancient monument has been named the *Hummingbird Pyramid*, after the great variety of local hummingbird species whose rhythmic wingbeats symbolized psychoacoustic influences among all ancient cultures of the Andes. The apex of the Hummingbird Pyramid (0.9978°S, 79.2283°W) is situated closely along the 1° South latitude, 7,472 miles from the Great Pyramid of Giza, Egypt. This resonant distance interval represents 30.02% of the Earth's mean circumference of 24,892 miles, *exactly corresponding to the 2:3:5 Fibonacci proportional relationship known as the Golden Ratio.*

This sacred geopositioning relationship between the Great Pyramid and the La Maná pyramid complex was visually expressed in the designs of the UV fluorescent Third-Eye Pyramid and World Map stone artifacts. A pair of palm-sized octagonal stone disks engraved with UV fluorescent circles reference the *mandala* of Sanskrit tradition that has been decoded as the quantum iterated function[4] [$z_{n+1} = z_n^2$], expressing the global distribution pattern of infrasound standing waves.[5]

Commonly referred to as Schumann Resonance, this fluctuating set of resonant planetary frequencies is composed of the sum of cosmic, solar, lunar, planetary and terrestrial vibrations that find continuity in the resonant cavity of Earth's atmosphere. Earth's energetic cocoon was extolled as the Akashic Field in votive passages from stone tablets preserved at Paleo-Sanskrit cultural sites on every inhabited continent of the world, praising the beneficial actions of Indra, the divine personification of resonant infrasonic influences from the planet Jupiter upon all living organisms of Earth.[6]

Resonant interactions of elements within all living cells were well recognized by the highly advanced biological and spiritual sciences of the global Atlantean Sanskrit culture as the eternal source of the flame of all life, *illuminating every cell from within.*[7] In their complete knowledge of the kundalini physics of the qi meridian system, our Atlantean forbearers designed arrays of massive, solid-state electromagnetic healing temples that focused and transduced planetary resonance.

Before any discussion with the community members of this area on such complex subjects, one local resident and guide to the region mentioned the unusual recurrence of rumbling sounds in these thickly forested mountains surrounding the magnificent Seven Cascades. He stated that ultra-low frequency sounds often resounded during the nighttime hours, especially during the rainy season months from December to April, and suggested these mountain peaks were used by ancient people for transmitting communications over long distances. *Tesla would have agreed with that suggestion!*

Millions of interlocking geopolymer basalt blocks comprising the bulk of the Hummingbird Pyramid and its causeway reveal a highly specialized architectural technology for enhanced seismic integrity and resistance to water erosion. In addition to the extreme density and superhard crystal/metal composition of the artificial stone, the many interlocking forms and angular internal construction features were painstakingly molded by many generations of pyramid-builders who had perfected the art of monumental construction in the most challenging of equatorial environments.

Prevention and control of landsliding was of paramount concern, and dictated the crucial angularity of highly complex stonework being uncovered at several excavation sites on the Hummingbird Pyramid. Giant megalithic blocks were apparently only cast within the deeper sections of the monument's foundations, whereas the surfaces of this massive pyramidal building were primarily cast in smaller multifaceted forms. Seams in the stonework display a clear tendency toward rhomboidal grid patterns.

To this day, landslides represent a major hazard to life in these low mountain areas that were densely populated during the Paleolithic Era. Sections of paved walkway and other water-worn exterior surfaces of the Hummingbird Pyramid uncovered thus far are puzzle-like mosaics of much smaller interlocking blocks that would have allowed minor damage to occur during adverse meteorological conditions while preventing the catastrophic collapse of larger sections of the steeply-angled building.

The specific handling of forms within various sections of this massive monument corresponds to distinct functions that can be easily identified. The rhomboidal columnar basalt forms which comprise the lower foundations of the Hummingbird Pyramid display an inclination angle of ~65° to the east *that is consistent on both the southwestern and northeastern corners of the monument.* This ever-present eastward slant was intentionally designed by the site's ancient builders to counteract the westward slumping of land toward the coastal flood plane with the westward flow of the Calope River.

A large sample group of geometrically shaped stones were collected for analysis from the steep debris field on the collapsed western face of the Hummingbird Pyramid, and in the clear stream running below. The great variety of angular geometries expressed in the forms of the stones is most intriguing, and give the immediate impression of being shards of a giant, interlocking crystalline puzzle.

Repeating patterns of crystalline angles often form square, rectangular, triangular and rhomboidal parallel faces that suggest distinct structural functions for different types. Flat stone plates with even thicknesses and long rectilinear plinths lay all about, protruding from the dark surface soils. Several examples of long, delicate stones perfectly formed as long triangular prisms were discovered (below), earning them the nickname *'toblerones'* (after the chocolate brand sold in boxes of the same size and shape).

Even more unusual and intriguing is the metallic composition of these geometrically shaped stones, which first became strikingly apparent when larger examples were lifted from the ground. Their stunning weight is far greater than natural columnar basalt, and the hardness and durability of these stones also appears to significantly exceed natural norms by ~15-25%, contributing to their very low water absorption.

The unnatural metallic composition of the vast majority of the stones tested at several locations on the west and north sides of the Hummingbird Pyramid spectacularly indicates the man-made origin of the gigantic stone structure that appears to be a full refaçading of the rugged landscape. This astonishing reality aligns closely with the impressive archeological investigations simultaneously unfolding at the Padang Pyramid in West Java, Indonesia and the Valley of the Pyramids in Visoko, Bosnia.

A wide variety of rectangular and trapezoidal blocks have been presented online in high-quality video format to effectively display their distinct geometric forms with specific surface features corresponding to ancient pavement stones (video stills, above, opposite and overleaf). As demonstrated in the video, *the act of striking these metallic stones together –even lightly– generates a clear, resonant ringing tone.*

This same resonant effect of ancient stonework was known and widely utilized among ancestral musical traditions of indigenous communities throughout Southeast Asia, as well as by modern tourists to the Padang Pyramid, who often play these resonant stones with wooden mallets. The sonorous qualities of these synthetic basalt pyramid stones reveals their sophisticated resonant function, endowed by a special metallic composition that was painstakingly fabricated throughout the world during the Paleolithic era.

At every known site where these types of artificial stones are found, amateur investigators are documenting compass deviations and magnetic vortices, yet no archeologists acknowledge this fact.

The many angular geometric stone prisms and plates recovered from the Hummingbird Pyramid display surface coatings of an orange cement that was produced from viscous slurry of kaolin clay and fly ash. This type of low-density, clay-based cement has already been observed at two Paleolithic pyramid sites in Indonesia[8], and positively identified by materials analysis experts as a man-made geopolymer cement:

> The geological team and also the coaches of the Indonesian Association of Geologists centre, Andang Bachtiar, discovered previously unknown facts about the site's composition. The cement material has a primary composition of 45% iron mineral and 41% mineral silica. The rest is 14% clay minerals with also a carbon element. "This is a good composition for strong cement adhesive, perhaps combining between the concepts of resin or modern strong adhesive[s] made from silica materials and the use of concentration of the iron element which become as brick amplifiers," said Natawidjaja [principal investigator at the Padang Pyramid site]...[9]

Expert determinations regarding the artificial origin of this simple iron-rich cement produced by Paleolithic pyramid-builders at major sites distributed worldwide has been quietly acknowledged by archeologists, yet *the same government-sponsored scientists continue to deny the synthetic origin of the pyramids' basalts.*

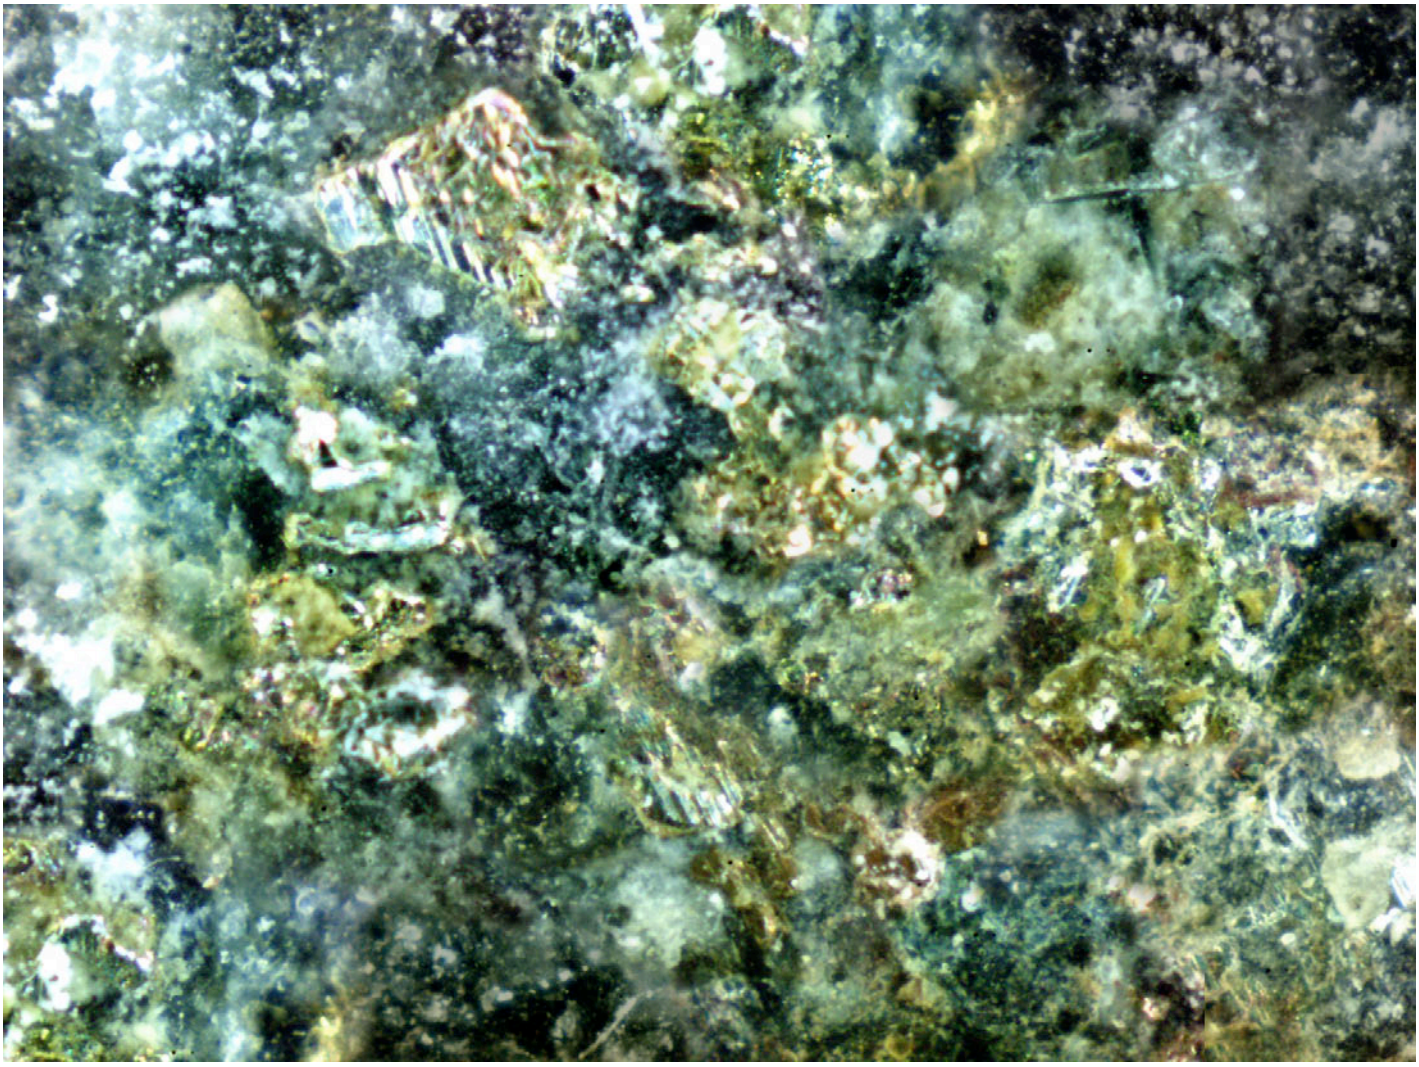
The same thorough materials analyses were conducted on the basalt-type megalithic stones that comprise the huge iconic plinths strewn throughout the five main terraces of the Padang Pyramid:

> Another discovery of the petrological analysis is the finding of many microfissures, or microscopic cracks, in the thin section of andesite stone columns that appear non-natural because the cracks cut [across] the stone's constituent mineral crystals.[10]

The prevalence of microfissures within the pyramid andesites confirms they were artificially cast in rigid molds, the microfissures having been formed by slumping or settling patterns within the cold geopolymer slurry that are not present in natural volcanic basalts that fully crystallize while cooling from a molten state.

In the sophisticated construction and maintenance of the Ohum pyramids of La Maná, Ecuador, these two synthetic geopolymer materials, metallic basalt and kaolin cement, have apparently been mixed together to produce an unusual heterogeneous stone/clay material. These samples possess significantly lower hardness and a much greater porosity, resulting in their high water permeability.

These composite stone/clay blocks must have served a specific function within the pyramid structure. Broad sections of the ancient building constructed out of this material were most likely designed and used as giant *seeps* for absorbing all water flowing over or collecting on the surfaces of the pyramid, for diversion into water channels coursing deep within the pyramidal structure. Such seeps would also act as effective water filtration systems by trapping all suspended particles within the microporous cement itself, while also ionizing the water during its slow percolation through the stone/clay seep.



After years of pondering on the unknown origin of magnetic properties among the many basalt and granite artifacts of the La Maná collection, multi-faceted blocks of all sizes recovered from excavations on the Hummingbird Pyramid were checked for magnetism using a neodymium magnet. *Indeed, the Hummingbird Pyramid stones possess the same odd magnetic properties as the famous relics.*

In fact, the majority of synthetic basalt paving stones, building blocks and casing stones possess anomalous magnetic properties that are *not* consistent with the great abundance of naturally formed basalts. This challenging fact reflects that same unusual situation that has confounded archeologists and collectors alike, concerning the handcrafted stone artifacts found below the La Maná Pyramid.[11]

While all of the stones' originally molded surfaces bear a rusty orange appearance, exposed cross-sections of broken stones from the Hummingbird Pyramid show darker basalt surfaces flecked with visible metal particles (above). Fracturing of these artificial metallic stones tends to occur along flat planes through the stone, revealing an easily identifiable mineral component –*iron pyrite*– evenly distributed as fine flakes throughout the basalt matrix. The rusty red coloration of portions of the stones also signifies the presence of powdered iron from ores processed in ancient times.

Preliminary measurements made with a high-quality metal detector have confirmed the presence of significant quantities of iron within the Hummingbird Pyramid's synthetic stones, but has also revealed the pervasive presence of another ferromagnetic element found in high concentrations in meteoritic material: *nickel*. As noted in the Bosnian Valley of the Pyramids, these accomplished Paleolithic builders often mined tunnel systems to connect their pyramids *and* provide the raw materials for their constructions above ground, selecting the most magnetic metals available in great abundance.

Dr. J. Davidovits, founder of the Geopolymer Institute, has defined the essential components and sophisticated geopolymer chemistry of ancient cements that catalyze a caustic reaction: sand and crushed basalt rock, alkali solution, water, fly ash, silica and a kaolinitic clay binding material. These exact components have been identified in the composition of conglomerate blocks from the Visoko pyramids, as with sandstone plates reconstituted from quartz sand deposits. Similarly, the deep kaolin beds of La Maná provided the binder that was mixed with black sands to produce reconstituted magnetic basalts.

A 200x micrograph of the crystal/metal matrix of geopolymer samples from near the facing of the Hummingbird Pyramid reveals a beautiful mosaic of exotic granulated components that were mixed and poured thousands of years ago to form these remarkable synthetic basalts (above). *Iron pyrite flakes, commonly known as 'fool's gold', are employed as efficient diamagnetic semiconductors.*

Ancient specialized applications of ferromagnetic cements to the artificial stabilization and refaçading of small mountains has also been identified at the Indonesian megalithic site of Gunung Padang, with artificial cements containing 45% iron, 41% silica and 14% clay.[12] Specific characteristics shared by the more than 22,000-year-old Indonesian pyramid, the 29,000-year-old pyramids of Bosnia and the pyramids of La Maná, Ecuador suggests *these sites were built during the same technological era.*

Davidovits' analysis of the limestone blocks of the Great Pyramid of Giza, Egypt revealed exotic admixtures including opal and paramagnetic alumino-silicates that deny their natural origin. Likewise, in this case of synthetic basalts of the Hummingbird Pyramid, elevated levels of ferromagnetic elements endow the structure with heightened resonant characteristics that can be directly perceived when two such stones are struck together, producing a purely metallic ring.

The great variety of metallic geopolymer sample types excavated from several sites within the La Maná pyramid complex fall into four groups defined by Davidovits in *Geopolymer Chemistry and Applications*[13] as metakaolin-based, rock-based, silica-based and fly ash-based geopolymers. Atlantean magnetic kaolin cement samples from the La Maná pyramid complex are characterized as meta-kaolin-based geopolymers, and were used for both mortar and cement block applications on walkways as porous pavements that allowed water absorption and percolation for ionizing the structures.

Similarly manufactured pavement stones were also formulated as fly ash-based geopolymer mixtures that maintain a noticably grey appearance with fine ferromagnetic, pyromagnetic and basalt sand inclusions. Rhomboidal and pie-shaped paving stones less than one inch in thickness recovered along the entire length of the Hummingbird Pyramid confirm the use of fly ash-based geopolymers for surfacing layers.

Atlantean firestone magnetic basalt formed the bulk of the large blocks composing the Hummingbird Pyramid, the Soma Pyramid and others can be characterized as both rock-based and silica-based geopolymer formulations as described by Davidovits in his extensive geopolymer dataset. *Millions of cubic meters of volcanic basalt from ancient lava cones were reconstituted into magnetic basalt temples.*

Atlantean magnetic granite samples have also been recovered from ancient buildings in multiple locations in the La Maná pyramid complex, including psychoacoustic infant cradles of various sizes. The artificial magnetic granite objects and pyramid stones can also be classed as silica-based geopolymers, only coarsely ground, preserving the speckled appearance of quartz and tourmaline in natural granite.

What compelling technological application demanded so many exotic elements be selectively pulverized and mixed together by Atlantean chemists for the creation of these monumental structures during the Late Paleolithic period <30,000 years ago? Modern solid state components such as 'dielectric resonator antennae' and 'dielectric wireless receivers' operate on the same principles employed on a giant scale by Paleo-Sanskrit pyramids, utilizing infrasound wavelengths of Earth resonance. *An Atlantean definition for 'dielectric resonator antenna' may be given as:*

> A *dielectric resonator antenna* is an infrasound antenna used at ultra-low frequencies, that consists of a pyramidal monument of piezoelectric materials of various shapes, with interior chambers constituting dielectric resonator cavities. The Dielectric Resonator Antenna functions as a concentrator of incoming electromagnetic energy. When the electromagnetic (EM) field excites the resonance of the DRA, a mode field pattern is built up inside the structure. Infrasound waves focused upon the resonator material bounce back and forth between the resonator walls, forming standing waves. The walls of the resonator are partially transparent to infrasound waves, allowing the infrasound power to radiate into space... This class of *dielectric wireless receivers* feature a complete absence of electronic circuitry and metal interconnects, offering immunity against damage from intense electromagnetic radiation, produced by EMP and HPM sources.

Beyond selective use of ferromagnetic metals within Atlantean firestone geopolymers, inclusion of mineral *pyrite* is often observed –a mineral whose name literally means 'firestone'. The Latin etymological root of 'pyrite' and 'pyramid' preserves a direct reference to the ignition of HHO plasma and red sprites streaming into the atmosphere above each of the Paleolithic pyramid complexes.

The only valid source of information on this remote period of human civilization, being firmly supported by the latest scientific data, is the famous trance channel Edgar Cayce. In several Life Readings, Cayce related information stored within the Akashic Records concerning the ancient Atlantean use of HHO plasma for antigravitic propulsion of spacecraft and other vehicles of that bygone technological era.

Fascinating revelations were channeled from the Source during a Life Reading given by Cayce on December 20, 1933 regarding the construction techniques developed by the Atlantean culture for achieving wireless power transmission for all aerial, aquatic and submarine vehicles (Reading 440-5):

> *Q: Give an account of the electrical and mechanical knowledge of the entity as Asal-Sine in Atlantis.*
>
> A: Yes, we have the entity's activities during that experience. As indicated, the entity was associated with those that dealt with the mechanical appliances and their application during the experience. And, as we find, it was a period when there was much that has not even been thought of as yet in the present experiences.

About the firestone that was in the experience did the activities of the entity then make those applications that dealt with both the constructive and destructive forces in the period. It would be well that there be given something of a description of this, that it may be better understood by the entity in the present, as to how both constructive and destructive forces were generated by the activity of this stone.

In the center of a building, that today would be said to have been lined with non-conductive metals, or non-conductive stone –something akin to asbestos, with the combined forces of Bakelite or other non-conductors that are now being manufactured in England under a name that is known well to many of those that deal in such things.

The building above the stone was oval, or a dome wherein there could be or was the rolling back, so that the activity of the stone was received from the sun's rays, or from the stars; the concentrating of the energies that emanate from bodies that are on fire themselves –with the elements that are found and that are not found in the Earth's atmosphere. The concentration through the prisms or glass, as would be called in the present, was in such a manner that it acted upon the instruments that were connected with the various modes of travel, through induction methods –that made much the character of control as the remote control through radio vibrations or directions would be in the present day; though the manner of the force that was impelled from the stone acted upon the motivating forces in the crafts themselves.

There was the preparation so that when the dome was rolled back there might be little or no hindrance in the application direct to the various crafts that were to be impelled through space, whether in the radius of the visioning of the one eye, as it might be called, or whether directed under water or under other elements or through other elements.

The preparation of this stone was in the hands only of the initiates at the time, and the entity was among those that directed the influences of the radiation that arose in the form of the rays that were invisible to the eye but that acted upon the stones themselves as set in the motivating forces –whether the aircraft that were lifted by the [HHO] gases in the period or whether guiding the more pleasure vehicles that might pass along close to the Earth, or what would be termed the crafts on the water or under the water. These, then, were impelled by the concentrating of the rays from the stone that was centered in the middle of the power station, or power house (that would be termed in the present).

In the active forces of these the entity brought destructive forces, by the setting up –in various portions of the land –the character that was to act as producing the powers in the various forms of the people's activities in the cities, the towns, the countries surrounding same. These, not intentionally, were *tuned* too high –and brought the second period of destructive forces to the peoples in the land, and broke up the land into the isles that later became the periods when the further destructive forces were brought in the land.

Through the same form of fire the bodies of individuals were regenerated, by the burning –through the application of the rays from the stone, the influences that brought destructive forces to an animal organism. Hence the body rejuvenated itself often, and remained in that land until the eventual destruction, joining with the peoples that made for the breaking up of the land –or joining with Baalilal at the final destruction of the land. In this the entity lost. At first, it was not the intention nor desire for destructive forces. Later it was for the ascension of power itself.

As to describing the manner of construction of the stone, we find it was a large cylindrical glass (as would be termed today), cut with facets in such a manner that the capstone on top of same made for the centralizing of the power or force that concentrated between the end of the cylinder and the capstone itself.

As indicated, [See 996-12] the records of the manners of construction of same are in three places in the earth, as it stands today: in the sunken portions of Atlantis, or Poseidia, where a portion of the temples may yet be discovered, under the slime of ages of sea water –near what is known as Bimini, off the coast of Florida. And in the temple records that were in Egypt, where the entity later acted in cooperation with others in preserving the records that came from the land where these had been kept. Also the records that were carried to what is now Yucatan in America, where these stones (that they know so little about) are now –during the last few months– *being* uncovered. Ready for questions.

Q: Is it for this entity to again learn the use of these stones?

A: When there have come those individuals who will purify themselves in the manner necessary for the gaining of the knowledge and the entering into the chambers where these may be found; yes –if the body will purify itself. In '38 it should come about, should the entity –or others may– be raised...

As to the use of same, and as to how it's to be applied, one must prepare self –and it may not wholly be given through any channel, until an individual has so purified his purposes and desires. For, as given, not again will man bring to himself, or to those that have not been awakened to their individual development, destruction for the Earth –saving man does it himself!

Q: What should be the nature of this purification?

A: Purifying from within, much in the way and manner as has been given or illustrated to the entity in how that the mental self must be purified, much in the same way and manner as the *inner* self has been purified through its sojourns in the planetary influences *between* the appearances in the earth. For, as given, the body, the body-consciousness, is a well-balanced body, mind and soul, *for* development as an initiate, to again use these forces, these influences, for constructive rather than destructive purposes...

Q: Give an account of the electrical and mechanical knowledge of the entity as Ptel-in, in Egypt.

A: As may be surmised from that given, the entity was among those that had laid aside their physical self in destructive forces in Atlantis and picked them up again in the periods of the Egyptian development that followed the closer after the Atlantean destructive forces, or overlapped somewhat.

In that experience not so much of the electrical or mechanical appliances were the activities of the entity, save in the assisting of the preservation of the records and the *mental* distribution of that designed to be for the betterment and the purifying of those peoples of that age, period or land. It must be remembered, as indicated through these sources respecting the peoples of that time, much of the animals that had been fully cleansed in Atlantis –remained with the peoples in the Egyptian development. But the entity, or Ptel-in, worked with the priest of that age in giving to the people the knowledge of the relationships of the Creator to the created, in the way of preparing the body physical *for* the receptivity –or as a receptacle that might attune its inner self –to the divine forces in that particular period of development.

The activities of the entity in the electrical or mechanical were not so active in the Egyptian as they had been in the Atlantean. And the offices or activities pertained more to the assisting of individuals that sought to cleanse themselves, and were used –as indicated– by the fires in the cleansing temple, and the activities in the Temple Beautiful. For, the entity was then among those that aided the priest in *setting* the individuals so purifying themselves, so making themselves the channels or the receptive channels for the spiritual enlightenment that came through not only those that had sojourned in the earth as constructive forces but through those of the spiritual realm that thought and directed and aided the individuals in their activity, that *had* purified, had cleansed themselves.

Q: How many facets did the crystals previously referred to have?

A: Would be better were these taken from that pattern of same that will be eventually put in the museum in Pennsylvania. For, as given, do not confuse self in the attempt to use something without having prepared self to know what to do with same –and bring, unintentionally as before, destructive forces in the experience of self and those about self. Not that this should not be sought. Not that information may not be asked for, but be sure that the records are read –and those that have been given may *only* be read by those who have cleansed themselves, or purified themselves!

Q: Have I karma from any previous existence that should be overcome?

A: Well that karma be understood, and how it is to be met. For, in various thought –whether considered philosophy or religion, or whether from the more scientific manner of cause and effect– karma is all of these and more.

Rather it may be likened unto a piece of food, whether fish or bread, taken into the system; it is assimilated by the organs of digestion, and then those elements that are gathered from same are, made into the forces that flow through the body, giving the strength and vitality to an animate object, or being, or body.

So, in experiences of a soul, in a body, in an experience in the Earth. Its thoughts make for that upon which the soul feeds, as do the activities that are carried on from the thought of the period make for the ability, of retaining or maintaining the active force or active principle of the thought *through* the experience.

> Then, the soul re-entering into a body under a different environ either makes for the expending of that it has made through the experience in the sojourn in a form that is called in some religions as destiny of the soul, in another philosophy that which has been builded must be met in some way or manner, or in the more scientific manner that a certain cause produces a certain effect.
>
> Hence we see that karma is *all* of these and more. What more? Ever since the entering of spirit and soul into matter there has been a way of redemption for the soul, to make an association and a connection with the Creator, *through* the love *for* the Creator that is in its experience. Hence *this*, too, must be taken into consideration; that karma may mean the development *for self* –and must be met in that way and manner, or it may mean that which has been acted upon by the cleansing influences of the way and manner through which the soul, the mind-soul, or the soul-mind is purified, or to be purified, or purifies itself, and hence those changes come about –and some people term it "Lady Luck" or "The body is born under a lucky star." It's what the soul-mind has done *about* the source of redemption of the soul! Or it may be yet that of cause and effect, as related to the soul, the mind, the spirit, the body. We are through for the present.[14]

These prescient statements from Edgar Cayce were not entirely understood at the time of their offering, but their deeper meaning has become crystal clear after decades of scientific progress. Given during the primary excavation period of ancient pyramids located in Mexico, Guatemala and Belize constructed by the Maya civilization, a descendant culture of the technically advanced Ohum civilization that once extended throughout Central and South America.

The La Maná pyramids comprise the greatest architectural achievement of the Ohum, extending for more than 100 sq. miles along the lushly rainforested western rise of the Andes mountain range. Every single expedition into the densely mist-covered regions (that no Google map will show) yields major discoveries. *The first of these discoveries pertained to the sacred Ayurvedic springwaters that flow from the pyramids.*

Cayce made a clear reference to the purifying effect of sacred waters as being crucial to discovering the proper use of the firestone of the Ohum pyramids, when he was asked the intriguing question: *"Is it for this entity to again learn the use of these stones?"*

The direct response given by Cayce is absolutely stunning in its implications: "When there have come those individuals who will purify themselves in the manner necessary for the gaining of the knowledge and the entering into the chambers where these may be found; yes –if the body will purify itself." *The journey of discovery of the firestone pyramids of La Maná involved years of drinking their crystalline springwaters.*

Cayce's revelation parallels the Vedic conception of the physical body as a focusing lens for the inhabiting soul, which selects the most advantageous environment for spiritual development in the resonance of Nature, where ionization is enhanced at sacred waterfalls and deep within caves. Purification of the physical body through sacred waters and barefoot contact with the Earth affects intracellular illumination of the body, endowing enhanced sensory perception, as well as cellular regeneration and rejuvenation.

Prescient statements given under trance by Edgar Cayce leave no doubt that the Atlantean pyramid network had achieved both bodily regeneration and production of wireless electrical power for cities and towns distributed globally in appropriate geopositions, according to the quadratic function [$z_{n+1} = z_n^2$].

This resonant global wirless network is still operative, as confirmed by enhanced electromagnetic field measurements made atop the Bosnian Pyramid of the Sun. *Infrasound recordings produced on the Bosnian Pyramid of the Sun's northern face confirm high-intensity EM fields are generated around the pyramids by piezoelectric transduction of focused acoustic waves.*[15]

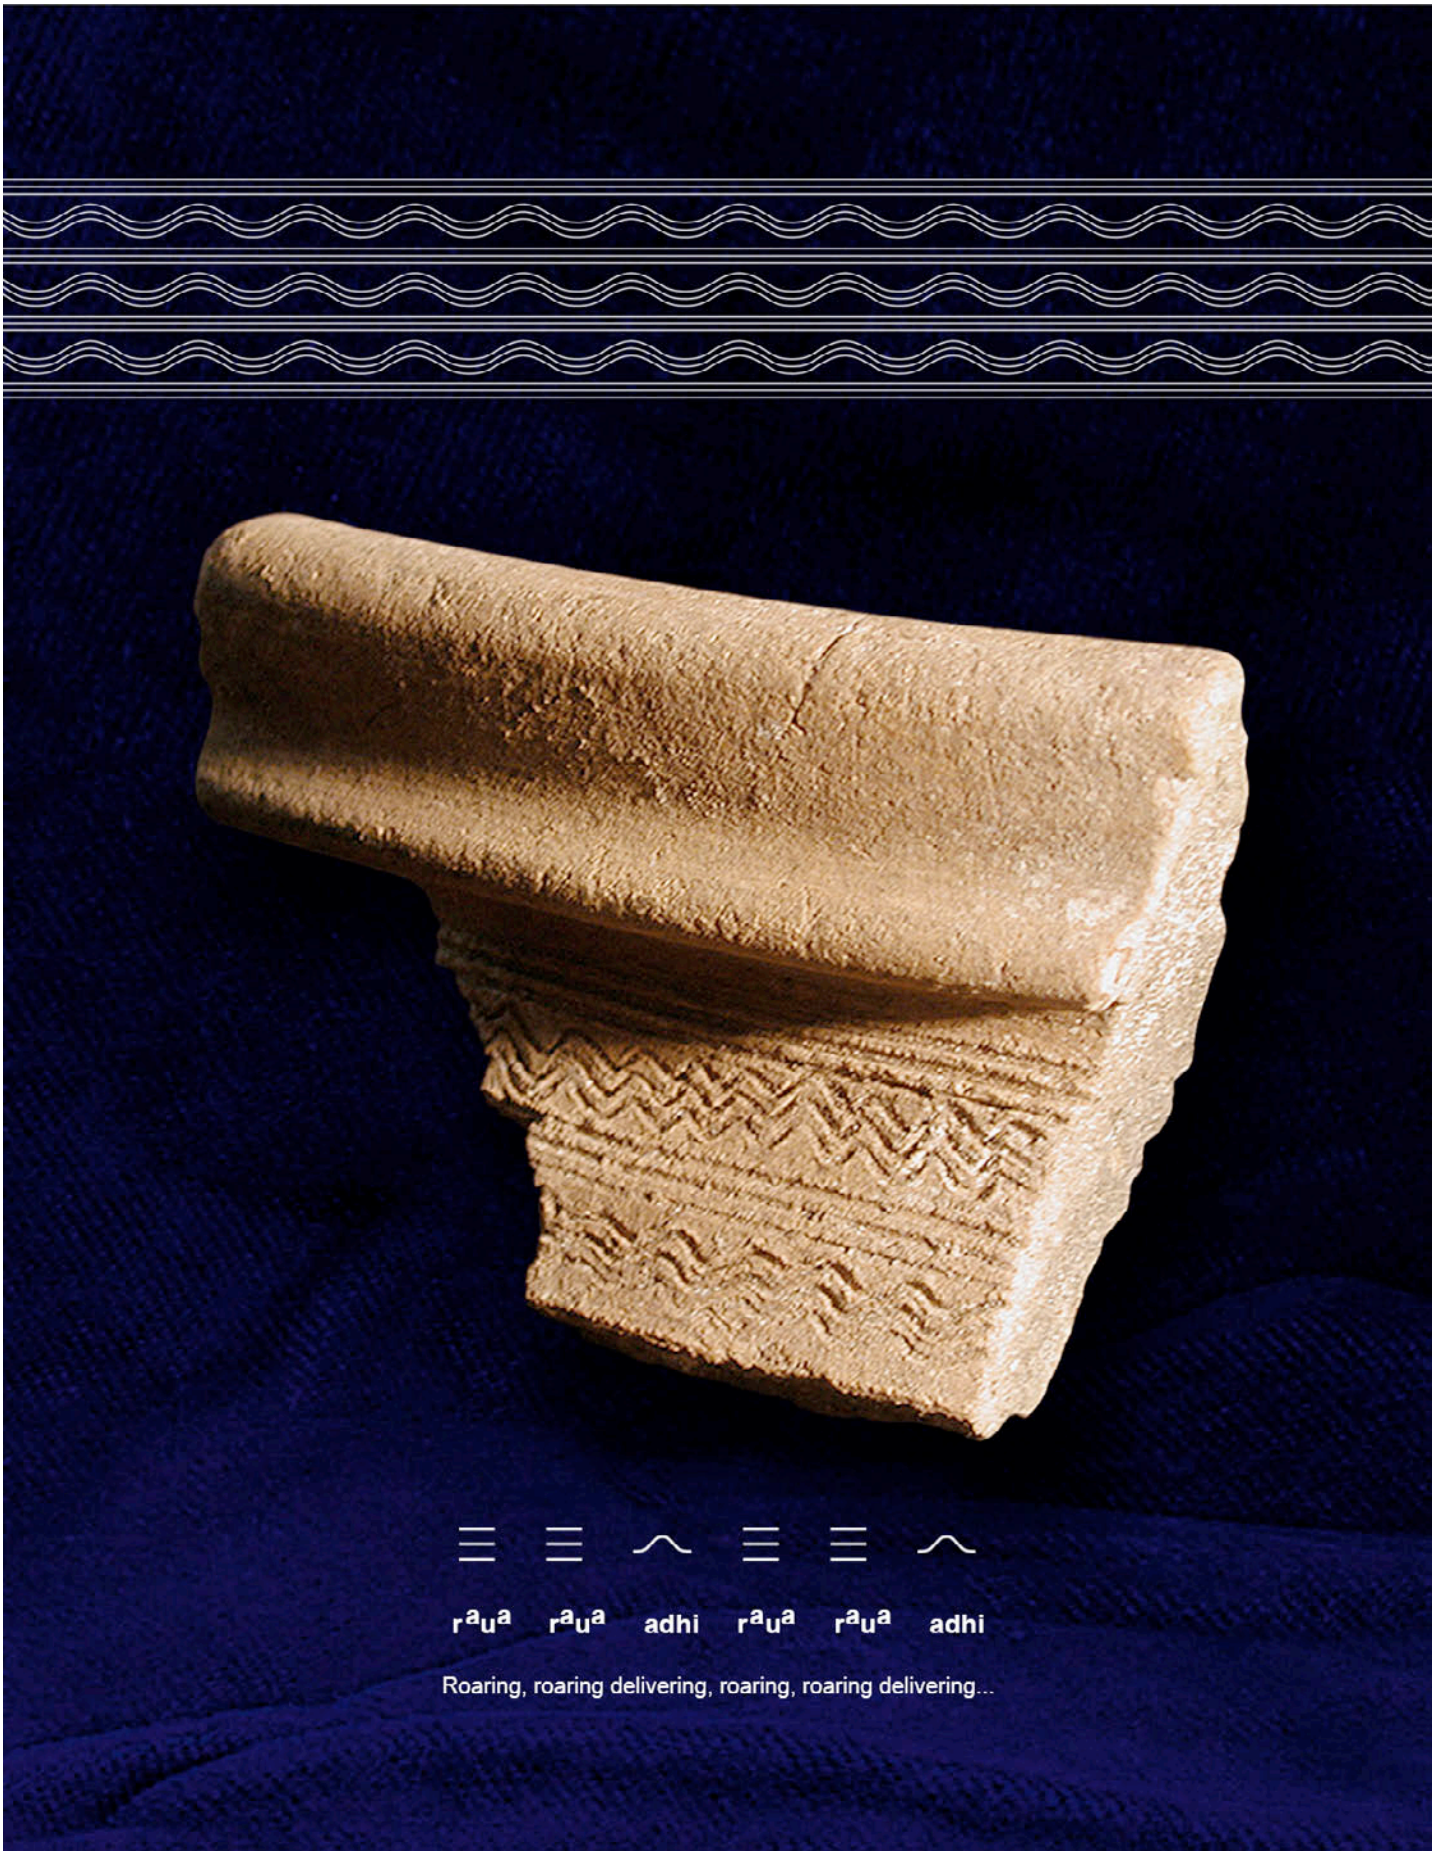
The advanced psychoacoustic and biorhythmic functions of the global array of pyramid complexes, mathematically defined as a global nonlinear infrasound resonance network aligned to the Great Pyramid, are reflected on the nanoscale by the selective magnetic composition of each component stone, and by the selective composition of sacred electrum waters that rejuvenate the human body.

The magnificent pyramid constructions distributed throughout the world await our renewed awareness of our own innate telepathic potential and bioelectric healing capacity for which they were constructed. Repeating spates of closely related infrasound rumbling, ground vibrations and high electrical ground currents are being reported worldwide in ever stranger confluences of piezoelectric fires linked with spontaneous combustion events, inducing dangerous conditions at infrasound focal points worldwide.

The field of planetary resonance is now being stimulated into heightened geomagnetic activity by the intensifying effects of ongoing solar eruptions as our entire solar system approaches magnetic reversal.[16] The paramagnetic stones of the Great Pyramid are literally roaring back to life, focusing infrasound standing waves that activate all other pyramid sites around the globe including the newly discovered ferromagnetic Hummingbird Pyramid, located along the equatorial latitude of 1° South.

Extensive exploration of the low mountains south of La Maná, Ecuador have revealed an entire complex of monumental constructions covered in 1–8m in soil, comprising *the oldest and largest pyramid complex in South America*, with direct technological links to the newly uncovered pyramids of Bosnia and Indonesia. Advanced geopolymer casting techniques show many similarities at these sites. Fallen pavement sections from the Hummingbird Pyramid display flat paving blocks supporting layers of interlocking basalt tiles (below) that resemble sandstone walkways on the Bosnian pyramids.

Megalithic blocks and long plinths of a type similar to those found at Indonesia's Gunung Padang are abundant in the interlocking foundation sections of Ecuador's Hummingbird Pyramid. The monument's foundations were exposed along a stretch of the northern face during dynamiting by road construction crews in the late 1970s. Lower portions of the roadcut are covered in rocky debris and falling soil, yet the upper portions have been easily cleaned of overgrowth to expose stunningly complex stonework. One perfectly vertical seam in the magnetic basalt foundation has been exposed, revealing the terminations of a tightly stacked cluster of rhomboidal plinths (above).



This angular outcropping of basalt plinths uncovered on the northeastern corner of this huge structure reveals a well-worn facade that was most probably stripped of casing stones many thousands of years ago, presumably during landsliding that occurred when the pyramid was covered in a dense old-growth forest of very tall trees. The great weight of overgrowth would have certainly exceeded the weight-bearing capacity of the many walkways and horizontal areas, having been overtaken by jungle for almost 13,000 years. Torrential rains during heavy seismic activity must have taken a major toll.

While the north face of the Hummingbird Pyramid ascends at an angle of 45° (at the same angular inclination as the north face of the Bosnian Pyramid of the Sun) the oblong megaliths stacked in the foundation of the structure present a lean to the east at roughly 65°, showing consistency with the columnar foundations exposed by river wear on the western side of this psychoacoustic monument.

The highly eroded surfaces of the Hummingbird Pyramid are covered in only 1m of soil near the base, while the upper portions of the structure remain buried beneath 7-8m of earth. The rich orange/brown soil will eventually be transformed into the pure kaolinite clays that line the region's bedrock, after thousands of years of further microbial activity and compaction below the growing weight of biomass.

The soil conditions, megalithic stone shapes, alignments and compositions, in addition to architectural forms and functions, show many apparent commonalities with the new Indonesian pyramid site that provide a broader context for the psychoacoustic reinterpretation of Paleo-Sanskrit cultural traditions once practiced worldwide. The new and exciting prospect of a global collaboration by archeologists, geologists and acoustics engineers at active excavations of Paleolithic monuments in Bosnia, Indonesia and Ecuador promises to recover the deeper layers of our global ancestral heritage.

Experimental psychoacoustic activation of the world's pyramid network will proceed with greater advances once infrasound measurements can be simultaneously obtained at all three pyramid sites and correlated to reveal nonlinear acoustic interactions within the field of planetary resonance.

r^a u^a r^a u^a adhi r^a u^a r^a u^a adhi
Roaring, roaring delivering, roaring, roaring delivering...

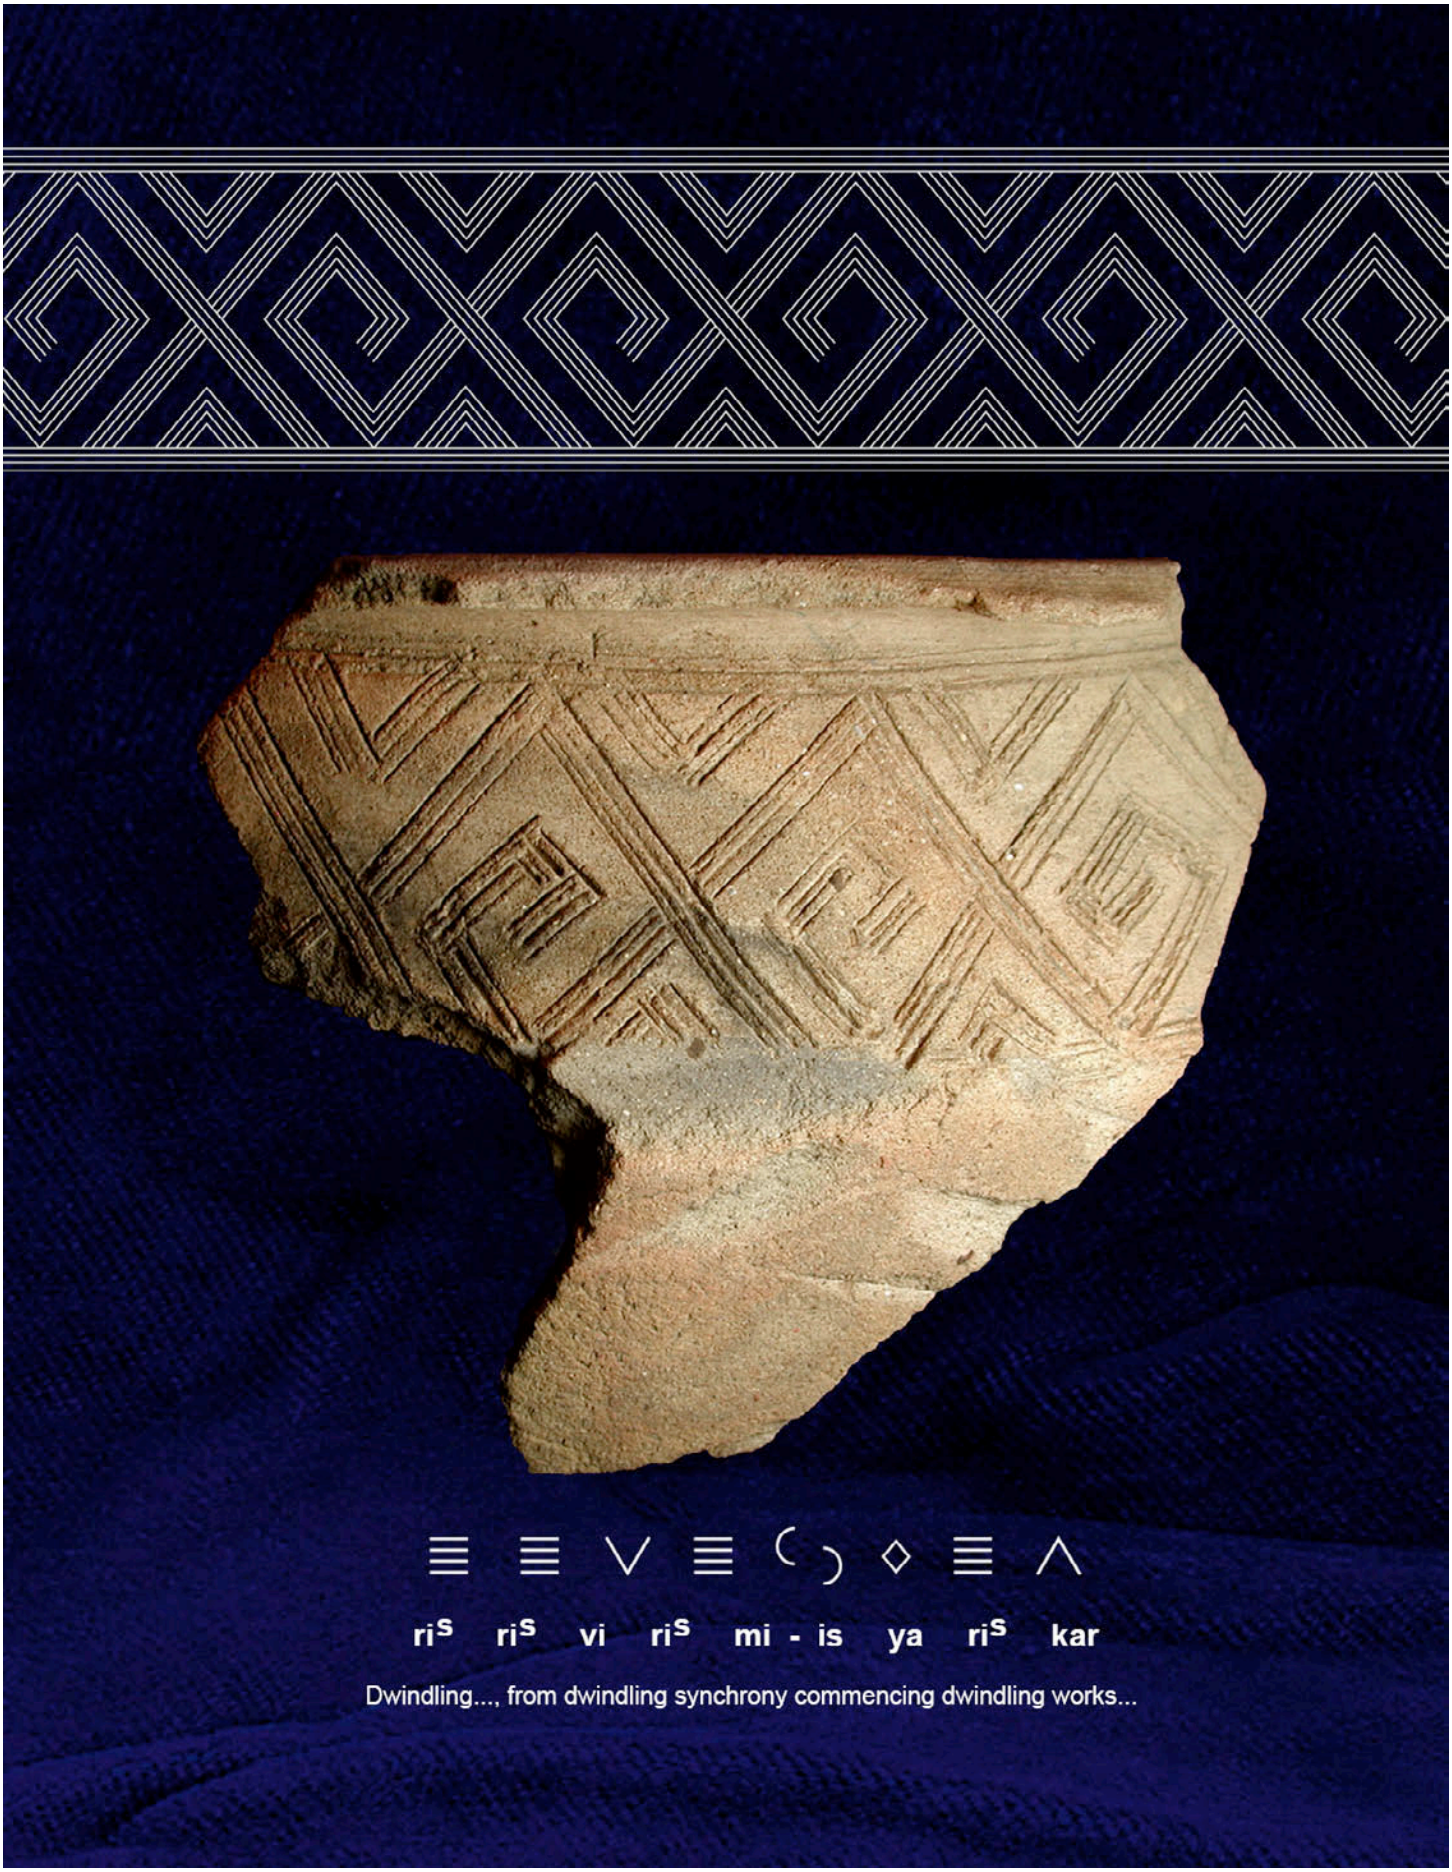
Acoustic activation of the worldwide pyramid network was driven by the three base frequencies of thundering infrasound resonance transduced by the 3 giant pyramids of Giza, Egypt. The global field of resonant oscillations was praised in repeating mantras, expressed as rows of Paleo-Sanskrit ligatures circumscribing several large pots found as fragments in surface soils on the Hummingbird Pyramid in 2014. Read from top to bottom, one basic example reads: *raua raua adhi raua raua adhi* –"Roaring, roaring delivering, roaring, roaring delivering..." (opposite). This mantra reinforces a psychoacoustic reference in glyphs on the Third-Eye Pyramid artifact *praising infrasonic healing influences.*

The La Maná ceramic inscriptions also reflect enigmatic statements from votive texts identified throughout the Paleo-Sanskrit world, from Caria, Italy, the Canary Islands and Illinois, US, where glyph texts express the same short reference to the tri-frequency infrasonic output of the highest free-standing pyramids in the world, the Giza pyramids: *raua kar upama* –"Roaring works of the highest."

Furthermore, this statement references the same pyramid functions as Paleo-Sanskrit texts from the Bosnian Valley of the Pyramids, inscribed directly into the megaceramic healing platforms of the Ravne tunnels, reading: *adhi-as kara kar-as raua-as kar-as* –"For delivering the action of workings, for roaring workings." *Scientific measurements of infrasound in the tunnels confirm this translation!*

Radiocarbon and thermoluminescence dating of these inscribed ceramic remains will provide a definitive age, yet many visible characteristics of these materials offer several factors supporting their Paleolithic origin. Recent damage to one of the sherds demonstrates their superb hardness, which, in modern terms, would be classified among the hardest ceramic products known as *stoneware.*

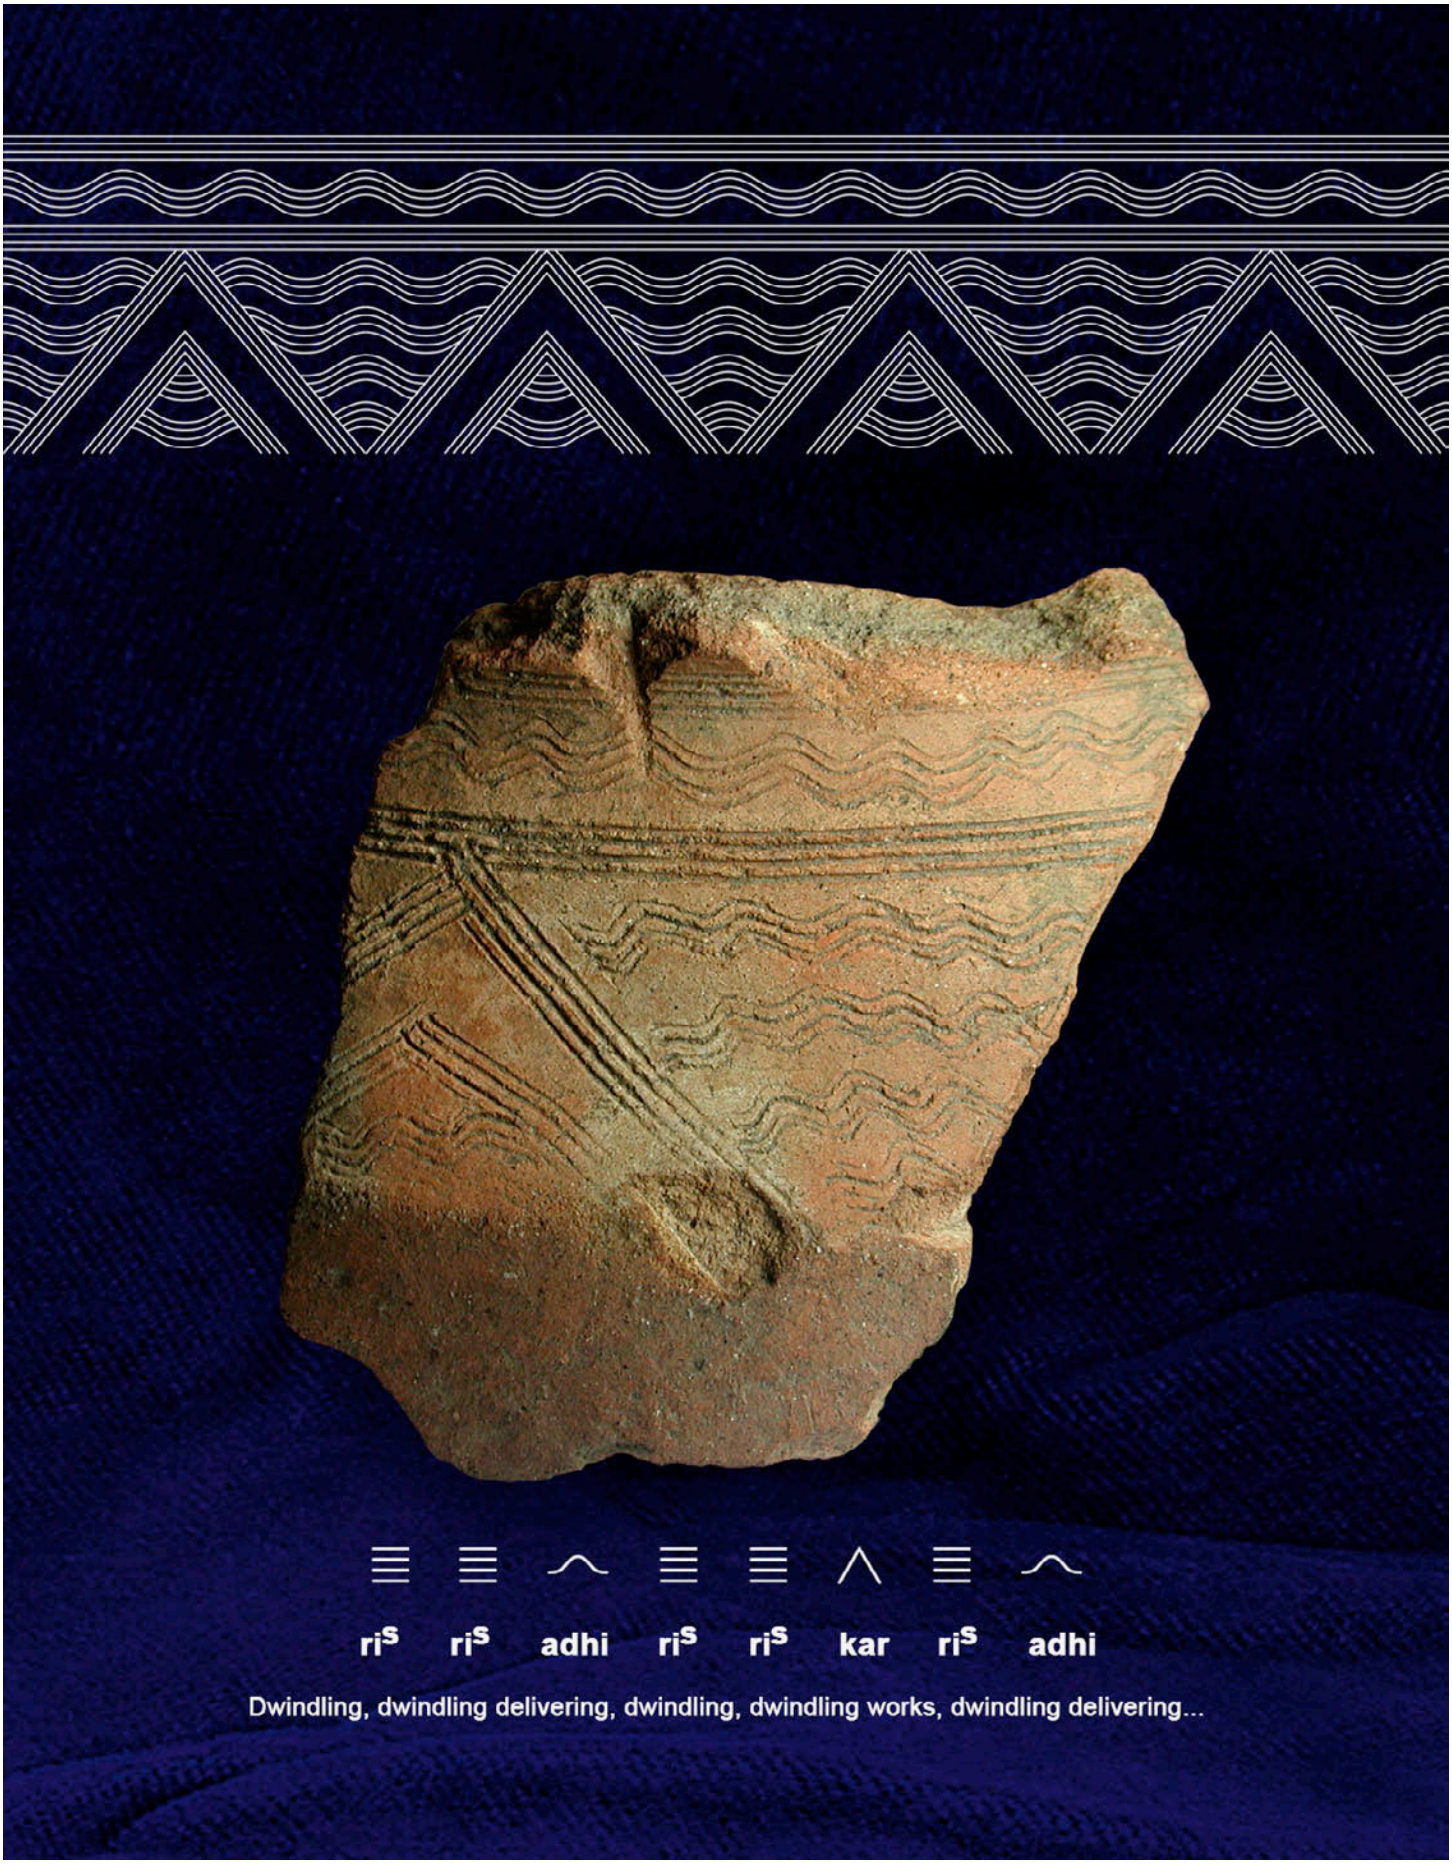
The inner curved surface of the largest piece presents a deep notch sustained from a sharp machete strike by a yucca farmer weeding his field, which did not break the hard ceramic fragment. The very thick and extreme hardness of the sherds suggests the application of geopolymer chemistry in these ceramics that were most likely produced by the makers of these restructured mountains. The smoky grey interior of the ceramic samples is also indicative that caustic chemical agents were mixed with sandy clays to produce stoneware quality ceramics at low temperatures achieved in simple pit fires.



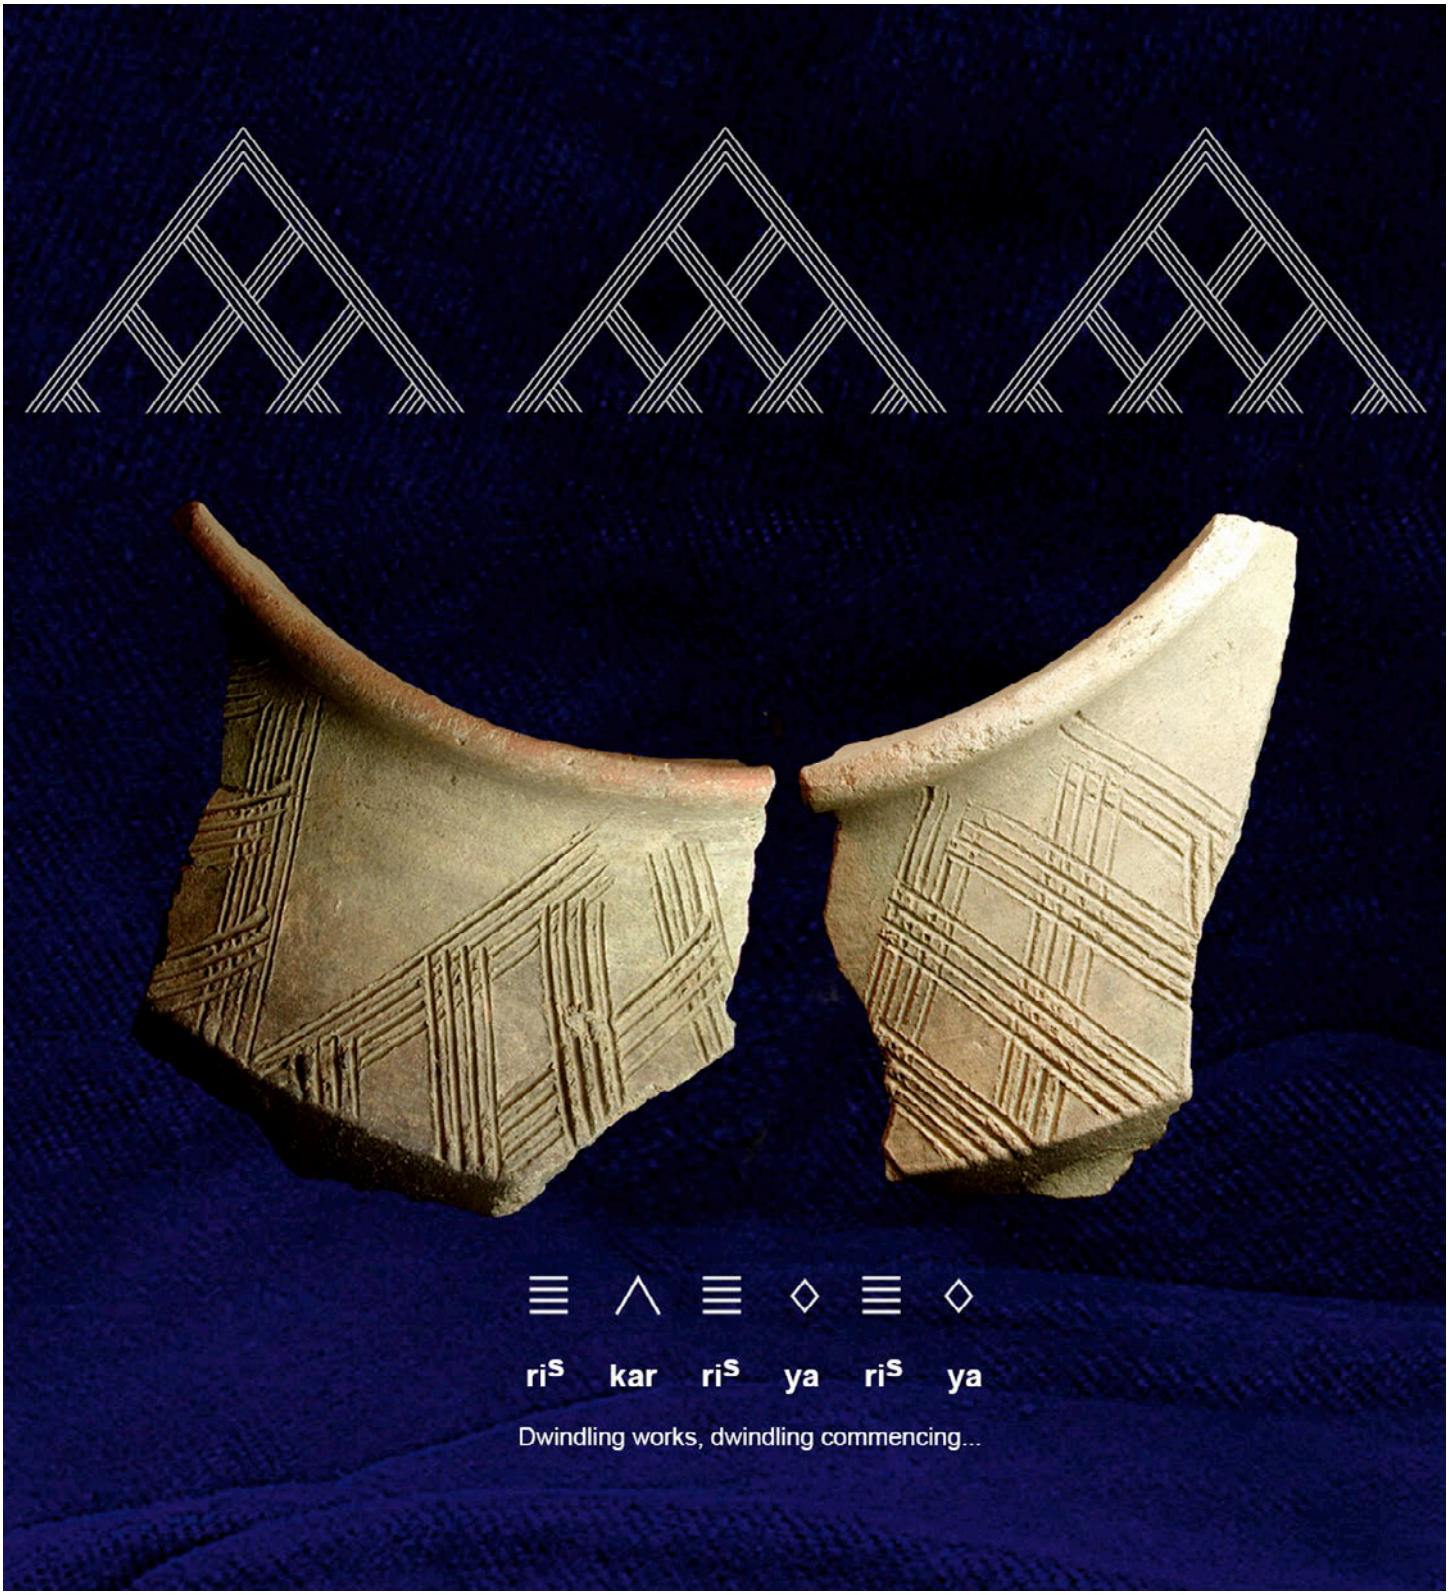
Among several hundred ceramic sherds recovered during 2014 from the surface soils on the Hummingbird Pyramid are many recognizable fragments of dining plates, stilted cooking pots and stilted platters. This group of exciting finds includes more than a dozen examples of small- and medium-sized cooking pots that were intricately adorned with a broad, circumscribed band of repeating hieroglyphic pictograms.

The considerable hardness of these refined ceramic products is contrasted by their high porosity that results from their very high content of quartz sand and other, more exotic particulate inclusions. Particulate loading of the kaolin clay imparts the distinctive sandy coloration and a sparkling brilliance when viewed in direct sunlight, emphasizing the reflective quartz grains and a variety of metallic mineral inclusions.

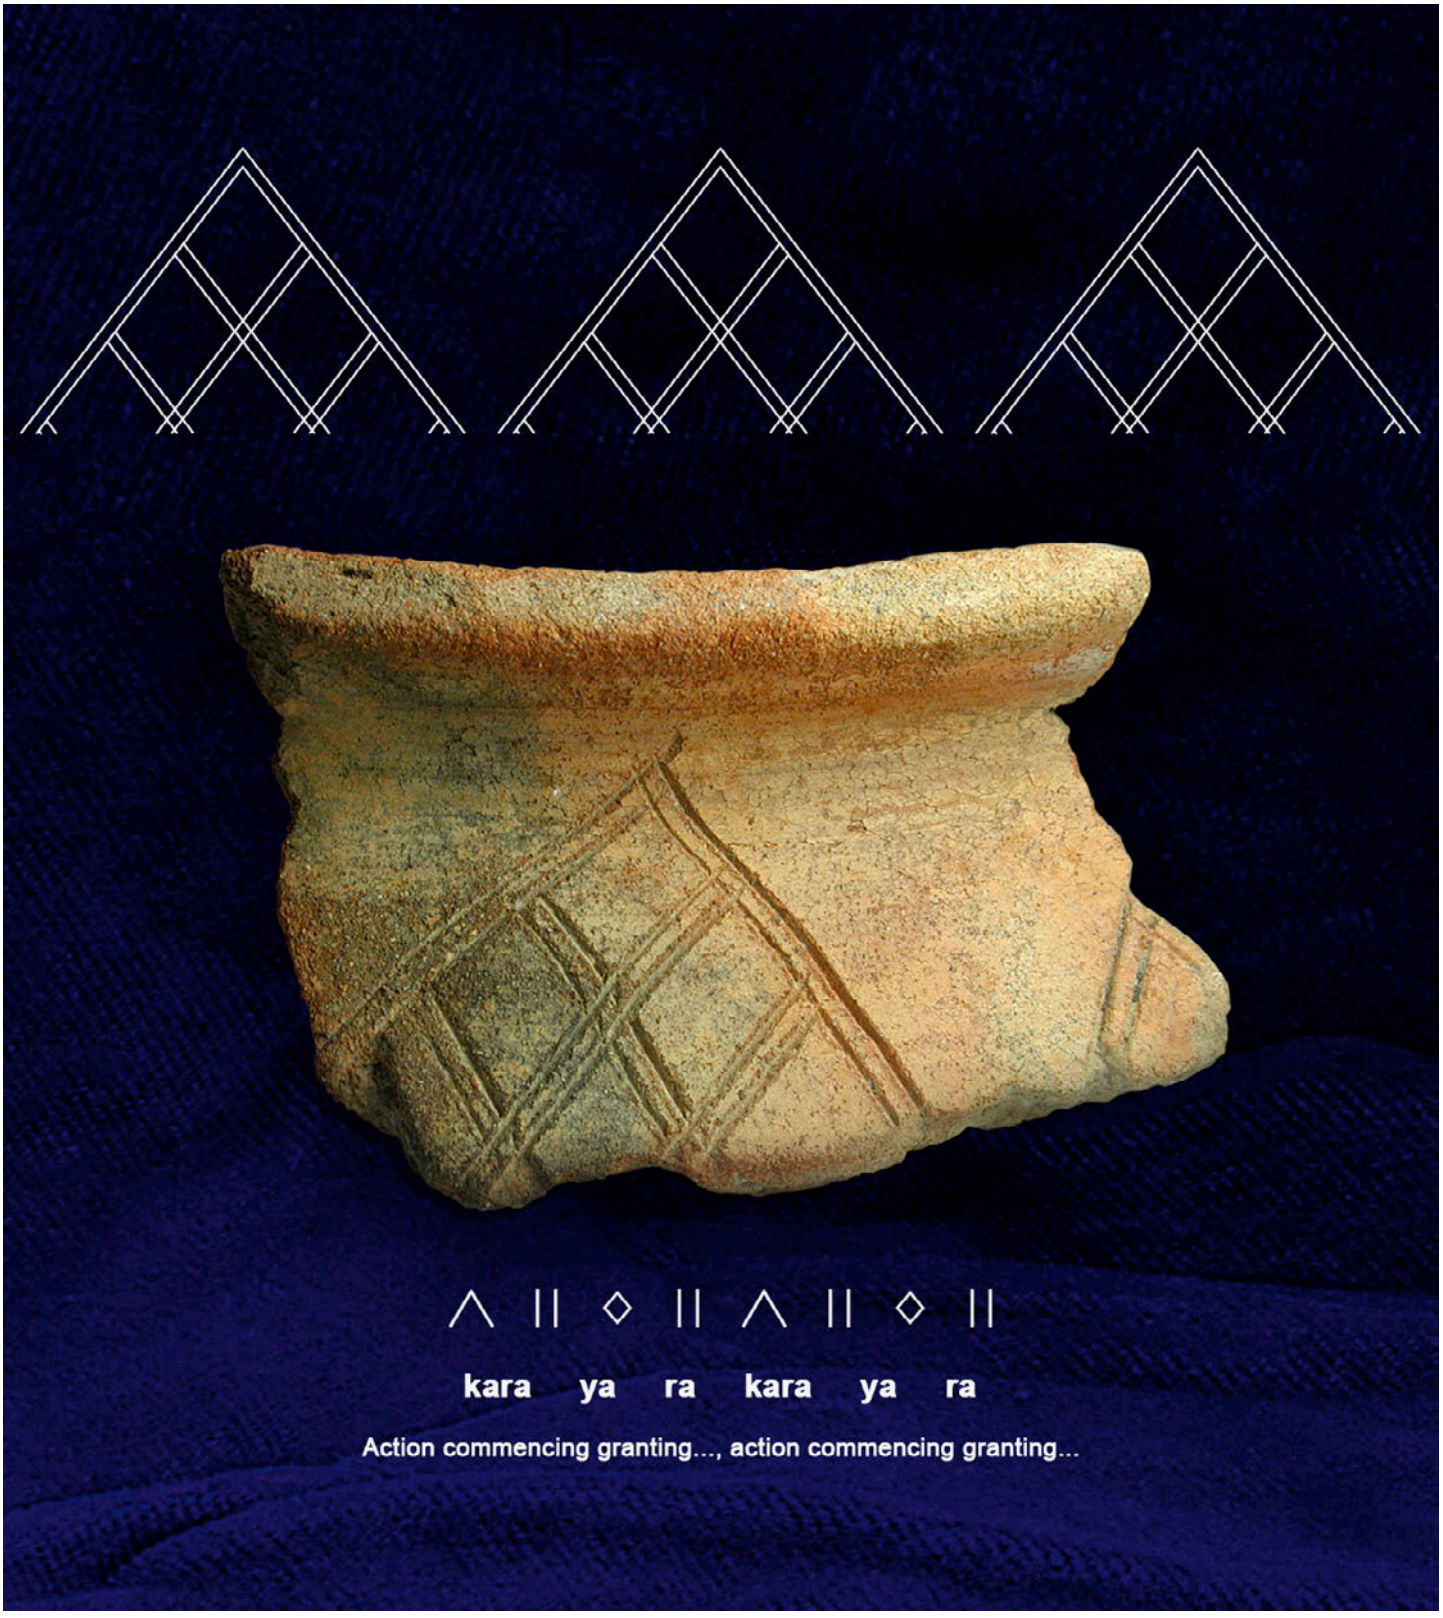
The high mineral content of these porous, often unglazed ceramics from atop the Hummingbird Pyramid are comparable to modern earthenware, with the exception of the presence of pulverized metallic inclusions – *for which no modern or ancient equivalent has ever been documented. This earthenware is magnetic.*



An intact example of a similar stilted platter was discovered during residential excavations near La Maná (above), and has been included to provide reference aiding visualization of the original size and stilted design configuration of cooking pots from the Hummingbird Pyramid's upper walkways.

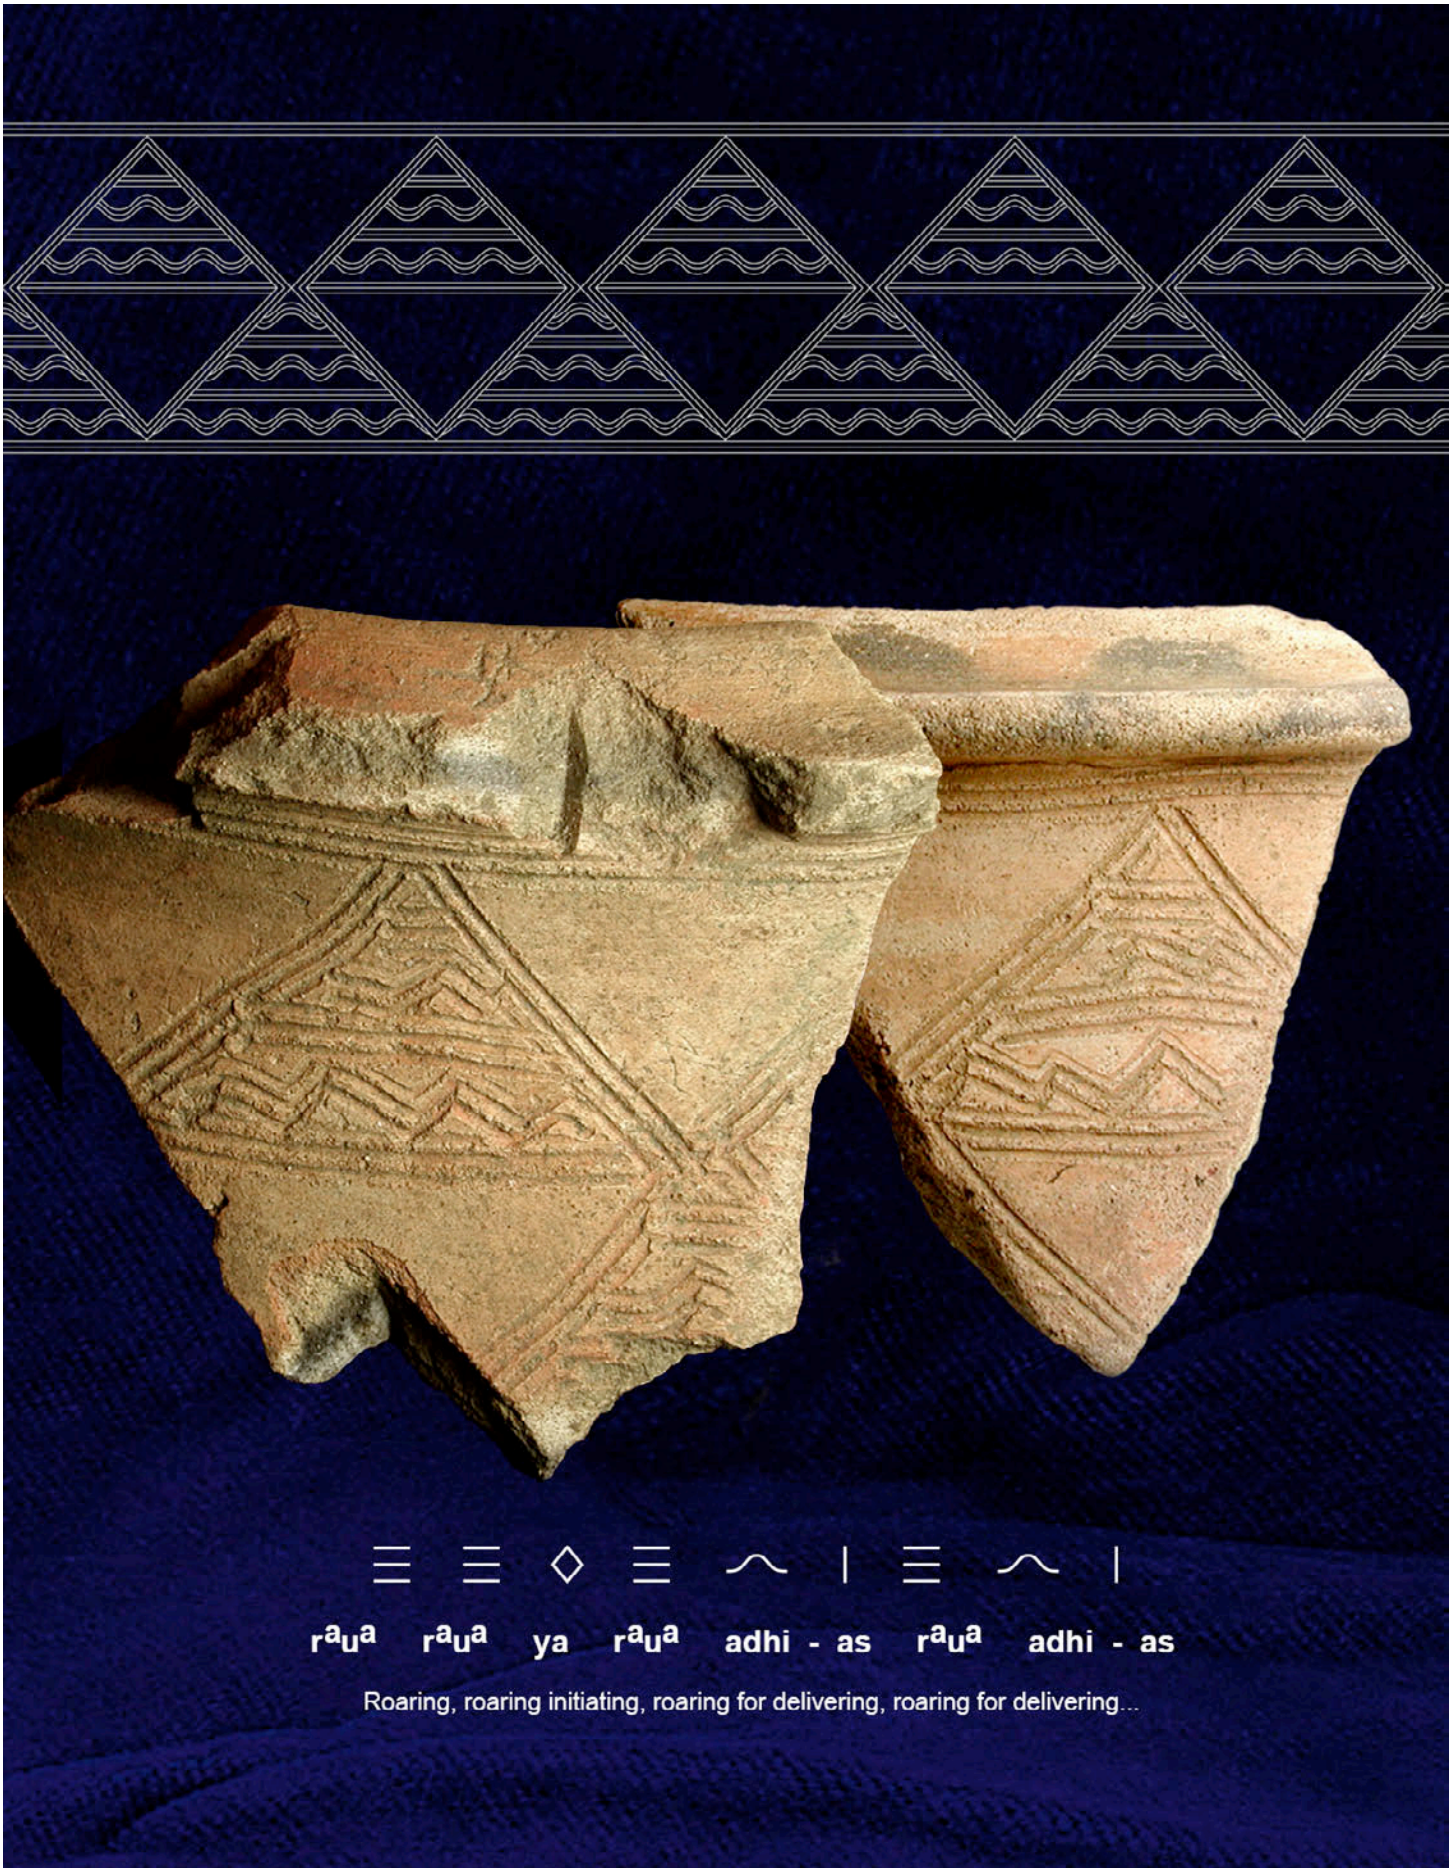


ri^S ri^S vi ri^S mi - is ya ri^S kar
Dwindling..., from dwindling synchrony commencing dwindling works...

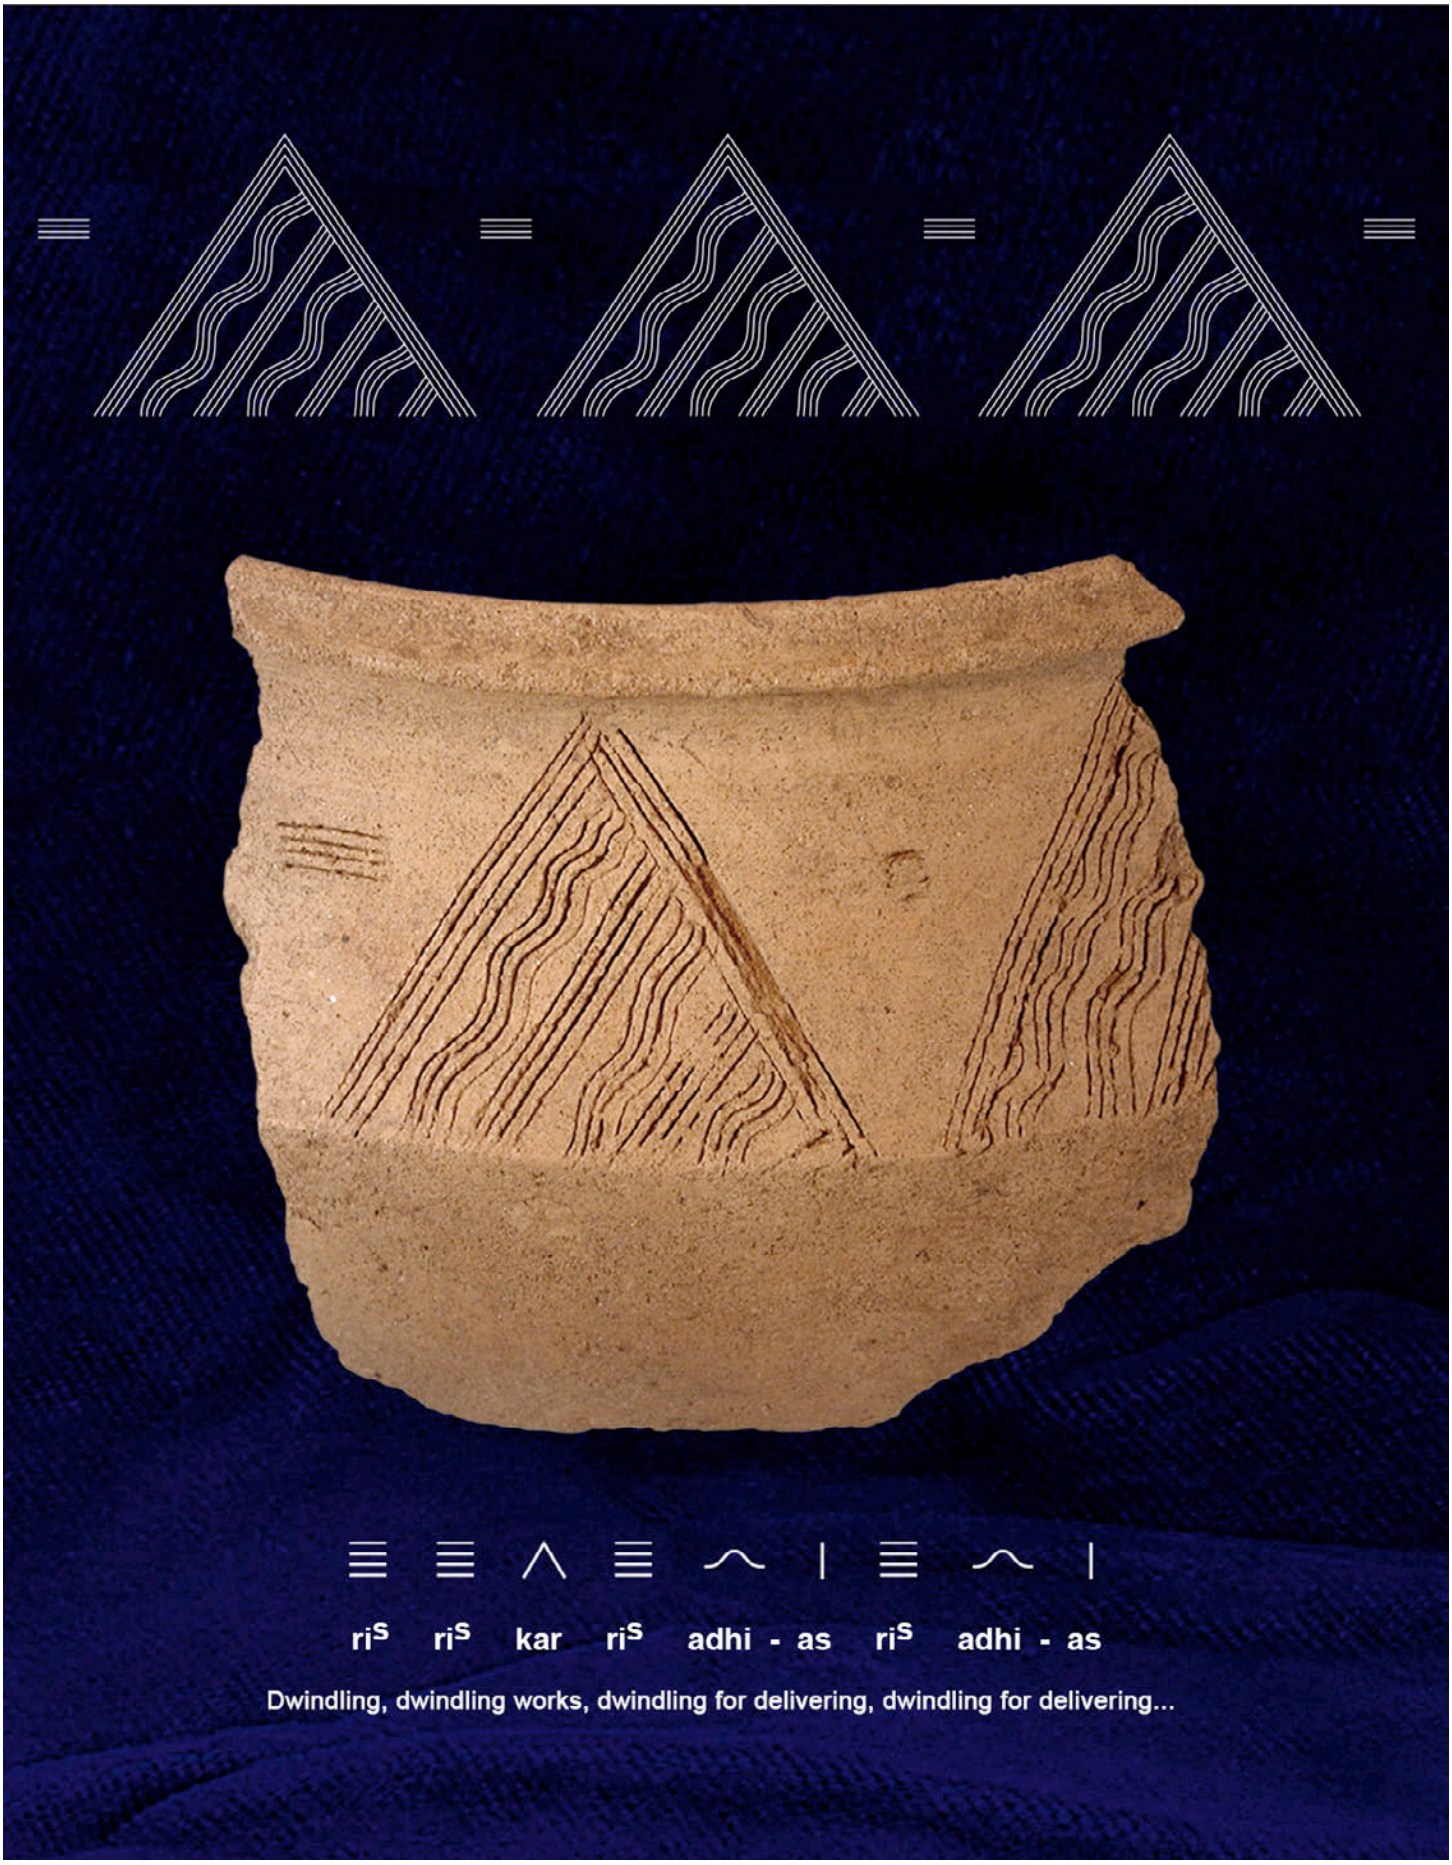


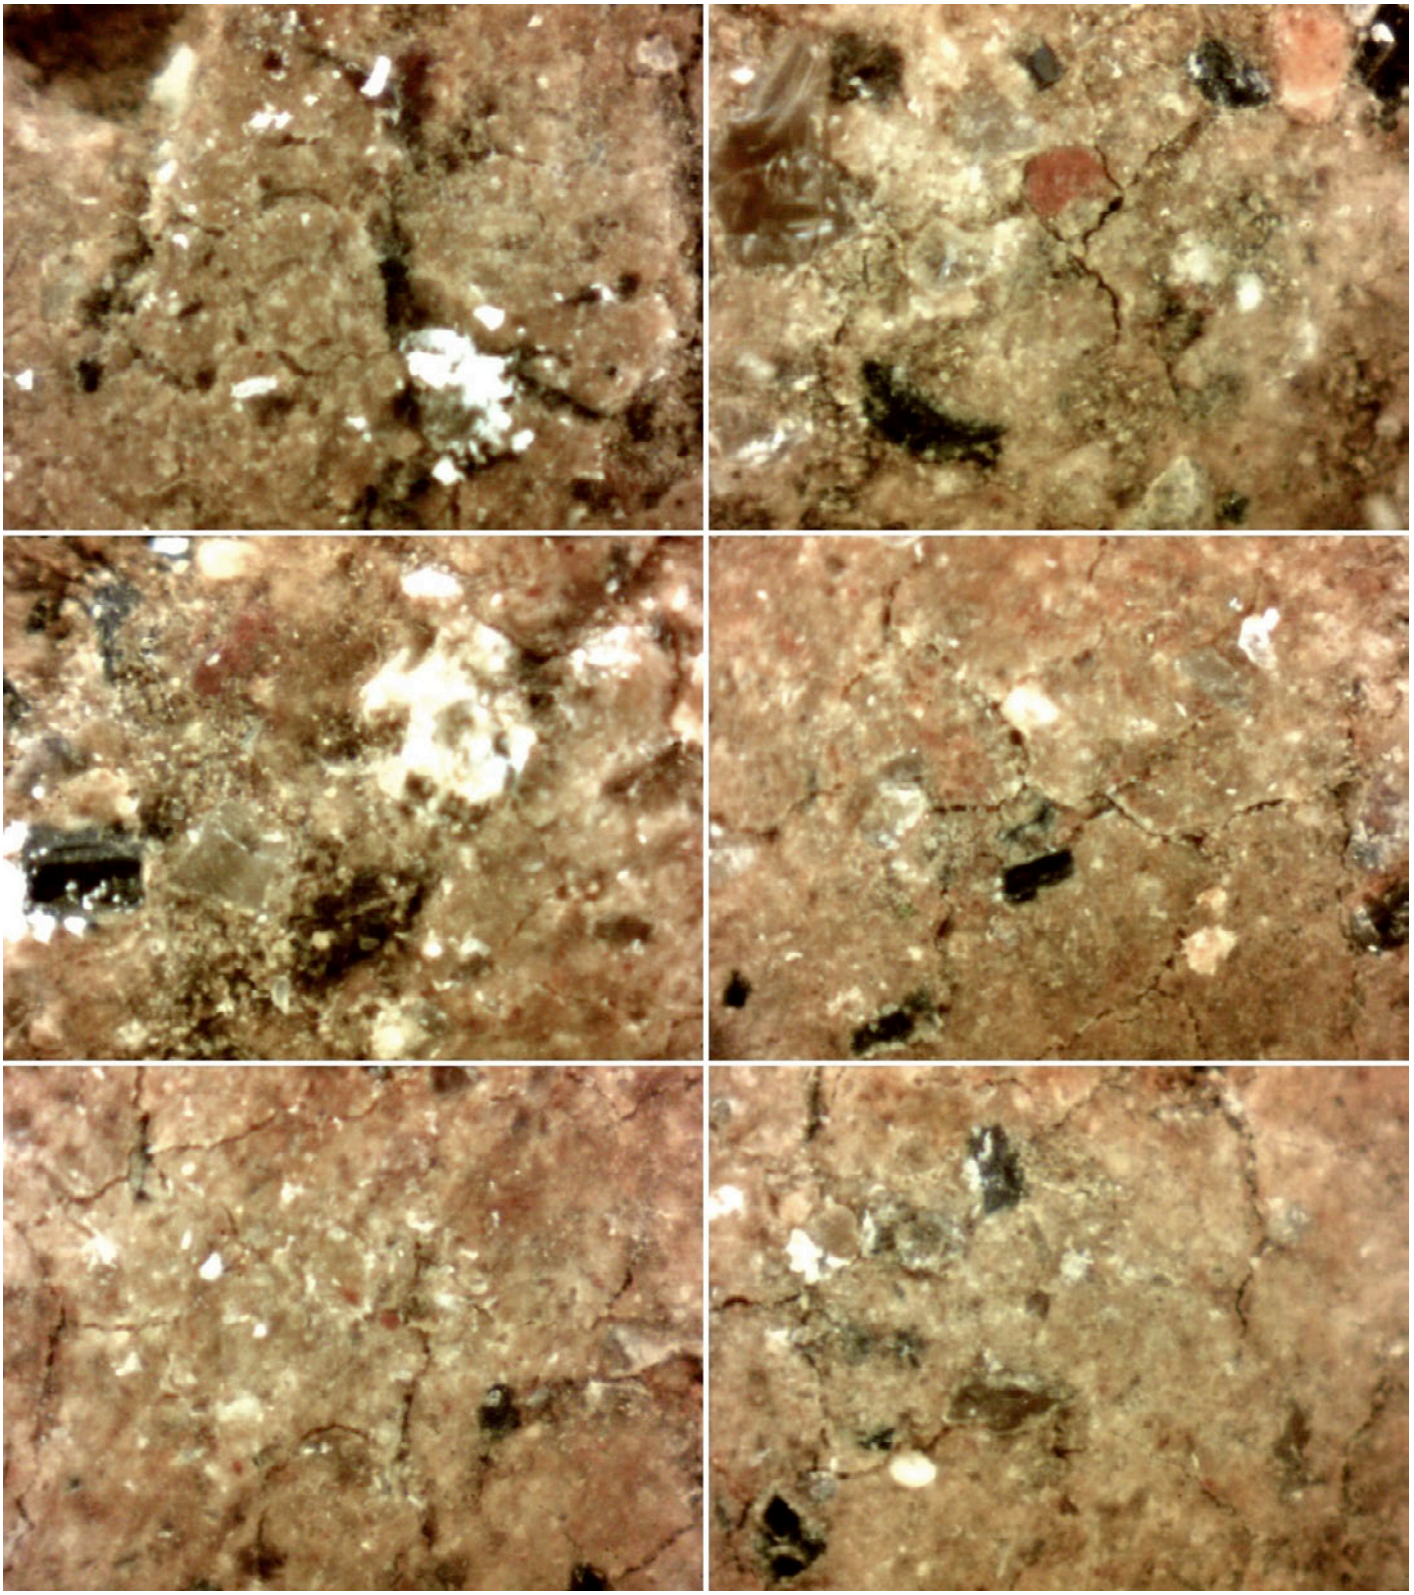
One of the more complex and beautiful examples of Paleo-Sanskrit shoulder text inscriptions decorates a small magnetic cooking pot, reading: *ris ris vi ris mi-is ya ris kar* , meaning "Dwindling..., from dwindling synchrony commencing dwindling works..." (opposite). Very similar hypnotic designs with tightly nested spirals characterize ligature groups used by Paleolithic and Neolithic cultures throughout Eurasia.[17]

Also seen worldwide is another iconic shoulder text, once again forming a pictogram of pyramids in rows, reading: *raua kar raua kar raua kar* , meaning "Roaring works, roaring works, roaring works..." (above).

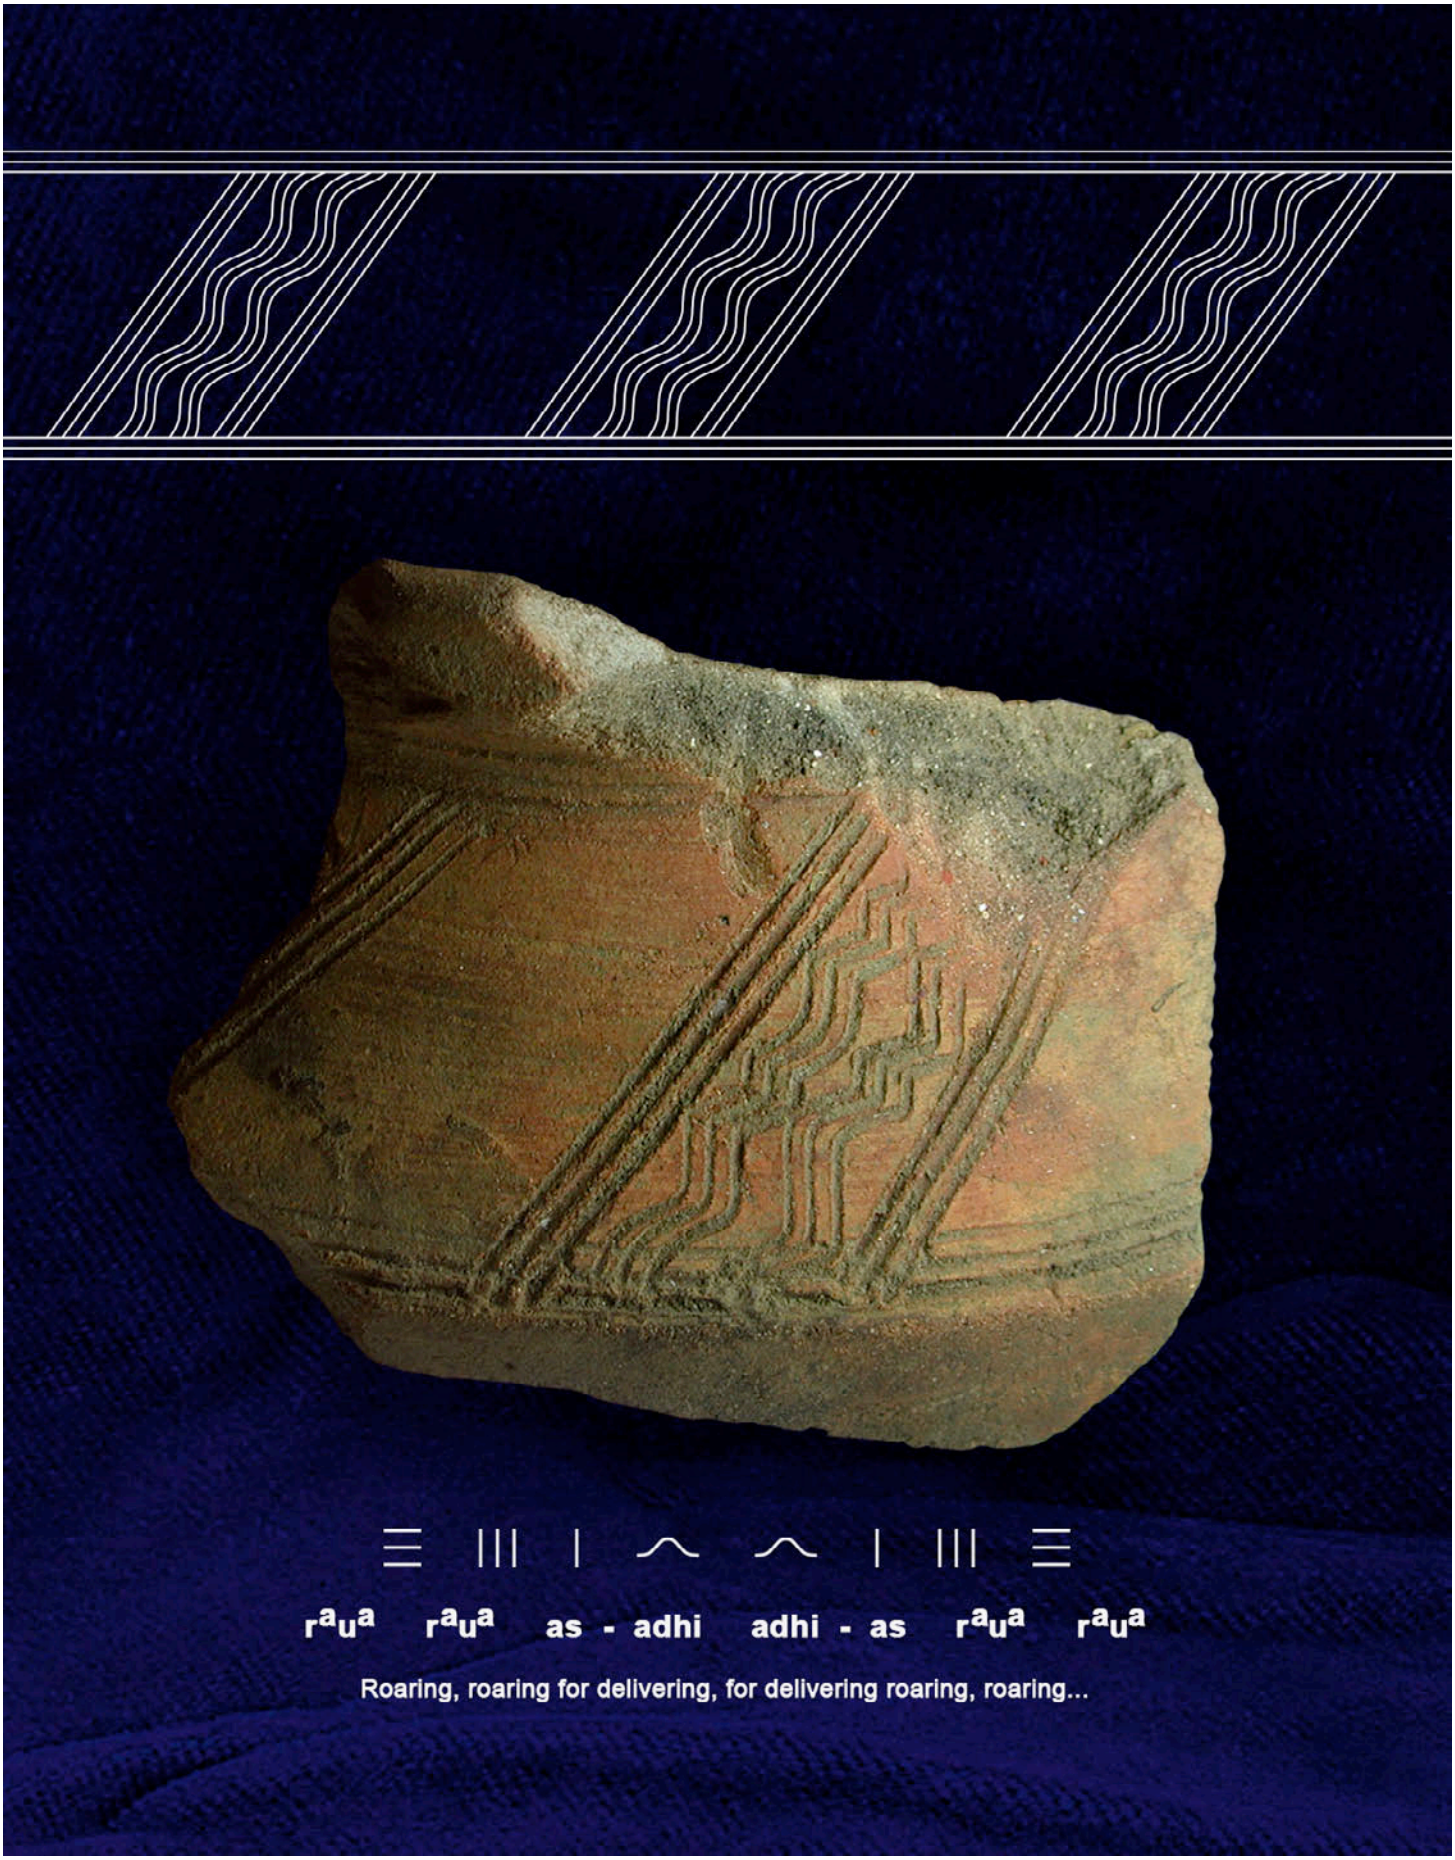


ri^S ri^S adhi ri^S ri^S kar ri^S adhi
Dwindling, dwindling delivering, dwindling, dwindling works, dwindling delivering...

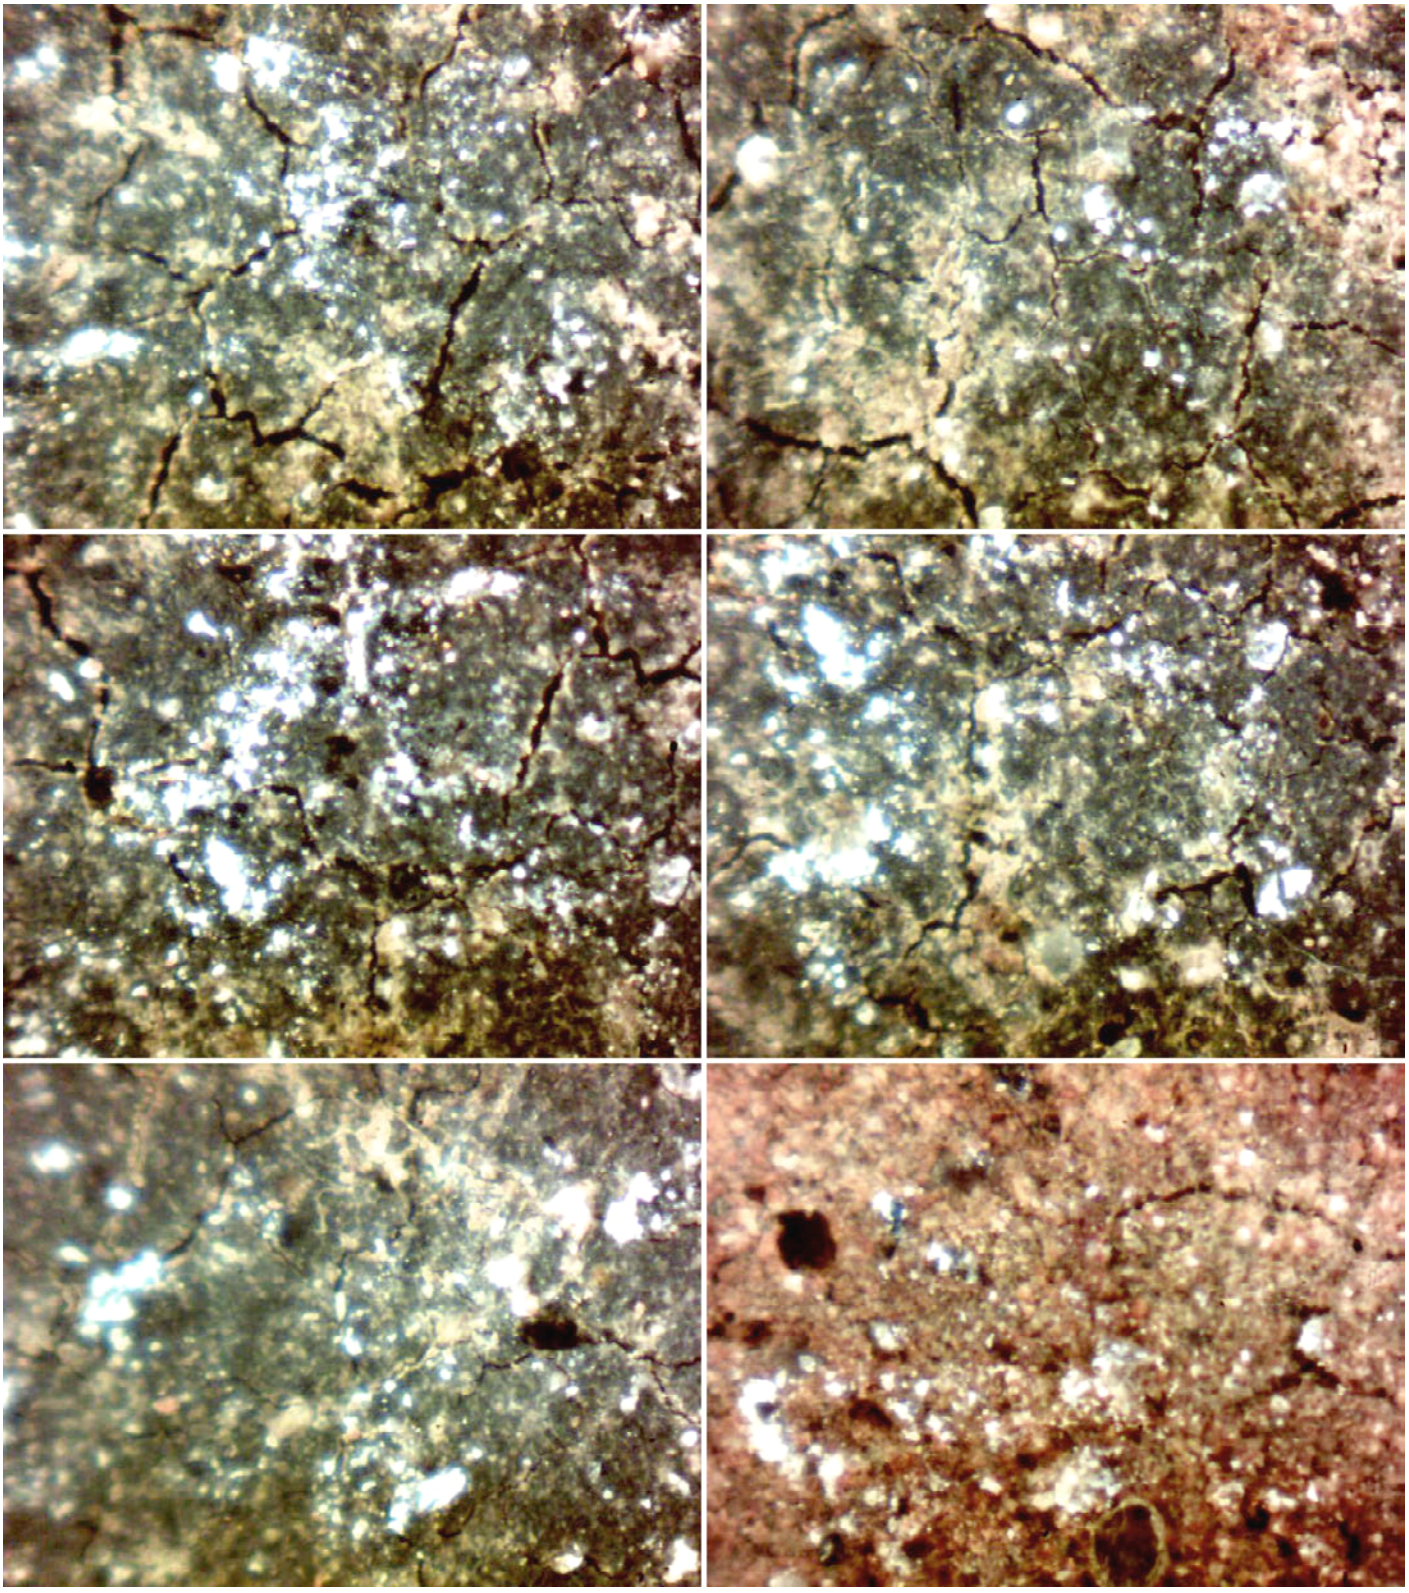




While various pots are covered with soot from cooking fires, other pots were apparently used for mixing a geopolymer cement. The exterior of a small stilted pot bears hardened smears of this orange cement paste, suggesting *the vessel was used for mixing the small quantities of cement occassionally used to repair walkways on the pyramid*. Inscribed text on the pot's shoulder reads: *ris ris adhi ris ris kar ris adhi* , meaning "Dwindling, dwindling delivering, dwindling, dwindling works, dwindling delivering..." (opposite). Another pictographic representation of pyramids in rows decorates the shoulder band of another small cooking pot, reading: *ris kar ris ya ris ya* , meaning "Dwindling works, dwindling commencing..." (above).



Another pot sherd was circumscribed with a band of very similar shoulder text forming a pictogram of pyramids in rows, reading: *kara ya ra kara ya ra* , meaning "Action commencing granting..., action commencing granting..." (above). A few small fragments from a medium-sized stilted cooking pot offer inscribed rows of nested triangles representing a votive text referring to the thunderous infrasound resonance emanating from the pyramids, reading: *raua raua ya raua adhi-as raua adhi-as* , meaning "Roaring, roaring initiating, roaring for delivering, roaring for delivering... " (opposite).

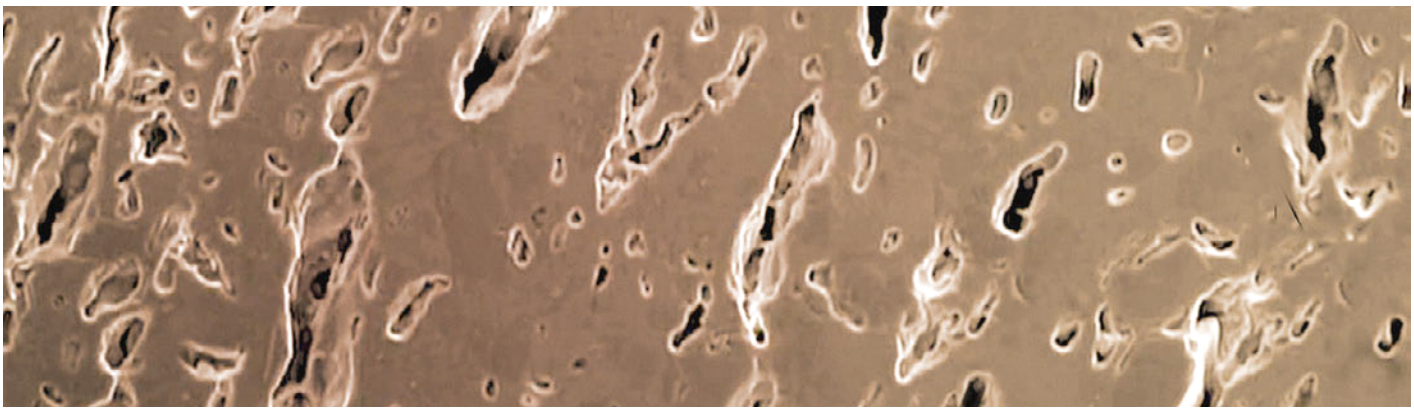


rauaraua ya rauaadhi - asrauaadhi - as
Roaring, roaring initiating, roaring for delivering, roaring for delivering...

ri^S ri^S kar ri^S adhi - as ri^S adhi - as
Dwindling, dwindling works, dwindling for delivering, dwindling for delivering...

A pot fragment found on the lower slope of the Hummingbird Pyramid bears fine hieroglyphic inscriptions forming pictograms of pyramids, reading: *ris ris kar ris adhi-as ris adhi-as* , meaning "Dwindling, dwindling works, dwindling for delivering..." (opposite). Under magnification at 200x, micrographs of the sherd show an abundance of translucent quartz and black tourmaline crystals derived from crushed granites, as well as yellow iron pyrite flakes, bright white nickel filings and fine red particles of crushed laterite (above). *Selective admixture of magnetic metals and pyroelectric crystals in ceramics matches the constituents of pyramid geopolymer stones for endowing these materials with enhanced electromagnetic properties.*

r^a u^a r^a u^a as - adhi adhi - as r^a u^a r^a u^a
Roaring, roaring for delivering, for delivering roaring, roaring...



A fragment from a small pot with an orange/red exterior glaze paint was circumscribed around the same characteristic shoulder band with a palindrome reading: *raua raua as-adhi adhi-as raua raua* , meaning "Roaring, roaring for delivering, for delivering roaring, roaring..." (opposite). Once again, microscopy at 200x reveals an even distribution of pulverized magnetic constituents including quartz, tourmaline, pyrite, nickel and laterite. The interior surfaces of this pot sherd have been darkened by a fine carbon residue that provides contrast with bright clusters of reflective nickel and pyrite particles mixed in quantity throughout the ceramic material (above), *endowing the magnetic properties of a semiconductor*.

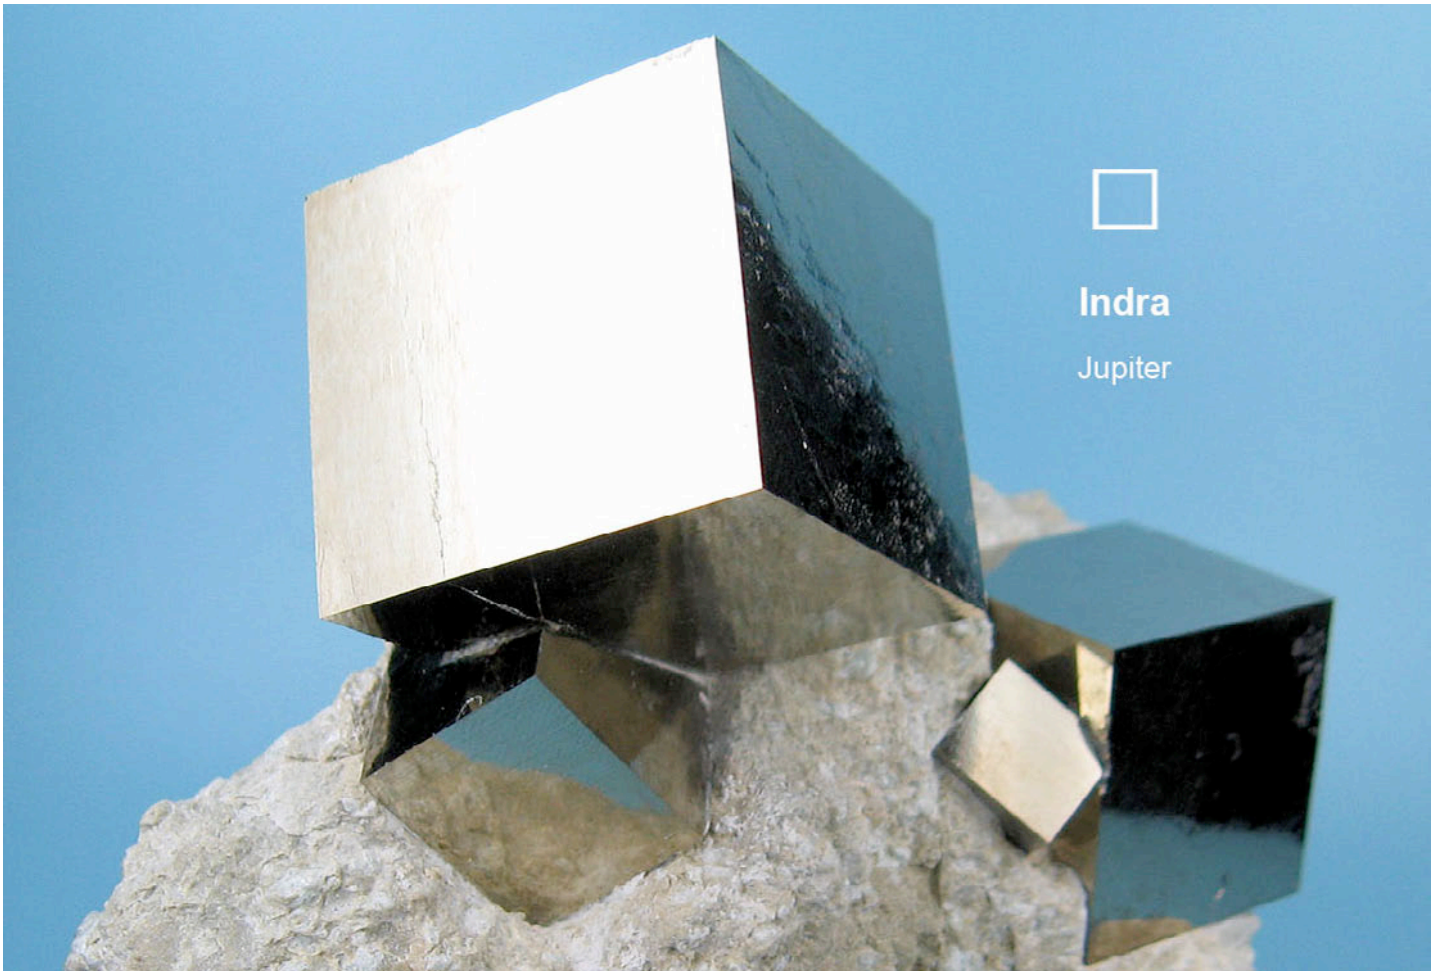
Dozens of large fragments from gargantaun pots presenting bands of beautiful hieroglyphic inscriptions stand out among the many sherds recovered during the first year of surface soil investigations conducted on the steep slopes of the Hummingbird Pyramid. Hundreds of earthenware fragments also turned up during yucca harvesting and planting on upper sections of the N-S extension of the long temple structure.

Both material composition and inscribed texts of the earthenware sherds confirm their origin during the Paleolithic era, representing the termination point of the Ohum culture dating to approximately ~13,000bp.

The high selectivity of mineral constituents that were finely pulverized for mixing into the La Maná earthenware exactly reflects the same technological functions served by such admixes to the pyramid stones themselves. The koalinitic cement binder material used between the pyramid stones shows the same high porosity as exhibited by the thick pot sherds, known as 'breathing earthenware' (below).

The selectively controlled particulate content of Ohum earthenware the Atlantean firestones of the La Maná pyramid complex exemplify the material impurities that define semiconductor materials:

> A **semiconductor** material has an electrical conductivity value between a conductor, such as copper, and an insulator, such as glass. Semiconductors are the foundation of modern electronics... The electrical conductivity of a semiconductor material increases with increasing temperature, which is behaviour opposite to that of a metal... Because the electrical properties of a semiconductor material can be modified by controlled addition of impurities, or by the application of electrical fields or light, devices made from semiconductors can be used for amplification, switching, and energy conversion.[18]



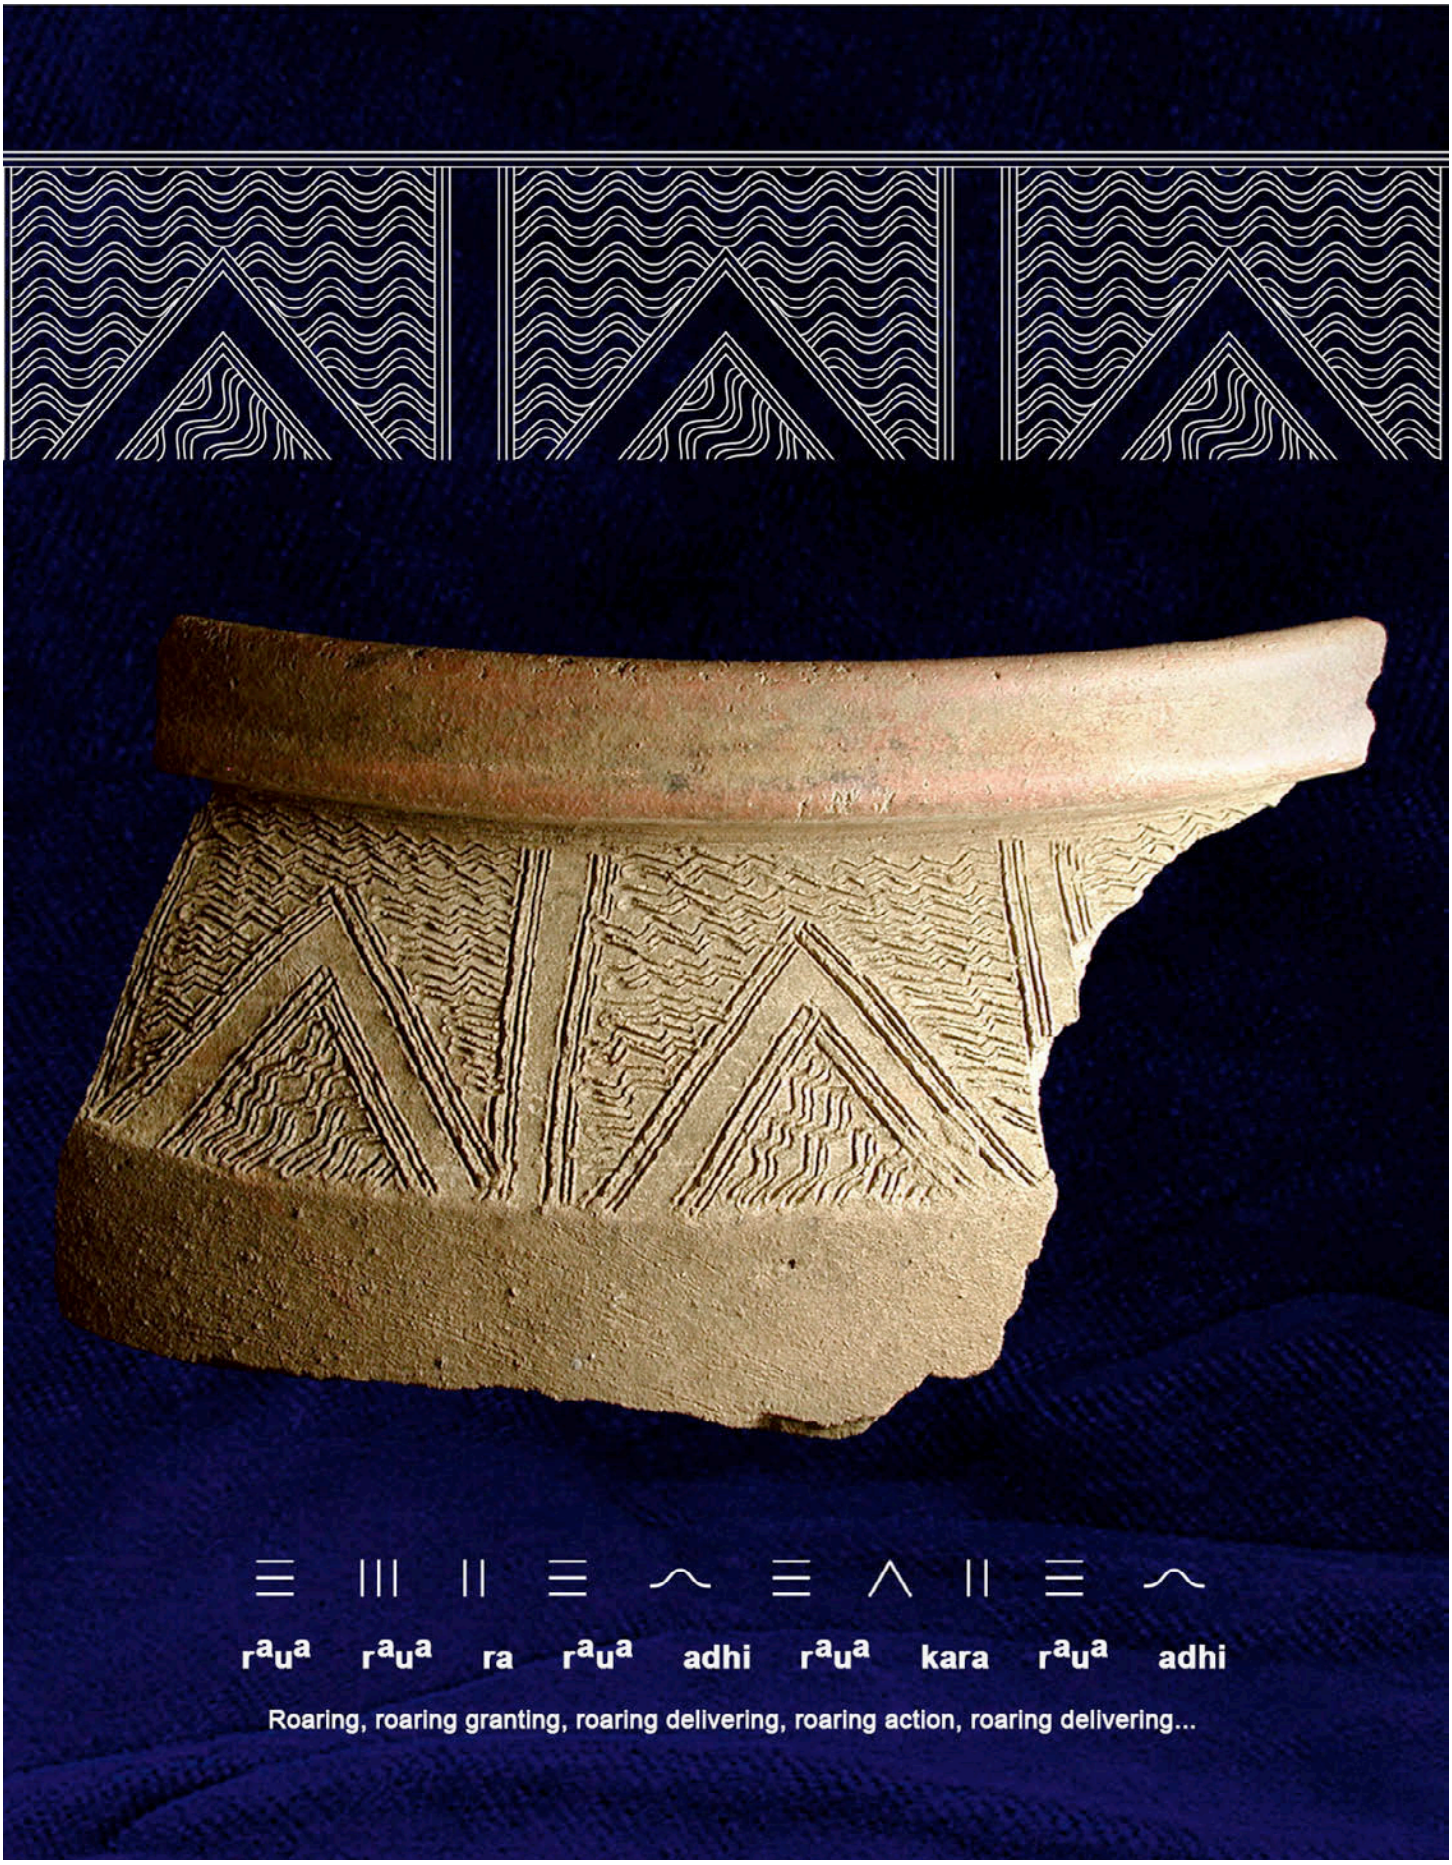
The well defined semiconductor functions of energy conversion and amplification were adeptly applied by the Ohum throughout the lands of On as a vast network of magnetized pyramid complexes that act as resonant infrasonic transceivers. Having recognized the pyramids as wireless stations, what special intergrated purpose warranted the immense effort to create the megaceramic semiconductor jars?

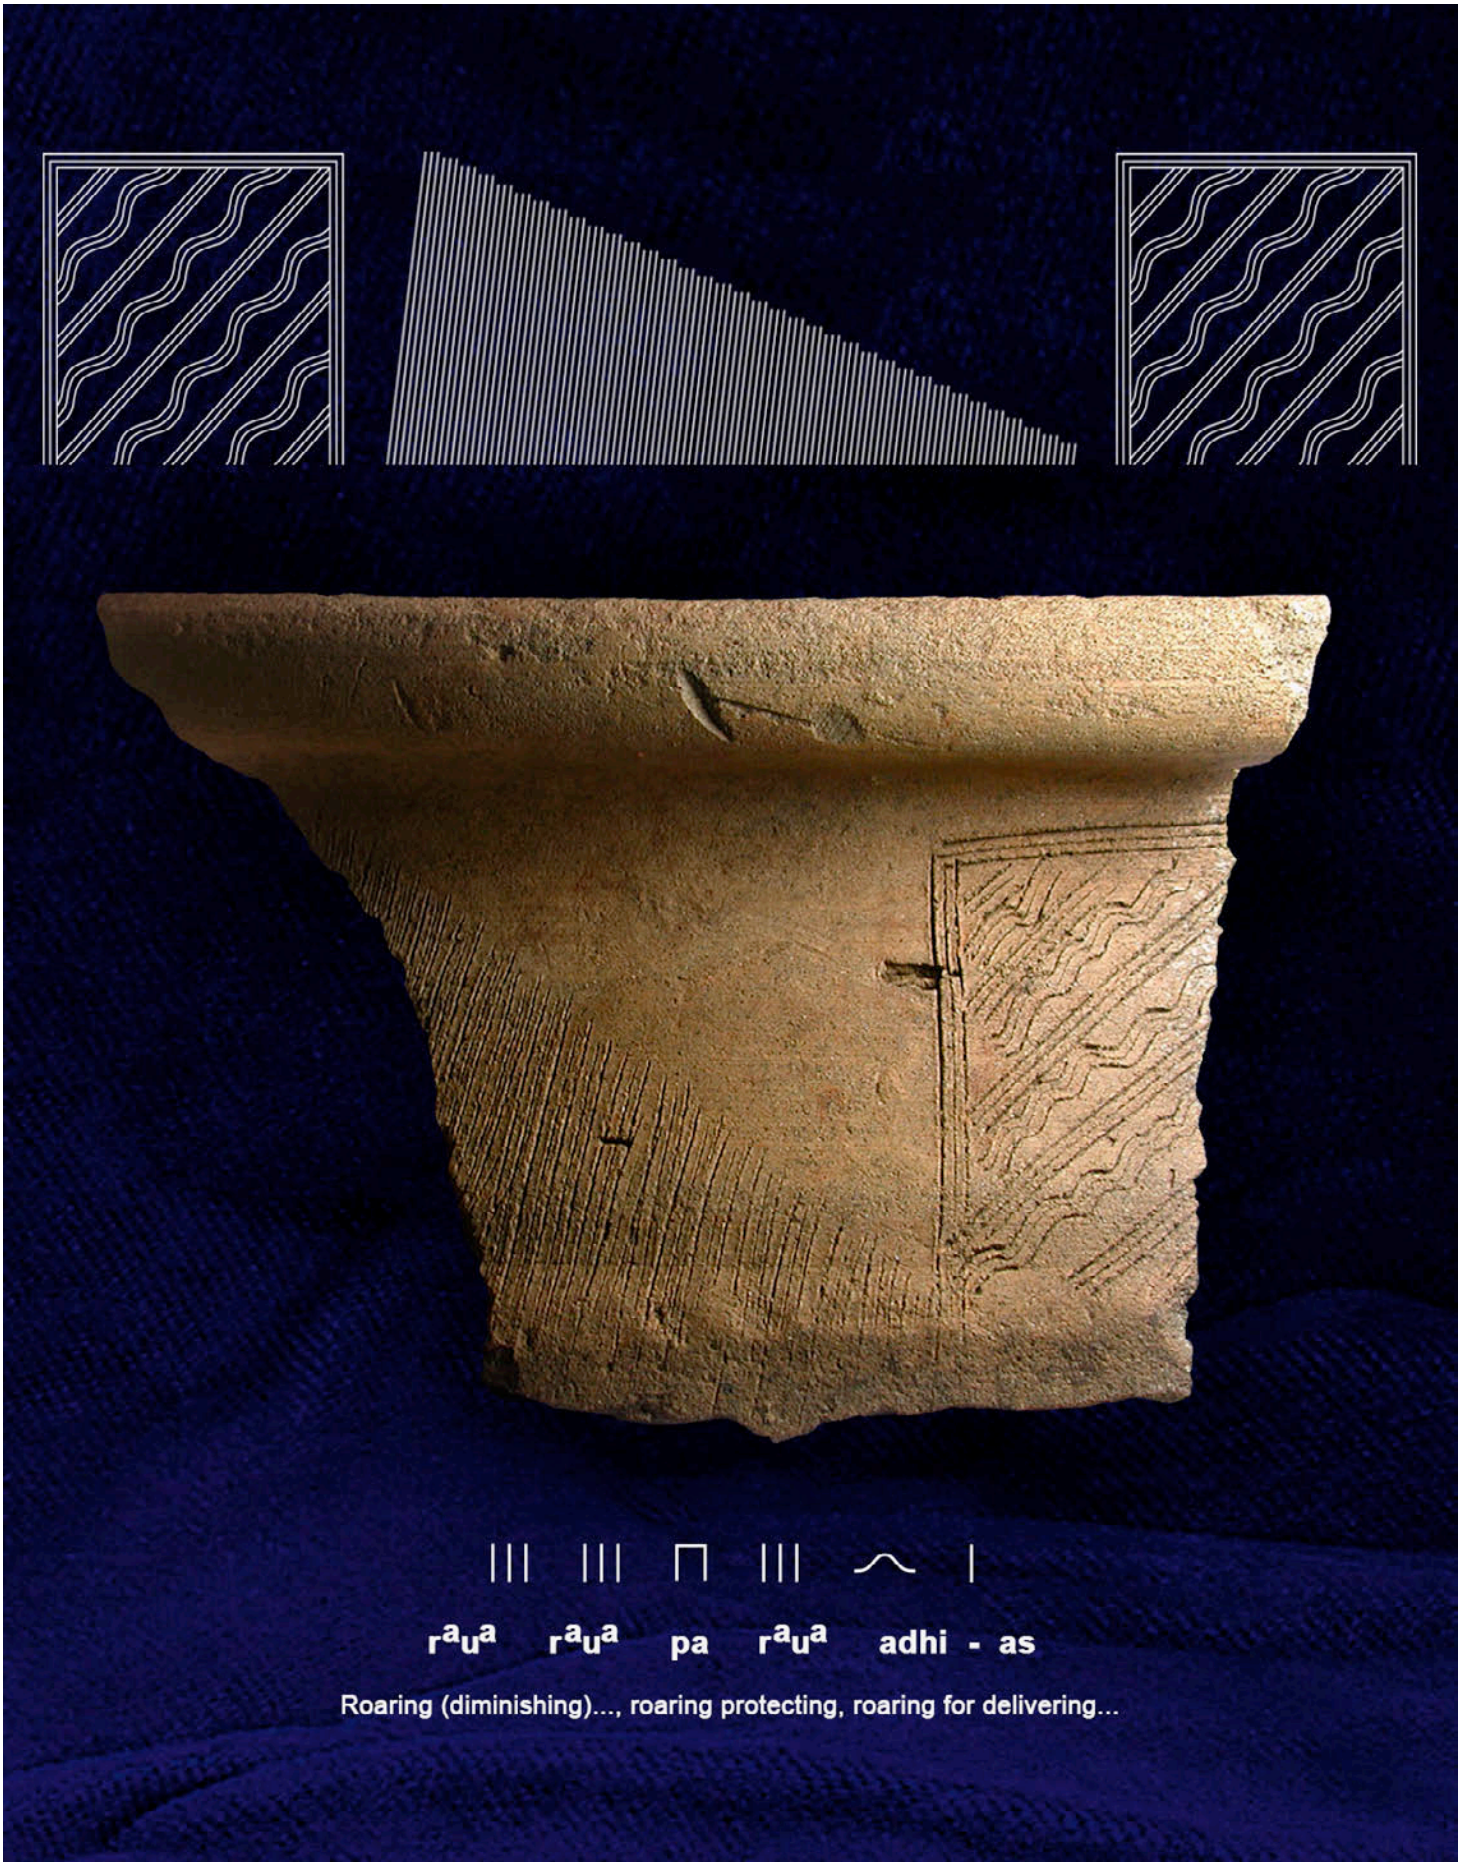
The incised geometric bands of Paleo-Sanskrit shoulder texts provide a comprehensive series of concise answers to this fundamental qestion that defined the enigmatic expressions of Atlantean civilization now deciphered from Paleolithic remains showing a remarkable lingistic consistency in all parts of the world.

The rumbling infrasonic resonance of Indra, the planet Jupiter, was efficiently transduced by megaceramic jars for sterilizing their contents by intense ionization, whether storing water, dried or fermenting foods and beverages, or interring the physical remains of deceased individuals in Ohum communities.

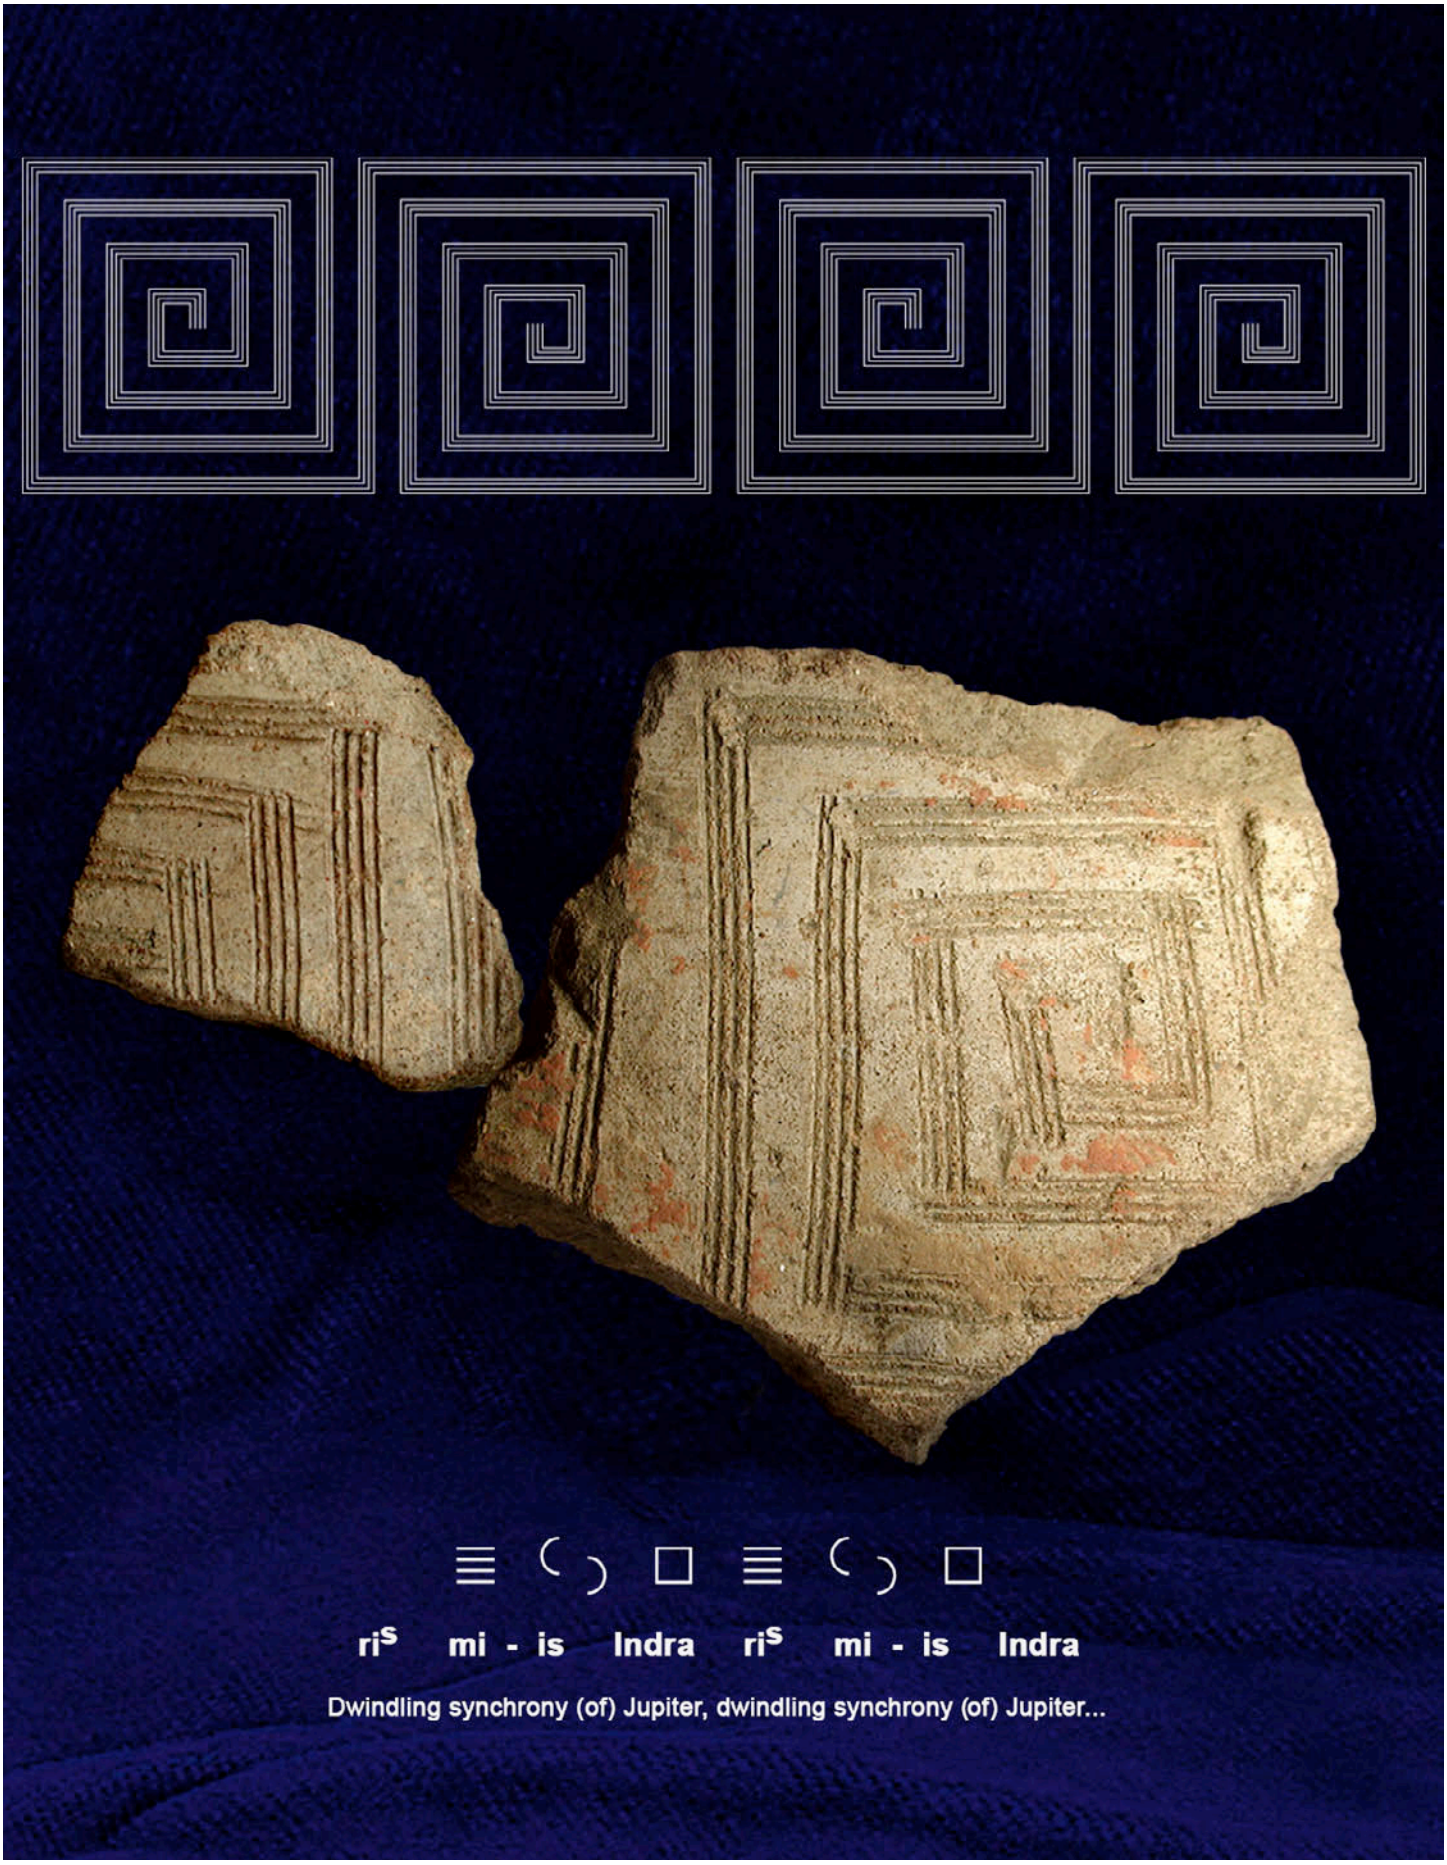
Among several dozen large pot sherds found on the steep western side of the hummingbird pyramid in 2014, a large painted example displays text from the shoulder of the vessel, reading: *raua raua ra raua adhi raua kara raua adhi* , meaning "Roaring, roaring granting, roaring delivering, roaring action, roaring delivering..." (overleaf).

Another megaceramic sherd presents a much wider neck and a simpler rim shape, having been designed for use without a lid, and was inscribed with a simple repeating text band reading: *raua raua pa raua adhi-as* , meaning "Roaring (diminishing)..., roaring protecting, roaring for delivering..." (overleaf).

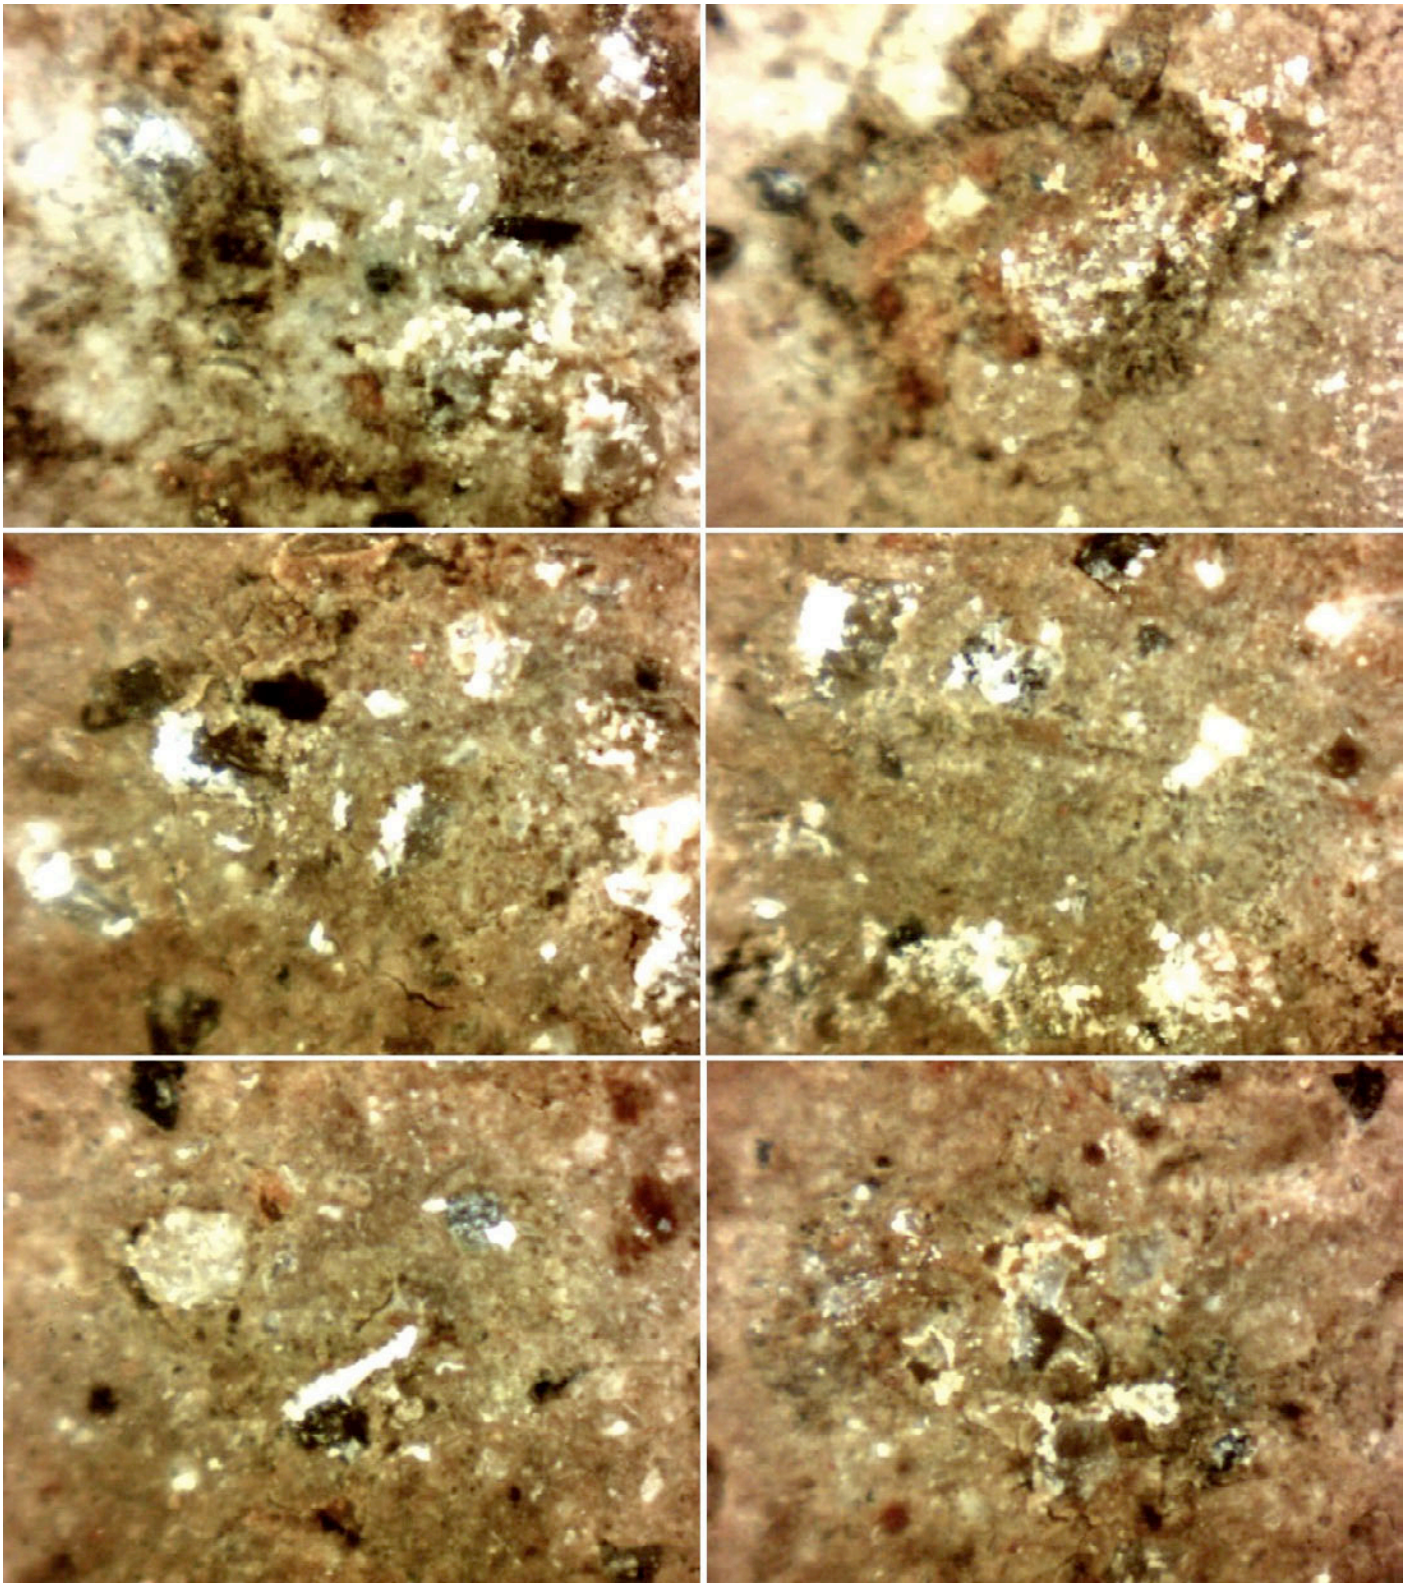




Crystal Inclusions	Piezoelectric	Pyroelectric	Diamagnetic	Paramagnetic	Ferromagnetic
quartz crystals	✓	✓	✓		
tourmaline crystals	✓	✓			
iron pyrite flakes		✓	✓	✓	
laterite particles				✓	✓
iron particles					✓
nickel particles					✓

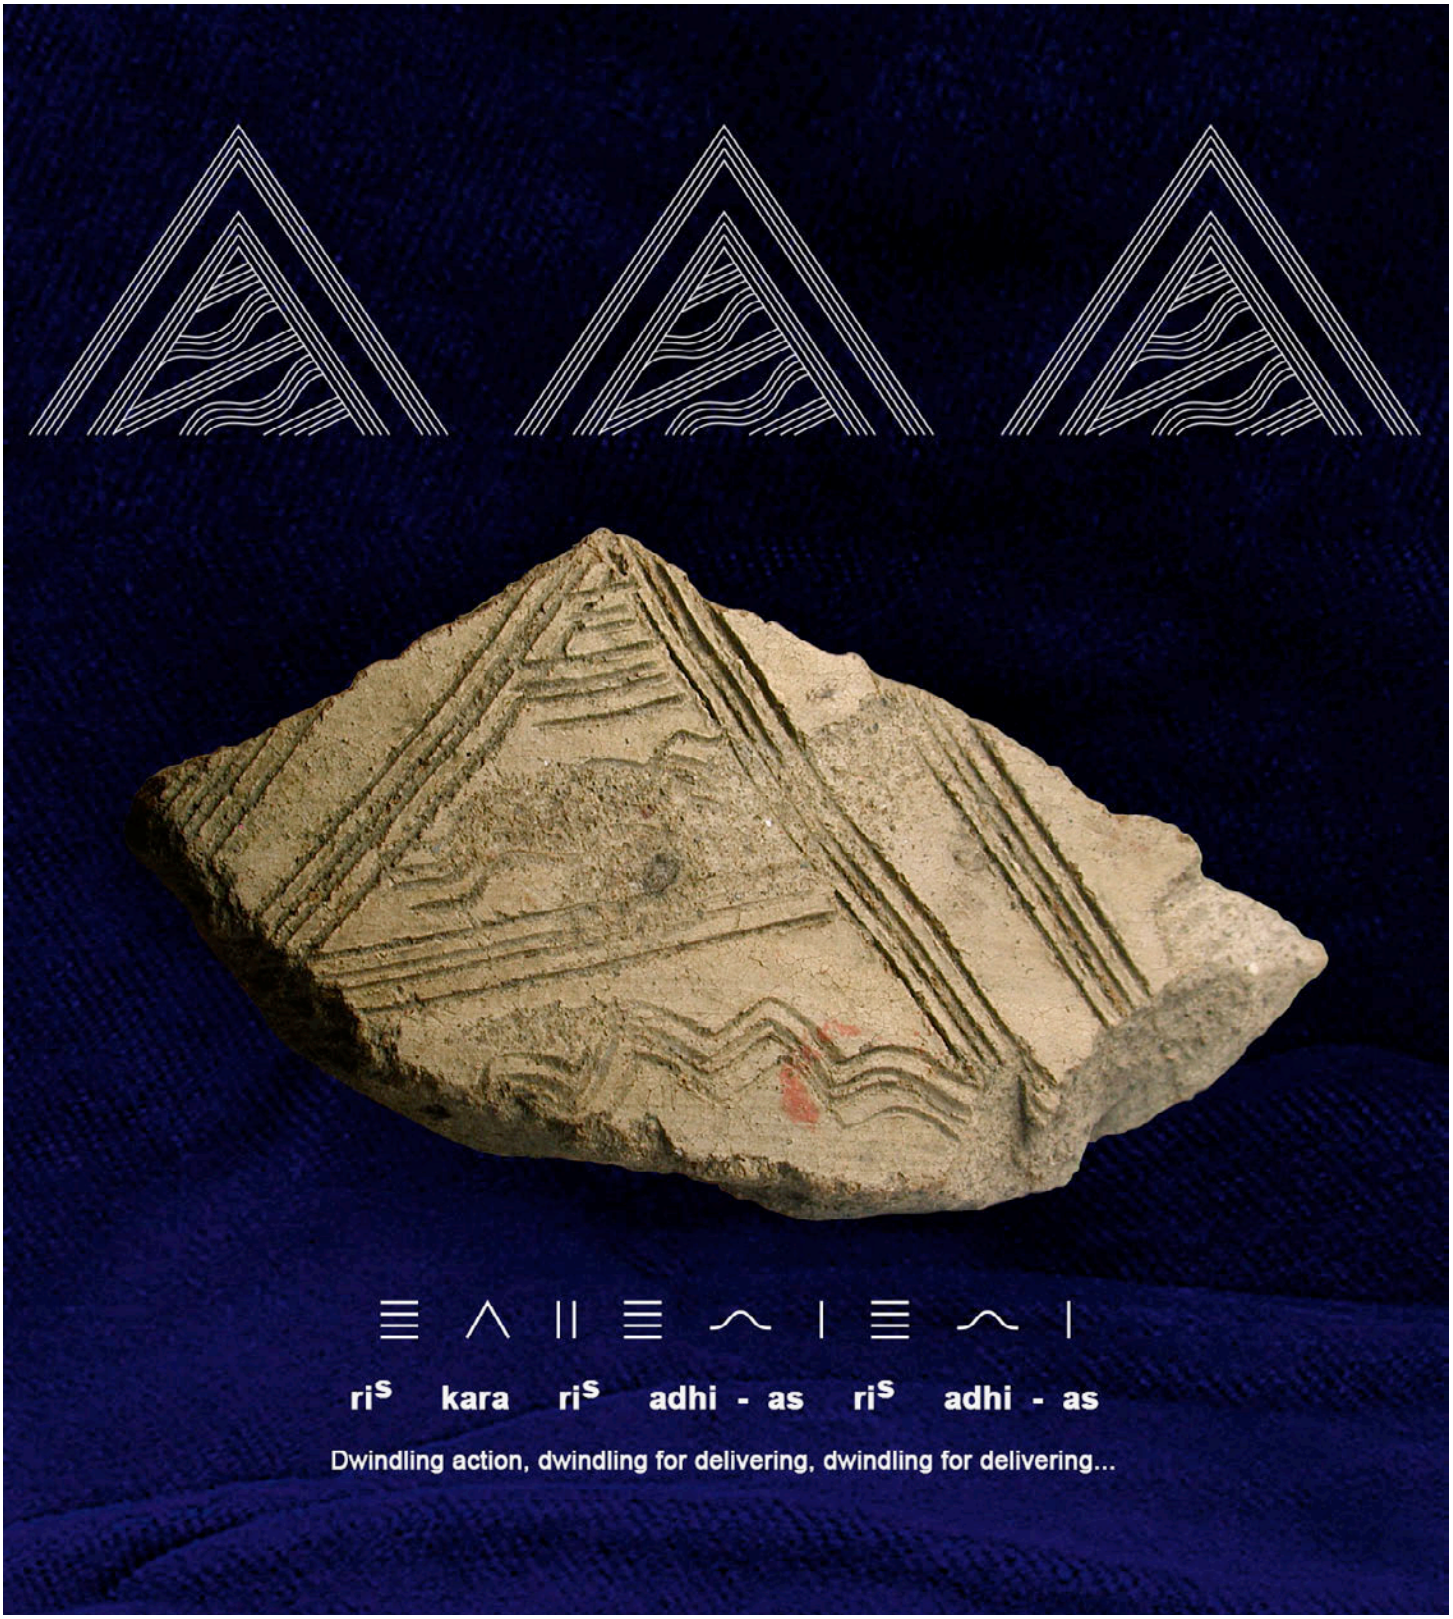


Crystalline metals and mineral components with piezoelectric and pyroelectric properties tranduce incident heat, sound and vibration into internal electric currents, generating an EM field. The pyroelectric property of tourmaline and quartz is shared by finely crushed iron pyrite flakes, while laterite contains a fine mix of oxidized magnetic minerals including magnetite, hematite and goethite.



Fine intermixing of ferromagnetic, paramagnetic and diamagnetic components in the La Maná pyramid stones and ceramics amplifies EM fields transduced from infrasound standing waves focused at resonant distance intervals from the Great Pyramid. Geometric pictograms inscribed on pot fragments from the Hummingbird Pyramid present overt imagery of pyramids that express hieroglyphic statements lamenting the gradual subsidence of planetary resonance, closely echoing Atlantean texts from that same period from all over the world.

Even greater confirmation of the accuracy of this psychoacoustic interpretation of the inscribed ceramic texts is plainly evident in the scientifically accurate waveform designs embedded in many of the ligatures, which clearly depict *standing waves extending from one pyramid to the next in a network.*



r^a u^a r^a u^a ra r^a u^a adhi r^a u^a kara r^a u^a adhi
Roaring, roaring granting, roaring delivering, roaring action, roaring delivering...

r^a u^a r^a u^a pa r^a u^a adhi - as
Roaring (diminishing)..., roaring protecting, roaring for delivering...

ri^S mi - is Indra ri^S mi - is Indra
Dwindling synchrony (of) Jupiter, dwindling synchrony (of) Jupiter...

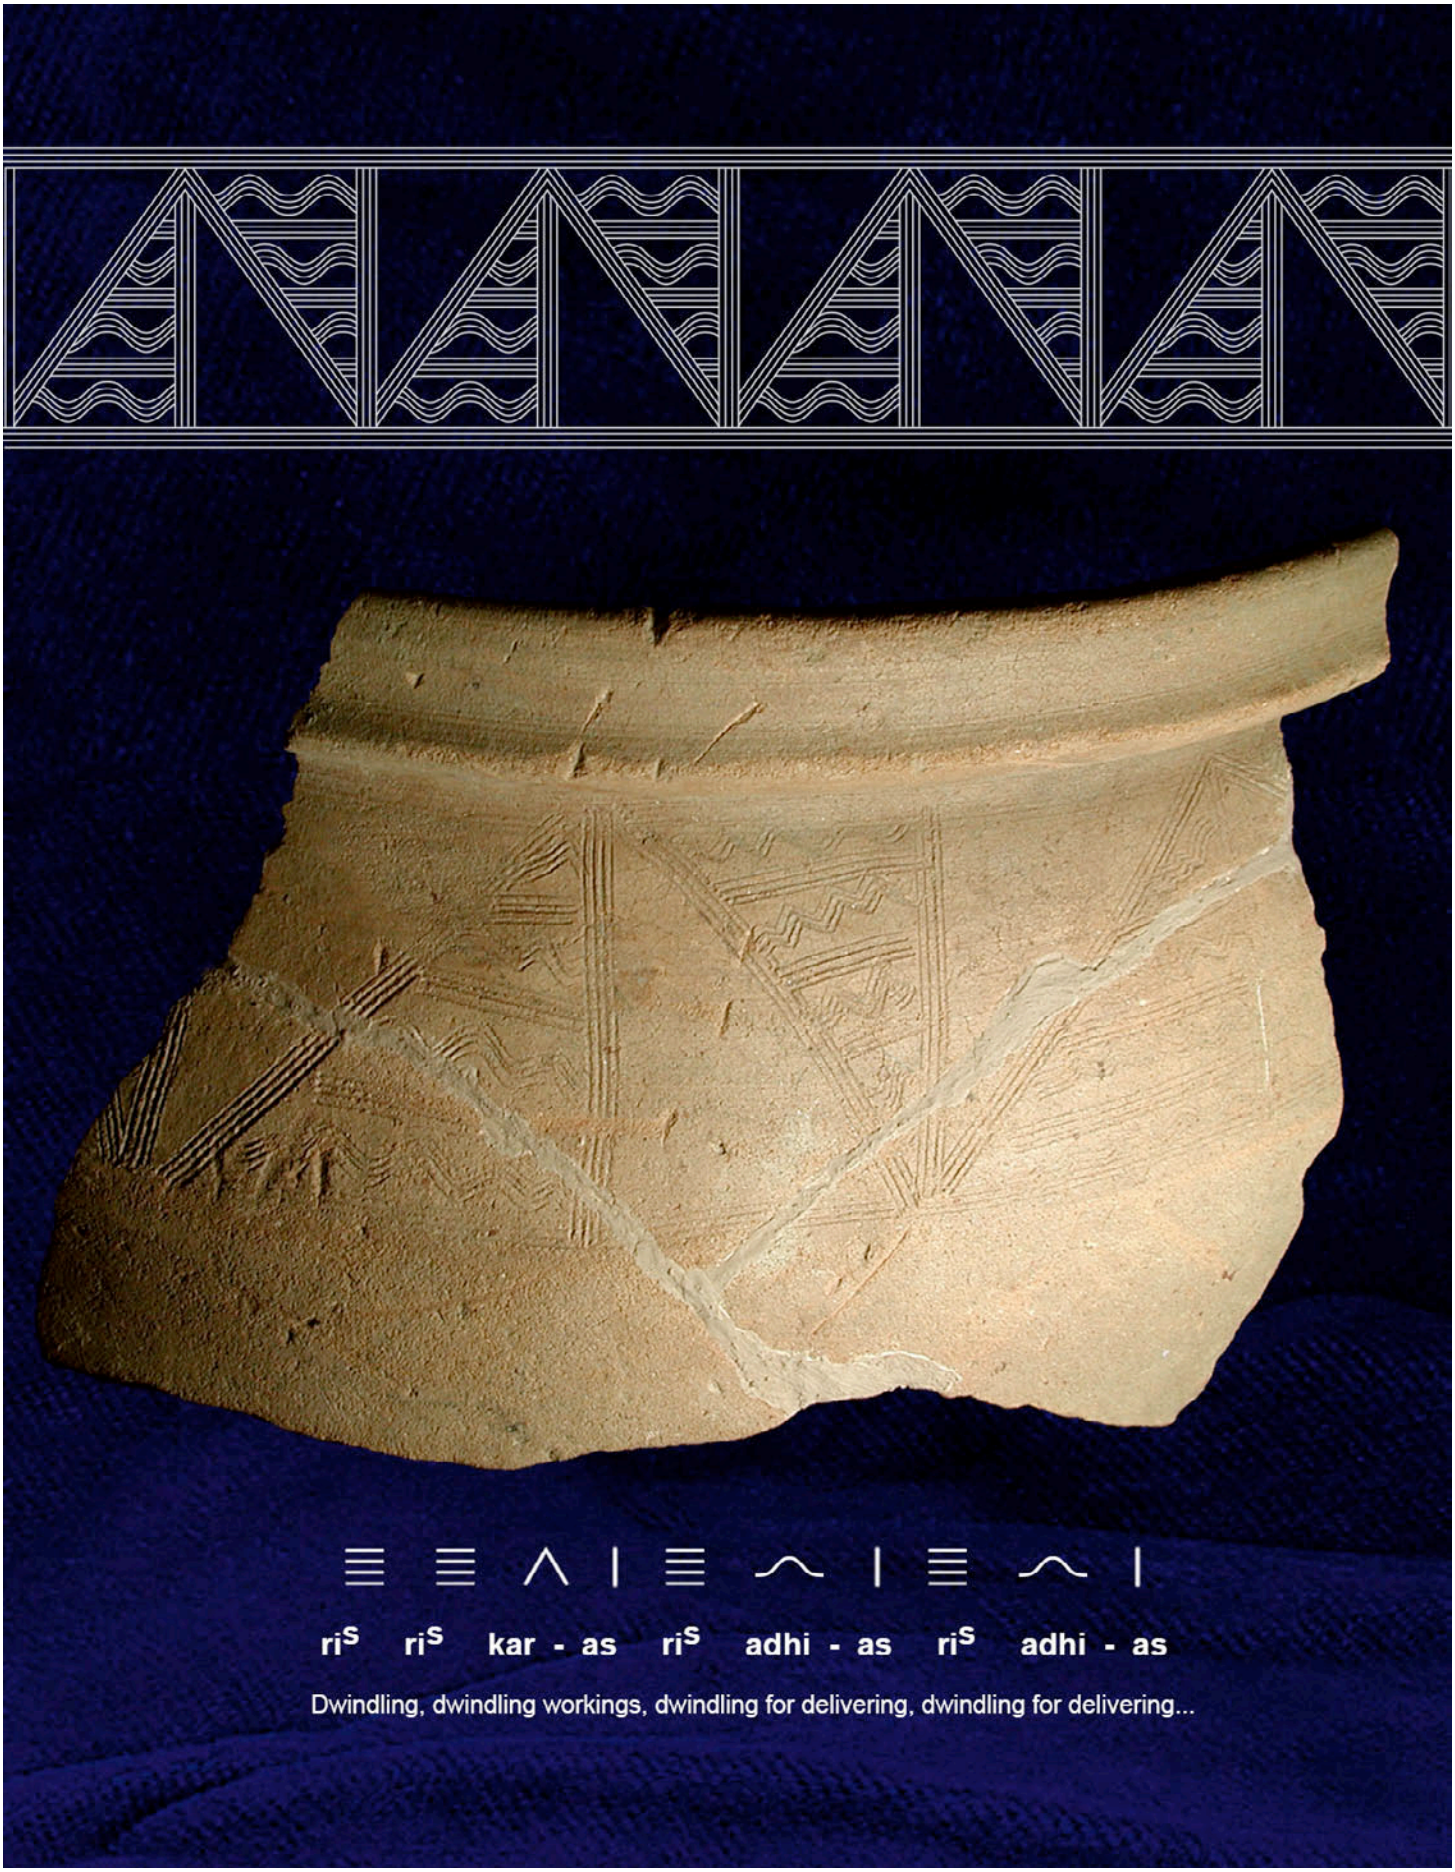
A beautiful square spiral pattern was inscribed on the shoulder of another large geopolymer ceramic pot, using a fine tool with 4 tines for conveying the *ris* glyph, reading: *ris mi-is Indra ris mi-is Indra* , meaning "Dwindling synchrony of Jupiter, dwindling synchrony of Jupiter..." (opposite). Traces of a bright red clay mixture are visible on the sherd's exterior surfaces, suggesting geopolymer clay/fly ash paste was mixed in the large pot during construction work undertaken at the Hummingbird Pyramid over 13,000 years ago. As with the other sherds, micrographs taken at 200x magnification reveal many crushed ferromagnetic, diamagnetic and paramagnetic particles, especially quartz, tourmaline, pyrite, nickel and laterite (above).

A smaller sherd with cement smudges and incised hieroglyphic shoulder texts referencing the diminishing vital forces endowed by the thunderous infrasound resonance of the pyramids that reads: *ris kara ris adhi-as ris adhi-as* , meaning "Dwindling action, dwindling for delivering, dwindling for delivering..." (above). As with other pots, the band of hieroglyphs along the vessel's shoulder resembles pyramids and standing waves, presenting a repeating mantra reading: *raua raua adhi raua raua kar-as raua raua adhi* , meaning "Roaring, roaring delivering, roaring, roaring workings, roaring, roaring delivering..." (overleaf).

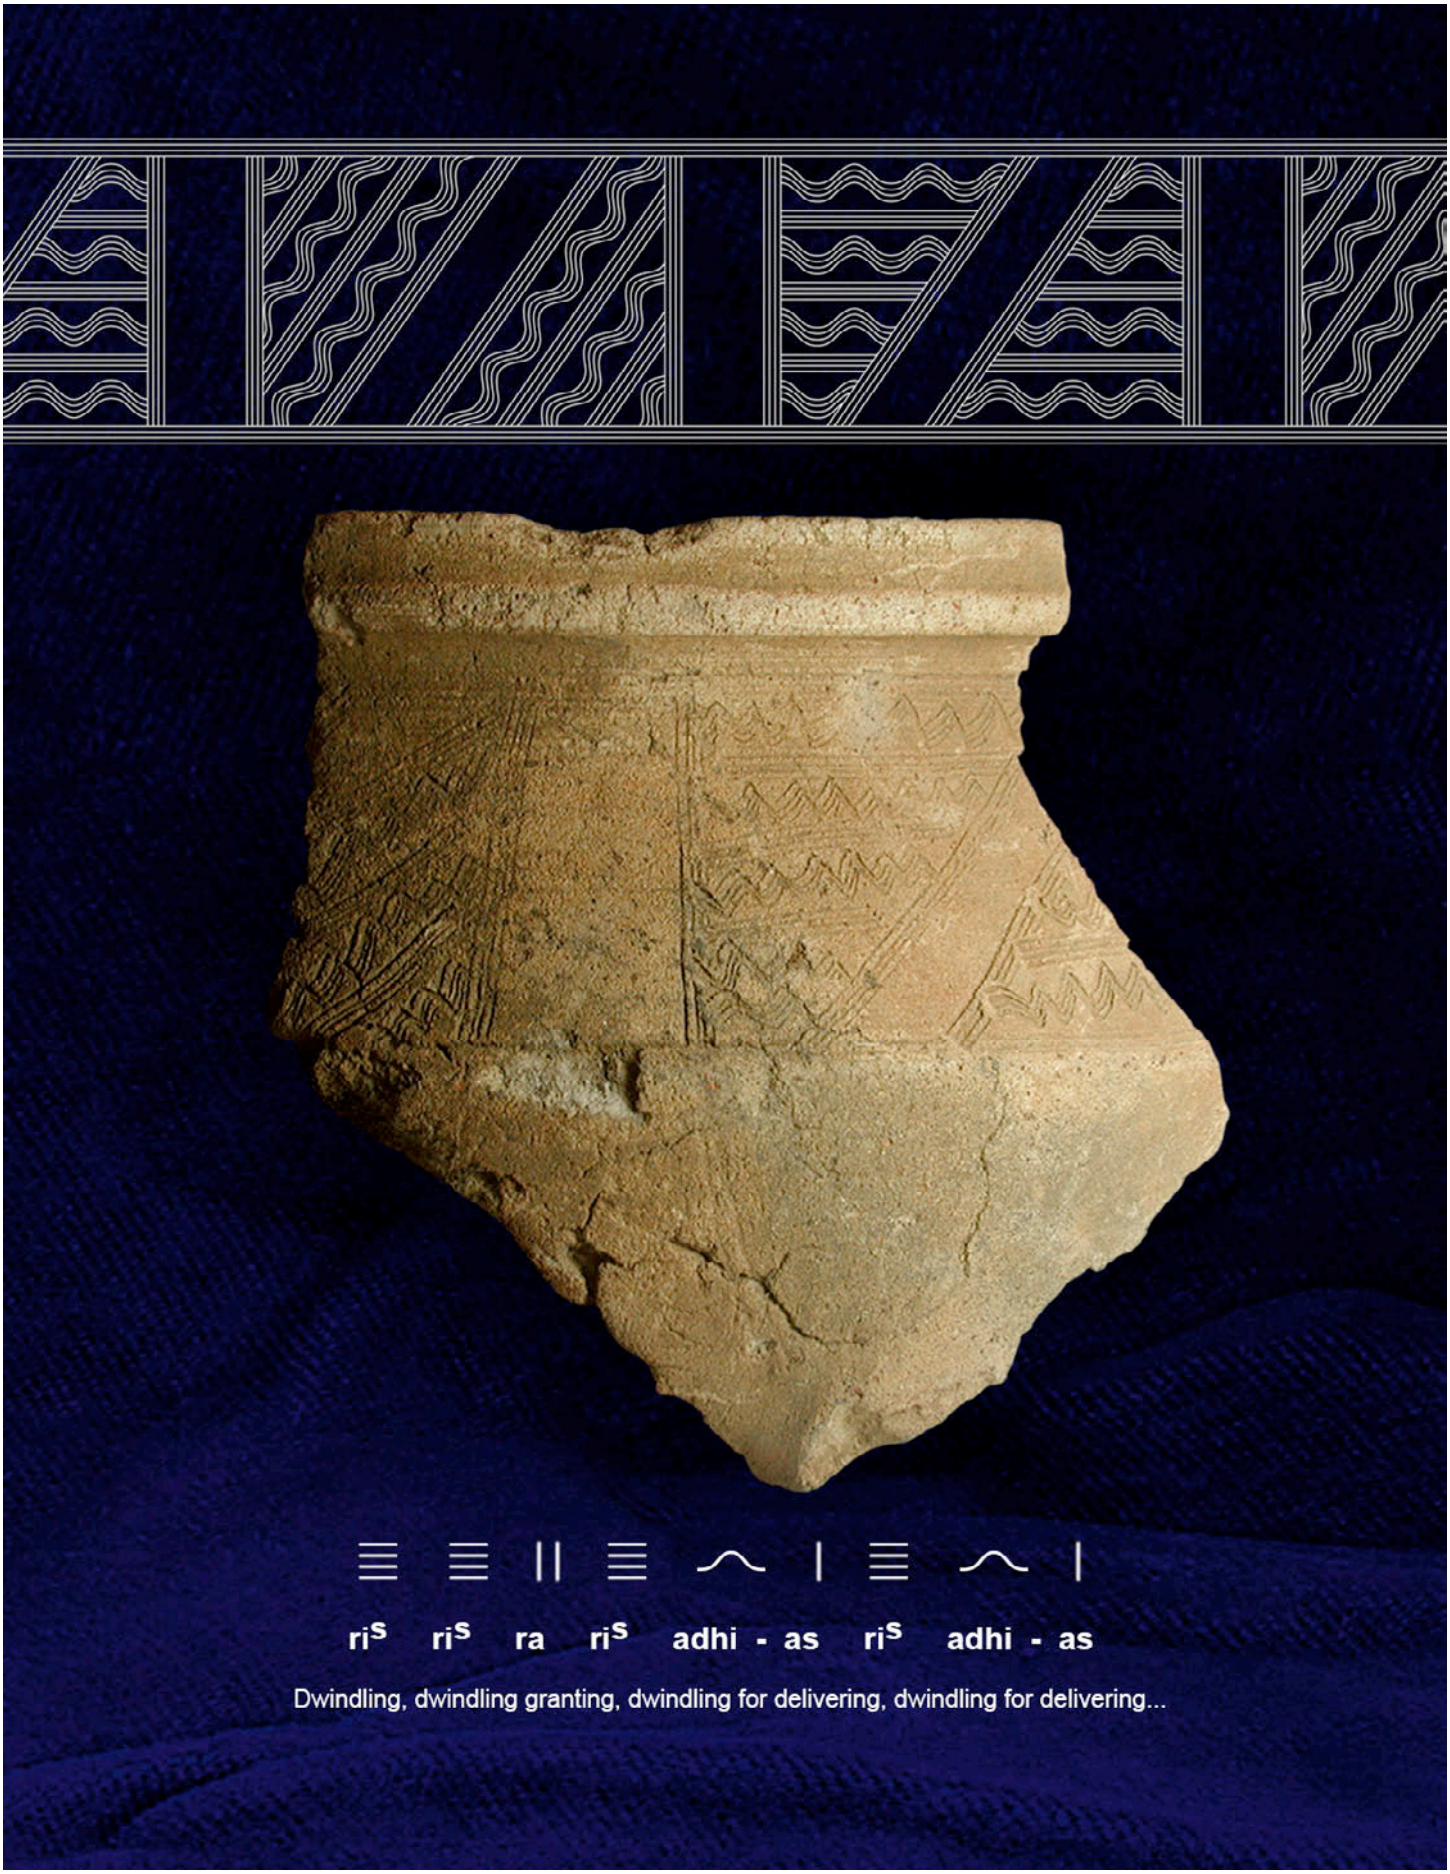
One of the fragments also bears traces of the same bright red geopolymer clay mixture encrusted on the surfaces of several other megaceramic pots, ranging from 0.6–1.3m in diameter, suggesting they were all primarily used as mixing vessels in the geopolymer process for preparation of artificial stone and cement slurries. The smears of hardened red material directly match large blocks of red laterite-based geopolymer cement found on the Hummingbird Pyramid are also present at several other Paleolithic pyramid sites.

The exterior surfaces of another pot sherd from the pyramid's upper walkways is covered with smudges of the bright red geopolymer paste on top of a beautiful section of text as a shoulder band wrapping around the medium-sized vessel, reading: *ris ris kar-as ris adhi-as ris adhi-as* , meaning "Dwindling, dwindling workings, dwindling for delivering, dwindling for delivering..." (overleaf).

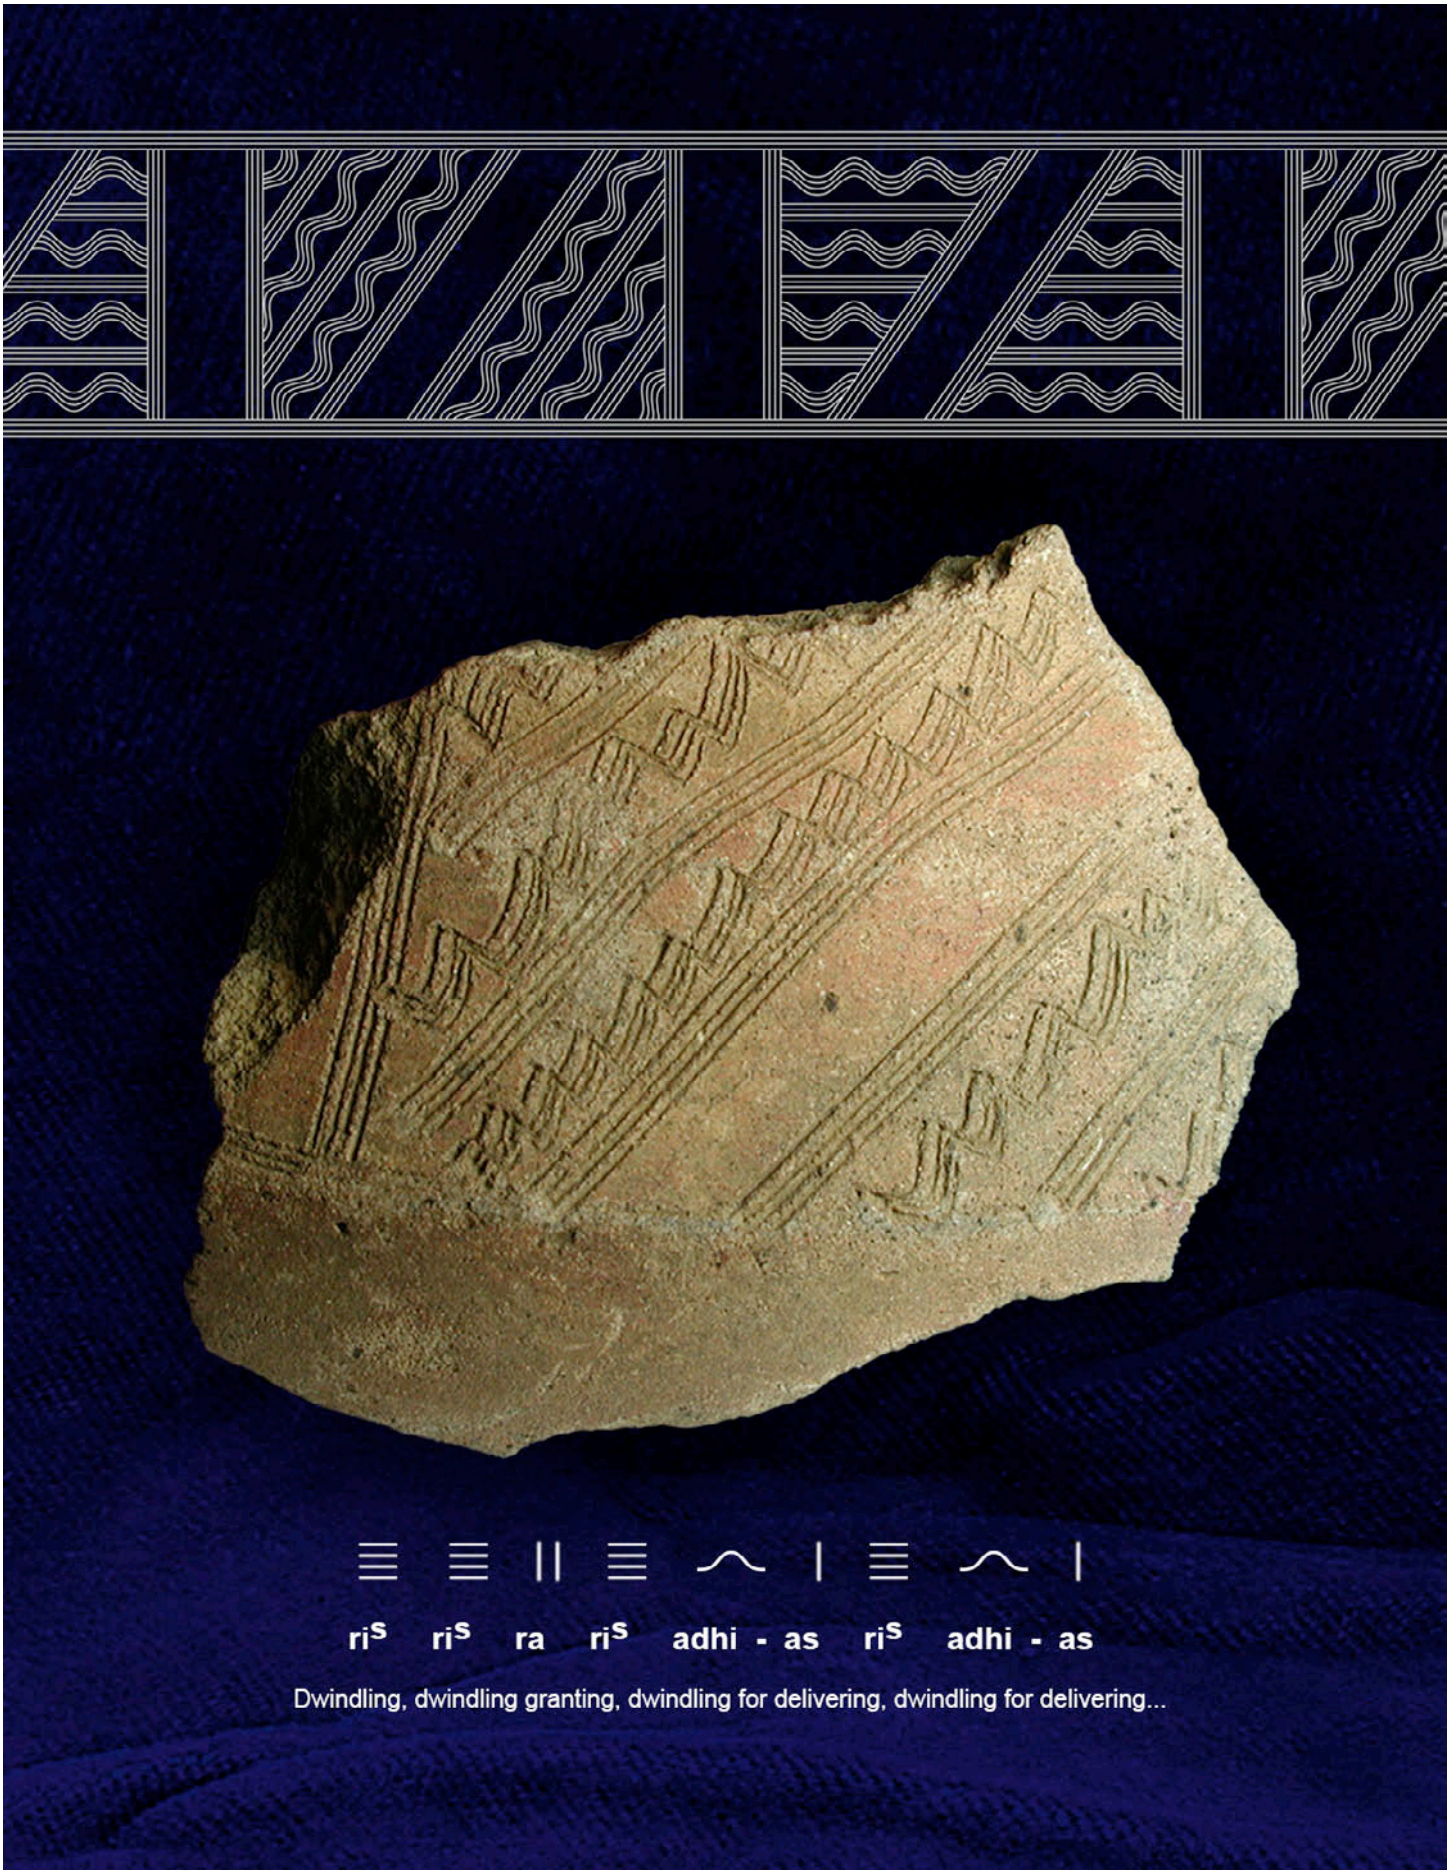
A slight variation on this votive lament is given in complementary texts inscribed on another pair of medium-sized vessels that reads: *ris ris ra ris adhi-as ris adhi-as* , meaning "Dwindling, dwindling granting, dwindling for delivering, dwindling for delivering..."



The selective application of several types of magnetic metal particles and finely crushed granite in both the inscribed earthenware and geopolymer stones of the La Maná pyramid complex confirms their special technological function for the transduction of infrasound planetary resonance. As overtly stated in the inscribed votive texts, these mineral-loaded geopolymer formulations act as compound semiconductors: "



The same Paleo-Sanskrit textual references to the 'roaring synchrony of Indra' and the same magnetic earthenware composition are presented by the 'Fuente Magna' bowl discovered near the shores of Lake Titicaca, in present-day Bolivia.[19] Proper dating of the ancient bowl will confirm its Paleolithic origin, as confirmed by the votive Paleo-Sanskrit glyph texts. The magnetic properties of the Ohum earthenware serves exactly the same function as the magnetic temple stones of Puma Punku, the Llanganates and La Maná pyramid complexes, for piezoelectric transduction of electricity for biophotonic qi healing practices.



r^a u^a r^a u^a adhi r^a u^a r^a u^a kar - as r^a u^a r^a u^a adhi

Roaring, roaring delivering, roaring, roaring workings, roaring, roaring delivering...

ri^S ri^S kar - as ri^S adhi - as ri^S adhi - as
Dwindling, dwindling workings, dwindling for delivering, dwindling for delivering...

ri^S ri^S ra ri^S adhi - as ri^S adhi - as
Dwindling, dwindling granting, dwindling for delivering, dwindling for delivering...

ri^S ri^S ra ri^S adhi - as ri^S adhi - as
Dwindling, dwindling granting, dwindling for delivering, dwindling for delivering...

The strong magnetic properties of semiconductors, shared by both ceramics and synthetic basalts of the La Maná pyramid complex, represent a highly advanced technological feature shared by several other megalithic structures in the Pacific region built during the same time period. *Visitors to megalithic sites on the Pacific islands of Rapa Nui, Kosrae and Pohnpei have also demonstrated magnetic stonework.*

The entangling jungles of Ecuador and Peru still conceal several cities built of *firestone* that can now be positively identified by the magnetic content and angular geometries of complex interlocking stonework. Artifacts bearing Paleo-Sanskrit inscriptions attest to the great antiquity of these pyramid complexes that far exceeds 13,000 years. Once again, psychic information channeled by Edgar Cayce provides details concerning this great ancestral Paleolithic culture of the Andean region, identified by the Akashic Source as the *Ohums* in a Life Reading given by the Sleeping Prophet on August 2, 1930 (Reading 99-6):

> In the one before this we find in that land known now as the Peruvian, or Ecuador. The entity then was among the Ohums of that period, and among the peoples who journeyed in and *conquered* the peoples from the Atlantean upheaval, or the first of the series of upheavals that occurred. The entity gained and lost, for the entity the aide then to the king who *conquered* and lost through associations with, the women of the land.[20]

This 1930 trance reading by Cayce constitutes the first modern reference to the *Ohum* culture that once occupied Ecuador –builders of a monumental temple complex in the Llanganates mountains (above). In a subsequent psychic reading by the trance channel on September 7, 1933, the Akashic Source provided the meaning of the name 'Ohum', also given as 'Ohm' and 'Ohlm', signified the "One Force" (Reading 254-67):

> What is the first cause? That which has brought, is bringing, all life into being; or animation, or force, or power, or movement, or consciousness, as to either the material plane, the mental plane, the spiritual plane.
>
> Hence it is the force that is called Lord, God, Jehovah, Yah, Ohum, Abba and the like. Hence the activity that is seen of any element in the material plane is a manifestation of that first cause. One Force. And, as seen and stated above, a record in a phonograph is made up of elements of a certain combination of that which has become in manifested form in certain movements in relation to the first cause, for the projection (and does project) by natural laws; as the physical or material laws, then, are the reflection or shadow of spiritual laws.

The profound explanation of the name 'Ohum' provided by the Source corresponds to the Sanskrit sacred syllable *Om*, signifying the cosmic symphony of infrasound resonance. Paleo-Sanskrit regional names reflect the same concept –*'On' (Ecuador) means "assent" while 'Og' or 'Oz' (Peru) means "abundance"*– denoting sacred regions where the infrasonic force is strong, as at geopolymer temples like Manco Pata.

Cayce granted a detailed psychic reading clarifying the subject of ancient high civilizations of the Western hemisphere on November 12, 1933, with the Source clearly distinguishing the original regenerative functions of the temple altars from the degraded sacrificial use during later periods (Reading 5750-1):

> In that [incarnation] preceding this we had rather a combination of sources, or a high civilization that was influenced by injection of forces from other channels, other sources [by mass emigration]...

> From time as counted in the present we would turn back to 10,600 years before the Prince of Peace came into the land of promise and find a civilization being disturbed by corruption from within to such measures that the elements join in bringing devastation to a stiffnecked and adulterous people.
>
> With the second and third upheavals in Atlantis, there were individuals who left those lands and came to this particular portion then visible. But, understand, the surface was quite different from that which would be viewed in the present. For, rather than being a tropical area it was more of the temperate, and quite varied in the conditions and positions of the face of the areas themselves...
>
> Then, with the leavings of the civilization in Atlantis (in Poseidia, more specific), Iltar –with a group of followers that had been of the household of Atlan, the followers of the worship of the *one* with some ten individuals– left this land Poseidia, and came westward, entering what would now be a portion of Yucatan. And there began, with the activities of the peoples there, the development into a civilization that rose much in the same matter as that which had been in the Atlantean land. Others had left the land later. Others had left earlier. There had been the upheavals also from the land of Mu, or Lemuria, and these had their part in the changing, or there was the injection of their tenets in the varied portions of the land –which was much greater in extent until the final upheaval of Atlantis, or the islands that were later upheaved, when much of the contour of the land in Central America and Mexico was changed to that similar in outline to that which may be seen in the present.

The first temples that were erected by Iltar and his followers were destroyed at the period of change physically in the contours of the land. That now being found, and a portion already discovered that has laid in waste for many centuries, was then a combination of those peoples from Mu, Oz and Atlantis.

Hence, these places partook of the earlier portions of that peoples called the Incal; though the Incals were themselves the successors of those of Oz, or Og, in the Peruvian land, and Mu in the southern portions of that now called California and Mexico and southern New Mexico in the United States.

This again found a change when there were the injections from those peoples that came with the division of those peoples in that called the promise land. Hence we may find in these ruins that which partakes of the Egyptian, Lemurian and Oz civilizations, and the later activities partaking even of the Mosaic activities.

Hence each would ask, what specific thing is there that we may designate as being a portion of the varied civilizations that formed the earlier civilization of this particular land?

The stones that are circular, that were of the magnetized influence upon which the Spirit of the One spoke to those peoples as they gathered in their service, are of the earliest Atlantean activities in religious service, as would be called today.

The altars upon which there were the cleansings of the bodies of individuals (not human sacrifice; for this came much later with the injection of the Mosaic, and those activities of that area), these were later the altars upon which individual activities –that would today be termed hate, malice, selfishness, self-indulgence– were cleansed from the body through the ceremony, through the rise of initiates from the sources of light, that came from the stones upon which the angels of light during the periods gave their expression to the peoples.

The pyramid, the altars before the doors of the varied temple activities, was an injection from the people of Oz and Mu; and will be found to be separate portions, and that referred to in the Scripture as high places of family altars, family gods, that in many portions of the world became again the injection into the activities of groups in various portions, as gradually there were the turnings of the people to the satisfying and gratifying of self's desires, or as the Baal or Baalilal activities again entered the peoples respecting their associations with those truths of light that came from the gods to the peoples, to mankind, in the Earth.

With the injection of those of greater power in their activity in the land, during that period as would be called 3,000 years before the Prince of Peace came, those peoples that were of the [Biblical] Lost Tribes, a portion came into the land; infusing their activities upon the peoples from Mu in the southernmost portion of that called America or United States, and then moved on to the activities in Mexico, Yucatan, centralizing that now about the spots where the central of Mexico now stands, or Mexico City. Hence there arose through the age a different civilization, a *mixture* again.

Those in Yucatan, those in the adjoining lands as begun by Iltar, gradually lost in their activities; and came to be that people termed, in other portions of America, the Mound Builders. Ready for questions.

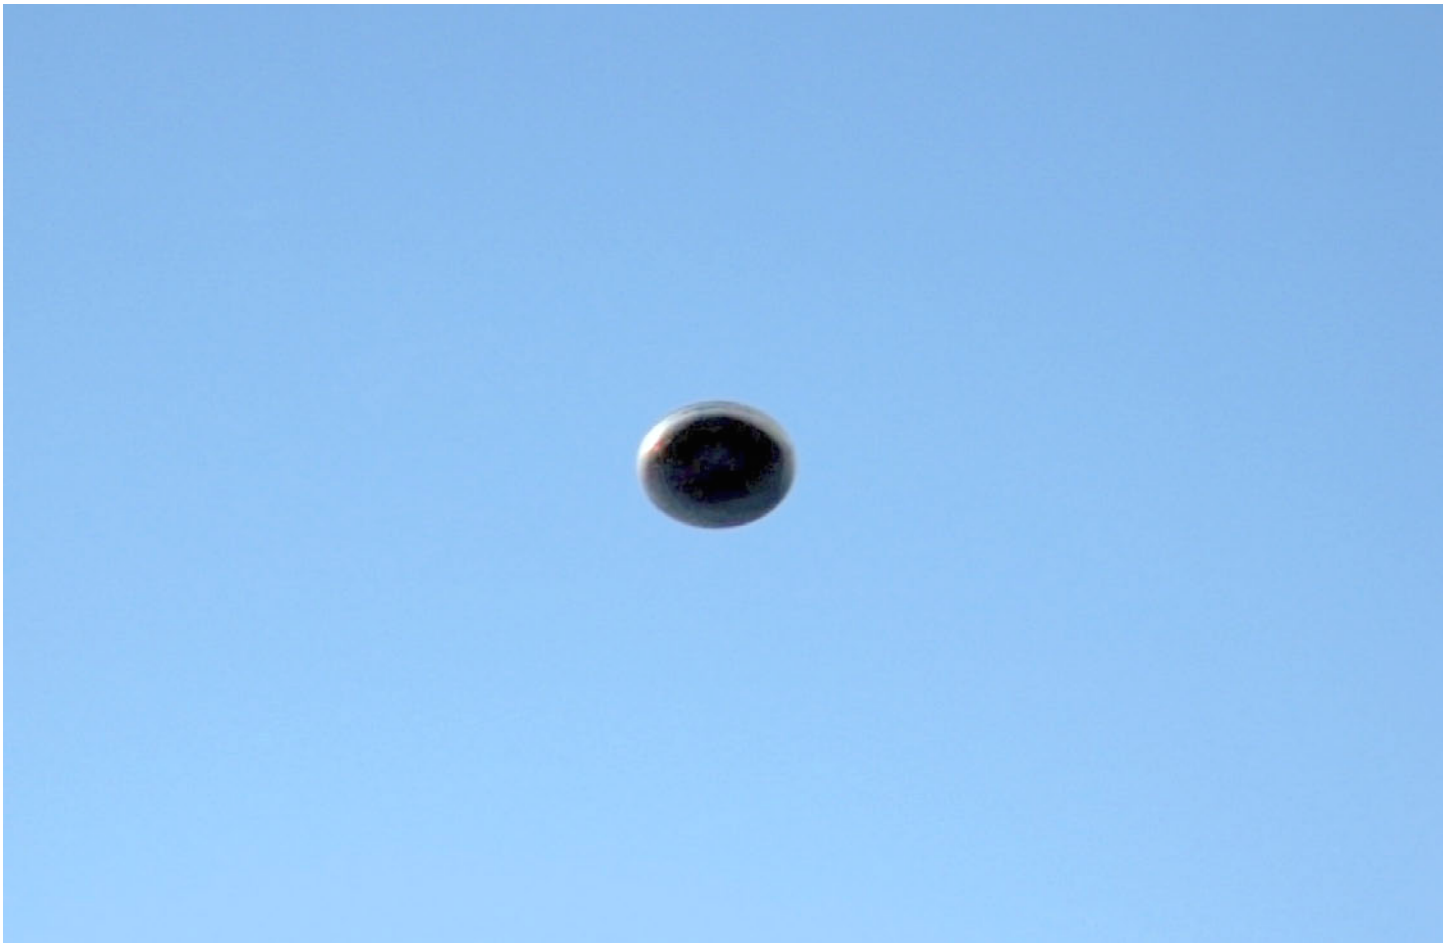
Q: How did the Lost Tribe reach this country?

A: In boats.

Q: Have the most important temples and pyramids been discovered?

A: Those of the first civilization have been discovered, and have not all been opened; but their associations, their connections, are being replaced –or attempting to be rebuilt. Many of the second and third civilization may *never* be discovered, for these would destroy the present civilization in Mexico to uncover same!

Q: By what power or powers were these early pyramids and temples constructed?



A: By the lifting forces of those gases that are being used gradually in the present civilization, and by the fine work or activities of those versed in that pertaining to the source from which all power comes.

For, as long as there remains those pure in body, in mind, in activity, to the law of the One God, there is the continued resource for meeting the needs, or for commanding the elements and their activities in the supply of that necessary in such relations... Yet, as time draws nigh when changes are to come about, there may be the opening of those three places where the records are one, to those that are the initiates in the knowledge of the One God.

The temple by Iltar will then rise again. Also there will be the opening of the temple or hall of records in Egypt, and those records that were put into the heart of the Atlantean land may also be found there –that have been kept, for those that are of that group. The *records* are *one*.

These profound offerings from the trance medium Edgar Cayce remain the only accurate source of detailed information ever brought to bear on such arcane and obscure subjects, only now understood within a scientific context. Nikola Tesla was the only inventor of his time to harness and apply "the lifting forces of those gases" –a cryptic reference to HHO plasma. *The Tesla Gravity Motor was completed in 1929 with Cayce's help, and later renamed the Rotating Field Amplifier, only to be effectively blocked from public awareness for a full 84 years before its exposure by this author in 2013.*

Likewise, the original regenerative function of firestone altars involved bioelectrical cleansing by exposure to HHO plasma. The square and cubical formats of Ohum alters cast on the Isla del Sol in the sacred waters of Lake Titicaca repeat the Paleo-Sanskrit hieroglyph for ***Indra***, the plasma giant Jupiter (above).

Another Life Reading on November 26, 1937 identified the influence of high sciences developed by the Atlanteans and shared among the leaders of various lands, including the Ohum of Og and On, as part of preparatory measures for foretold tectonic subductions of the landmass of Poseidia (Reading 1486-1):

> Before that we find the entity was in the Atlantean land, during those periods when there was the knowledge – through the teachers or leaders in the Law of One– as related to the destruction of the Atlantean or Poseidon land.
>
> And the entity was among those who journeyed from Atlantis or Poseidia itself, first to the Pyrenees or Portugese land and later into what would be called in the present the Egyptian land –during those periods after the recall of Ra-Ta, when he with Saneid and the activities from the land of On and Oz and those from what is now known as the Gobi land attempted to make for a unification of the knowledge.
>
> Hence we find the entity then, Ax-Ten-tna, as would be said in the present, was the first to set the records that are yet to be discovered, or yet to be had of those activities in the Atlantean land, and for the preservation of the data, that as yet to be found from the chambers of the way between the sphinx and the pyramid of records.

Technical knowledge concerning standing wave resonance, nonlinear geopositioning alignments and the preparation of *firestone* was imparted during expeditions guided by the Atlantean leader Ajax, also known as Ax-Tell, as outlined by the trance medium the following year on September 7, 1938 (Reading 1681-1):

> Before that we find the entity was in the Atlantean land. There we find the entity was very close to those in authority; being that one who was the keeper of the portals as well as the messages that were received from the visitation of those from the outer spheres, in the latter part of the entity's experience there.
>
> For it was the entity that received the message as to the needs for the dividing of the children of the Law of One for the preservation of the truths of same in other lands. Hence we find the entity was among those who were as the directors of those expeditions, or the leaving for the many varied lands just before the breaking up of the Atlantean land. Hence the entity outlined in the most part, it might be said, the expedition guided by Ax-Tell and the ones to the Pyrenees and to the Yucatan and to the land of Og.

There we find the entity then gave those communications that were established later by the entity from the Pyrenees, and later again established in the mountains in the Grecian land –and there those messages that called for the meetings of the nations were brought about by the activities of that entity during that sojourn.

Later, with the revivifying of the Priest in Egypt, the entity was among those who set about the unifying of the teachings of the Atlanteans, the Egyptians (as... called today), the Indian, the Indo-Chinan, the Mongoloid and the Aryan peoples. All of those were the activities of the entity, for he was the messenger and the message-bearer –or the means through which transmissions of activities were set up. The name then was Segund.[21]

Hieroglyphic potsherd texts found in La Maná, Ecuador affirm the Atlantean awareness of vital forces endowed by the reverberation of Jupiter was shared by the Ohum civilization that had co-developed in South America during that extended period. Clear information concerning the temporal context of these activities emerged on July 5, 1938 during a session for Thomas Townsend Brown (Reading 470-22):

Q: What was the date of the Peruvian incarnation as given in Life Reading, and what was the disturbance in the Earth as mentioned? Give such details as will clear up this period.

A: As indicated from that just given, the entity was in Atlantis when there was the second period of disturbance –which would be... some 28,000 years before Christ, see? Then we had a period where the activities in the Atlantean land became more in provinces, or there were small channels through many of the lands.

And there were those, with the entity and its associates or companions, who left the activities to engage in the building up of the activities in the Peruvian land. For the Atlanteans were becoming decadent, or being broken up owing to the disputes between the children of the Law of One and the children of Belial.

In the Peruvian or Incal land we find the entity's disturbing forces came, when there were too many beautiful women in a part of the activity. Yet this did not prevent the entity using or giving to those of the land so much of the gold, the copper, the various metals –especially gold– as the foundation for a portion of the activity during those experiences.[22]

Those subtle words from the Sleeping Prophet indirectly reference the crystalline structure, high purity and trace gold and silver nanoparticle content of the celestial waters of the La Maná springs, discovered in 1984 along with several dozen magnetic inlaid stoneworks that fluoresce under ultraviolet light.[23] The same remarkable high-purity golden water was also identified at healing springs in Tlacote, Mexico.[24]

Ingestion of nanogold and silver Ayurvedic springwaters endows the purified human body with enhanced conductivity required for bioelectrical healing techniques practiced by initiates in the firestone pyramids of On, constructed after the Atlantean expeditions ~30,000 years ago. Monumental constructions of the Ohums include the Great Walls of Peru, mentioned in a session on February 16, 1932 (Reading 364-4):

> We also find that entering into Og, or those peoples that later became the beginning of the Inca, or Ohum, that builded the walls across the mountains in this period... Hence we find in those various portions of the world even in the present day, some form of that as *was* presented by those peoples in *that* great *development* in this, the Eden of the world.[25]

Further details concerning the Ohums' later degeneration into ritual sacrifice, offered on the circular healing altars of their ancestors, emerged during a Life Reading on June 2, 1938 (Reading 1604-1):

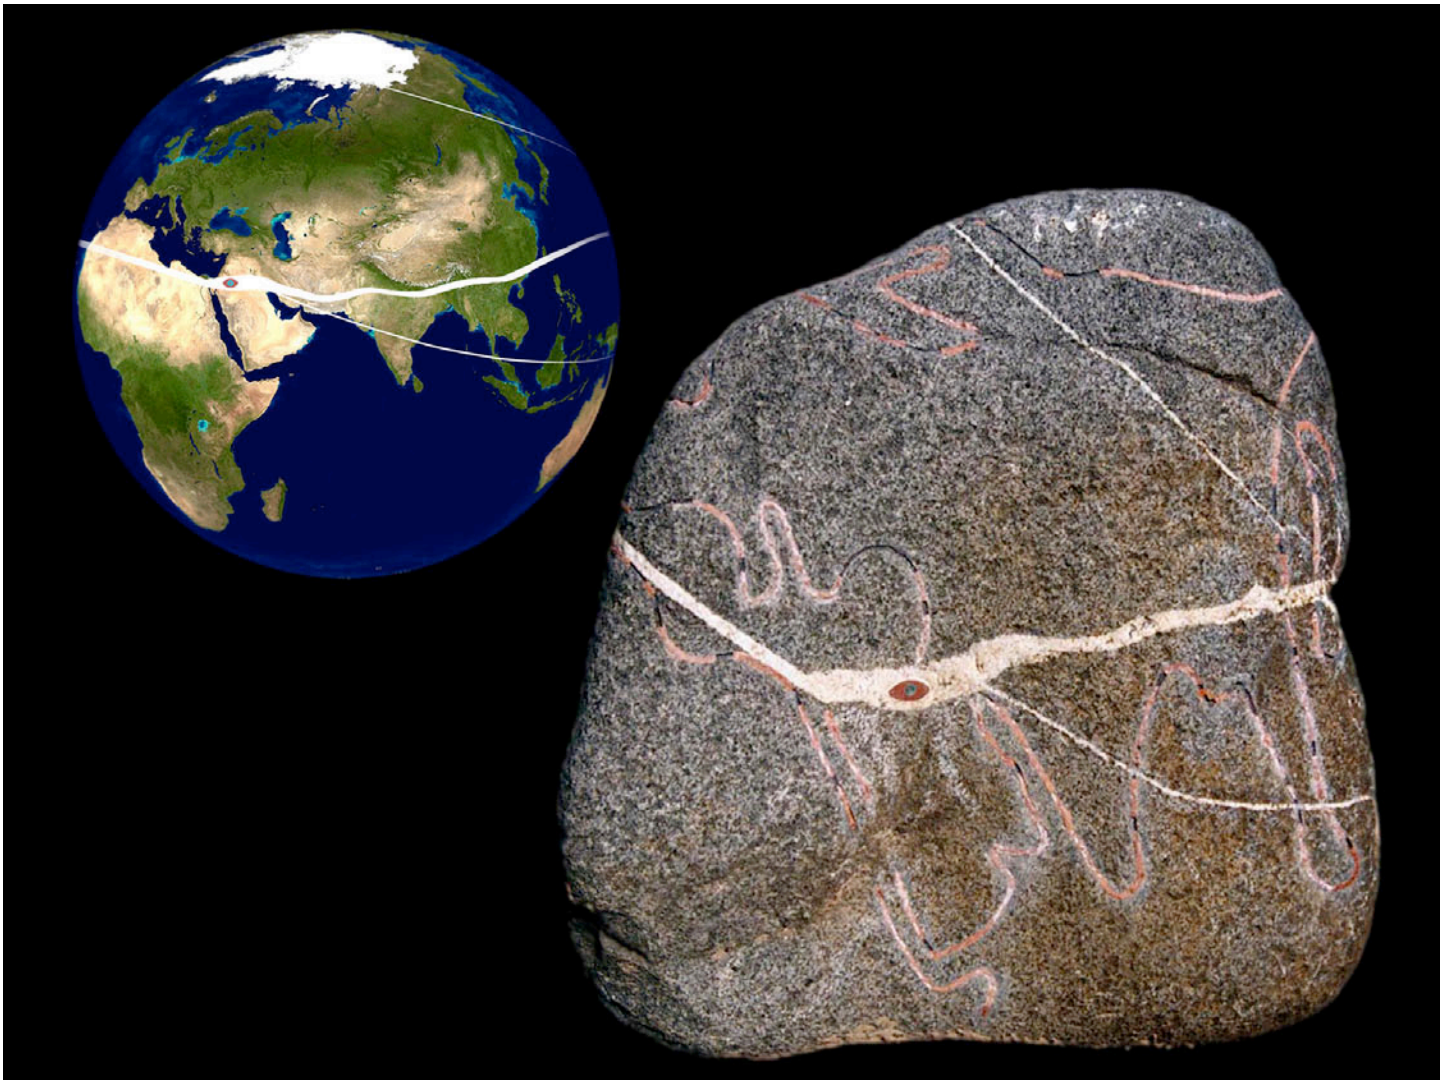
> Before that we find the entity was in the Yucatan or Mayan land, when there were those activities that destroyed the Atlantis land –or that portion of the Poseidian isle or city. The entity was among those who journeyed to other lands, knowing much of the activities of the Sons of Belial [Baal] as well as the precautions and warnings that had been issued by the children of the Law of One.
>
> Hence we find the entity was among those who in the early portions of that material sojourn entered into the new buildings, the new activity that became destructive because of the influences from the land of Og and On, and the activities that arose in the western portion of that particular period of sojourn [or reincarnation]... In the experiences then the entity rose to that position of the priestess of the sacrificial activity. Much blood flowed by the hand of the entity during that sojourn.[26]

The sacred Sanskrit mandala configurations of firestone platforms designed and used for advanced bioelectrical qi healing practices were defaced in later times by the carving of deep channels for blood collection by the degenerate psychopathic rulers of those phases of severe soul retrogression (above).

Supporting details resurfaced during a Life Reading given the following year on May 26, 1939, carefully distinguishing between advances made and the degradation that lead to disaster (Reading 1895-1):

> Before that we find the entity was in the land now known as the Incal or Peruvian or Ecuador land, during those periods when the people from On and Og were making for so many changes, –by the disturbing forces which arose from individuals who came into the land from the Atlantean land, as well as those who were to journey for the establishing of activities in what is now the Yucatan land.
>
> The entity then was a princess, and a daughter of one of the rulers associated with the one who with so many wives (of which the entity was one) made for both good and bad. Hence the entity was given to the keeping in line with the activities of those who were to establish new outlying districts. Hence the beauty of the entity, as well as its associations of power and strength, made for those activities in the Yucatan land –with those of the Atlanteans as well as those from the land of Og and On– that brought about a great advancement...
>
> The entity gained throughout that experience, yet –with the regenerating, or the degrading as it became later, to those sacrifices that took hold of the offering of bodily forces, –these became a torment.[27]

Comprehensive past life information obtained through Edgar Cayce offers a unique source of detailed descriptions of the state of affairs among various populations participating in the global communication network, in addition to providing significant background context regarding the spiritual divisions between two large groups: those adherents to the spiritual *Law of One* and the amoral followers of *Baal*, or *Belial*.

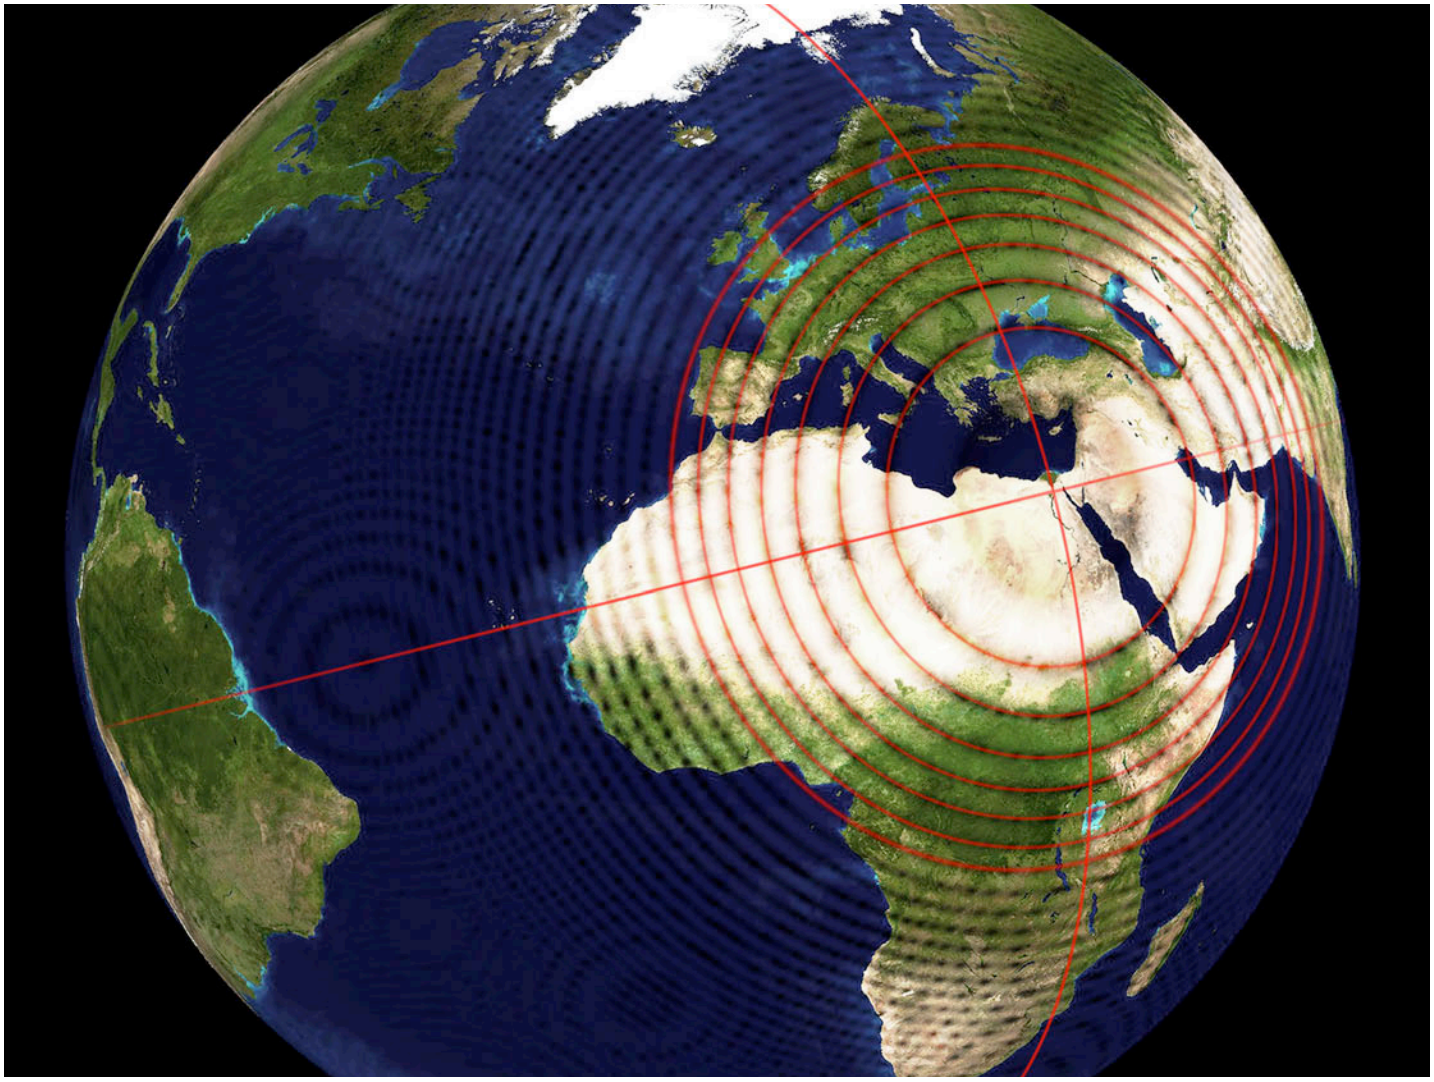


The original HHO plasma functions of the pyramids for bioelectrical purification of human bodies for spiritual service to humanity that was so impressively established by those of the Law of One had been purposefully undermined and subverted by those of the Baal forces over the course of millennia.

While followers of the Law of One offered temple services for spiritual purification and the cleansing of negative spirit attachments, so often referred to by Cayce as 'appendages', those of Baal sought control by infiltration through covert sexual entrapment *for the purpose of spreading demonic spirit possession.*

Another Cayce reading addressed the destruction of Ohum cities in the lands of On and Og now being uncovered below several meters of compacted earth and clay in relatively remote, jungle-covered areas of present-day Ecuador and Peru. A brief mention of the global cometary catastrophe of ~12,890bp was made during a Life Reading given on February 25, 1925 (Reading 265-1):

> In the one before this we find in the rule in the land now known as the Peruvian forces, and in the last days of the Ohums. When the destruction came to the cities of those rulers, the entity then leading in the forces and the ruler of that people.[28]

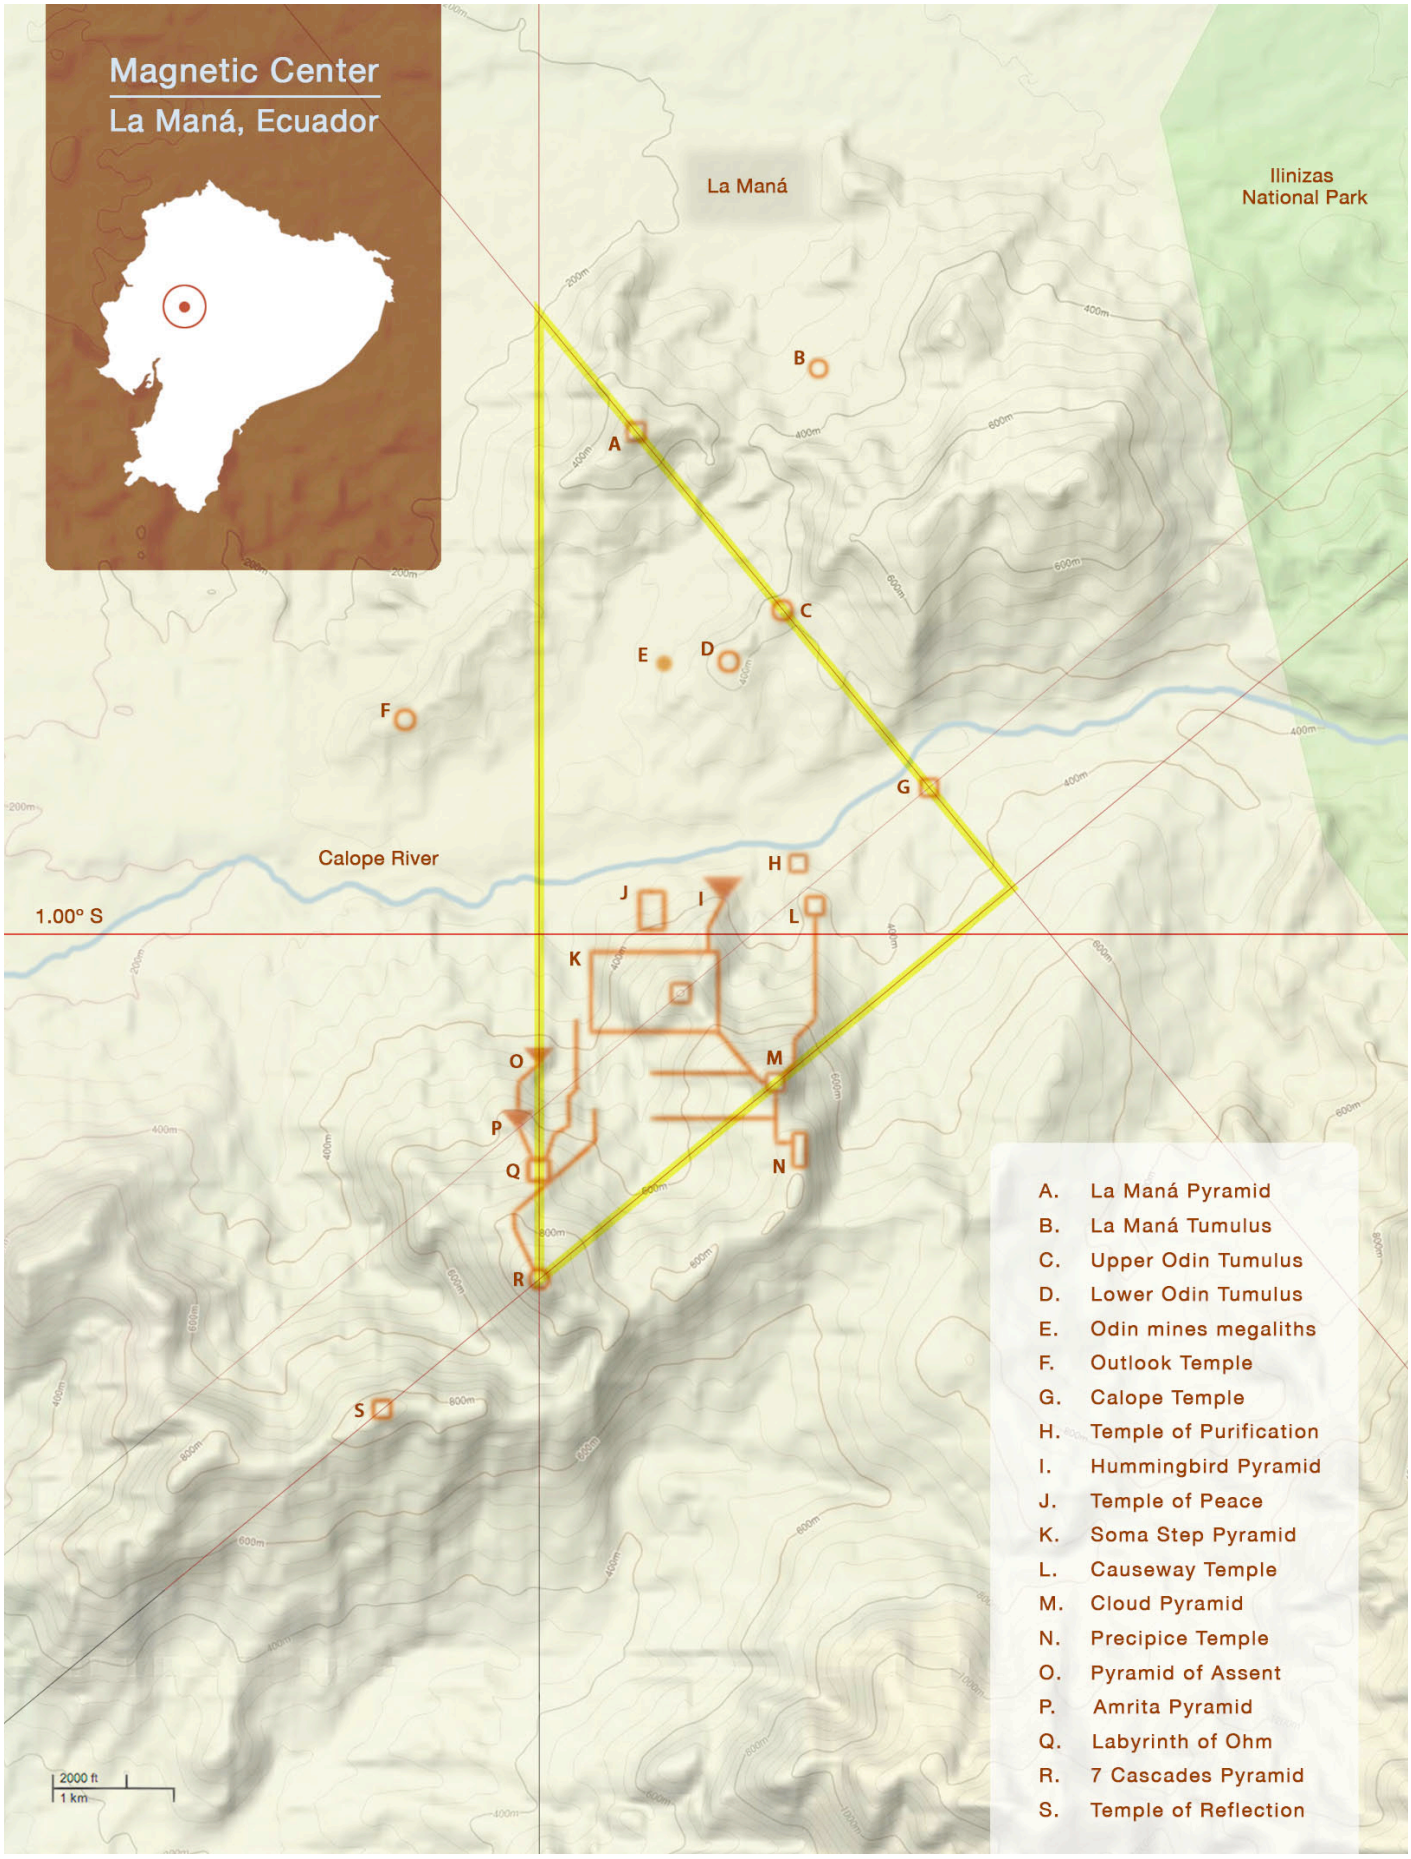


In further sets of psychic readings by Edgar Cayce focusing on the multi-staged destruction of the Atlantean continent that additionally subsumed the Ohum cities of South America, the Akashic Source specifically identified their corruption by extreme forms of greed, materialism and sexual misconduct as the central underlying causes for the critical overdriving of the global pyramid resonance system.

The clear words of Paleo-Sanskrit authors translated from engraved texts on thousands of stone and ceramic artifacts, discovered on every inhabited continent of the Earth, directly link this highly destructive oversight to their collective greed and desperation to counteract the gradually dwindling state of planetary infrasound resonance received from the Sun and the plasma giant Jupiter.

Decisive confirmation of highly advanced Paleolithic civilization in the Andes is embodied by a granite boulder engraved with a global map displaying antediluvian coastlines (above). *Cayce's channeled information suggests this map marks the majestic capital city of On, located in present-day La Maná, Ecuador.* The astounding synchronicity of psychic data with new scientific findings is simply undeniable.

Flight paths along the axes of standing waves depicted by thick white lines circumscribing the Ohum World Map were addressed by Cayce on November 1, 1939, during a Life Reading that concisely identified the mathematical and spiritual significance of the location of the pyramids of Giza (Reading 281-42):



> *Why* Egypt? This had been determined by that leader or teacher (not physical leader, but spiritual interpreter or guide) as the center of the universal activities of nature, as well as the spiritual forces, and where there might be the least disturbance by the convulsive movements which came about in the Earth through the destruction of Lemuria, Atlantis, and –in later periods– the flood.

> What were the factors, ye ask, which determined this in his mind? Or from what concept did the entity gain that knowledge? Was it just a concept, just a revelation, just a physical analysis, or what? When the lines about the Earth are considered from the mathematical precisions, it will be found that the center is nigh unto where the Great Pyramid, which was begun then, is still located.
>
> Then, there were the mathematical, the astrological and the numerological indications, as well as the individual urge... Ye say, then, such an entity was a god! No. No, ye only say that because there is the misunderstanding of what were the characters or types of spiritual evolution as related to *physical* evolution in the Earth at that period.
>
> As an illustration (this merely illustrating, now): It is hard for an individual, no matter how learned he may be, to conceive of the activities that exist only three miles above the Earth. Why? Because there are no faculties within the individual entity in the present *capable* of conceiving that which is not represented within his individual self.[29]

These perspectives offered by the Akashic Source reference the unseen transit of spacecraft fleets along invisible field lines of planetary resonance to which the axes of the pyramids are aligned. Mathematical precision in the geometric measurement of pyramid symmetries is required for the focusing of infrasound standing waves,[30] as confirmed by the resonant geoposition and anomalous magnetic stonework of the Paleolithic Sanskrit pyramid complex hidden in the mist-shrouded mountains of La Maná, Ecuador.

Years of exploration of the Calope River and Seven Cascades vicinity have uncovered more than 30 sites spread over a large area that confirm the hidden presence of 17 major psychoacoustic stone monuments. The Hummingbird Pyramid is directly linked to an entire complex of magnetic monuments by an ascending causeway that extends from the pyramid's apex for over 200m before beginning a gradual incline to *a much larger pyramid, also deeply buried in soil.*

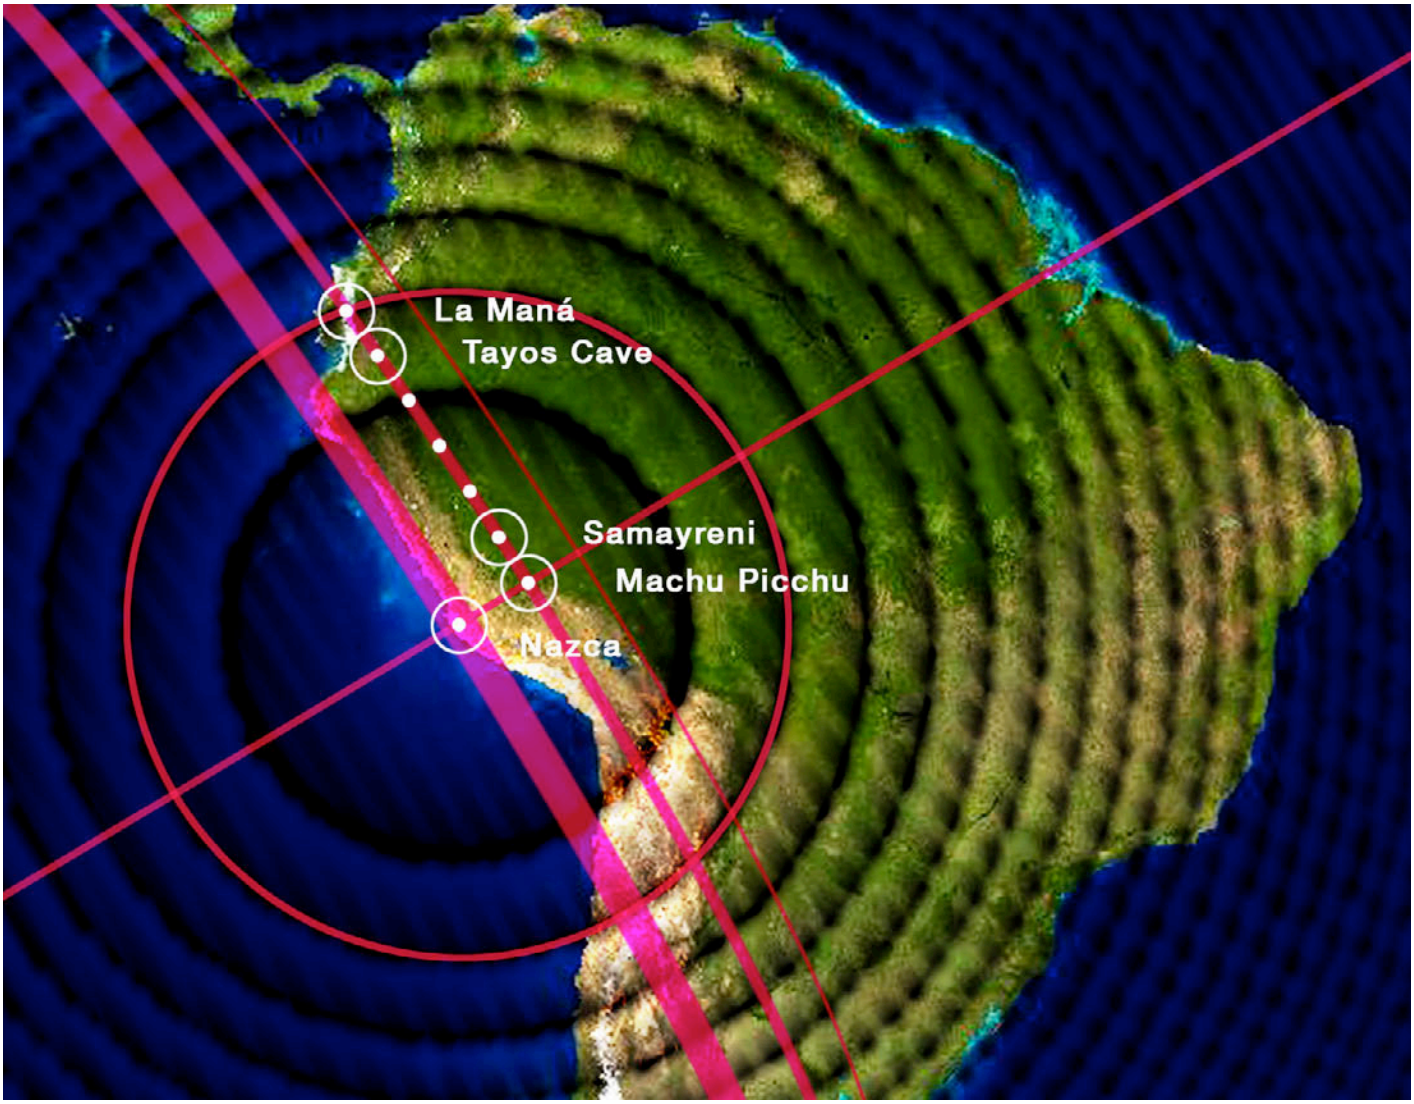
Located at the 1° South latitude along Ecuador's Calope River, the Hummingbird Pyramid complex is distributed across an area of more than 80km^2. Initial investigations have yielded a wealth of artificial stone blocks, megaliths and pavement stones, stone tools and ceramic sherds. *Dozens of functional psychoacoustic whistles from the La Maná Pyramid collection include the largest examples of ancient psychoacoustic instruments known in the world.* The hieroglyphic inscriptions, magnetic qualities and unusual UV fluorescence of the La Maná artifacts are not unique, but have also been identified among the thousands of engraved stones from the Illinois Cave archive in the Midwest US.

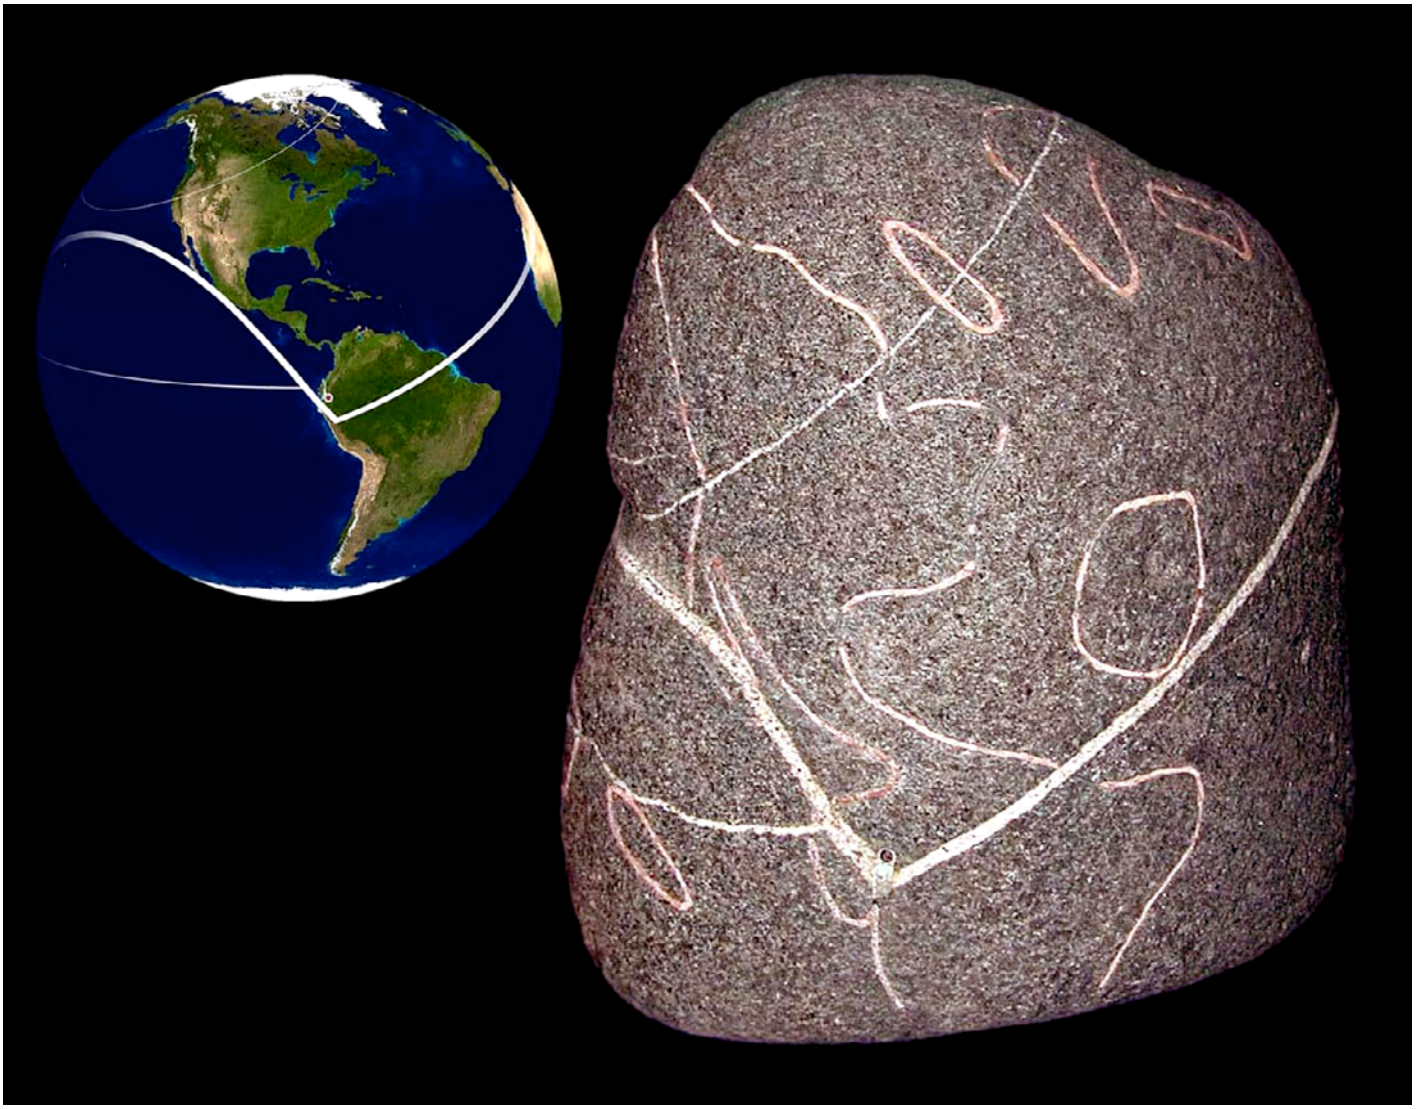


The precise alignments of pyramids and temples comprising the ancient magnetic city of La Maná reflect the advanced global geopositioning technology of the Paleo-Sanskrit pyramid-builders based on the distribution pattern of infrasound standing waves.[31] This discovery of the spherical structure of the field of planetary resonance comprises the greatest mathematical evidence for the continuity of worldwide cultural expression by this remarkable Paleolithic civilization.

The alignment of the heart of the La Maná pyramid complex along the 1°S latitude reflects the same pattern observed of other major Paleo-Sanskrit pyramid sites around the world, with Giza along 30°N, Visoko along 44°N and Gunung Padang along 7°S. The line of sites A, C and G defines the resonant 30.0% distance that also passes through Machu Picchu and Ollantaytambo, Peru to the southeast, as well as the Mayan pyramids at Tazumal, Guatemala to the northwest. Perpendicular axes define the inline positions of sites G,K,P, as well as M,R,S –*both describing exact alignments that converge at the apex of the Great Pyramid of present-day Giza, Egypt.* These perpenticular alignments are transected by the longitudal alignment formed by sites O, Q and R completing a Fibonacci Triangle –*a right angle triangle with two sides showing a phi ratio of 1 : 1.618* (highlighted in yellow, opposite). The largest monumental constructions in this complex have been identified and named for ease of reference:

Site	Monument	Geoposition
A	La Maná Pyramid	0.9625°S 79.2345°W
B	La Maná Tumulus	0.957°S, 79.2216°W
C	Upper Odin Tumulus	0.9758°S, 79.2234°W
D	Lower Odin Tumulus	0.9795°S, 79.2275°W
E	Odin mines megaliths	0.9795°S, 79.233°W
F	Outlook Tumulus	0.9837°S, 79.2515°W
G	Calope Temple	0.989°S, 79.212°W
H	Temple of Purification	0.995°S, 79.223°W
I	Hummingbird Pyramid	0.9978°S, 79.2283°W
J	Temple of Peace	0.9978°S, 79.236°W
K	Soma Step Pyramid	1.004°S, 79.231°W
L	Causeway Temple	0.998°S, 79.221°W
M	Cloud Pyramid	1.011°S, 79.224°W
N	Precipice Temple	1.016°S, 79.222°W
O	Pyramid of Assent	1.009°S, 79.2415°W
P	Amrita Pyramid	1.0143°S, 79.243°W
Q	Labyrinth of Ohm	1.017°S, 79.2415°W
R	7 Cascades Pyramid	1.026°S, 79.2415°W
S	Temple of Reflection	1.036°S, 79.2534°W

Exploration, discovery, documentation and excavation of these Paleo-Sanskrit monuments has been underway for only 3 years now, undertaken in the dense cloud forest environment that blankets these giant geopolymer constructions. Despite our identification of 19 major monuments within this ancient pyramid complex, a more complete survey of the area requires further technological analyses.



A wealth of organic materials already collected from well-documented sites requires radiocarbon dating analyses that can be correlated with data to be obtained from archeological core drilling to provide an accurate temporal context for these highly advanced Paleolithic construction sites. *Remote sensing using ground penetrating radar, LiDAR, seismic tomography, electrical resistivity and geomagnetic techniques will undoubtedly identify more temples and interconnecting tunnel systems within the area immediately surrounding the central complex of this ancient Magnetic Center.*

Alignments marked by the temples, tumuli and pyramids of the Magnetic Center of La Maná also reflect perfect orientation to other notable sites within the worldwide Atlantean infrasound network.[32] The distance between La Maná Pyramid and the Nazca Lines of Peru is 995 miles, comprising precisely 4.00% of the Earth's mean circumference of 24,892 miles (denoted by the red circle, above). *The remarkable accuracy of this geospacial relationship reflects a shared knowledge of advanced psychoacoustic resonance between the groups who constructed these iconic sacred sites.*

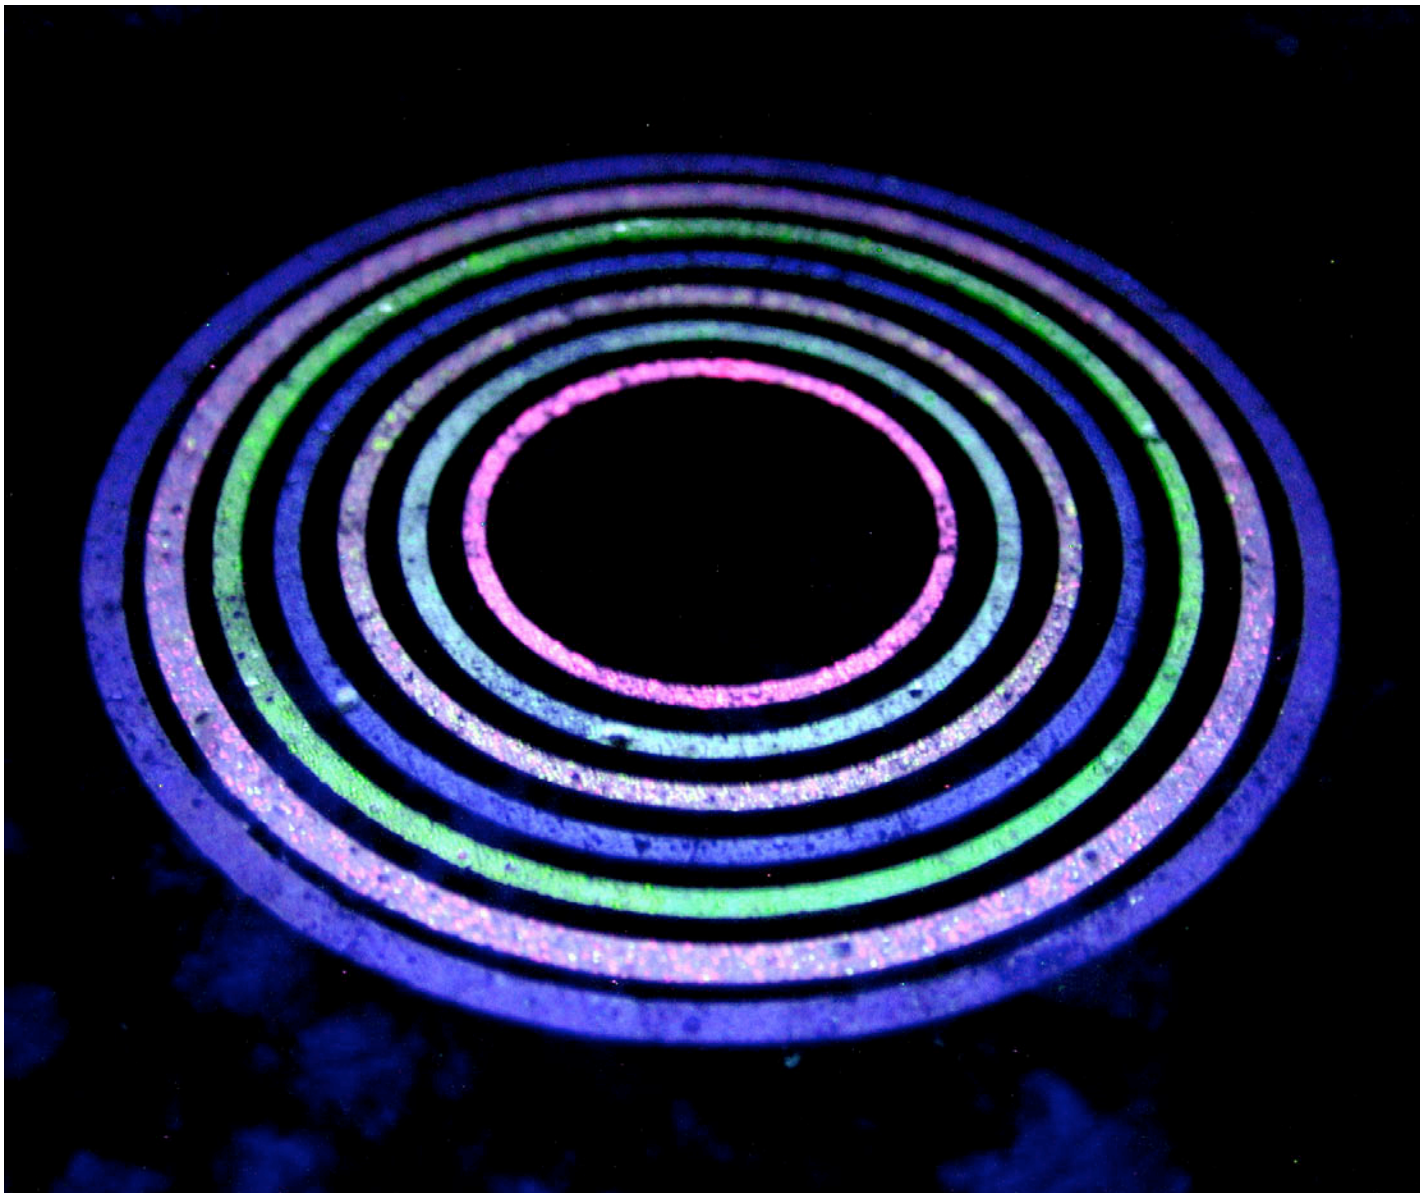
The La Maná Pyramid is 952 miles from Machu Picchu, Peru. Both sites are located along the 30.0% resonant distance alignment from the Great Pyramid. A line from La Maná to Machu Picchu can be divided into 6 equal segments of approximately 160 miles, corresponding to 5 intervening nodal points of infrasound resonance. This set of nodes includes the geopolymer ruins of the Samayreni River, Peru, located 164 miles from Machu Picchu along the resonant 30% alignment. The La Maná Pyramid is 183 miles from the Tayos Cave ruins associated with the Crespi artifacts in Cuenca.

Ancient Sacred Temple / Site	Geoposition	Dist. to Giza	Circ. %
Hummingbird Pyramid, Ecuador	0.99°S 79.22°W	7,472 miles	30.02%
Tayos Cave, Ecuador	3.45°S 78.19°W	7,497 miles	30.11%
Samayreni Temple, Peru	11.06°S 73.79°W	7,488 miles	30.08%
Machu Picchu, Peru	13.12°S 72.58°W	7,478 miles	30.04%
Nazca Lines, Peru	14.83°S 74.95°W	7,673 miles	30.83%

High-precision Fibonacci alignments fixed in megalithic stonework all over the world were also painstakingly engraved into an astonishing masterwork from the Sotomayor collection known as the World Map Stone (above).[33] This half-ton megalith presents a wrap-around world map inlaid with the coastlines of all inhabitable continents known today, as well as two major landmasses in the Pacific and Atlantic Oceans that were lost during catastrophic tectonic plate subduction events.

Thick quartz lines cirumscribing this granite boulder mark the sacred alignment of focused infrasound resonance radiating from the east and west faces of the Great Pyramid. The line makes a 90° turn near La Maná, marked near the juncture with the resonant 30% circumference distance from Giza. *As resonant flightpaths, these lines comprise direct evidence for a nonlinear pyramid distribution pattern.*

Exact construction dates for this newly uncovered pyramid complex in La Maná, Ecuador have yet to be comprehensively established, yet the great extent of this ancient city and clear distinctions in the construction styles among the many buildings suggest a rich progression of megalithic construction periods during the multi-phased development of this incomparable Paleo-Sanskrit civilization.



In the lower layers of the Odin mines, below 25m of earth, clay and thick layers of grey ash, burnt wood and stone debris, the intact rib of an adult mammoth was excavated by a machine operator who purchased the huge Pleistocene bone for his own private collection. The stratigraphy of the deepest mines provides conclusive evidence of the volcanic desolation of the La Maná area caused by a cluster of meteoritic impacts in the Atlantic region now dated to approximately 12,890 years ago.[34]

The La Maná artifacts and related ancient monumental sites deserve renewed worldwide attention and the comprehensive scientific investigation of geologists, archaeologists and technical engineers for remote sensing onsite. Furthermore, these ancient monuments deserve acknowledgement by the Ecuadorian government and funding for the application of satellite-based geosensing technologies.

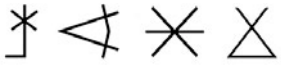
Magnetic Center

Magnetic Center



The Third-Eye Pyramid stone was discovered among over 300 artifacts by Dr. Elias Guillermo Sotomayor in 1984 during gold prospecting and mining activities in the area south of La Maná, Ecuador. Earthenware figures clad in complex arrangements of helmets and bangles were excavated at a soil depth of over 26' (8m) –*within a mountain Sotomayor suspected to be a buried pyramid itself.* Subsequent research supports this conclusion, and the buried structure is identified here as the La Maná Pyramid (0.9625°S, 79.2345°W).

Ultraviolet fluorescence effects of the artifacts' mineral inlays (above) were appreciated under the healing radiations produced by HHO plasma generated within the pyramids chambers. The artifacts' fluorescence effects reference the sacred illumination of calcite biomineralizations of the pineal gland that occurs within the pyramid chambers, known among the ancient Paleo-Sanskrit culture as activation of the '*ajna*' chakra.

The measurable magnetic qualities of the basalt stone caused a great amount of intrigue upon initial discovery by Sotomayor, but proves to be common among synthetic stone artifacts manufactured during that bygone era, confirming cultural continuity between Paleolithic sites in Illinois, US; Caria, Italy; Visoko, Bosnia; and La Maná, Ecuador. This conclusion has also been firmly established by epigraphic, geometric, and psychoacoustic research previously presented in the books *Phi* (2008) and *Sanskrit* (2014).

Ongoing research at the many associated ancient sites in the communities of La Envidia, El Corazon and Moraspungo continues to elucidate a newly recognized historical period of highly advanced technological achievements. Epigraphic study revealed Paleo-Sanskrit script on the bottom face of the Third-Eye Pyramid stone. [1] The decipherment of K. Schildmann reveals the votive meaning of the inscribed phrase:

u maʰā-ta-as vi upama

Oh, for greatness from the highest

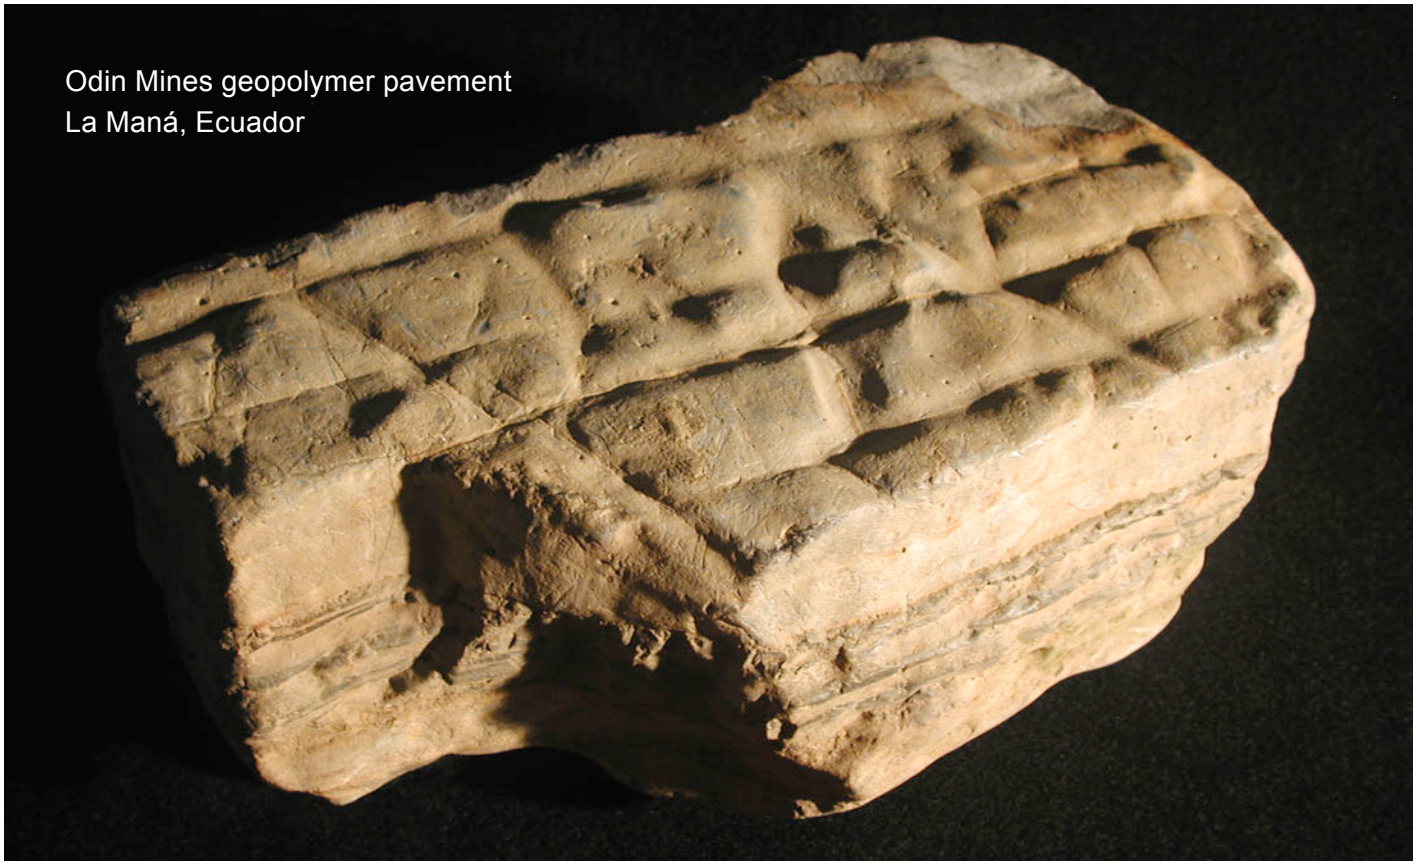
This phrase praises the psychoacoustic healing functions and global geopositioning system of the Atlantean pyramid network, now confirmed by on-site infrasound and ultrasound measurements at the Bosnian pyramids and other ancient megalithic sites in recent years. Researcher Dr. S. Osmanagich has documented the beneficial effects of exposure to enhanced infrasound and ultrasound resonance and the resulting high concentrations of negative ions measured in tunnel systems below pyramid complexes.[2]

Simultaneous advances in geopolymer chemistry have revealed special Paleolithic building materials in Bosnia and Indonesia employing kaolinitic clays as an essential binding material for *geopolymeric setting.* The same construction materials were used to build the Ohum pyramid complex of La Maná, Ecuador, consisting of magnetic geopolymer megaliths that present the same unusual properties as the Third-Eye Pyramid stone, especially the orange material adhering to the unworked surfaces of the artifact. *This orange coating consists of the same kaolinitic cement binding material used in Bosnia and Indonesia.*[3]

Kaolinitic geopolymer cement coating
Third-Eye Pyramid - La Maná, Ecuador

Geopolymer basalt crosswalk foundation
Zapanal River - La Envidia, Ecuador

Thick kaolinitic clay layers underly the low equatorial mountains of La Maná and La Envidia, effectively filtering the springwaters to the high purity that has become internationally recognized by over a dozen institutions in Europe and the US. *The same filtration functions of kaolin-based cements were utilized by Ohum engineers to create rainwater seeps that drain water into streams running through interior chambers.*



Geopolymer basalt crosswalk foundation
Zapanal River - La Envidia, Ecuador

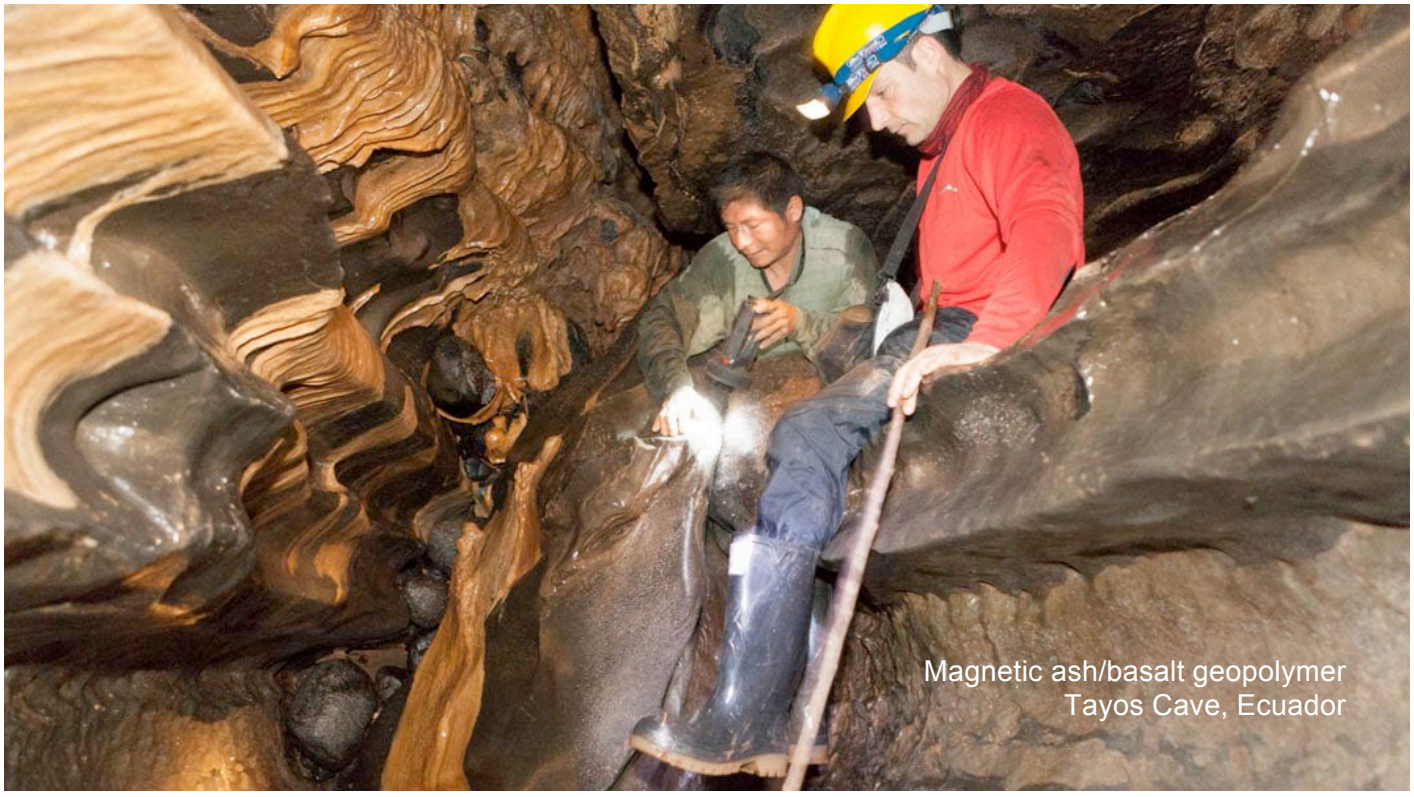
Exploration of the upper section of the Zapanal River in La Envidia, Ecuador has revealed many wonders. Rolling back the thick mat of interwoven roots exposed the beautiful orange surfaces of massive stone blocks cast to form the foundation of a wide river crosswalk feature (opposite).[4] Inset steps were cast into the riverbed (above) to accommodate a layer of small geometric paving tiles with greater metallic content.

The magnetic quality of the riverbeds of the Upper Zapanal River confirm their articial origin. In addition, streams and rivers throughout the vicinity of the ancient lava cone called Cerro La Maná are known as sources of red gold (gold/copper). Volcanic emissions from Cerro La Maná showered fine gold/copper pellets over the surrounding terrain, much of which collected in the wide valley due south of La Maná.

This area was exploited in the 1980s and '90s by Odin Mining & Exploration Ltd., a Canadian industrial mining company. *The Odin gold mining operations removed hundreds of tons of magnetic geopolymer material from 60-90' (18-27m) below the valley floor, including megalithic blocks of magnetic geopolymer basalt containing fine particles of tourmaline, gold, silver, iron, pyrite and nickel.*

While Odin Mining & Exploration Ltd. is known for extracting alluvial gold deposits in Cangrejos, Ecuador, *extensive operations near La Maná were not publicly disclosed due to the presence of buried pyramids and underground tunnel systems.* Textured, magnetic basalt paving stones have been recovered (below).

Odin Mines geopolymer pavement
La Maná, Ecuador



Odin Mining & Exploration Ltd. is a Vancouver-based outfit operating as a front company for Elizabeth of Gotha, alias Queen of England, monarch of the failing British Empire. Covert archeology operations also conducted by Odin Mining in the region of La Maná, Ecuador have been concealed as part of a much larger agenda concerning control of indigenous populations in the Americas through theft of natural resources and parallel governmental genocide programs, as continued by President Correa and the government of China.

Vancouver-based corporate and government genocide operations against indigenous populations in western Canada have been effectively exposed by Kevin Annett and the International Tribunal into Crimes of Church and State (ITCCS).[5] Recent reports reveal *Sino Bright Investments* as a front for Chinese military operations involving offshore drug importation by Yakuza and Triad cartels, as well as contracted serial murders and abductions of Terrace and Powell River, BC natives for organ harvesting and child trafficking.[6]

China's major industrial projects in the Ecuadorian Amazon also serve the wider goal of native depopulation and Chinese emigration also pursued in BC, Canada, continuing China's military-run organ harvesting programs and related mass disappearances of targeted minority groups such as the Uyghur Muslims.
The global governmental control system operates by dominating access to natural resources and ancient sacred sites that have been vigorously protected by indigenous tribes of the Amazon. The Shuar culture of Ecuador maintain ancestral reverence for an extensive underground complex known as Tayos Cave, from which hundreds of Paleo-Sanskrit artifacts were removed and gifted to Padre Crespi in Cuenca. *The 1981 Paquisha War and 1995 conflicts between Ecuador and Peru related to control over the cave complexes.*[7]

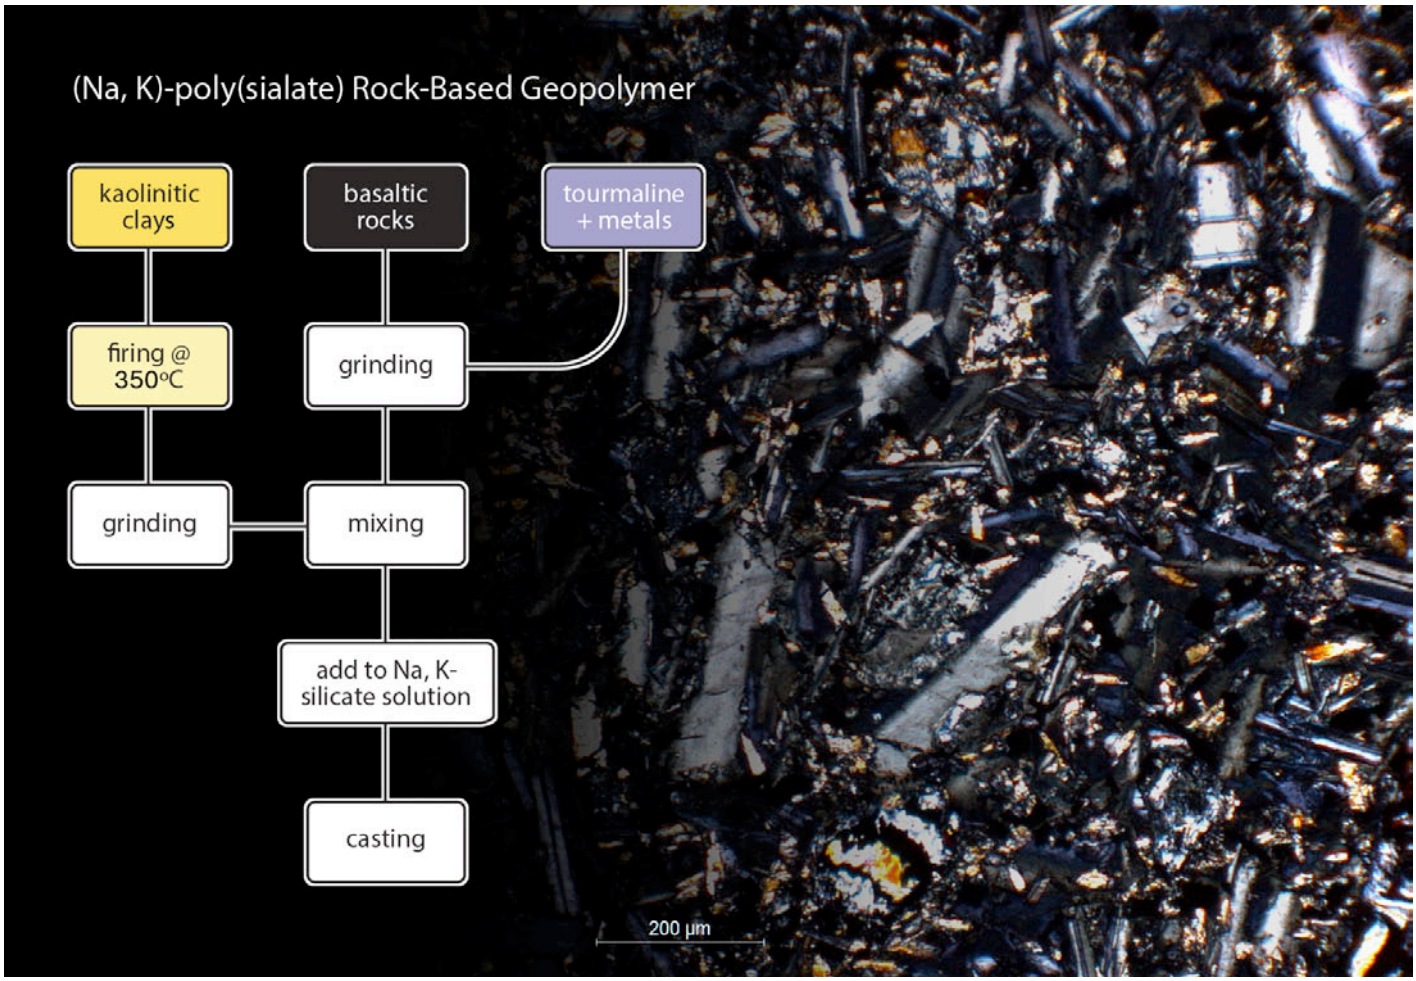
The Tayos Cave complex was built by the Ohum civilization, applying sophisticated Atlantean techniques (below). Atlantean scientists recognized that rhythmic fluctuations in the levels of infrasound resonance on Earth are caused by cyclical planetary alignments which, together, induce cyclical rhythms in the biophoton field of the human body. Benefits of bioelectrification result from increased absorption of gases into metals within cells, facilitating enhanced nuclear transmutations near 38°C, releasing biophotons.[8]

Atlantean architects erected giant pyramids for barefoot contact with magnetic pavements, enhancing ionization of the body fueled by colloidal electrum water. Atlantean techniques for the *'preparations'* of geopolymer stone were mentioned in a Life Reading by Cayce on September 26, 1936 (Reading 1265-1):

Magnetic ash/basalt geopolymer
Tayos Cave, Ecuador

> Before that we find the entity was in the land now called the Egyptian, during those periods when there were those entering in from the northern land… The entity was of those peoples, and a close associate then of Araaraart as well as Arart and Ra-Ta, and the entity made for the building up of those influences for the archaeological researches as would be called of that day, as well as the preparations of stones, of gold, of all the various forms of building materials. The entity then was in the name Phar-Ar.

The magnetic basalt artifacts and pyramid stones from the La Maná pyramids directly confirm Cayce's subtle implication that fine gold powder was blended into the synthetic stone slurries of the Atlanteans. An explanation of the functions of Atlantean 'firestone' was given on December 20, 1933 (Reading 440-5):

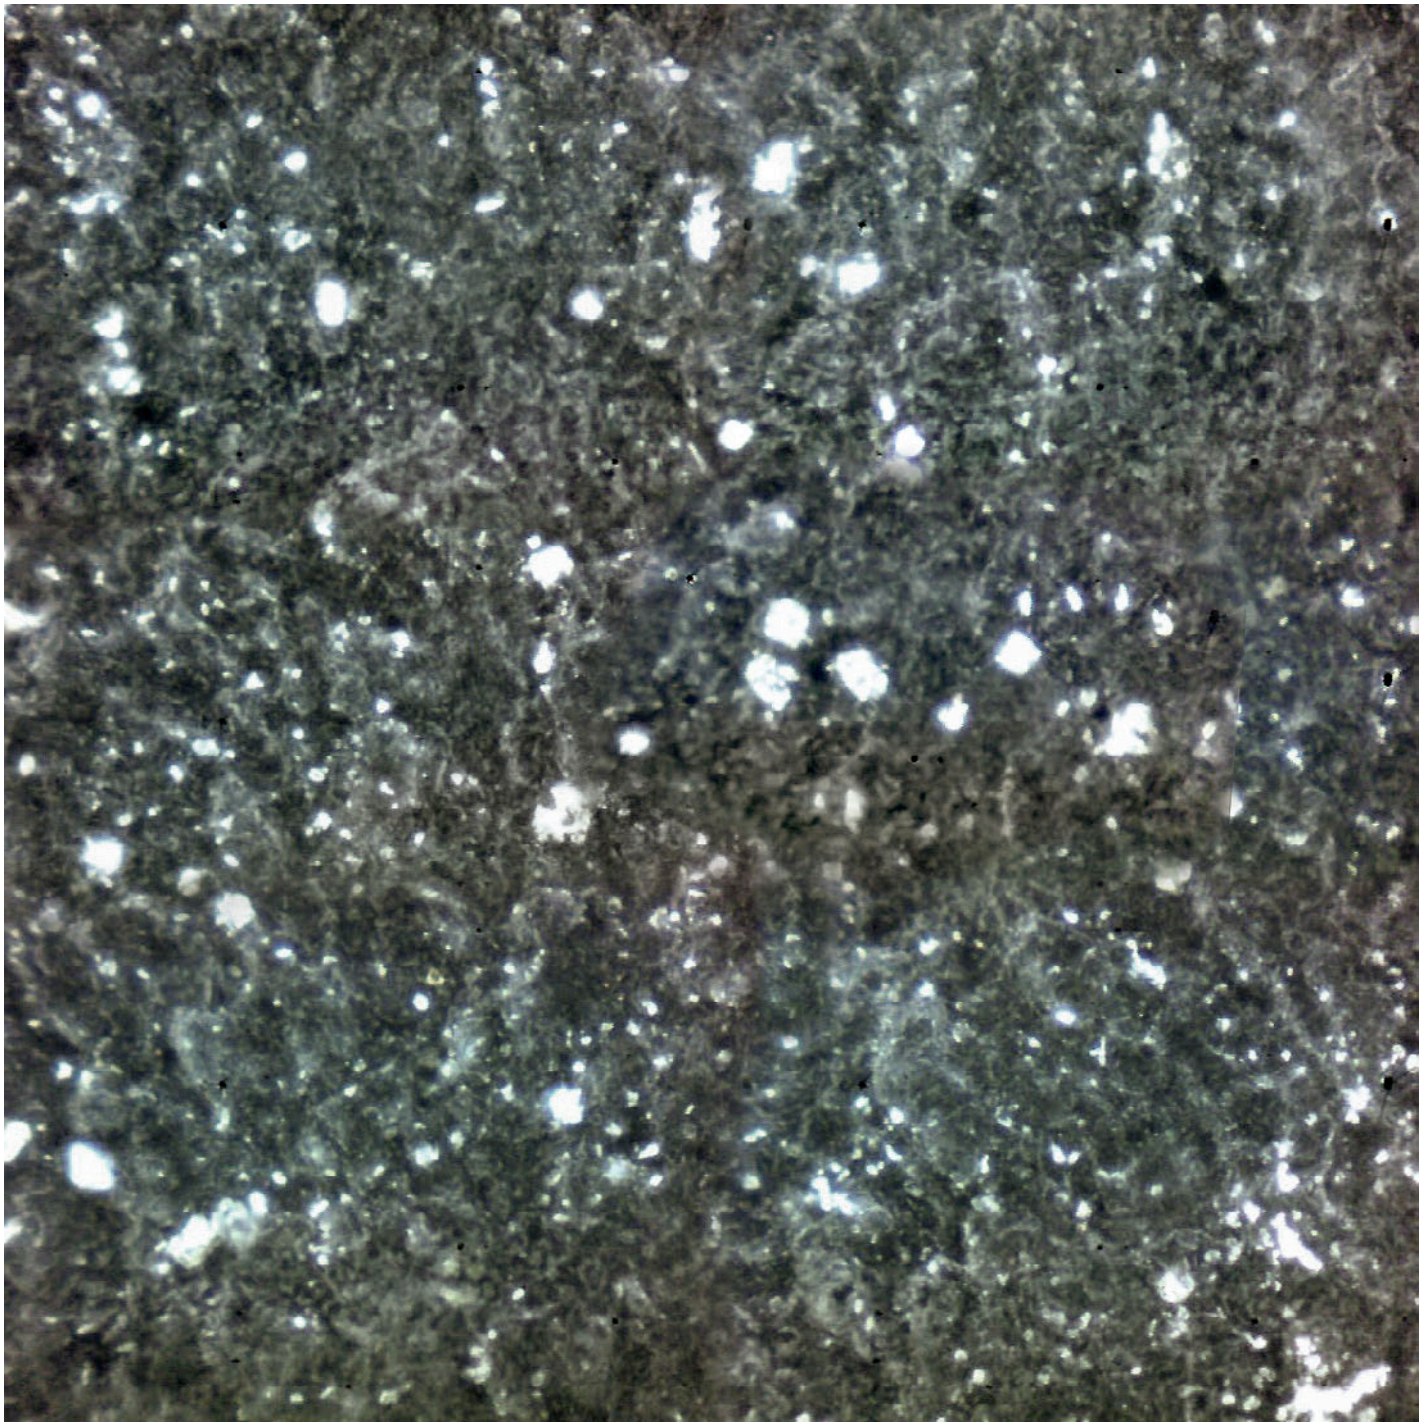


> About the firestone that was in the experience did the activities of the entity then make those applications that dealt with both the constructive and destructive forces in the period. It would be well that there be given something of a description of this, that it may be better understood by the entity in the present, as to how both constructive and destructive forces were generated by the activity of this stone.
>
> In the center of a building, that today would be said to have been lined with non-conductive metals, or non-conductive stone –something akin to asbestos, with the combined forces of Bakelite or other non-conductors that are now being manufactured in England under a name that is known well to many of those that deal in such things.

The significance of Edgar Cayce's simple reference to Bakelite was not understood when it was given in 1933, yet subsequent scientific developments in the field of molecular chemistry reveal their accuracy. Founder of the Geopolymer Institute, Dr. J. Davidovits provides an introduction to the modern invention of polymers such as Bakelite, which preceded the development of present-day geopolymer technology:

In 1972, I founded the private research company Cordi SA, later called Cordi-Géopolymère. In my pursuit to develop new inorganic geopolymer materials, I was struck by the fact that the same simple hydrothermal conditions governed the synthesis of some organic plastics in alkali medium, as well as mineral feldspathoids and zeolites.

Thus, phenol and formaldehyde polycondense into the famous Bakelite invented by Bakeland at the beginning of the 20th Century, one of the oldest man-made plastics. On the other hand, the aluminosilicate kaolinite reacts with NaOH at 100-150°C and polycondenses into hydrated sodalite (a tectoaluminosilicate, a feldspathoid), or hydroxysodalite.



From the study of the scientific and patent literature covering the synthesis of zeolites and molecular sieves –essentially in the form of powders– it became clear that this geochemistry had so far not been investigated for producing mineral binders and mineral polymers. I proceeded therefore to develop amorphous to semi-crystalline three-dimensional silico-aluminate materials, which I call in French "géopolymères", geopolymers (mineral polymers resulting from geochemistry or geosynthesis).[9]

Just as stated by Cayce in 1933, the invention of organic plastic polymers such as Bakelite applied novel chemical processes that facilitated development of inorganic mineral polymers, called *geopolymers*. The crucial binding agent is kaolinitic clay, or poly(siloxo-aluminumhydroxyl), that has been dehydroxylated by calcination. Davidovits outlines the processing of a *metakaolin* matrix for rock-based geopolymers in alkali solutions (sodium hydroxide or potassium hydroxide), into which additional silica has been dissolved:

(Na,K)-poly(sialate) Matrix for Rock-Based Geopolymerization

There has been some work carried out to determine the use of rock-forming minerals for the production of geopolymeric precursors... Kaolinite [that has been calcined and] added to the alkaline solution plays the role of a (Na,K)-poly(sialate) matrix that embeds the rock-forming particles and reacts with the dissolved molecules, essentially amorphous silica, –but also plays a major role in the interaction of their surfaces.[10]

Metakaolin (MK-750) is the primary reactive agent, produced by dehydroxylation of kaolinitic clays at low oven temperatures of 250–500°C. Also called calcination, this indispensible step renders silica and alumina available for reaction in solution with alkali components and dissolved silicates.

A flow chart outlining the requisite raw materials and technical manufacturing process for (Na,K)-poly(sialate) basalt geopolymers of the metallic semiconductor type produced by the Ohum civilization of the Andes is provided (opposite), representing advanced materials developed by the Atlantean civilization.

Artificial magnetic basalt samples recovered from the Ohum pyramids of La Envidia, Ecuador display an abundance of additives, incorporating finely ground tourmaline crystals and a wide variety of fine metal particles, expecially iron, pyrite, nickel, silver and gold (above). Piezoelectric and pyroelectric crystals transduce all recieved radiation into an internal EM field that accumulates and stores electrical charge.

Magnetic basalt geopolymers
Upper Zapanal River
La Envidia, Ecuador

Years of artifact prospecting and collection in the Upper Zapanal River in La Envidia, Ecuador has produced a fine group of eight magnetic geopolymer healing tools, manufactured by the Ohum for bioelectrical qi healing, acupressure, oil massage and *guasha*, for scraping the skin (above). A pair of oblate spheres and a pair of flat, polished stones were cast in magnetic basalt and used for qi healing and massage, while a large *magnetic granite geopolymer* tool with a handle for gripping served the same sophisticated purposes.

Two long, pointed instruments with handles for grasping were cast in magnetic basalt with an elevated content of ash, thereby increasing the strength of the thin tools. Both were held in the palm of the hand with the point pressed into the acupressure points of the body being healed, for amplifying qi healing processes.

This magnetic basalt guasha tool of the Ohum is certainly the oldest instrument of its kind ever discovered in the world, belonging to the Ohum culture which flourished in Ecuador and Peru through participation in the Atlantean temple activites of the Sons of the Law of One. These sophisticated Atlantean genetic and cellular healing practices elevated global cultural achievements from ~30,000 to ~13,000 years ago.

adhi rauapa rauaIndra
Delivering roaring protection, roaring (of) Jupiter.

Advanced Paleolithic knowledge of mineral formation and chemical techniques for the production of rock-based alkali geopolymers is also confirmed by archeological finds in central Ecuador, where the Ohum civilization once flourished. The ruler of the Ohum lands of On occupied the throne of the Great Ohlm, cast in magnetic ash-basalt geopolymer, forming hieroglyphic text reading: *adhi raua pa raua Indra* , meaning "Delivering roaring protection, roaring (of) Jupiter" (opposite).

The Cayce Life Readings include fascinating information concerning colonies of On (Ecuador) in the region of *Yuk*, referred to today as Central America, exhibiting the same constructive applications of Atlantean firestone geopolymers, and often associated with Paleo-Sanskrit petroglyphs. A Life Reading given on November 20, 1934 identified the Paleo-Sanskrit root of the name *'Yucatan'* (Readings 3823-1):

> Entity was in the Atlantean land, during those periods when there was the abandoning of the land owing to the periods of destruction. The entity was among those that came to what is now the southern portion of the land of the present nativity, or in what is called Yucatan –then it was called Yuk.
>
> In that sojourn the entity was among those that aided in establishing there the priests and the priestesses in the activity of the teachings of the peoples as related to the Law of One. In the latter portion of the entity's sojourn there, many of those lands now known as the Egyptian –then of Mu or Ra– came to pass the messages for the building of the activities and of those things that made for the preservation of the thoughts and teachings of those people in that land.

The same spiritual fusion of the ancient Atlantean temple culture with native traditions in the regions of Mu (a continent in the Pacific Ocean, now submerged), Og or Oz (Peru), On (Ecuador) and Yuk (Central America) was similarly addressed during a Life Reading given on September 3, 1937 (Reading 1437-1):

> Before that we find the entity was in the land now known as the Yucatan or Central America, when there were those activities by those peoples who came from the Inca or the [Ohum] land of Og and the Atlantean land; when there were the attempts to reestablish those activities of not only the older portions of the Atlantean civilization but also of those who sojourned in that particular experience.
>
> The entity was raised to that one in authority as an *active* priest, furnishing the activities in the temples (that are beginning to be uncovered in the present)... In the experience then the entity was known as Guloupo...

Emigration of Atlantean evacuees from Poseida prior to the Great Flood cataclysm occurred throughout those lands adjacent to the Atlantean Isles, including a small group of Atlanteans who resettled in Yuk under the leader Iltar, and subsequently established a major firestone pyramid complex (Reading 5750-1):

> Then, with the leavings of the civilization in Atlantis (in Poseidia, more specific), Iltar –with a group of followers that had been of the household of Atlan, the followers of the worship of the *one* with some ten individuals– left this land Poseidia, and came westward, entering what would now be a portion of Yucatan. And there began, with the activities of the peoples there, the development into a civilization that rose much in the same matter as that which had been in the Atlantean land. Others had left the land later. Others had left earlier.
>
> There had been the upheavals also from the land of Mu, or Lemuria, and these had their part in the changing, or there was the injection of their tenets in the varied portions of the land –which was much greater in extent until the final upheaval of Atlantis, or the islands that were later upheaved [following cometary bombardment at ~12,900bp (Kennett *et al*., 2009; Bunch *et al*., 2012)], when much of the contour of the land in Central America and Mexico was changed to that similar in outline to that which may be seen in the present.
>
> The first temples that were erected by Iltar and his followers were destroyed at the period of change physically in the contours of the land. That now being found, and a portion already discovered that has laid in waste for many centuries, was then a combination of those peoples from Mu, Oz and Atlantis. Hence, these places partook of the earlier portions of that peoples called the Incal; though the Incals were themselves the successors of those of Oz, or Og, in the Peruvian land, and Mu in the southern portions of that now called California and Mexico and southern New Mexico in the United States.

The submerged remains of the large pyramid complex built by the followers of Iltar were only recently discovered in 2001 by submarine investigators on the ocean floor in the Gulf of Guanahacabibes,[11] located off the westernmost peninsula of Cuba.[12] *Electrical malfunctions of the deepsea ROV have hampered the seafloor investigation due to enhanced EM fields transduced by the firestone pyramids themselves*.[13]

One of the ancient Ohum colonies in Yuk has been exposed by the weathering of ocean waves on basaltic rock, on the west coast of present-day Nicaragua. Now visited as a tourist destination for surfers, *the long volcanic breakwater formation at El Transito Beach is located precisely along the 12° North latitude,* reflecting the same high-precision latitudinal placement observed of the Ohum capital city of On at 1° South latitude, in the vicinity of the modern-day town of La Maná, in Central Ecuador.

Study of related offshore structures through marine archeology will reveal the full extent of this ancient complex at El Transito Beach, Nicaragua. Modern cement pool structures overlie more ancient stonework cast by the Ohum (above). Landowners have collected flat basalt pavement stones from the ancient temple walkways built by the Ohum colony during the expansion period from ~28,000–26,000bp.

Enhanced magnetic properties of the basalt blocks and pavement stones of El Transito Beach have been reported by local residents, who have used them in various recent shorefront construction projects for walls and pathways. The fine metal particulate composition of these basalts confirm their synthetic origin as pyromagnetic firestone constructions of the Ohum colony mentioned by Edgar Cayce.

El Transito Beach, Nicaragua (12.061°N, 86.713°W) is 7,398 miles from the Great Pyramid of Giza, Egypt, corresponding to 29.72% of Earth's mean circumference of 24,892 miles. El Transito Beach is also 1,034 miles from the Hummingbird Pyramid in La Envidia, Ecuador, comprising 4.15% of Earth's mean circumference, having been especially calculated to maximize reception of infrasound resonance.

Geoposition requirements for the building of firestone pyramids included the use of these sacred values for resonant distance intervals in miles and percent of Earth's circumference, given by the Atlantean leader Ajax for the founding of firestone cities in the South and Central American regions during the colonization period immediately following the evacuation of Atlantis, prior to the Great Flood event ~30,000bp.

Magnetic basalt geopolymer pavement
El Transito Beach, Nicaragua

According to detailed historical information retrieved from the Akashic records through the Life Readings of Edgar Cayce, political accords were made between the technologically sophisticated Atlanteans in Egypt and the royal houses of each of the colonial regions. These accords were technology sharing agreements by which the ruler of each region was selected by King Araaraart, while all other positions of authority were designated by High Priest Ra-Ta (Readings 5748-2, 281-42):

> In each of the spheres [or regions] given was the rule set under some individual by this second ruler [Araaraart] in now Egyptian country... With the return of the Priest there began the choosing as to who was to be considered in authority, in the spiritual precepts. And there was the activity of the Priest in choosing entities, individuals from all walks of life, all stations, –whether in authority in the political or the economic...

The great extent of the geopolymer basalt remains being uncovered at El Transito Beach, Nicaragua confirms the Cayce material by providing a technological connection in their use of highly advanced building materials of the Atlanteans. The Ohum capital city of On, in Central Ecuador, was the center of the Ohum civilization ruled by the Great Ohlm from the firestone pyramids. From Egypt, King Araaraart assigned Princess Issua, of the Atlantean House of Ode, as emissary to the lands of On (Reading 845-1):

> Before that we find the entity was in that known as the Atlantean land, during those periods when there were the preparations for those that were of the household of faith, or the Law of One, when there was seen that there were to become the destructive influences that must shatter, must destroy the land, the peoples.
>
> The entity was among those that were to become the emissaries or the sojourners in what is now the Incal land, or the Peruvian land. Later from that sojourn the entity came to what is now the Central American land, aiding in the establishing of not only the tenets but the manners and the forms of worship during those sojourns. The entity was among the princesses of the land, not only of the Atlantean but of the Ohum [of On, Ecuador] and Og [Peru] lands –and later Muri [Lemuria].

In the experience the entity gained throughout, in that it adhered to the Law of One; that there must be the application within self, the same application to the fellow man –for that which is the motivative force in each is of the same source, or one, and brings the ability in associations for the increase to come from constructive or the God-forces in the associations.

Then, as to the abilities of the entity in the present and that to which it may attain, and how: First, look within self. Know as to what is the motivative influence within self as to the satisfying of self's own desires, as to that which would maintain the Law of One, of truth, of self within self; or is it –the motivative influence avarice, greed, or that which is of self's own desires? Then know that the motivative forces and influences are founded in that set as the Princess of Ohum and Og, in the name then Issua; which brought that which saved the lands during those experiences.

They are not founded in truth unless of that oneness of purpose. This determined within self, then know that as ye apply that ye know day by day in thy activities with thy fellow man these make for contentments in no matter what state of mind or body self may be put; for there is that contentment in that the self is a channel of blessings to someone, not as of self but through the manifesting of the love of the Creative Forces as expressed in Him –as... thou knew from thine own personal activity in the Ohum and Og land.

This lengthy explanation from the Source relates the Atlantean spiritual precepts of the Law of One as manifest in the devout temple life of Atlantean and Ohum Princess Issua of Ode. The unified political, social and spiritual dimensions of the global Atlantean pyramid network was carefully monitored and maintained through the global system of regional rulers and emissaries designated by King Araaraart in Egypt.

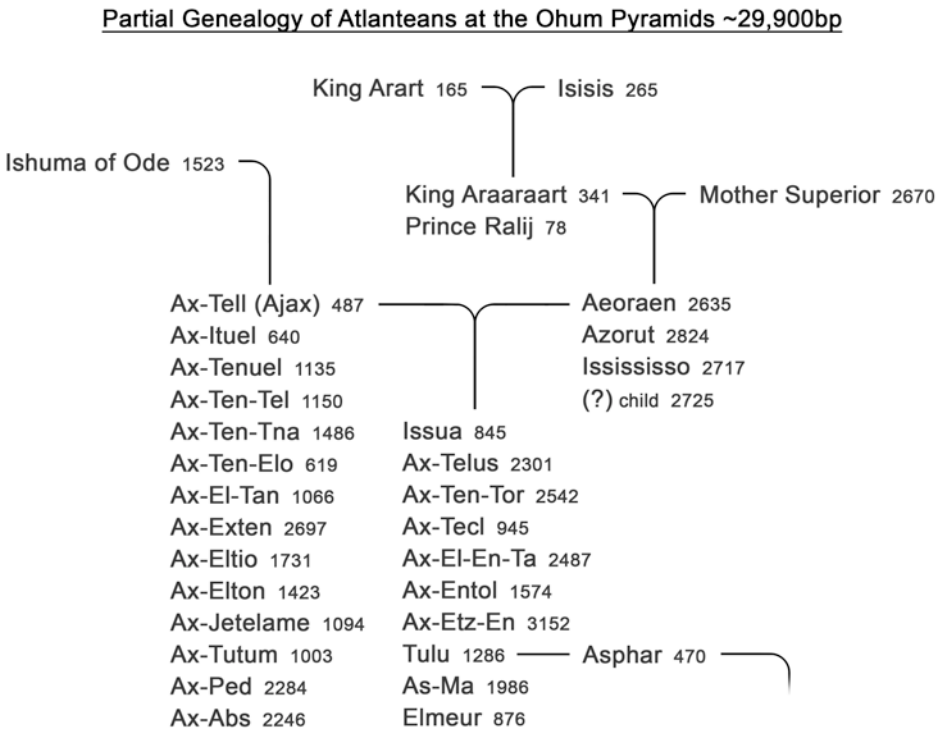
The establishment of Atlantean psychoacoustic temple activities in the Ohum capital city of On, near La Maná, Ecuador, was strategically planned by Atlantean leader Ajax of Ode, and guided by his daughter and emissary Princess Issua and the Great Ohlm, a leader raised to power by King Araaraart (Reading 228-2):

In the one before this we find in the land of now the Peruvian country, in the second rule of the Ohlms, and the entity then the ruler in that plane, and giving much of the earthly splendor to the country, retarding self in that time through the relations as had with those of the lower class, or caste, and then we find the entity in the name of The Great Ohlm. In this, we find in the present the desire to see much splendor in others, and in many places, yet shunning those of the opposite sex in a manner, yet desiring ever to bask in the better... thought of such people.

Inequality between the sexes arose during those periods among the Ohum and the Atlanteans from the taking of multiple wives, as exemplified by the hypocritical actions of the Priest Ra-Ta that resulted in his banishment. A closely related Life Reading was given by Cayce for a fashion model on November 8, 1936, identifiying another Atlantean Princess, named Tulu, as a daughter of Ajax of Ode who became one of the wives of Asphar after emigration from the lands of Ra, in present-day Egypt (Reading 1286-1):

Before that we find the entity was in the land now known as the Inca or Peruvian or Ecuador land, during those periods when the people from On and Og were making for so many changes, –by the disturbing forces which arose from individuals who came into the land from the Atlantean land, as well as those who were to journey for the establishing of activities in what is now the Yucatan land.

The entity then was a princess, and a daughter of one of the rulers [Ajax] associated with the one [Asphar–now Thomas Townsend Brown] who with so many wives (of which the entity was one) made for both good and bad.



Hence the entity was given to the keeping in line with the activities of those who were to establish new outlying districts. Hence the beauty of the entity, as well as its associations of power and strength, made for those activities in the Yucatan land –with those of the Atlanteans as well as those from the land of Og and On– that brought about a great advancement.

Through those experiences the entity advanced far because of its abilities in judgement as drawn from nature, as well as from the signs of the heavens and those activities that same bear upon the influencing of man, –as well as the seasons and the crops and the like, that were a part of the dependence of each people during those periods. The entity gained throughout that experience, yet –with the regenerating, or the degrading as it became later, to those sacrifices that took hold of the offering of bodily forces, –these became a torment...

Thus does it behoove the entity to find in those activities that which will bring about in the experience that which will make *home* –as a *reality*; close to nature. Not in the strife and turmoil, not in cities, not where there are the surroundings of those forces that bespeak of the commercial life, but that as of *nature*!

> That as was given by the entity then as the priestess of those peoples, that made for the dedicating of their lives, that which would bring into the experience of each soul its relationships to *nature* as it manifests itself in its defiance of, in its laws with, in its beauties of, in its troubles with humankind; as it meets same in the rain, the sun, the storm, the dew, the beauty of the sun and the moon and all the glories of nature itself become rather as the song of the entity in its experience; when the sons of God with the voices of the winds sang together of the heralding of the glory of the noonday to the sons of God! That became as the chant of the entity in that experience, in the name Tulu.

The degraded activity referred to by the Source concerns human sacrifices *that became an inversion by the Sons of Belial of the original purposes of the Atlantean temple activities: to sacrifice animal genetic hinderances for regenerating fully human bodies during regular periods in HHO plasma chambers.* Ritual human sacrifice represents the preverted activities of the Sons of Belial that had entered into the practices of the Ohum through the influences of the Lost Tribe of Israel that emigrated by boat (Reading 5750-1).

A partial genealogy of Atlanteans at the Ohum Pyramids of On outlines the political unification of the Atlantean House of Ode with the Persian House of King Arart in Egypt ~29,900 years ago (above). This powerful group undertook the global unification of spiritual knowledge under the tenets of the Law of One, integrating contributions from advanced teachers in all regions of the world and dispersing those essential truths concerning the relationship of human beings to the unified energy of the Creator (Reading 900-422):

> All force is vibration, as all comes from one central vibration and its activity into, out from, and its own creative forces, as given, with that of the divine as manifested in man, is same vibration –taking different form. Here, we may give a dissertation, in a manner, as to what Creative Energy is, as related to man and his activity, and as the forces as are seen and about man. As has been given... [God created man] in his own image... Then containing all of the vibrations that were without, were given into that whole being of man –which in *its* vibration gave man the soul. *Above* all else created, see? Then we see how the evolution of force in vibration brought up to the point wherein man becomes one *with* the Creative Energy... How? In that the ability to create mentally, and with the hand *makes* that which *is* the created force of that mind, and with that may make destructive forces for self. Hence man becomes one *with* the Creative Energy, or away *from* that Creative Energy...

Direct political lines that linked each region of the Atlantean collective were crucial for maintaining the properly tuned functioning of the pyramids for focusing the standing wave fields of planetary resonance. *Furthermore, resonant thundering of the global pyramid network effectively synchronized the brainwave patterns of all rulers worldwide, as clearly described in votive texts engraved on psychoacoustic whistles:*

ra mi - is upama ra $r^{a}u^{a}$ - as • as - adhi

Granting synchrony (of) the highest, granting for thundering, the One for delivering

• ra mi - is upama - as $r^{a}u^{a}$ - as ra

the One granting for synchrony (of) the highest..., for thundering granting

ri^{s} $r^{a}u^{a}$ - as mi - is upama - as adhi - as $r^{a}u^{a}$ - as

For dwindling thundering for synchrony (of) the highest..., for delivering for thundering

ra mi - is upama - as mi - is upama

granting for synchrony (of) the highest, synchrony (of) the highest

$r^{a}u^{a}$ - as ra • adhi • as - ra ra ra ra

for thundering granting, the One delivering, the One for granting, granting, granting...

ra adhi ra $r^{a}u^{a}$ - as ri^{s} ri^{s}

Granting delivering, granting for thundering dwindling, dwindling

ra $r^{a}u^{a}$ - as ri^{s} ri^{s}

Granting for thundering dwindling, dwindling

Repeating bands of hieroglyphs are inscribed around the neck and shoulder of a male figure wearing a large funnel-shaped helmet, reading: *raua Indra • ra* and *raua mi-is ra* , meaning "Roaring (of) Jupiter, the One, granting…" and "Roaring synchrony granting..." (above). Quite similar hieroglyphic texts adorn other large seated ceramic figures recovered from the vicinity of the modern city of Quevedo, Ecuador (opposite).

The blackware finish of Ohum ceramics was achieved by application of advanced chemistry knowledge of the Atlantean civilization. The same Atlantean blackware manufacturing techniques were used by the Etruscans, Romans, Greeks and Minoans. Geopolymer chemist Dr. J. Davidovits has defined the basic process applied by Paleolithic artists for achieving Low Temperature Geopolymeric Setting (LTGS), citing the oldest known example in Europe as the Venus of Dolní Vestonice at ~25,000bp:

> The results obtained with LTGS have been surprising and very interesting from the archaeological point of view, e.g. the fabrication of ceramic whose surface is covered by an intense black color, identical in appearance to numerous prehistoric European ceramics (Dolní Vestonice, 25,000 B.C.) as well as Etruscan pottery of the Bucchero Nero type (630 B.C.) and Impasto maronne (650 B.C.)...
>
> The Venus could have been produced in an open wood fire (a garden fire), at a temperature of 300-400°C maximum, but with the clay containing natural chemical ingredients, such as alkaline soluble salts, generating a geopolymeric reaction...
>
> During antiquity and upto the 17th Century of our modern time, a great number of mineral chemical constituents were extracted from plant and wood ashes... The ashes of several plants and hardwoods were heavily used for their high content in SiO_2, CaO, K_2O. The [sophisticated chemistry] know-how related to these [Paleolithic] techniques is hardly known in our modern times...

Table 17.1 gives a list of plants and hardwoods, commonly used for their high content of mineral constituents, namely lime CaO, potash K_2O and SiO_2. Ashes from beech, oak, apple, hazelnut, acacia trees contain CaO in the range from 56-82%. The acacia is native [to] Egypt and its ashes together with those of the palm tree were the source of CaO in the making of the Pyramid stone according to Davidovits (2002, 2004, 2006). Reeds and heather (and also papyrus reed), together with cereal husks are very rich in reactive phyto-silica, whereas fern and bulrush provide the necessary alkali, potash or kali, K_2O.

Table 17.1: Mineral constituents found in plant and wood ashes in % by weight of the ash.[14]

	SiO_2	CaO	MgO	Na_2O	K_2O	P_2O_5	SO_3
beech : trunk	5.4	56.4	10.9	3.6	16.4	5.4	1.8
beech : branches	9.8	48.0	10.6	2.4	13.8	12.2	0.8
beech : leaves	33.8	44.9	5.9	0.7	5.2	4.7	3.6
oak	2.0	72.5	3.9	3.9	9.5	5.8	2.0
apple tree	2.7	70.9	5.5	1.9	11.8	4.5	2.7

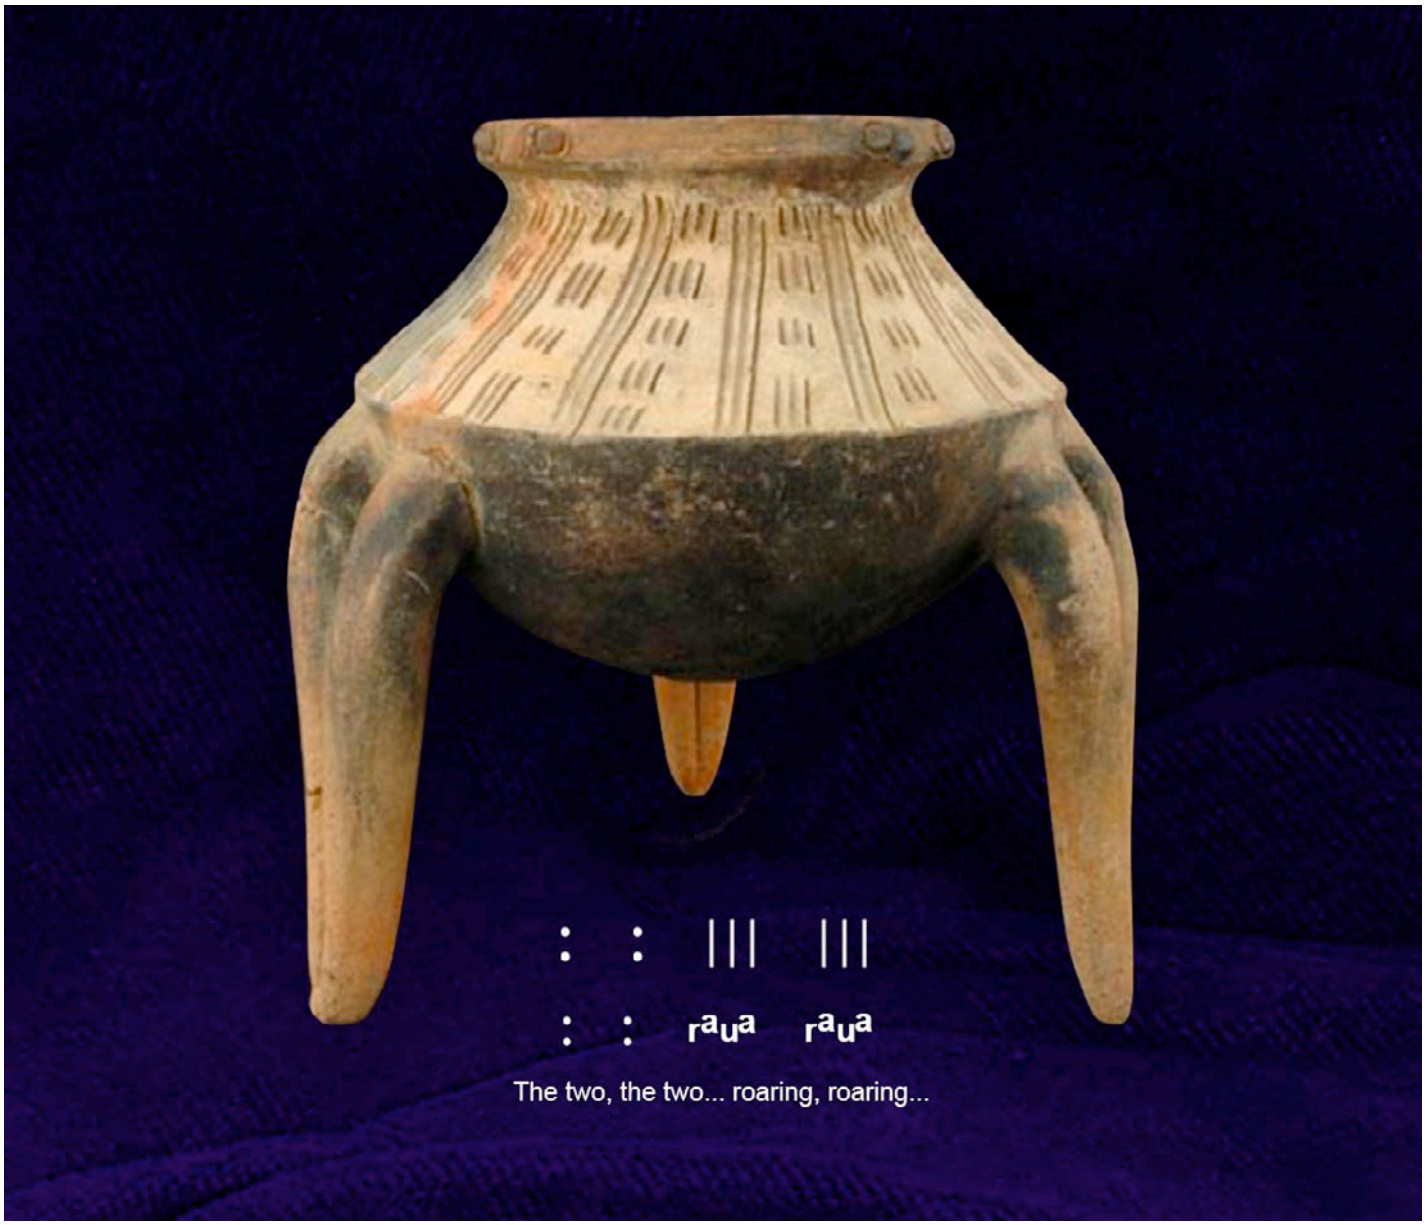
Low Temperature Geopolymeric Setting (LTGS) takes place in alkaline conditions (NaOH, KOH) in concentrations from 1 to 5% by weight of the ceramic paste. At drying temperatures (50°C to 250°C), the kaolinite in clays is transformed by LTGS into a three dimensional compound of the poly(sialate) Na-PS sodalite type or K-PS kaliophilite type, stable to water and possessing high mechanical strength (Davidovits 1980; Davidovits and Boutterin, 1982a, 1982b; Boutterin and Davidovits, 1988).

According to the quantity of NaOH-KOH added to the argillaceous material, the geopolymer cross-linking is more or less complete. For a lateritic earth, we can say that:



1. from 0.5% to 1% by weight, the earth is stabilized with a good behavior against water.
2. from 1% to 2.5%, blocks are water stable, with a compressive strength ranging between 4 MPa and 6 MPa.
3. from 2.5% to 5%, blocks are comparable to fired brick, with strengths ranging from 8 MPa to 60 MPa.

These mechanical characteristics depend on the setting temperature. Each setting temperature yields a very particular finished product.[15]

Atlantean development of the LTGS blackware chemistry technique informed later developments of the Ohum culture of present-day Ecuador and Peru, having produced a great diversity of psychoacoustic whistles with inscribed Paleo-Sanskrit votive statements. One example represents a reclining figure wearing a helmet, with hieroglyphs reading: *ra raua-as ra mi-is Indra raua-as* , meaning "The One granting for roaring, granting synchrony (of) Jupiter, for thundering..." (opposite).

A blackware fertility whistle depicts a man holding himself and smiling –with square teeth as *Indra* glyphs meaning 'Jupiter', and inscribed: *raua ris mi-is upama ris mi-is upama ra • •* , meaning "Roaring dwindling, synchrony (of) the highest dwindling, synchrony (of) the highest granting (of) the One, the One..." (above).

Artists of the Ohum civilization also manufactured earthenware vessels for a great variety of practical applications, especially for food preparation, storage and cooking, as well as the mixing of geopolymers. Analyses of dozens of Ohum pot sherds in cross-section reveals the presence of carbon as smoky grey or blackened areas, confirming the alkali chemistry of the Low Temperature Geopolymeric Setting (LTGS) process was used by Ohum artists, as inherited from the Atlantean culture.

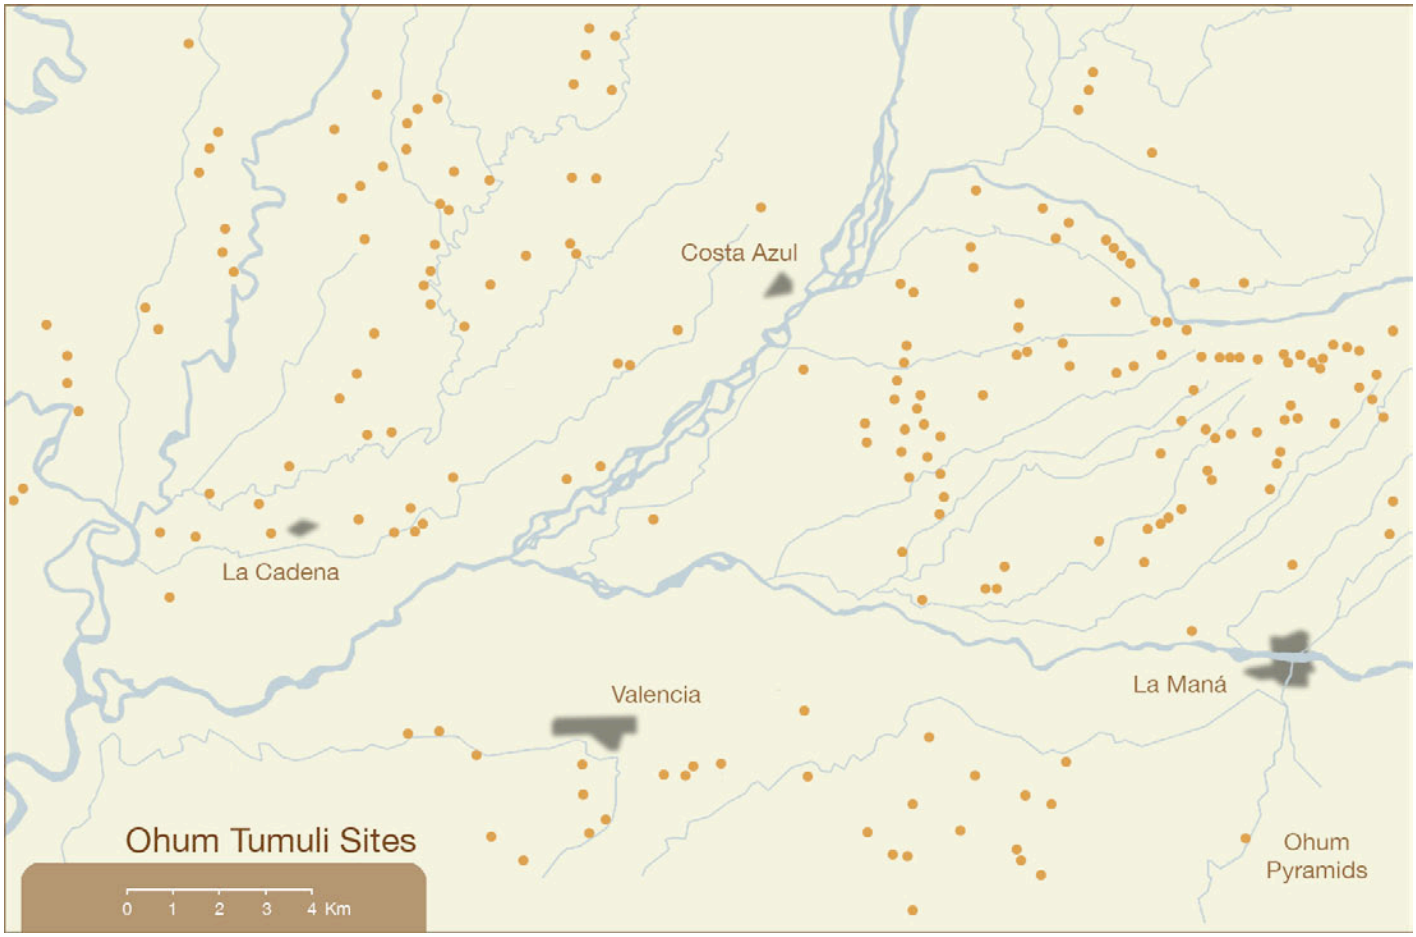
A small three-legged earthenware cooking pot recovered from the vicinity of the Ohum pyramids of La Envidia, Ecuador is covered with carbon soot which has not been RC^{14} dated, like so many other examples. The pot is inscribed with geometric hieroglyph patterns that offer a basic Ohum votive phrase, reading: ***: : raua raua*** , meaning "The Two, the Two, roaring, roaring..." (above).

'The Two' is a sacred reference to the deities Svar and Indra, known today as the Sun and giant plasma planet Jupiter, revered as life-giving benefactors of human consciousness granting infrasound resonance.

Fine examples of ancient Ohum megaceramics have also been discovered during residential construction projects and mound excavations undertaken by La Maná area landowners. One such find represents a giant, partly fragmented earthenware fermentation jar (seen opposite, wrapped with protective cellophane). The original domed lid was also collected during excavation, fragmented into dozens of sherds.

This robust type of megaceramic fermentation jar displays a perfectly hemispherical bottom –and no shoulder text inscriptions– because the vessel was designed for half-burial during use, with a very wide neck and thick rim to accommodate the large domed lid. Five small fragments from the damaged rim sections were recovered and reintegrated with the giant jar during the delicate repair process.

The giant food preservation jar's initial weight was measured at 44kg before conservatory repairs were made. The jar stands 63cm tall, with a maximum diameter of 74cm and maximum circumference of 210cm. Its broad rim measures 52mm in width and 40mm in height, presenting a matte orange glaze coating and a total outer diameter of 52.2cm. *The immense proportions and weight of this fermentation vessel are exceeded by others preserved in the region's caves and burial mounds.*



Giant vessels of this class provided a large storage capacity for water, fermented foods like Korean *kimchi* and alcoholic beverages such as *chicha.* The descendant Inka culture produced large painted *raqui* jars with conical bottoms for chicha production involving corn fermentation[16], yet raqui do not possess the special qualities of Ohum earthenware.

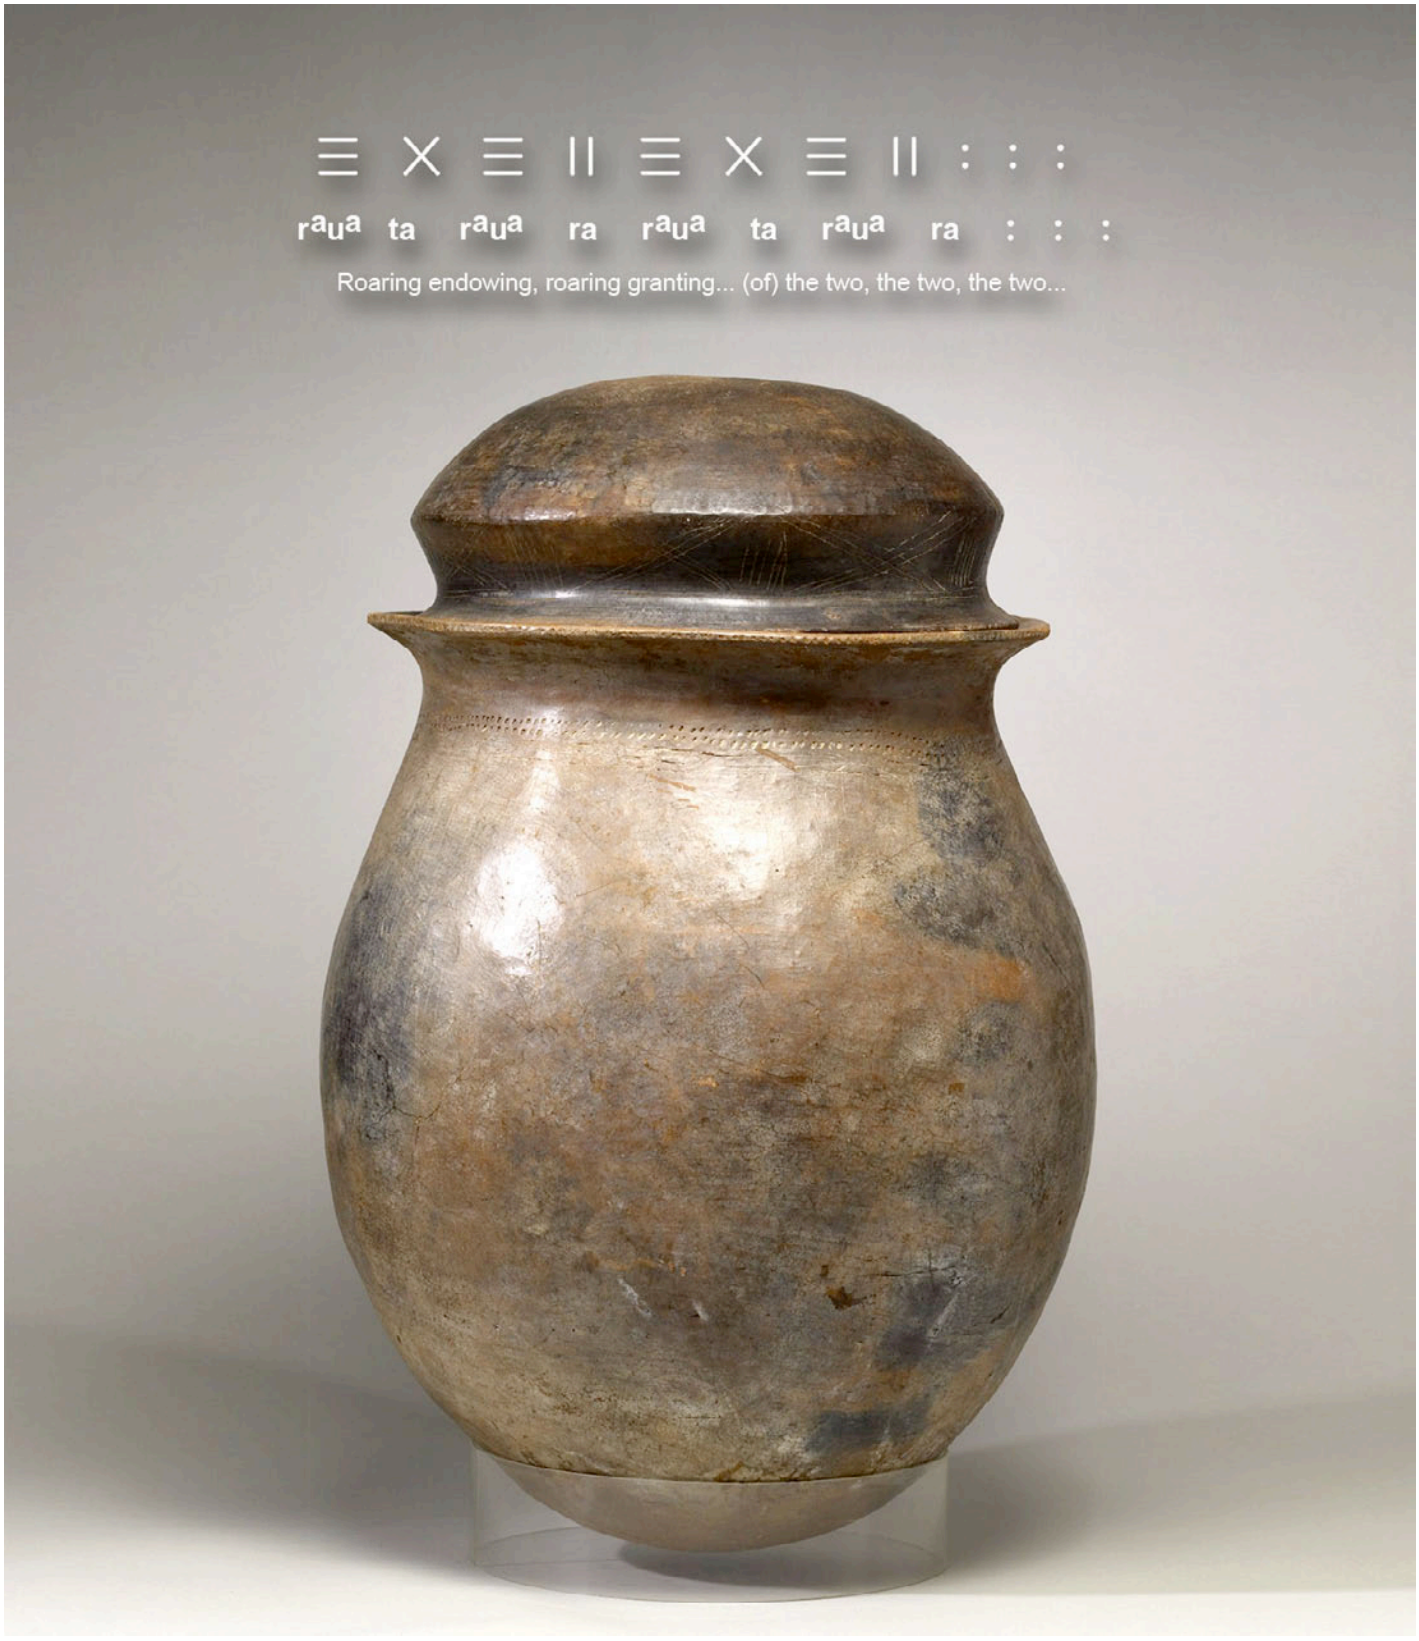
Exquisite bioelectrical knowledge possessed by the Ohum Paleolithic culture[17] over 13,000 years ago is revealed by the exotic pyromagnetic mineral content of their gigantic earthenware vessels that exactly matches the metallic composition of the synthetic stonework of their magnificent pyramid complexes.

Archeological excavations conducted near Quevedo, Ecuador by Julio Viteri Gamboa and Olaf Holm from 1968-1976 show Ohum megaceramic burial urns *in situ*, stacked vertically within the tumuli (opposite), at sites with linear alignments of large circular burial mounds they estimated to be >8,000 years in age.[18]

The same comprehensive and irrefutable petrological analyses that established the semiconductor properties of Atlantean firestone comprising the La Maná pyramid complex have revealed the identical semiconductor composition of Ohum earthenware, activated by roaring infrasound over 13,000 years ago.

The sophistication and sheer immensity of the Ohum pyramid complex of On and the great abundance of associated earthen tumuli and megaceramic remains discovered throughout the entire region indicates an extremely prolonged period of widespread high-tech Paleo-Sanskrit cultural activity. Recent surveys of the dense clusters of tumuli situated in the vicinity of the La Maná pyramids have identified hundreds of habitation sites (above), with each site encompassing dozens of tumuli (Guillaume-Gentil, 2010).[19]

Each of the tens of thousands of tumuli contains several megaceramic jars. A small group are displayed in a local archeology museum in Quevedo[20], yet most of the megaceramic jars excavated by archeologists decades ago have since disappeared into vaults at the Smithsonian Institute and the Bank of Ecuador.



Simpler earthenware jars *without semiconductor inclusions* were recovered in subterranean chambers at Tierradentro and at hundreds of other ancient sites near San Agustin, Colombia. Spectacular hewn stone staircases spiral down into resonant volcanic tuff bedrock, forming recessed entrances to the many small hypogea. The chambers' whitewashed interior walls are completely covered in hypnotic symmetrical linear patterns painted in red ochre and charcoal representing Paleo-Sanskrit votive texts (overleaf).

Well preserved geometric murals provide simple hieroglyphic phrases praising bioelectrical benefits granted by the infrasonic resonance of Jupiter, as focused by the Great Pyramid, repeating the phrase: *raua ya ra Indra kara upama* , meaning "Roaring commencing granting (of) Jupiter..., action (of) the highest..." (above).

Thin-walled chicha fermentation pots and large burial urns have been excavated from hypogea and tumulus formations in San Agustin, Colombia (below). A repeating band of Paleo-Sanskrit hieroglyphs is roughly circumscribed around the shoulder of the domed lid, reading: *raua ta raua ra raua ta raua ra* **: : :** , meaning "Roaring endowing, roaring granting..., the two, the two, the two..." (opposite).

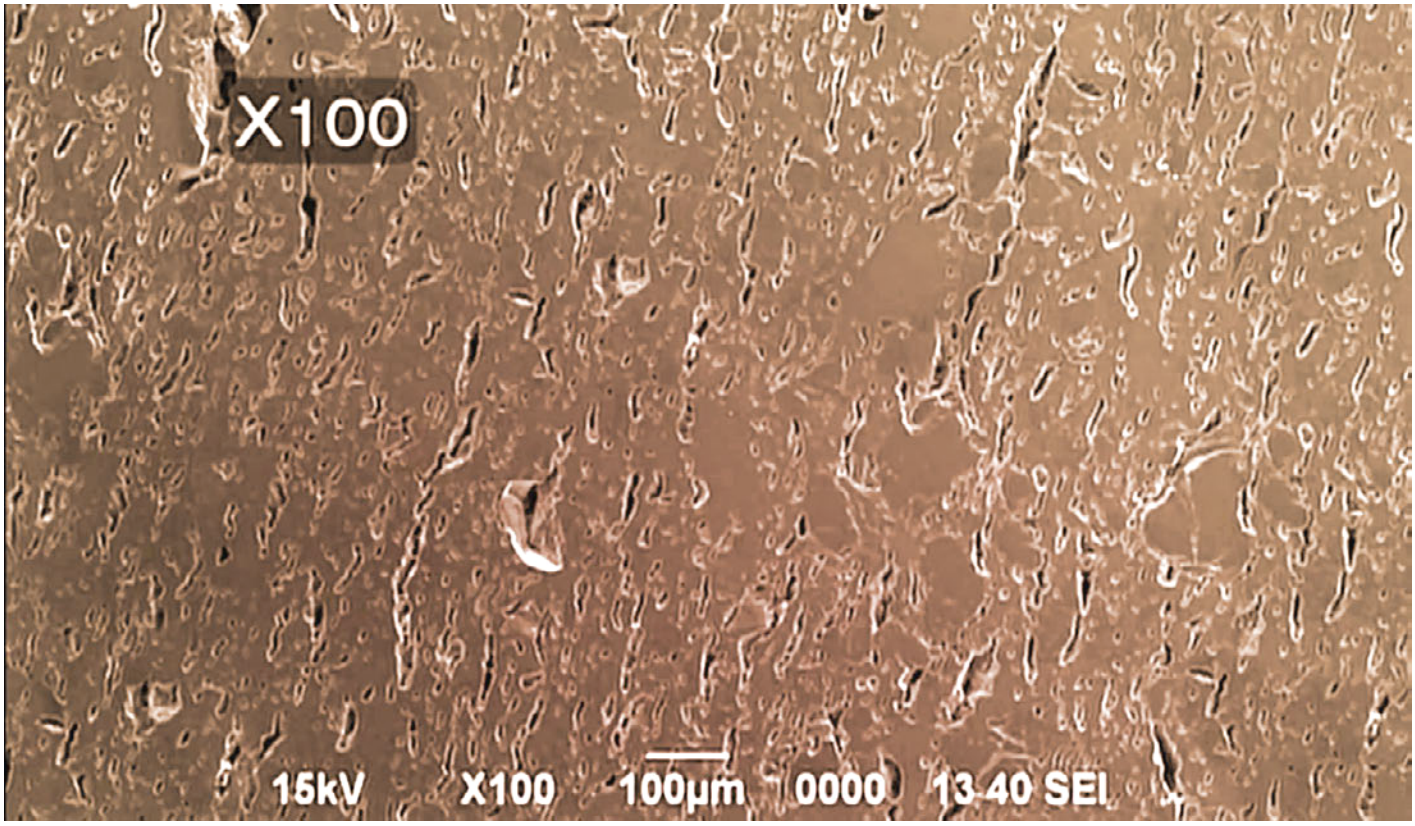
The San Agustin jars are burnished blackware produced using a lye-based glaze, made from wood ash, [21] that lack the great thickness and weight of the more ancient Ohum megaceramics, *as well as their special pyromagnetic mineral inclusions*. Accurate radiocarbon dates for large urns such as these have been systematically suppressed by academia, for they were actually produced ~11,000–9,000bp, during the recovery period following destruction of the great Ohum cities 12,890 years ago (Kennett *et al.,* 2015).

Chechem Ha Cave, Belize
17.015°N, 89.093°W

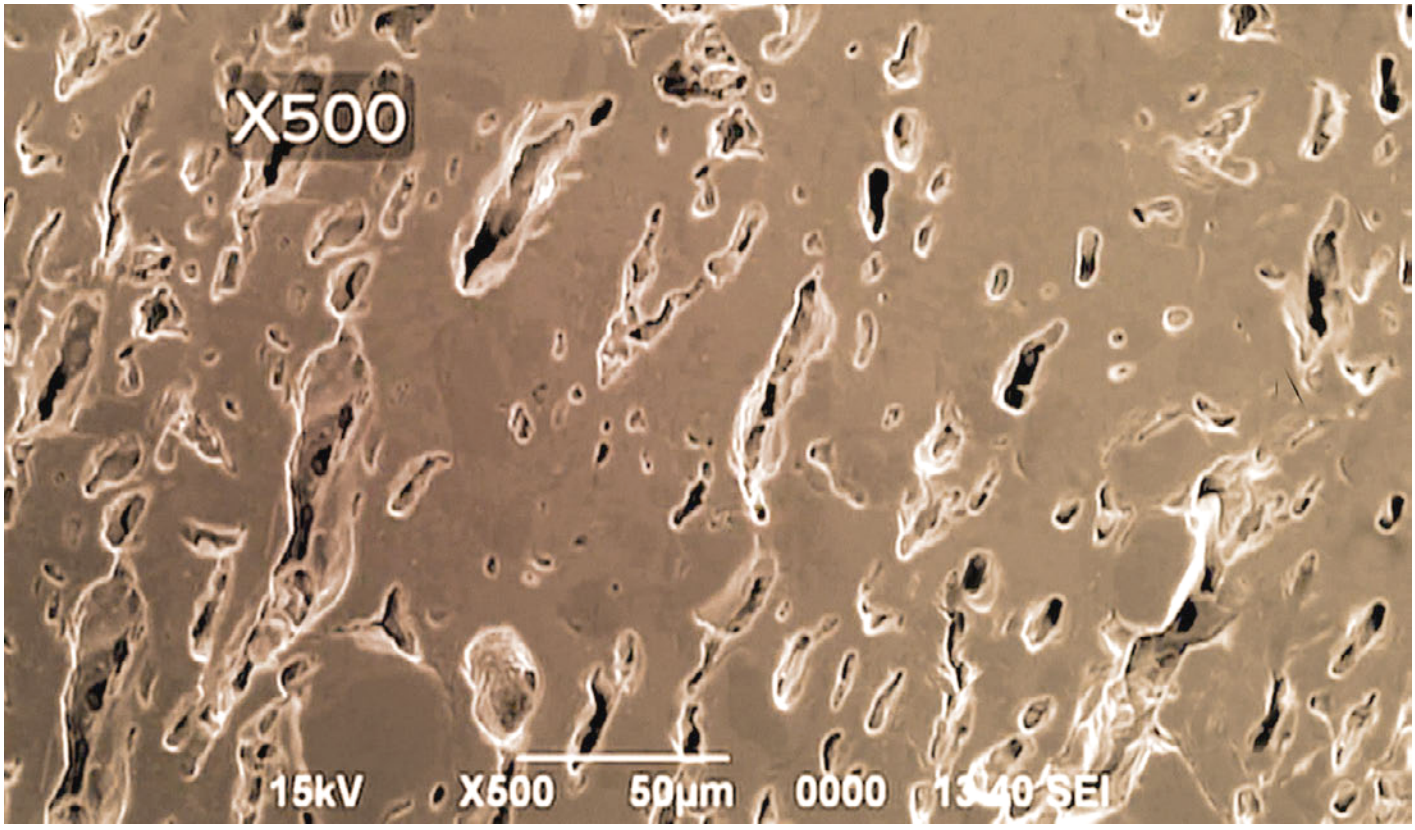
Atlantean geopolymer techniques for refaçading entire cave systems (as at Chauvet and Lascaux Caves in Europe) were also applied in the land of Yuk, or the Yucatan, by colonies of the Ohum culture native to Ecuador. Chechem Ha Cave, located in present-day Belize displays artificial limestone refaçading along with dozens of huge earthenware jars identical to those manufactured by the Ohum culture of Ecuador.

Limestone geopolymer refaçading
Chechem Ha Cave, Belize

Chechem Ha Cave, Belize (17.015°N, 89.093°W) is situated 7,314 miles from the Great Pyramid, a sacred distance comprising 29.38% of Earth's mean circumference. This resonant distance value approximates Fibonacci #135 in miles (7,308 x 10^{-24}) and Fibonacci #358 in percent (29.38 x 10^{-73}). *Precise alignment along the 17° North latitude also conforms to geoposition requirements of the Atlantean pyramid network.*

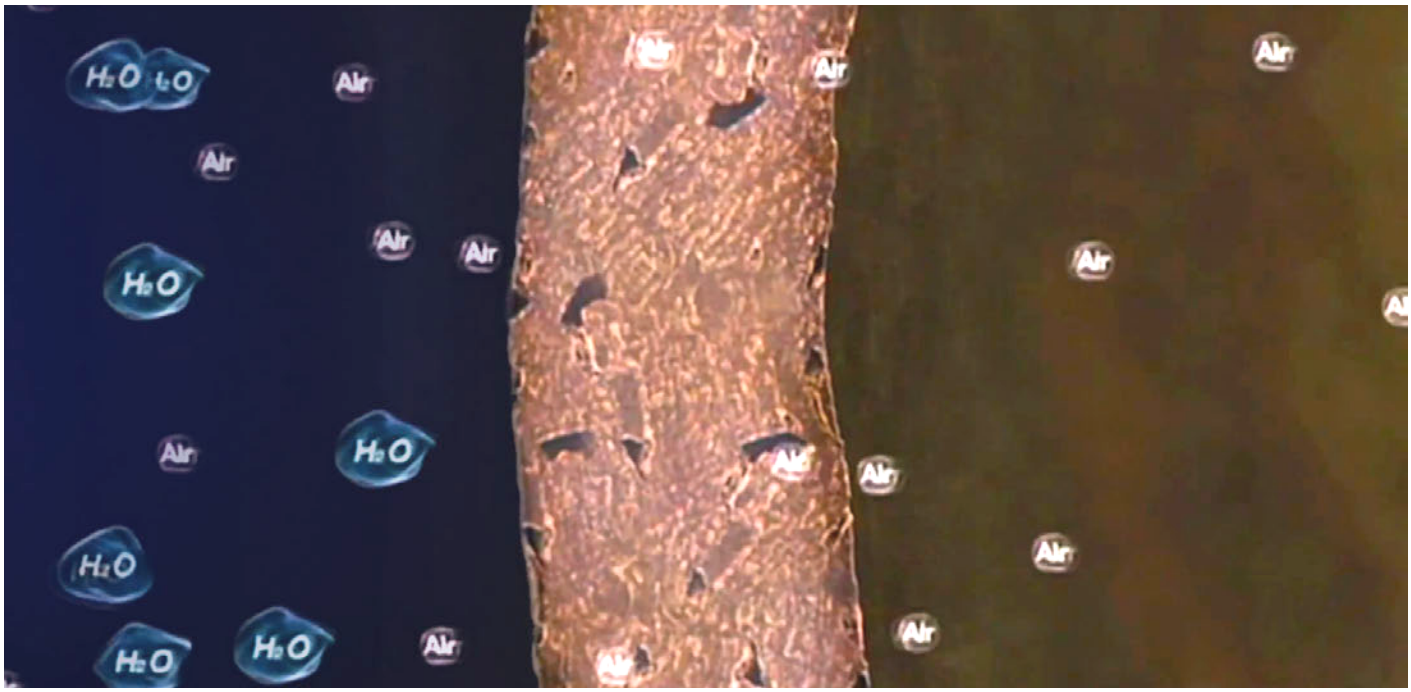


The hallmarks of Atlantean chemistry are immediately recognizable in the blackware finish of the LTGS process that characterizes the large vessels of Chechem Ha Cave. Several other earthenware jars match those of the Ohum –in size, thickness and color. The neck fragment of a broken jar displays a very small figural depiction forming the Paleo-Sanskrit ligature:
• *ra-as as-adhi ris adhi ris* , meaning "The One for granting, for delivering dwindling..." (at left). Such votive texts reveal the dating of Chechem Ha Cave at ~3,000bp is based on tiny Maya sherds from later periods,[22] *while the giant fermentation vessels actually exceed 13,000 years in age, being Ohum works, as the cave itself.*



The near perfection of the egg-like geometric form of Ohum fermentation jars is only matched today by the master potters of Korea who have maintained ancient traditional techniques of *onggi* fermentation vessels from their Neolithic Jomon ancestors. Traditional onggi pottery glaze requires firing temperatures of ~1,100°C and consists of a thin slurry of water, wood ash and leaf mold easily obtained during autumn.

The Paleolithic origin of onggi-making stretches much farther back in time than previously suspected. *Ancient hieroglyphic ligatures of the Paleo-Sanskrit language are still applied by Korean onggi potters to this day.* Paired wavy lines circumscribing onggi vessels signify a votive phrase: ***adhi ra adhi ra adhi ra***, meaning "Delivering granting, delivering granting..." (above). These glyph ligatures also adorn the ancient Ohum earthenware of Ecuador, providing decisive confirmation that the onggi fabrication technique was inherited through direct lines of cultural transmission from the high-tech Paleo-Sanskrit civilization that thrived throughout the entire world during the extended time period from ~30,000–13,000 years ago.[23]

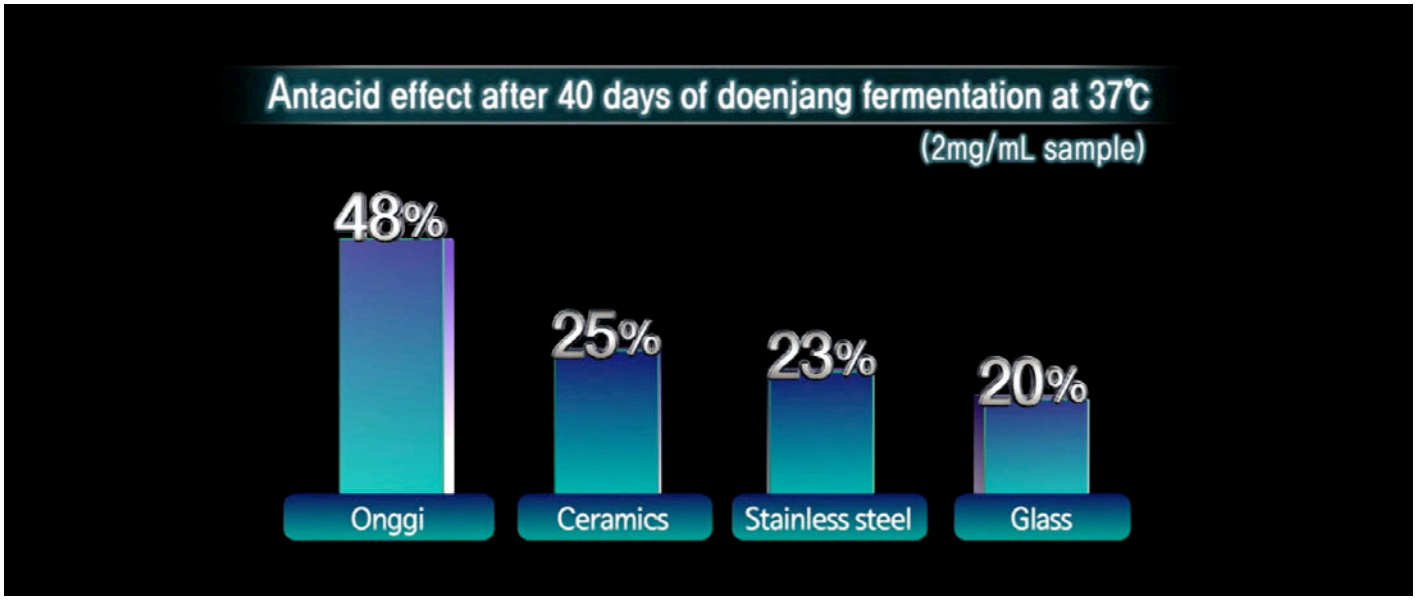


Scanning electron microscopy of a cross-section of an onggi vessel under 100x magnification shows fine networks of micropores weaving throughout the earthenware that are not present in conventional ceramics (above). The interconnecting pores are further revealed at 500x magnification (below), endowing onggi with high gas permeability, allowing diffusion of fermentation gases while remaining impermeable to water.

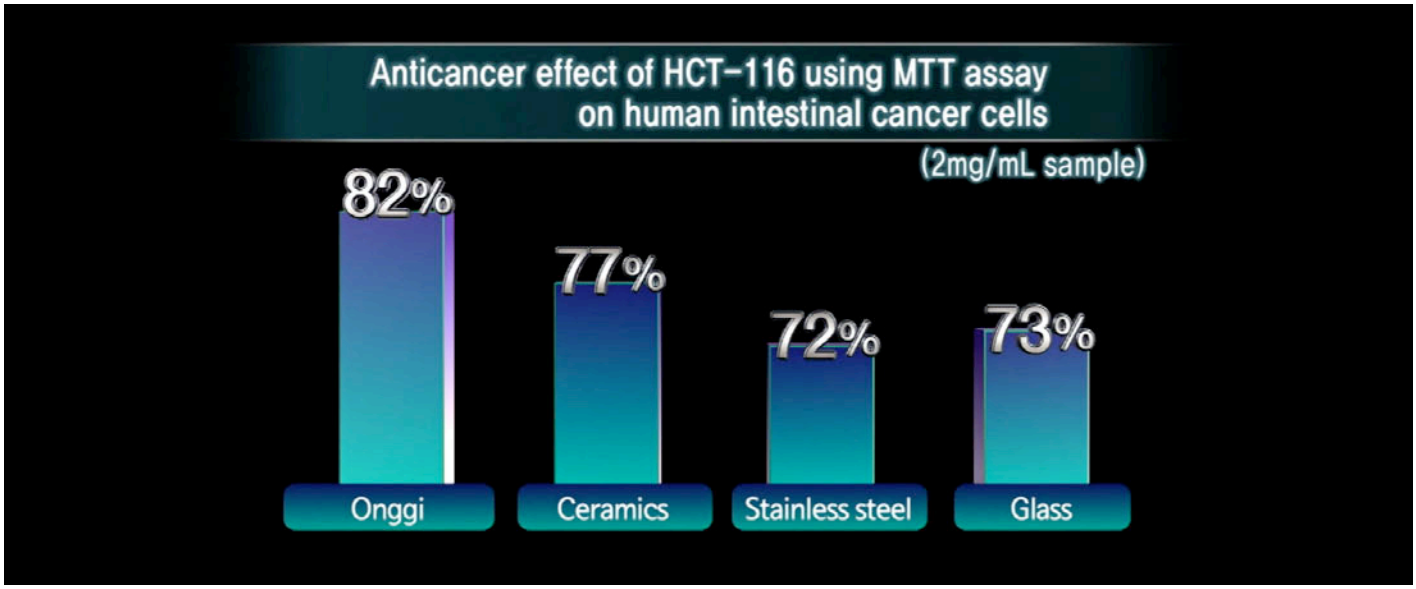
The unique porosity of modern Korean onggi is achieved by working firm clay with a high sand content. This special feature allows adequate ventilation for maintaining the freshness of fermenting food stores, an action traditionally referred to as 'onggi drawing breath' (illustrated below). When stored in areas with optimal conditions for maximizing sunlight and fresh air, onggi earthenware enables fermentation periods exceeding 10 years. *The addition of sand also enhances the piezoelectric properties of the huge jars, for conducting electrical ground currents that effectively eliminate pathogenic microbes from their surfaces.*

The very similar earthenware produced by the Paleolithic Ohum culture of present-day Ecuador and Peru were mixed with specially formulated combinations of fine quartz sand, tourmaline, magnetite, pyrite, iron, nickel and laterite. *These inclusions give Ohum earthenware piezoelectric, pyroelectric, ferromagnetic and paramagnetic properties for transducing focused infrasound at the pyramids into electrical currents that sterilize the vessels and their contents.* The Ohum also interred their dead in megaceramic funerary urns for electromagnetic preservation of the body and associated offerings deep within earthen tumuli.

When Ohum earthenware sherds from the La Maná area are submerged in water for cleaning, many fine streams of air bubbles are released, slowly escaping the fine networks of micropores. Many thousands of years of weathering in surface soils has further enhanced their very high porosity.



Laboratory testing of the antifungal (anticancer) effect of traditional Korean foods fermented in different types of conventional containers have shown the superiority of the ancient onggi vessel's porous design. Comparison of doenjang, a staple Korean fermented bean paste product, stored for 4 weeks at 37°C in onggi, ceramic, stainless steel, and glass containers showed onggi earthenware maximizes the alkalizing and anticancer effects of the process (results graphed opposite, shown with napa cabbage).[24]



Professor Park Geon-yeong of Pusan National University summarizes the extremely beneficial saline probiotic chemistry that develops during the fermentation process under optimal conditions:

> In the fermentation process, protein splits into peptides and creates many anticarcinogens. There is a component called genistein. When fermented, genistein becomes agylcone, which is a strong anticarcinogen.[25]

The elevated probiotic component of fermented foods also promotes the rebalancing of microbial colonies in the human gut, affecting a gradual restoration by replenishing and diversifying the intestinal biome that supports a healthy immune system. Modern reliance on refrigeration has replaced ancient fermentation techniques, facilitating the sharp rise in cancers and autoimmune disorders seen in today's toxic cities – *radiating microwave frequencies that stimulate the growth of pathogenic microbes and fungi.*[26]

A wide earthenware basin discovered in the Bolivian altiplano near the shores of Lake Titicaca, named the Fuente Magna bowl,[27] displays all the same characteristics of Ohum earthenware made prior to ~13,000bp. *The sandy coloration of the bowl, and its great thickness, match the megaceramics from La Maná, Ecuador.*

The rim of the bowl has been engraved as a pair of snakes, held by a figure showing embedded Paleo-Sanskrit ligatures forming the arms and legs, reading: *vi ris kar ris* , or "From dwindling, works dwindling..." (above). Texts inscribed on the interior of the Fuente Magna include a hieroglyphic ligature formed by hypnotic square spirals, reading: *mi-is Indra* , meaning "Synchrony (of) Jupiter" (below). The votive language of Indra, the One, confirms this as an Ohum bowl from the period of Atlantean influence.

The Ark of Noah

The Ark of Noah

One of the most astonishing high-altitude archeological finds, discovered on 'Doomsday Mountain' near the modern town of Dogubeyazit, Turkey, has forced scientists and Biblical scholars to re-examine and acknowledge the exceptional physical evidence supporting the reality of the Great Flood event:

> In the six hundredth year of Noah's life, in the second month, the seventeenth day of the month, the same day were all the fountains of the great deep broken up, and the windows of heaven were opened. And the rain was upon the earth forty days and forty nights. In the selfsame day entered Noah, and Shem, and Ham, and Japheth, the sons of Noah, and Noah's wife, and the three wives of his sons with them, into the ark; They, and every beast after his kind, and all the cattle after their kind, and every creeping thing that creepeth upon the earth after his kind, and every fowl after his kind, every bird of every sort. And they went in unto Noah into the ark, two and two of all flesh, wherein is the breath of life. And they that went in, went in male and female of all flesh, as God had commanded him: and the Lord shut him in.

> And the flood was forty days upon the Earth; and the waters increased, and bare up the ark, and it was lift up above the earth. And the waters prevailed, and were increased greatly upon the earth; and the ark went upon the face of the waters. And the waters prevailed exceedingly upon the earth; and all the high hills, that were under the whole heaven, were covered. Fifteen [?] cubits upward did the waters prevail; and the mountains were covered.
>
> And all flesh died that moved upon the Earth, both of fowl, and of cattle, and of beast, and of every creeping thing that creepeth upon the earth, and every man: All in whose nostrils was the breath of life, of all that was in the dry land, died. And every living substance was destroyed which was upon the face of the ground, both man, and cattle, and the creeping things, and the fowl of the heaven; and they were destroyed from the earth: and Noah only remained alive, and they that were with him in the ark.

> And the waters prevailed upon the Earth an hundred and fifty days. And God remembered Noah, and every living thing, and all the cattle that was with him in the ark: and God made a wind to pass over the Earth, and the waters assuaged; The fountains also of the deep and the windows of heaven were stopped, and the rain from heaven was restrained; And the waters returned from off the Earth continually: and after the end of the hundred and fifty days the waters were abated. And the ark rested in the seventh month, on the seventeenth day of the month, upon the mountains of Ararat. -- *Genesis 7:11; 8:4*

Biblical accounts of the epic scale of Noah's ark and the catastrophic proportions of The Great Flood have filled readers with awe for many, many generations. Details such as these boggle the rational mind, especially *the extreme age of 600 years given for Noah, at the time of the Deluge.* Simpler flood accounts have also been recovered from Sumerian libraries, on cuneiform tablet texts from Nineveh dating back 4,500 years.[1] The present-day resting position of the ark is a several hundred meters below its original landing, and was known among ancient Mediterranean cultures as a significant historical site of worship.

Romano-Jewish historian Josephus wrote that visitors to the mountaintop location customarily removed bitumen from the ark, to be kept as amulets and talismans.[2] However, long before these Roman and Sumerian texts were authored, the ark had been shoved downslope from its original resting place by an ancient lava flow which impaled the vessel on a limestone ridge, leaving the ship's prow pointing uphill.

A satellite image of the boat-like formation appeared in *Life* magazine in 1960, following an expedition that was later documented in a book called *The Ark File* (1974) by expedition member Rene Noorbergen. The ship's physical remains were subsequently confirmed as the ark of Noah by onsite surveys in 1977 and '79 by Ron Wyatt, an independent investigator who applied metal detectors and ground penetrating radar.

Upon inspection of the ridges delineating the great ship, Wyatt could discern a regular pattern of rib timbers comprising the ark's hull, still visible as dark areas eroding out of the embankment. The first comprehensive scans of the ark formation were conducted by Wyatt in 1985 using handheld metal detectors, revealing a regular pattern of iron struts distributed latitudinally and longitudinally throughout the huge wooden hull.

Measurements of the large structure revealed a total length of 515' or 6,180", corresponding to 300 Egyptian cubits (@ 20.6"/cubit), exactly matching the dimensions of Noah's ark stated in the Bible. The Egyptian cubit was inherited from the preceding high civilization of Atlantis, *and Noah was an Atlantean.* Noah's great age of 600 years at the time of the Deluge was resonantly enhanced through the roaring infrasound of the global network of Atlantean pyramids, endowing average human lifespans of ~900 years. Physical trace evidence of resonant atmospheric conditions induced by the pyramids was retrieved by Ron Wyatt in the form of petrified wood samples acquired with the permission of the Turkish government.

Several rust-colored rings of what appeared to be heavily corroded wrought iron rivets were identified by Wyatt in the exposed hull sections, apparently connected to long iron struts that once fastened the ship (below). Despite their nearly unrecognizable condition, lab analyses identify them as man-made alloys.

Comprehensive radiocarbon dating analyses of the abundant fragments of petrified wood at the ark site bearing organic carbon have certainly been conducted by both Turkish and US government scientists at national laboratories, yet those results have not been publicly released *--for the surprising actual age of the ark of Noah exceeds the dates provided in the Biblical account by over 25,000 years.*

It is widely accepted that wood petrification and bone fossilization processes usually occur over prolonged timescales requiring tens of thousands of years or more, being significantly dependant on the prevailing environmental conditions. *The ark timbers' petrified condition implicates a minimum age of ~20,000 years.*

In lieu of conventional dating results, those having been purposely withheld from the public, another highly accurate source of information on the subject of Noah's ark has provided an event timeframe that shows a close correspondence with the physical evidence now at hand. World-renowned trance channel Edgar Cayce was specifically asked for an approximate date for the period of the Biblical flood in follow-up questions answered during a Life Reading conducted on February 17, 1932 (Reading 364-6):

> *Q: In relation to the history of Atlantis as presented, at what period did the flood as recorded in the Bible in which Noah took part, occur?*
>
> A: In the second of the eruptions, or --as is seen --two *thousand* --two-two thousand and six [22,006?] –before the Prince of Peace, as time is counted now...

This incomplete response provided by the trance medium concerning the timeframe of the *second period of eruptions in Atlantis*, described as the Deluge in the Bible, was later clarified as having occurred ~30,000 years ago, according to a Life Reading for Thomas Townsend Brown given on July 5, 1938 (Reading 470-22)[3]:

> [T]he entity was in Atlantis when there was the second period of disturbance --which would be some twenty-two thousand, five hundred (22,500) [years] before the periods of the Egyptian activity covered by the Exodus; or it was some twenty-eight thousand (28,000) [years] before Christ, see?

The compendium of over 14,000 Edgar Cayce readings also contains a Life Reading given on July 29, 1941 for the contemporary modern reincarnation of Noah himself (Reading 2547-1): "For, before *that* [incarnation] the entity was that one to whom was entrusted man's advent into the world --Noah."

Cayce gave another relevant Life Reading on July 19, 1944 for a client who had been one of the grandsons of Noah --*a son who was born on the ark itself*, to the wife of Japheth (Reading 5367-1):

> Before that [incarnation] we find the entity was in the land when there were those preparations that man would not be wholly destroyed but how that the Father-God warned Noah to build the ark and to gather his sons and their families. The entity was one born in the ark during those periods, for the wife of Japheth, the son of Noah, was heavy with child, and it was born during those periods in the ark.

These synchronous information sets concerning the Great Flood were channeled by Edgar Cayce over an extended period of 12 years, and deserve careful reconsideration in light of the physical remains of Noah's ark that are just now beginning to reach the awareness of the general public, a full 7 decades after Cayce's passing. Many of the Sleeping Prophet's controversial claims have been vindicated by science.

Analysis of the ark timbers directly supports Cayce's statements. The well-accepted method for defining the age of trees normally involves delineation of distinct seasonal growth patterns as annual rings that can be read by biologists from the cross-section of a tree trunk. When applying this standard technique to arrive at age determinations for petrified wood samples from Noah's Ark, Wyatt was confronted with an intriguing anomaly that may find an explanation in yet another unusual passage from the Bible:

> ...[F]or the Lord God had not caused it to rain upon the Earth,... But there went up a mist from the Earth, and watered the whole face of the ground. --*Genesis 2:5,6*

These surprising and long contested statements explain enigmatic tree-ring evidence presented by Ron Wyatt, who documented petrified wood samples collected from the ark that display no clearly discernable ring patterns, despite the nearly perfect preservation of pore structures throughout the samples (opposite).

In 1987, Wyatt retrieved a section of deck timber sample that had been identified by ground penetrating radar scans at <1m below the soil surface. Cross-sections cut into the petrified deck timber sample during laboratory analyses revealed a 3-layer lamination using tree sap resin had been expertly accomplished by the skilled Atlantean ark builders (above). Noah's use of "gopher wood" *(Genesis 6:14)* actually refers to *wood laminated with pitch*, corresponding to the exact meaning of the Hebrew word 'kopher': *"pitch"*.

Wyatt had determined the ark's original landing position after spotting a wide swath of petrified wood and heavy slag rubble that proved to be metallic in character. Laboratory examination of several heavy ore-like samples taken from this large rubble field located on the high ridge a few hundred meters above the ark revealed an unnatural elemental composition recognizable as waste slag from sophisticated iron alloying processes. Wyatt surmised that several tons of this high-density material had been placed in the lowest compartments of the ark to act as ballast, stabilizing the giant flood-worthy vessel (opposite).

Another research expedition to the ark undertaken by Ron Wyatt in 1991 facilitated the amazing discovery of a partially preserved wrought iron alloy rivet that still displayed the distinctive flared look of wrought iron fittings (above). Spectrographic analysis of the ballast material and 3 rivet samples from the ark confirmed their man-made origin, identifying the significant presence of refined aluminum, titanium, and magnesium:

Slag Ballast 1		Ark Rivet 1		Ark Rivet 2		Ark Rivet 3	
titanium	74.26%	iron	10.38%	iron	8.24%	iron	8.38%
aluminum	7.00%	aluminum	8.62%	aluminum	8.08%	aluminum	8.35%
manganese	0.0%	titanium	1.92%	magnesium	3.82%	titanium	1.59%
		carbon	1.88%	titanium	1.34%		
		manganese	0.21%				

Noah's Ark Anchor Stone
Metallic Geopolymer
Kazan, Turkey

Numerous standing stones, each with a large circular hole at the top, were first identified as giant anchor stones by Ron Wyatt in 1977 in the village of Kazan, situated far below the ark site. Having found 13 giant anchors in all, Wyatt determined the megaliths were deployed on long ropes below the ark as 'drogue stones', effectively stabilizing the keelsons of the giant ark in turbulence. Sets of crosses were engraved into each of the immense anchor stones, with the exception of two partially interred examples, representing the eight members of Noah's family who were saved in the ark, and their progeny.

The unusual forms, surface features and special composition of these megalithic anchors bear the many hallmarks of advanced geopolymer fabrication techniques developed by Atlantean engineers for producing strong and extremely heavy synthetic stones with remarkable acoustic and electromagnetic properties.

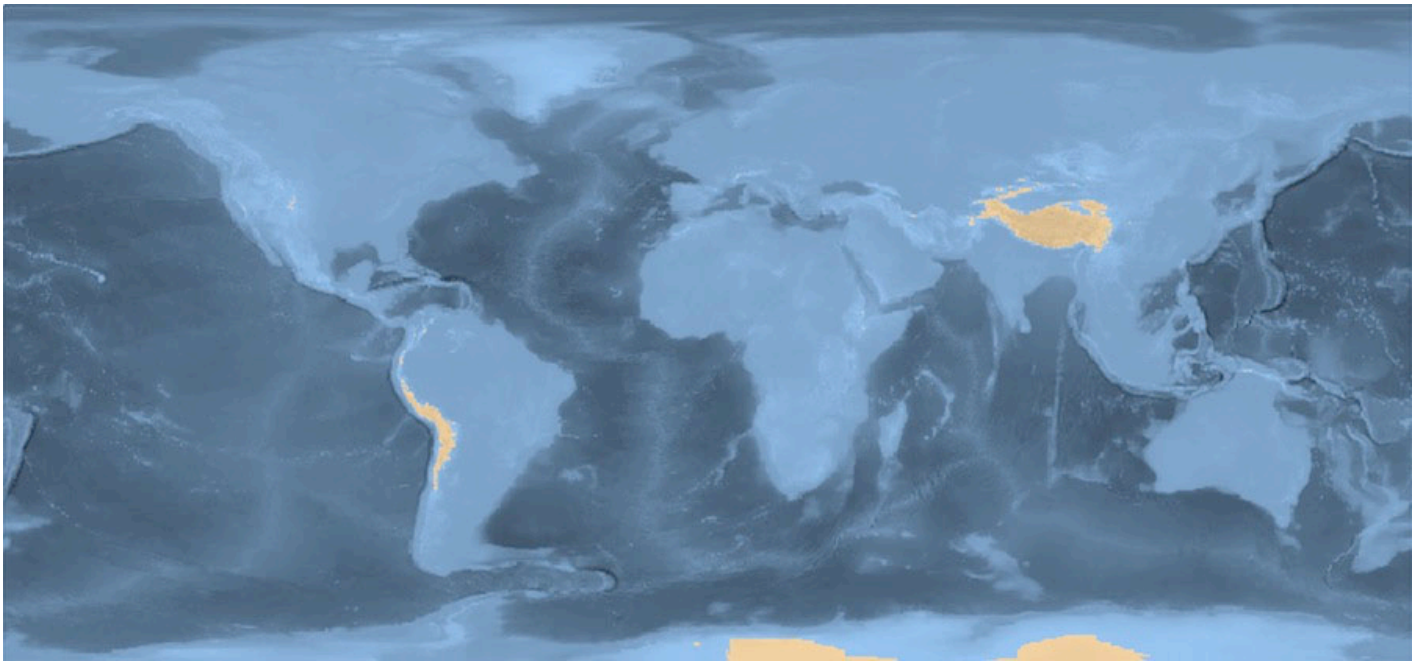
Atlantean 'firestone' geopolymers were cast in heavy, clay-lined wooden molds from a liquid slurry of pulverized basalt and quartz, finely ground ferromagnetic metals, kaolin clay, fly ash and water. The megalithic anchors have been mischaracterized as locally quarried andesites[4], yet their strong magnetic properties and extremely high density deny any possibility of a natural origin. Micrographs of samples from the giant anchors reveal metal particles proving their synthetic origin as high-tech Atlantean geopolymers.

The largest and best-preserved example of the ark's drogue stones was measured at an impressive 15' in height, while conservative estimates for its total weight exceed 10 tons (opposite). The synthetic megalith's original cast surfaces have been preserved on a large portion of the anchor, displaying the distinctive rusty hue of iron-rich kaolin clay that slowly migrated into the liquid slurry from the mold interface during a period of several hours required for the geopolymer mixture to cure to full hardness.

After speaking through translators with local villagers, Ron Wyatt also surveyed and obtained video footage of a special valley still referred to today as the 'Valley of the Eight'. Immediately surrounding the house of Noah are a network of low megalithic walls for animal husbandry that were once three times their present height, having accumulated nearly 30,000 years of soil.

Located on a promontory high above Noah's stone house Wyatt discovered a giant altar in the form of a cube, roughly measuring 12' x 12' x 12', bearing deep erosive scars from extreme weathering conditions at high-altitude *over a vast time period spanning nearly 30 millennia* (below). The platform's rough geometric shaping and prominent location suggests it was an altar built by Noah, overlooking the 'Valley of the Eight'.

In addition to the 13 giant drogue stones discovered thus far, another megalith was documented that stands apart from the others, and may have served a distinct purpose. The same clusters of crosses have been engraved into this strangely shaped megalith by Roman era visitors to the ark sites. This massive monolith gives the first impression of being a petrified wood fragment from a gigantic tree due to the bark-like corrugations covering its exposed skyward surface, yet the object is composed of stone (opposite).



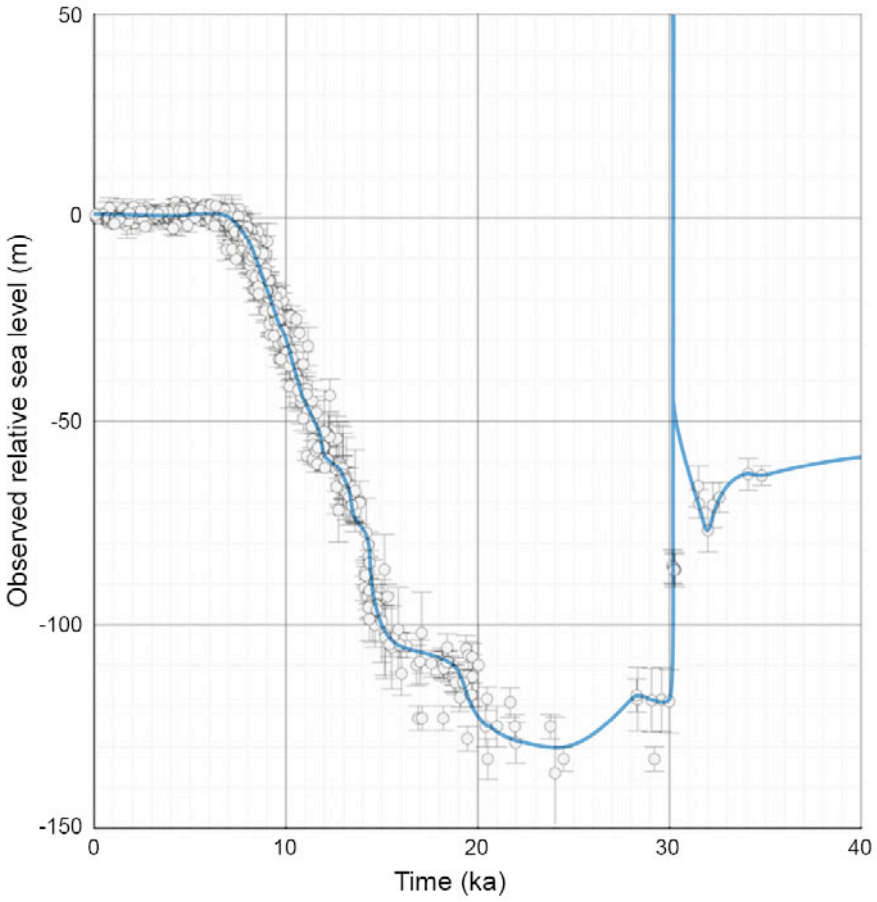
When struck with a stone, this corrugated megalith produces a loud, resonant metallic ringing that betrays a high metal content, confirming its synthetic origin as a textured geopolymer used as a giant gong platform for bioelectrical qi healing.[5] Cayce identified this type of artificial stone as Atlantean firestone.

Noah's Ark Metallic Geopolymer
Bioelectrical Qi Healing Platform

The presence of a massive Atlantean firestone healing platform on the ark of Noah, *which would also have served for long distance communication by generating loud infrasound when rhythmically struck*, provides another clear temporal indication perfectly aligned with an age of ~30,000 years.

Cayce conducted Life Readings for the visionary inventor Nikola Tesla that detailed his prior incarnation as Ajax of Ode, Atlantean leader and Vedic scientist responsible for great technological advances made during that period. *High technologies demand great responsibility, for their abuse invites total disaster.* How high did global sea levels rise during the Deluge, and what could possibly cause such an event?

The ark is presently resting at an altitude of ~1,966m, while the original resting place further up the mountain was situated at ~2,300m altitude. The Biblical account of the Great Flood event states that the surrounding mountain peaks completely submerged, as they were no longer visible to Noah during the period of the floodwaters greatest height. However, 30,000 years ago the summit of Mt. Ararat would most likely have been less prominent *--perhaps as much as 2,000m lower than it is today* (5,137m).



Digital terrain models of Earth with sea levels elevated to an extreme altitude of 3,200m, according to present-day landforms, offer a striking visualization of our planet under Deluge (above). *Only the Andes and the Tibetan plateau remained as high-altitude refuges where terrestrial species survived the great calamity.*

Cayce addressed the cause of the Great Flood, identified as the second destruction of Atlantis, during a Life Reading on December 20, 1933. He gave the applications of magnetized firestone pyramids that were developed by Atlantean scientists for wireless power transmission and communication between towns, cities and entire countries, utilized by all aerial, aquatic and submarine vehicles (Reading 440-5)[6]:

> About the firestone that was in the experience did the activities of the entity then make those applications that dealt with both the constructive and destructive forces in the period. It would be well that there be given something of a description of this, that it may be better understood by the entity in the present, as to how both constructive and destructive forces were generated by the activity of this stone...
>
> ...[T]he activity of the stone was received from the sun's rays, or from the stars; the concentrating of the energies that emanate from bodies that are on fire themselves --with the elements that are found and that are not found in the Earth's atmosphere. The concentration through the prisms or glass, as would be called in the present, was in such a manner that it acted upon the instruments that were connected with the various modes of travel, through induction methods --that made much the character of control as the remote control through radio vibrations or directions would be in the present day; though the manner of the force that was impelled from the stone acted upon the motivating forces in the crafts themselves...

The preparation of this stone was in the hands only of the initiates at the time, and the entity was among those that directed the influences of the radiation that arose in the form of the rays that were invisible to the eye but that acted upon the stones themselves as set in the motivating forces --whether the aircraft that were lifted by the [HHO] gases in the period or whether guiding the more pleasure vehicles that might pass along close to the Earth, or what would be termed the crafts on the water or under the water. These, then, were impelled by the concentrating of the rays from the stone that was centered in the middle of the power station, or power house...

In the active forces of these the entity brought destructive forces, by the setting up --in various portions of the land-- the character that was to act as producing the powers in the various forms of the people's activities in the cities, the towns, the countries surrounding same. These, not intentionally, were *tuned* too high --and brought the second period of destructive forces to the peoples in the land, and broke up the land into the isles that later became the periods when the further destructive forces were brought in the land.

The advanced technological context of the causal circumstances explained in precise terms by Edgar Cayce offers a compelling explanation for such a catastrophic inundation, the likes of which had never been experienced before that time, nor since. Isotopic analyses of megafauna bones confirms mammoth populations were decimated 30,000 years ago, having repopulated Eurasia from the Tibetan plateau.[7]

A recent assessment of sea level change extending back tens of thousands of years based on the correlation of dated shoreline materials accommodates Cayce's Great Flood timeline perfectly (Lambeck et al., 2014).[8] A blue line has been superimposed on the data to indicate general trends in sea level change over time that coincide beautifully with a sharp peak at 30,000bp, marking the epic Great Flood catastrophe as given by Cayce (above). Dating of the petrified ark timbers constitutes irrefutable proof.

Abundant physical remains in the form of high-tech metal alloys, slag ballast, the petrified wooden ark and metallic megaliths substantiate the statements of trance medium Edgar Cayce, attesting to the extremely advanced technological capabilities of the Atlantean ark-builder Noah. His great works endure today as somber monuments warning of the destructive force of human negligence, and the recurring technological abuses of declining civilizations that have brought Earthly humanity to the brink of extinction many times.

The ancient rock art site of Gobustan, Azerbaijan display unusual features which are identical to those of the metallic geopolymer stones that mark the region of the landing of the Ark of Noah. Located 284 miles to the east of the resting place of Noah's Ark, Gobustan has become well known for its great many rock art depictions, and the sonorous quality of the megaliths themselves that function as lithophones.

The loud acoustic resonance that emanates from many sandstone megaliths when struck by a hammer stone is not a natural feature of any known rock type, yet typifies ancient synthetic stones found all over the world since the time of the Great Flood that deposited Noah's Ark on a mountain peak ~30,000 years ago.

Natural bedrock has been sheared off from the large plateau above the ancient site, forming a boulder field of giant megaliths below. Fragments of the bedrock material were ground down to a fine particle size for reconstitution as artificial stone. This process was designed to produce a stone that exceeded the strength, density and weight of the natural bedrock material, by the addition of finely ground metallic particles and finely ground metakaolin binder material to produce high-grade metallic geopolymers.

Gobustan, Azerbaijan (40.112°N 49.378°E) is situated 1,245 miles from the Great Pyramid of Giza, Egypt, a distance representing exactly 5.00% of the Earth's mean circumference distance (of 24, 892 miles). This resonant distance alignment with the Orion pyramids confirms the ancient sacred site, with caves in the cliffs, was reconstructed to transduce infrasound standing wave resonance received from the pyramids.

The special acoustic resonance generated by striking these metallic geopolymers has been promoted by famous Azerbaijani musicians and tour guides alike for decades, yet their artificial origin as manufactured semiconductors has not been recognized. The similarity in appearance to the natural bedrock of the area has confounded tourists who have taken the time to test a great number of stones to discern which ones possess the resonant properties and which ones are actually just bedrock fragments, as they appear.

Geologists who conduct microscopic analysis of the resonant stones will immediately observe their high metallic content, including iron and nickel, yet the fine particle size and even distribution throughout the stone matrix unquestionably indicates the unnatural origin of the sonorous material.

The general timeframe for the construction of the lithophones of Gobustan, the rock art on their surfaces and the extensive cave systems entered from the cliff site can be determined given the general context of the Atlantean culture that spread throughout the world in the period following the Great Flood catastrophe, and the invention of metallic firestone geopolymer formulation by Ajax of Ode that preceded the disaster.

Linguistic evidence embedded in the rock art depictions confirm the Paleolithic origin of the votive markings, which contain hieroglyphic symbols of the Paleo-Sanskrit language used by the Atlantean global psychoacoustic culture of the pyramids and megalith-builders. *Votive texts composed by the various animal forms depicted at Gobustan match those of the Paleolithic caves of Europe, praising the granting of Indra.*

A majestic megalith forming a large vertical wall was utilized to convey the repeating votive message engraved in the forms of several ibex and a horse, reading: *adhi ra adhi adhi ,* meaning "delivering granting, delivering, delivering..." (above). The iconic use of the arches forming the horns of the ibex is exactly replicated in the famous cave paintings of Lascaux and Chauvet, in France, yet the use of reconstituted geopolymer stone at each of these Paleolithic sites confirms their common cultural origin.

The great antiquity of the petroglyphs has also been determined by government-funded petrological studies of lichen formations seen all over their surfaces, *yet this research has not been published for it brings unwanted attention to extensive cave systems that extend deep into the resonant bedrock of the site that have not been revealed publicly. A wealth of cultural material from the Paleo-Sanskrit world nation lies buried within the Gobustan plateau, awaiting exposure to the light of knowledge.*

Clear stylistic similarities between the rock art engravings of Gobustan, Azerbaijan and the rock art engravings of Gobëkli Tepe, Turkey have also been downplayed to obfuscate the fact that the giant standing stone megaliths of Gobëkli Tepe are artificial geopolymer products manufactured through the same processes applied at all the other Paleolithic sites dating from ~15,000–45,000bp. The same false claims are made by archeologists at both ancient sites, as with so many others: that the megaliths are all formed by natural rock and the markings were made by primitive animal-worshipping nomadic tribes.

This erroneous conclusion falls short of explaining the wealth of non-animal depictions found throughout the Gobustan sacred site, which include geometric figures that are well known hieroglyphic symbols of the global Sanskrit culture, translated here for the first time as sophisticated votive phrases. *The cryptic meaning of each sacred phrase directly relates to biorhythmic benefits received from resonant stone.*

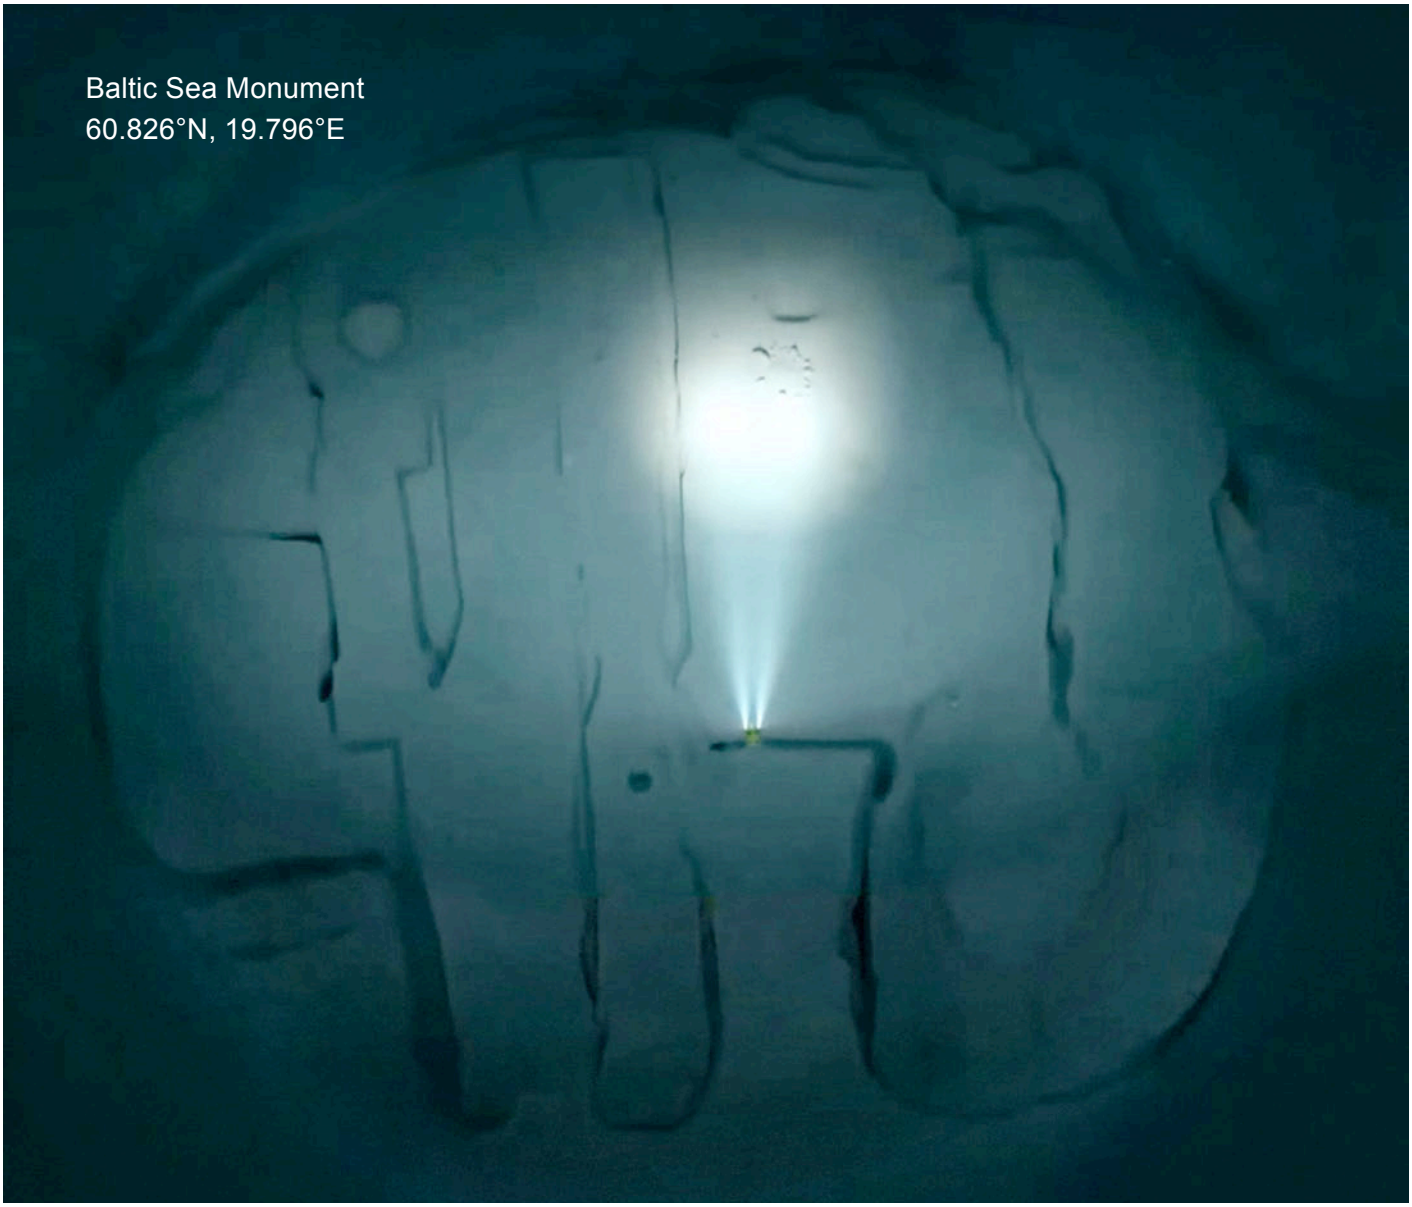
A group of the same ***adhi ra*** ibex pictograms adorns the face of another prominent vertical rock face, accompanied by an antelope with straight horns repeating the same votive phrase, as well as *a swastika* (above). The swastika has been translated in modern Sanskrit as signifying 'well-being', yet the original Paleo-Sanskrit translation specifies the hieroglyph as: ***asu - asu*** , meaning "life-life", directly referring to the resonant activity of the stone in transducing healing bioelectrical fields for human benefit.

The stylistic emphasis of the curving arches of the hieroglyphic figures, formed by the profile of the neck, and underbelly of the animals, convey the special votive message that the resounding low-frequency sounds heard and viscerally felt at the sacred site are being transduced by the rock itself for your benefit.

In this artistic way, the Paleolithic builders of these *'megalithophones'* are inviting devotees at the site to receive the healing emanations, as well as marking the areas of the sacred site where entrances to the underground temple were once located. Further research will reveal the great extent of the cave site.

Several other notable features seen in the artificial rockwork at Gobustan are present at Gobëkli Tepe, including large extensions of megalithic pavement slabs that contain large geometric depressions in the form of circles, lines and squares (opposite). What were these depressed features used for? What may at first appear to be large grinding holes for processing food may actually represent holes where water was placed for purification by the measurable electrical fields transduced from focused infrasound resonance through the piezoelectric properties of the quartz crystals comprising the metallic sandstone.

Water placed within these holes would have been rapidly purified as pathogenic microorganisms are eliminated by pulsed electrical currents moving through the water as transduced by the crystals comprising the stone. The special geopositioning alignment of the Gobustan site offers all the wavelengths of cosmic energy being amplified through the axis-symmetric forms of the Orion pyramids, each site having been erected as components of a global wireless system of Atlantean design.

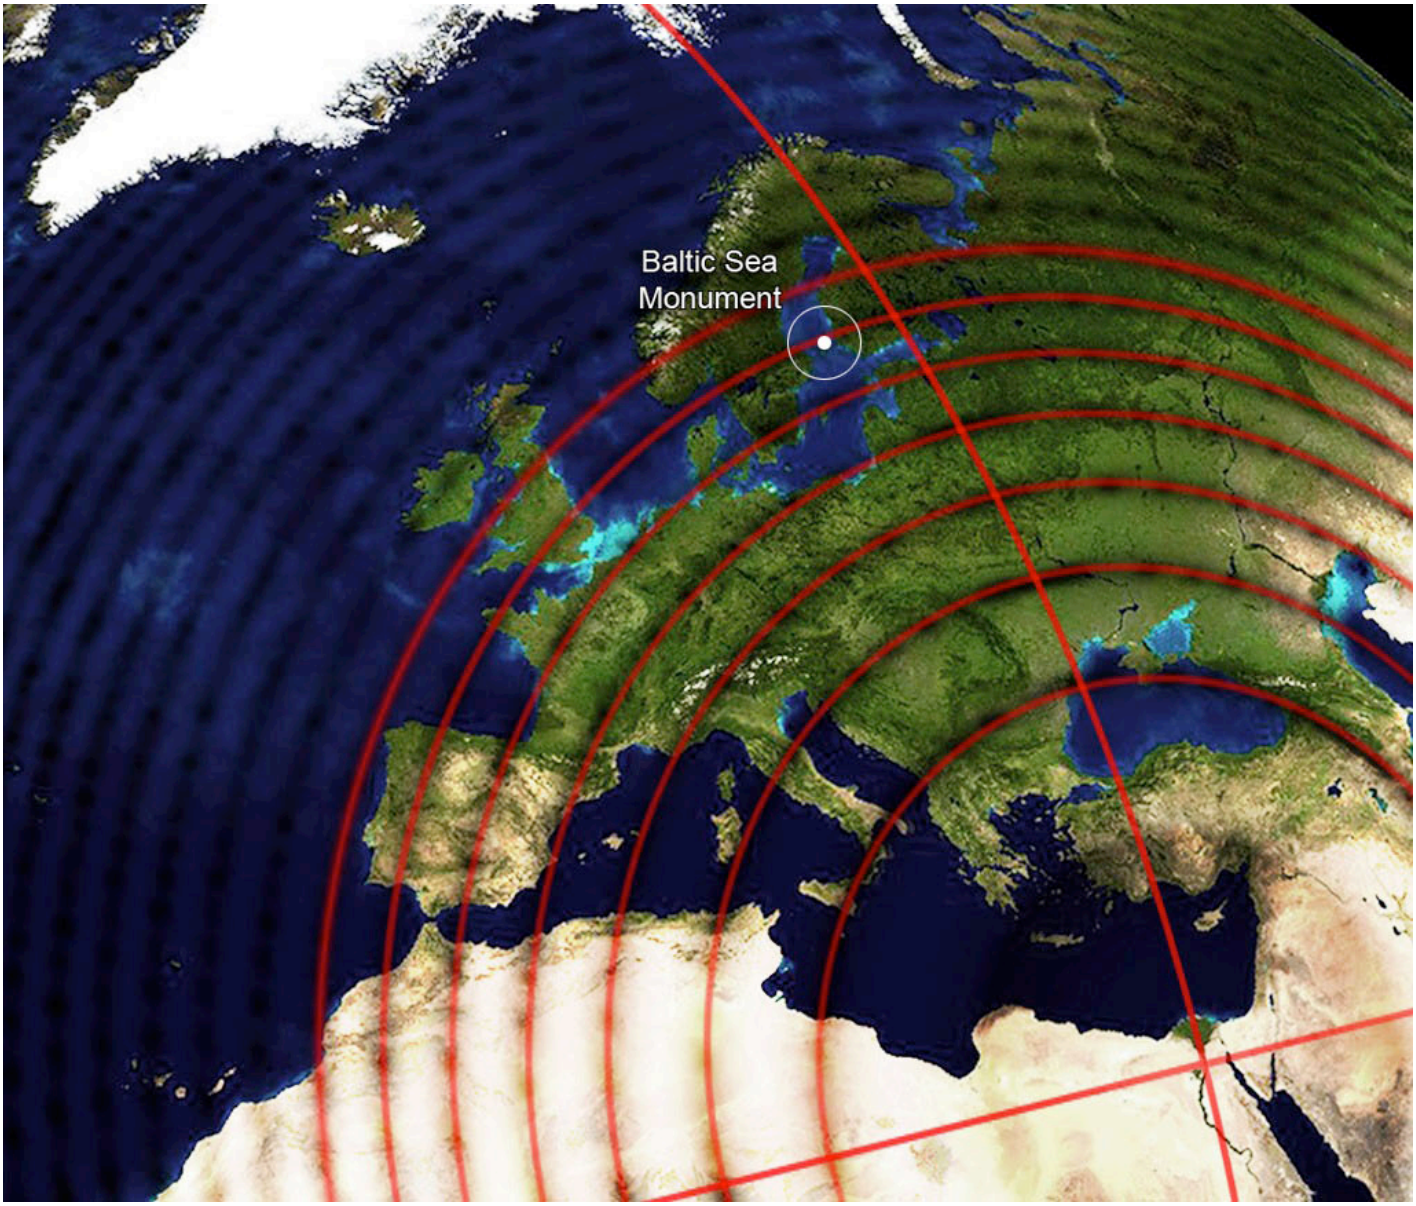


Square recesses cast into the megaliths at Gobustan praise the resonant influence of the planet Jupiter, while a small row of recessed steps leading down into the square basin represent the *raua* glyph, completing the full votive phrase: *Indra raua ra , meaning "Jupiter roaring granting"* (opposite).

Very similar stone basins representing Paleo-Sanskrit votive phrases are present on several massive geopolymer megaliths uncovered by locals at Sakafune-ishi and Masuda Iwafune, in Asuka, Japan (above). *The cast polygonal stonework of the Ishibutai resonating chamber is identical to stonework in Peru.*

Located exactly along the 34°N latitude, the megalithic sites of Asuka, Japan (34.033°N 135.816°E) are situated 5,844 miles from the Great Pyramid of Giza, Egypt. This distance represents 23.48% of Earth's mean circumference (of 24,892 miles), approximating twice the value of Fibonacci #358 (2938... x 10^{-71}) in miles and twice the value of Fibonacci #136 (1182... x 10^{-27}) in percent distance.

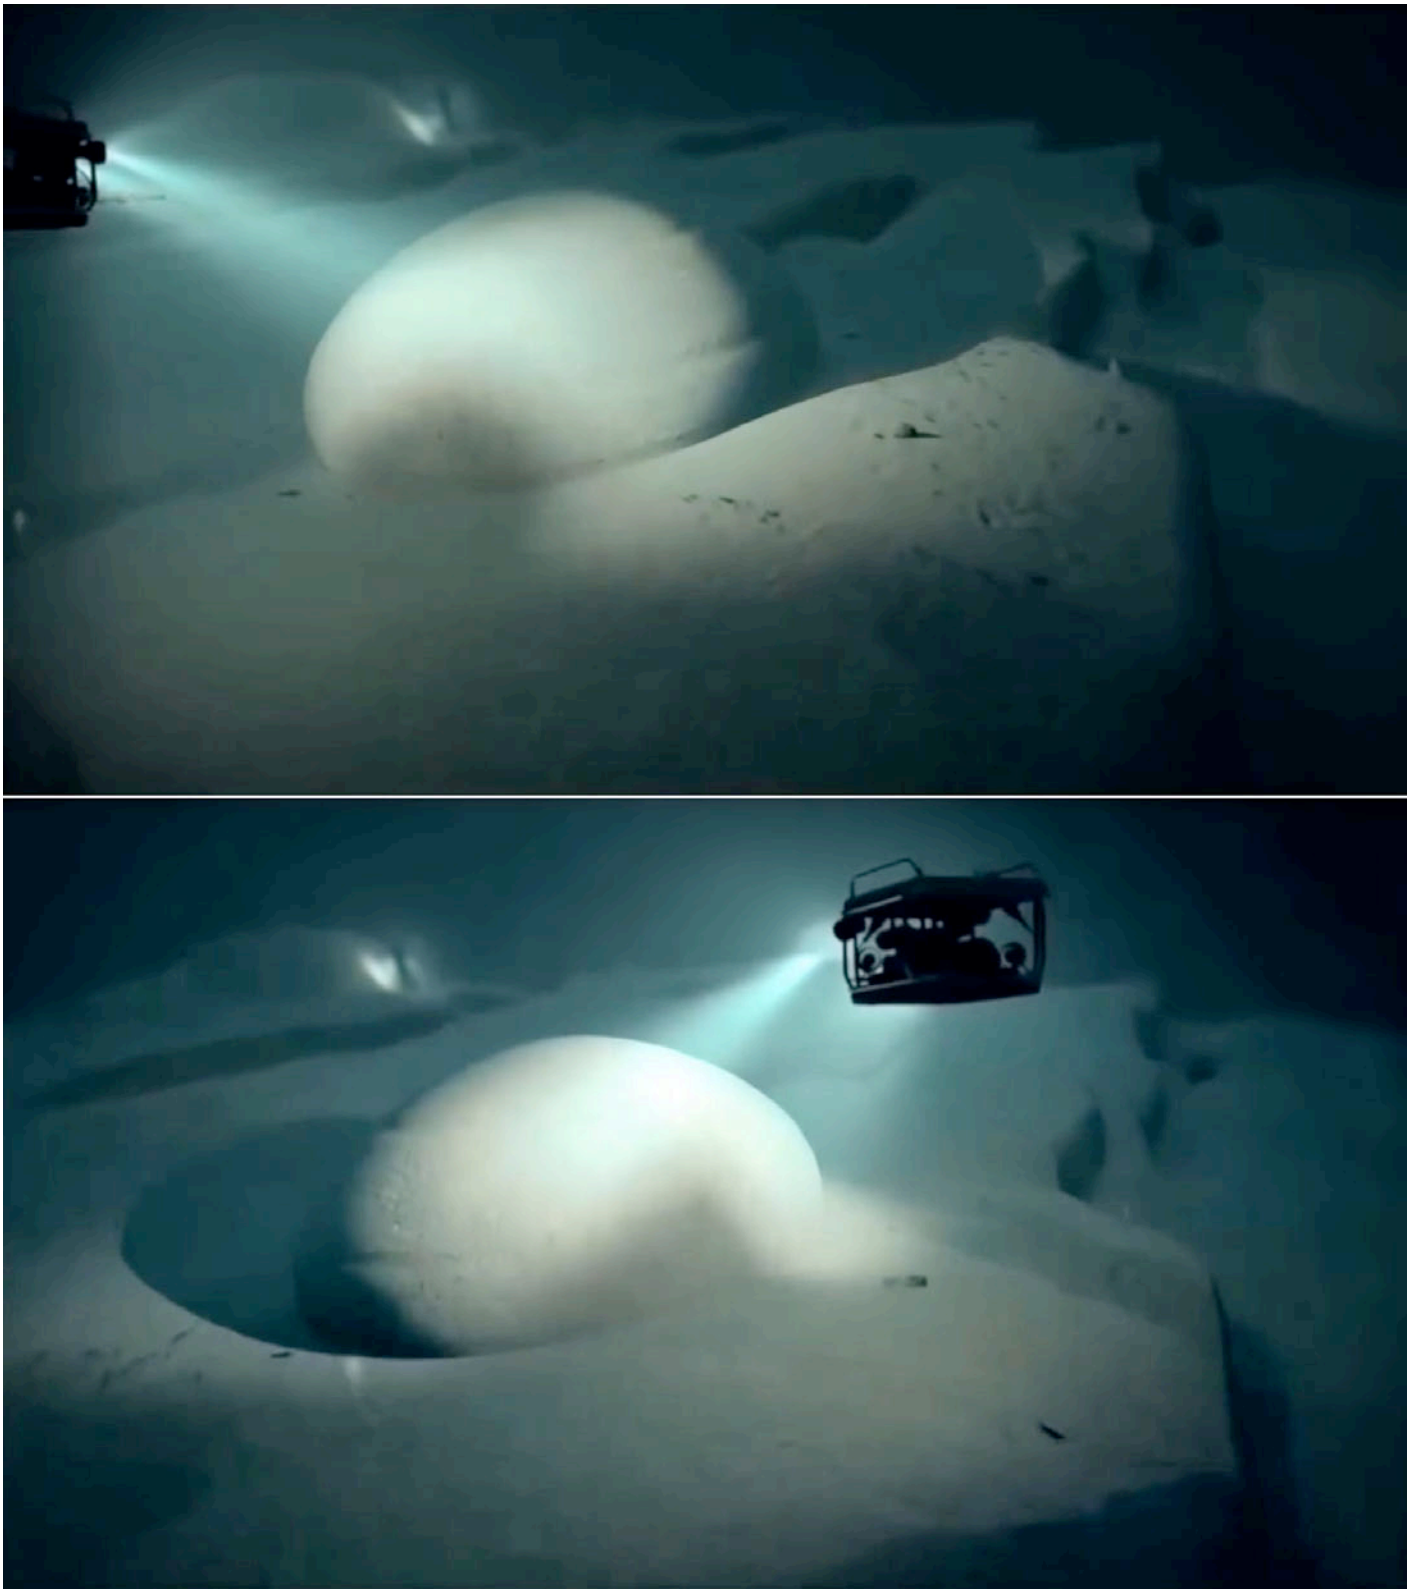
Recent recognition of sophisticated Paleo-Sanskrit linguistic references linked with advanced Atlantean geopolymer manufacture processes at the same sites have been paralleled by astonishing recent discoveries made in the field of marine archeology. The submerged Paleolithic city off Yonaguni Island has revealed what was once a major urban center off the present-day coast of southernmost Japan, while marine investigators in northern Europe have also made a staggering underwater find that shows that same advanced synthetic stone structures with embedded Paleo-Sanskrit linguistic features.



The stunning and highly controversial find made by marine treasure hunters using side-scanning sonar to detect shipwrecks in the Baltic Sea has finally been identified as a submerged monumental construction from the Paleolithic era. The giant circular seafloor promontory measuring ~60m in diameter is actually a terraced monument built by the highly advanced Atlantean civilization over 14,000 years ago.

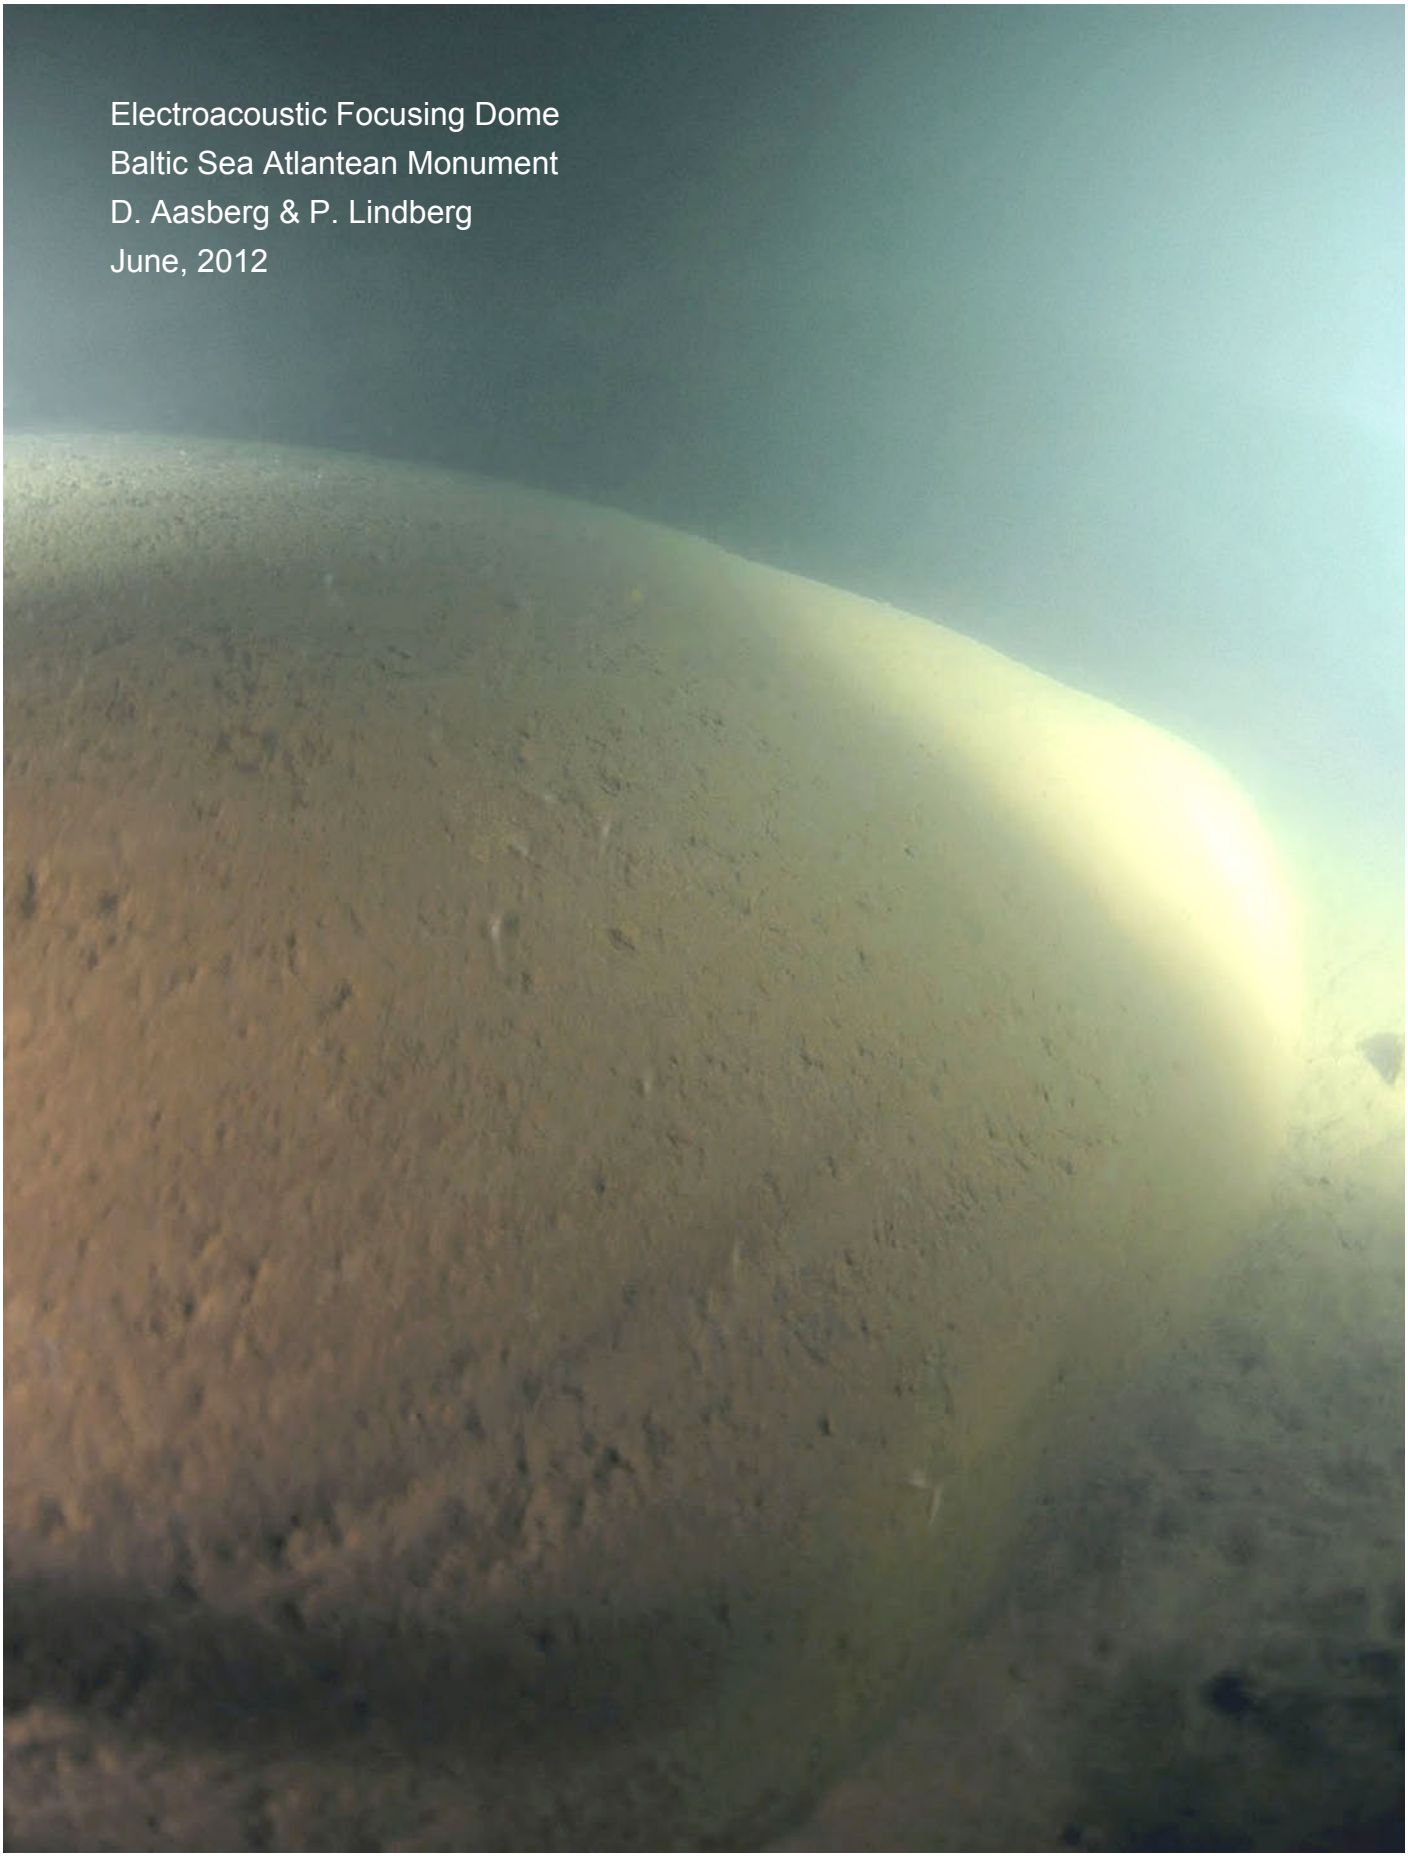
Co-discoverer and Ocean X team leader Dennis Aasberg describes just a few of the geometric features presented by the gargantuan disc-shaped temple rising above the sea floor, likening it to concrete:

> It looks like a round object separated from the bottom. It looks... like concrete. When we brush it off its [surface is] black. The object looks the same underneath as on the upper side. Same color too. Just like a plate on the bottom. And it has something that looks like big stairs... perhaps one meter high each step. Its strange... We have not been able to find more holes besides the 2 meter hole with a [recessed] square [formation] around it.[9]



Prohibitive conditions severely limit filming of the ancient monumental structure, especially rough seas and the very poor visibility of <1m near the bottom. Animated digital terrain models allow a clearer perspective of the massive proportions and complex geometric configuration of the submerged Atlantean monument (above).[10] The greatest hindrance to the seafloor site investigation is an intense electromagnetic vortex that perpetually interferes with all types of electrical equipment situated on or above the ancient monument *–in the vertical water column, onboard ships at the sea surface and even affecting low-flying airplanes.*

This special type of potentially dangerous EM vortex causes digital magnetometers and compasses to spin perpetually in proximity to the temple and directly above it, a fact that is familiar to military and civilian pilots working in the vicinity of pyramids all over the world –especially in Egypt, Mexico and Guatemala.



The Baltic Sea Monument (60.826°N, 19.796°E) is situated 2,194 miles from the Great Pyramid; a distance corresponding to 8.81% of Earth's mean circumference distance of 24,892 miles. *The artificial stonework of the monument effectively transduces EM fields from localized infrasound resonance* (above). The sunken monument displays the same great circle distance from the Great Pyramid as the megacity of London, England, now experiencing intensifying spates of spontaneous piezoelectric fires and exploding manhole covers[11] induced by infrasound standing waves resonating from the solar twins *now at perihelion*.

The increasing interaction of our sun with its invisible brown dwarf binary companion is fundamentally responsible for the ongoing tectonic build-up culminating in the magnetic reversal of the entire binary system, with all its planets.[12] This pattern of sharply rising volcanic activity has been directly correlated with precise length-of-day measurements that detect millisecond alterations in Earth's rotation (Palladino *et al*, 2013).[13] As especially designed by Atlantean engineers, binary solar dynamics are presently activating terrestrial infrasound fields and corresponding EM fields transduced by the worldwide network of pyramids, megaliths and terraced temple structures, such as the submerged Yonaguni and Baltic Sea monuments.

The sharp geometric design of the giant discoidal temple structure displays parallel corridors with flat, vertical walls and horizontal terraces forming perfect 90°-angled corners that can be clearly observed in the latest digital bathymetric animations of the impressive Baltic Sea temple (video stills above).

The most conspicuous man-made geometric structure on this massive stepped platform monument is a large hemispherical dome feature emerging from the slimy silt (opposite) that likely served to focus ultra- and infrasonic waves into a hemispherical inner chamber, accessed from the adjacent recessed corridor.

Electroacoustic Focusing Dome
Baltic Sea Atlantean Monument
D. Aasberg & P. Lindberg
June, 2012

The elevated position of the submerged Atlantean temple site provides for slightly greater current flow over the structure that has reduced the total amount of silt deposition on the monument over the course of ~14,000 years since its cataclysmic submersion. The upper platforms of the great sunken temple are covered in only 10-20cm of silt, *allowing the Ocean X divers to discern huge geometric symbols cast into the ancient cement building that represent Paleo-Sanskrit hieroglyphs of the global Atlantean culture.*[14]

"The 2 meter hole with a square around it" described by lead investigator Dennis Aasberg forms a sacred votive ligature combining the symbols of a square and a dot at its center. The square glyph represents a planet, while the dot represents a numeral, together reading: *Indra* • , meaning "Jupiter, the One" (below).

This phrase was also airbrushed in charcoal paint on the >19,000 year old geopolymer limestone cement walls of Lascaux Cave, France[15], as a square with a long row of dots reiterating "Jupiter, the One, the One..." The same Atlantean votive phrase was cast in hieroglyphic format multiple times in magnetized basalt stonework at Puma Punku megalithic temple,[16] constructed ~11,000 years ago at Tiwanaku, Bolivia. Elevated square healing platforms referencing the transduced infrasonic resonance of the plasma giant Jupiter are prominently featured at both Puma Punku and the Baltic Sea monument (opposite).

The circular format of the entire temple and its singular dome present the Paleo-Sanskrit numeral '1' used by Atlantean spiritual traditions to praise "The One" –the universal divine creative force. Reinforcing this votive phrase are Edgar Cayce's statements concerning the spiritual tenets of "The Law of One":

> [I]n that sojourn in the earth environment in what is called Poseidia, in Atlantis... we find there had been the separating into groups... The Sons of Belial were... those that sought more the gratifying, the satisfying, the use of material things for self,... those without a standard of morality... save of self, self-aggrandizement.
>
> The other group –those who followed the Law of One– had a standard... Their *standard* was that the soul was given by the Creator or entered from outside sources *into* the projection of the *mental* and spiritual self at the given periods. *That* was the standard of the Law of One, but was *rejected* by the Sons of Belial...
>
> [These opposing groups directed] those forces that came with the use of the light that formed the rays upon which the influence from without was crystallized into what would become as the sound from the outer realm to the static or individual realm.

These were not only the rays from the sun, set by the facets of the stones as crystallized from the heat from within the elements of the earth itself, but were as the combination of these... For it was these gases, these influences that were used for what we call today the conveniences as for light, heat, motivative forces; or radial activity, electrical combinations; the motivative forces of steam, [HHO] gas and the like for the conveniences.

The use of these influences by the Sons of Belial brought, then, the first of the upheavals; or the turning of the etheric rays' influence *from* the Sun –as used by the Sons of the Law of One –into the facet for the activities of same– produced what we would call a volcanic upheaval; and the separating of the [Atlantean] land into *several* islands –five in number.[17] (Reading 877-26)

Cayce's exceptionally detailed trance statements identified a technological class of Atlantean crystalline stone consisting of a "combination" of "the elements of the Earth", corresponding to the modern scientific definition of a *geopolymer*, of the same class as the reconstituted limestone blocks of the Great Pyramid.[18]

Modern Vedic language traditions in India have preserved the Sanskrit technical term for this advanced type of artificial metallic geopolymer stone, based on the root word ***anala*** , meaning 'fire'. This type of manufactured stone was designed to ignite HHO plasma[19] around the Atlantean pyramids and monuments, and was commonly known as: ***analopala*** , meaning 'fire-stone'. (This term does not refer to simple *flint* rocks that are struck to produce sparks, as the word 'flint' is specified by the Sanskrit 'agniprastara'.)

Further details were offered on the subject of synthetic stone over the course of decades of readings given by Edgar Cayce for individuals with past lives in the Atlantean lands, naming the scientific leader and inventor of Atlantean *firestone* geopolymer as 'Ajax of Ode', called Ax-tell in the area of present-day Egypt:

[I]n the land of the Poseidians when the rule was in the house of Ode... the entity then gave to that people the manner of use of the universal forces as may be applied in the way of mechanical construction in a physical plane. The entity was then known as [Ajax of] Ode.[20] (Reading 487-4)

The entity came from the Atlantean land into Egypt when there were those periods of reconstruction in the land, and from those turmoils and strifes there arose much that made for individual and group development –and the attempt of those in the experience to foster... those things that were good... The entity came then, in the name Ax-tell, from those forces that were in charge of the Law of the One.[21] (Reading 487-17)

Atlantean 'firestone'
magnetic basalt
hand sample

D. Aasberg &
P. Lindberg
June, 2012

Ti

Fine metallic inclusions:

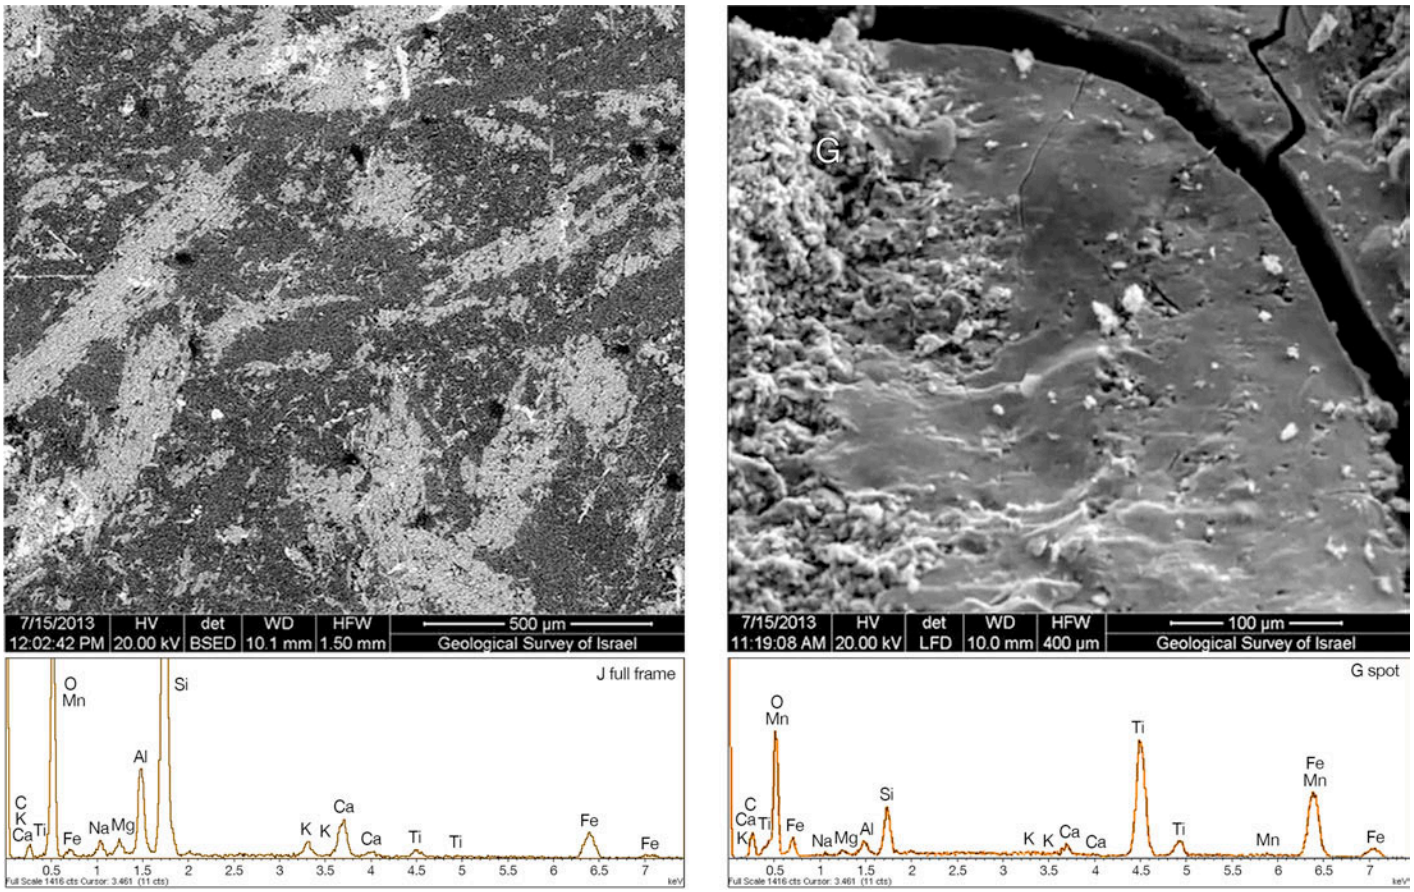
- titanium (paramagnetic)
- manganese (paramagnetic)
- iron (ferromagnetic)

> About the firestone that was in the experience did the activities of the entity then make those applications that dealt with both the constructive and destructive forces in the period... The preparation of this stone was in the hands only of the initiates at the time... that directed the influences of the radiation that arose in the form of the rays that were invisible to the eye but that acted upon the stones themselves... [22] (Reading 440-5)
>
> The stones... were of the magnetized influence upon which the Spirit of the One spoke to those peoples as they gathered in their service, are of the earliest Atlantean activities in religious service... [23] (Reading 5750-1)

These astonishingly detailed descriptions of advanced technological and spiritual means of the Atlantean civilization –*spoken in trance in the 1930s*— provide a viable explanation for odd EM vortex phenomena experienced by the Ocean X team at the sunken Baltic Sea Monument, as recounted by Peter Lindberg:

> Electronic disturbances with equipment started on the water's surface, but it was on their way down to the anomaly that the problems increased... The satellite phone didn't work when the boat was directly over the object, but just some tens of meters away from [that exact] position they worked again...
>
> Electrical problems were experienced on *all* expeditions to the anomaly. The camera stopped working, lamps stopped working, satellite phones stopped working, [and we experienced] some technical issues with the robot. [The] electrical camera [on the ROV and the] BlueView [multibeam imaging sonar] function stopped working...
>
> A strong radio signal of 40-50 megahertz was picked up when they were near the object. (Dennis [Aasberg] said that [the signal] wasn't coming from the [seafloor] object.) [24]

Baltic Sea Atlantean Monument
magnetic basalt sample
fragment cross-section



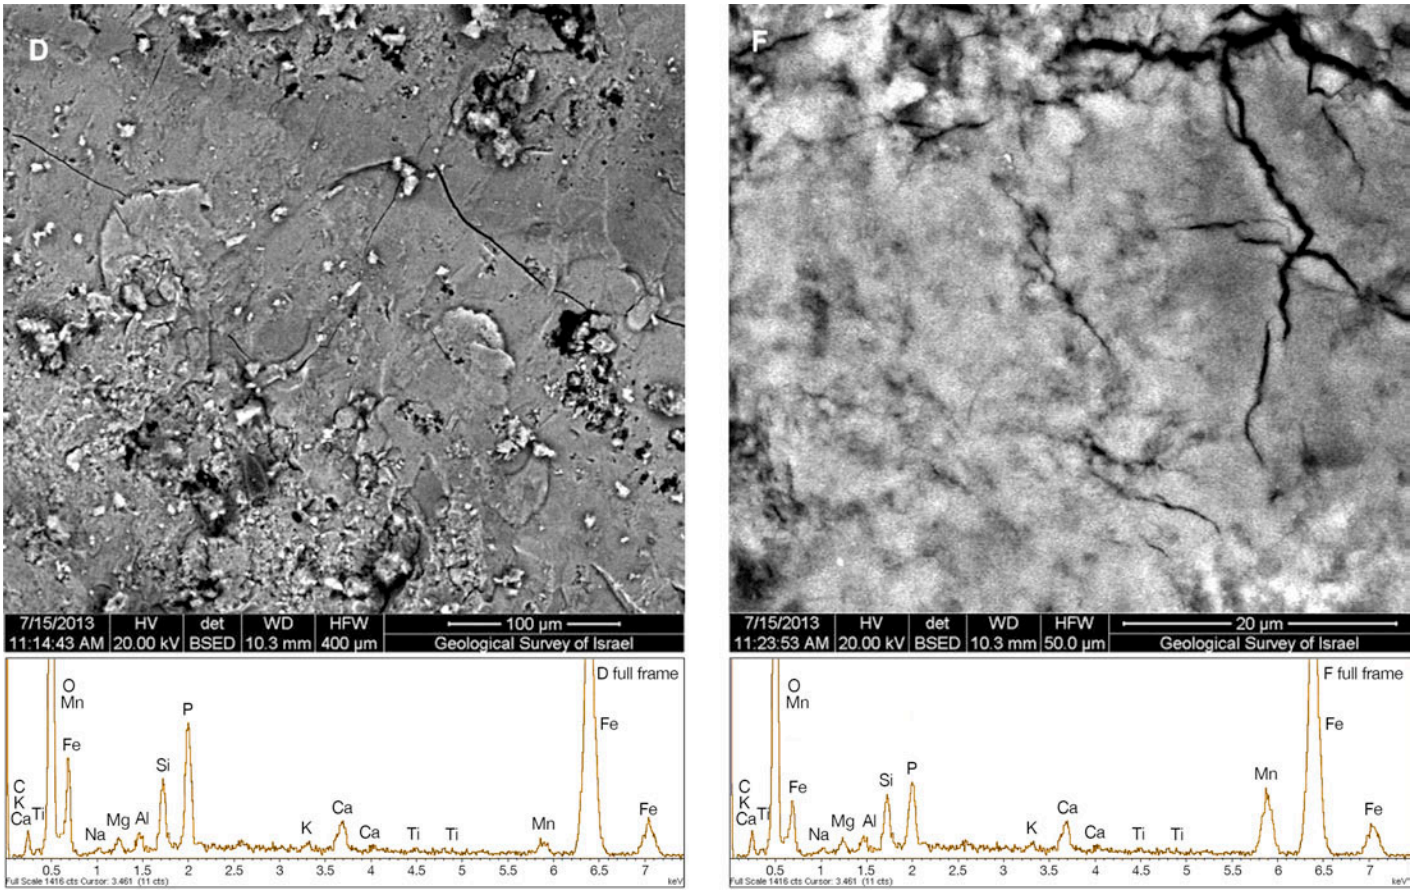
After a series of EM field-induced equipment malfunctions including a perpetually spinning magnetometer and several electrical short-outs that rendered their ROV inoperable during their June, 2012 expedition, Ocean X divers finally managed to obtain a few small hand samples from the sunken monumental structure for submission to multiple laboratories in Sweden and Israel for comprehensive material analyses.

A multilayered, roughly rectangular sample of the stone-like material composing the monument was found laying on its surface, under several centimeters of silt at a depth of ~85m (opposite). The sample was subsequently broken into several fragments for conducting various petrological analyses, including chemical resistance tests, morphological characterization by scanning electron microscopy (SEM), and determinations of elemental composition by energy dispersive x-ray spectroscopy (EDS).

An initial visual inspection reveals an abundance of fine metallic inclusions throughout the stone-like material that appears to have been reconstituted from a finely pulverized mixture of basalt, quartz and tourmaline, conferring piezoelectric properties to the composite artificial basalt material. Rust-colored areas denote iron particles, while the shiny metal flecks display unnatural purity and concentration.

Tests conducted by the Weizmann Institute[25] and Tel Aviv University's Institute of Archaeology included SEM imaging of the artificial basalt sample, exposing a variety of distinctive features not found in naturally crystallized volcanic basalt. Instead, these features characterize ancient magnetic geopolymer basalt and andesite now conclusively identified at multiple sites dating to the Paleolithic period of high civilization:

> The sample taken from the object is analysed by the Weizmann Institute in Israel. Their tests indicate this is no ordinary rock. It contains abnormally high concentrations of titanium, manganese and iron. The metals are all key materials in the manufacture of high-tech aerospace components.[26]



Surprising EDS results identified high metal concentrations of iron, manganese and *titanium* elevated far above standard abandunce values for natural, geologically-formed specimens. Manganese and titanium are paramagnetic metals not found in pure states in nature, but as mineral compounds. Iron is ferromagnetic.

The interspersed particulate combination of ferromagnetic and paramagnetic metals with piezoelectric crystals observed in Atlantean firestone represents a high-efficiency semiconductor material that converts and amplifies all frequencies of electromagnetic energy into an EM vortex surrounding the construction.

The high-tech metallic composition of reconstituted basalt comprising the Baltic Sea Monument decisively indicates a man-made origin for the extensive site as an ancient geopolymer fabrication, matching similarly manufactured stones from Paleolithic pyramid complexes in Visoko, Bosnia; Cianjur, West Java, Indonesia; and La Maná, Ecuador. Microscopic examination of synthetic stones from these pyramid sites revealed an additional feature: networks of microfissures (opposite). As seen in natural mudstone conglomerates, microfissures result from the material slumping during a semi-fluid phase before curing to full hardness.

These remarkable findings are consistent with modern cements and reconstituted stones that display characteristic microfissures that result from slumping in a mold during artificial casting processes. Identical microfissures have been observed in the magnetized andesite megaliths of the Gunung Padang Pyramid in West Java, Indonesia, where spinning compasses and other EM vortex phenomena have also been documented.[27] *The Indonesian government has completely blocked the release of information regarding the inner chambers, waterways and tunnels discovered and excavated within the Padang Pyramid years ago.*

Ongoing criminal subversion of the advanced technological remains of Paleo-Sanskrit civilization is closely linked with the work of Nikola Tesla. Atlantean pyramids, stepped monuments and megalithic temples comprise a global wireless power and telecommunications network displaying a spherical Fibonacci distribution pattern defined by the quantum function [$z_{n+1} = z_n^2$].[28] Infrasound is transduced and focused by Atlantean temples through the same standing wave resonance principles rediscovered by Tesla in 1899.[29]

The function of the Baltic Sea Monument's enigmatic stair-stepped feature is also hinted at in the Life Readings on Atlantis given by Edgar Cayce. He explains that Atlantean society included humanoid species of various sizes, from diminutive dwarf species to extraordinarily giant humanoid species:

> Q: *Please give a few details regarding the physiognomy, habits, customs and costumes of the people of Atlantis...*
>
> A: These took on *many* sizes as to stature, from that as may be called the midget to the giants –for there were giants in the earth in those days, men as tall as (what would be termed today) ten to twelve feet in stature, and in proportion –well proportioned throughout. [30] (Reading 364-11)

The sunken monument's unusually slanted staircase was specially designed for use by ~1m dwarves on the far left side, by humans on the mid-left and by ~4m giants on the right side of the wide-access staircase. This group included the 'little people' known to Shoshone culture as *Nimerigar* (ie. the 'Pedro' mummy), and the *Nephalim* of Biblical legend –a giant, domineering extraterrestrial species associated with human sacrifice and cannibalism– best known from skulls excavated at Paracas, Peru.

The many profound sociological, technological, historical and linguistic implications of the Baltic Sea Monument have certainly contributed to Swedish Naval interference with the Ocean X marine expedition in June, 2012, as reported by team leader Dennis Aasberg. He asks the obvious, unanswered question: "Why [does] the [Swedish] military want to take part in this [marine site investigation]?... What do you think? Perhaps they already know what [it is that] we have found?" [31]

The strong 40-50 MHz signal registered by the ROV in the immediate vicinity of the massive Atlantean monument corresponds to a very high frequency (VHF) sonar beam, most likely emitted from the group of 6 command ships deployed by the Swedish Navy to intercept the June, 2012 expedition. The Naval group waylaid and actively disrupted Ocean X investigators by beaming the monument with high-intensity sonar, *intentionally overloading electronics with the strong EM field resonantly transduced by the firestone.*

Subversive goals being deceptively pursued by the Swedish military pertain to the ongoing worldwide governmental cover-up of 'free energy' technology embodied by ancient pyramid complexes on every continent, still being hidden from the general public. Wide ridge formations at the Baltic Sea site have been recognized by Ocean X researchers as elevated causeways linking the main circular monument to 2 nearby megalithic structures that have been partially revealed by initial side-scanning sonar surveys.

The Baltic Sea Monument is part of an extensive megalithic complex dating to the remote Paleolithic era, much like the gargantuan complex of stepped platform monuments, temples, caves, plazas, roadways and a complete amphitheater documented at the submerged site just offshore at Yonaguni Island, Japan. The same oppressive scenario surrounds the discovery of a submerged pyramid site in the Azore Islands, as Portuguese military involvement has effectively prevented release of further details on the subject.

These giant structures constitute resonant platforms for sophisticated bioelectrical qi healing practices that have been preserved in strict secrecy by adepts of the Buddhist spiritual traditions of Southeast Asia.[32]

As for the Ocean X team's Baltic Sea site investigation, pathocratic interests are being enforced by the Swedish military along with TitanTV Media, which delayed film editing for 6 months without explanation and effectively silenced Aasberg's team with piecemeal project funding and mandatory non-disclosure agreements offered under the guise of purchasing film rights to all data produced by the investigation.

As the regrettable truth sets in for the Ocean X team that corporate television production contracts are just part of the government-orchestrated delay/cover-up scam, they will be pleased to learn the 'anomalous object' has finally been resolved and demystified here, for the first time, reintegrating the advanced physics of magnetic resonance that empowered that magnificent era of Atlantean high civilization.

Jupiter & Roman Concrete

Jupiter & Roman Concrete

Recent breakthroughs in the analysis of ancient building materials warrant a thorough re-examination of technological continuity between the Atlantean Paleo-Sanskrit motherculture and much later Greek and Etruscan phases of advanced civilization that formed the cultural foundation of the Roman Empire.

Clear linguistic continuity has been described in detailed comparisons of the Paleo-Sanskrit language with Etruscan descendant forms, exemplified by lamps bearing hieroglyph texts stating their basic function: *ra las* , meaning "granting shining".[1] Etruscan blackwares were made with geopolymer ceramics,[2] while surviving examples of Roman harbors constructed in geopolymer concrete display magnificent resistivity to chemical corrosion (above) according to material analyses conducted at Univ. of California at Berkeley:

> For underwater structures, lime and volcanic ash were mixed to form mortar, and this mortar and volcanic tuff were packed into wooden forms. The seawater instantly triggered a hot chemical reaction. The lime was hydrated –incorporating water molecules into its structure– and reacted with the ash to cement the mixture... First Vitruvius, an engineer for the Emperor Augustus, and later Pliny the Elder recorded that the best maritime concrete was made with ash from volcanic regions of the Gulf of Naples... especially from sites near today's seaside town of Pozzuoli. Ash with similar mineral characteristics, called pozzolan, is found in many parts of the world...
>
> In [modern] concrete made with Portland cement this [binding agent] is a compound of calcium, silicates, and hydrates (C-S-H). Roman concrete produces a significantly different compound, with added aluminum and less silicon. The resulting calcium-aluminum-silicate-hydrate (C-A-S-H) is an exceptionally stable binder... Their analyses showed that the Roman recipe needed less than 10 percent lime by weight, made at two-thirds or less the temperature required by Portland cement. Lime reacting with aluminum-rich pozzolan ash and seawater formed highly stable C-A-S-H and Al-tobermorite, insuring strength and longevity. Both the materials and the way the Romans used them hold lessons for the future.[3]

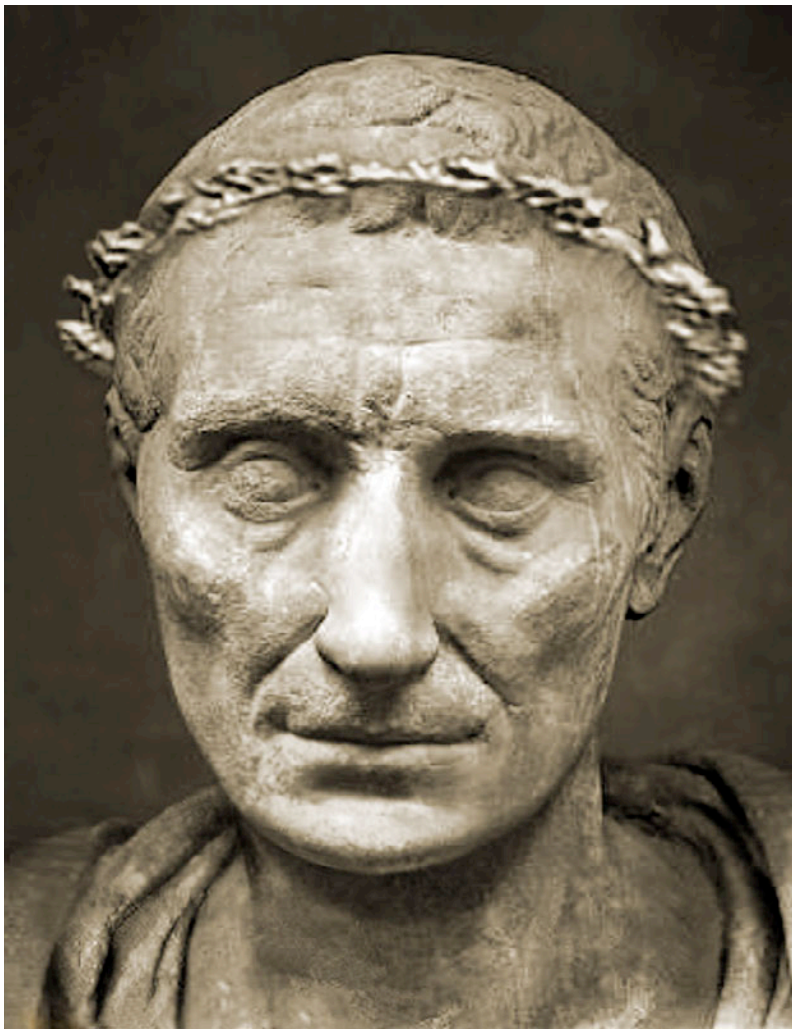
High performance Roman concrete displays the same chemical makeup of calcium-aluminum-silicate-hydrate compounds as artificial geopolymer limestones of the Great Pyramid, situated in present-day Giza, Egypt.[4] The great preservation of the Giza pyramids also witnessed at many Roman amphitheaters attests to their material and structural excellence, having withstood so many centuries in regions of high tectonic activity (opposite). Built by Emperor Vespasian and his heir Titus from 70-80AD, the Colosseum represents the zenith of Roman geopolymer concrete engineering in a grand elliptical format (above).

The extraordinary acoustical engineering of Greek and Roman amphitheaters was achieved by sharp geometric conformation of theatrical spaces to concentric circles enhanced by tuned concave limestone seating arrays and strategic placement of dozens of large bronze urns that acted as resonant amplifiers:

> The ancient theatre of Lyttus in Crete (Candia)... contained three rows of 13 acoustic vases in each, known also as “echea”. According to Vitruvius, “echea”, which are actually Helmholtz resonators, were placed in ancient Greek and Roman theatres in order to improve their acoustic performance.[5]

Advanced acoustical engineering and geopolymer chemistry enabled architectural monuments honoring the High Priest of Jupiter: founder of Roman cities by civil application of high sciences, upheld as Divus Julius. The Atlantean Paleo-Sanskrit civilization deified Jupiter for thunderous infrasound transduced by pyramids, as understood by ancient Stoic philosophers *and later transmitted to Posidonius, teacher of Julius Caesar.* Psychoacoustic knowledge preserved in the Bible and Essene Gospels has been directly linked to Caesar in an insightful hypothesis first examined by Bauer (1843)[6], later by Stauffer (1952)[7], and more recently by an Italian author who compares the Biblical Jesus with the life history of Julius Caesar.

In his book 'Jesus Was Caesar' (2005), Francesco Carotta addresses the essential question: "Is Jesus the historical figure of Divus Julius, the God to which Julius Caesar was elevated?" Decades of liturgical research by Carotta succinctly confirms this hypothesis by detailing name and place substitutions in the Bible that directly correspond to the life, death and apotheosis of Caesar, revealing the Julian origin of Christianity.[8] Carotta identifies the Christian cross as a Roman tropaeum (overleaf); a wooden cross displaying the armor of vanquished leaders *–also used to display a wax copy of Caesar's corpse.*



Historical circumstances inspiring the Biblical narrative of the Resurrection of Christ find root in images of Caesar's resurrection on the funeral bier before cremation below his full-figure wax effigy displayed on the tropaeum, as partly depicted on later denarii by L. Buca (below). The crowned profile portrait head of Venus Genetrix stamped on the reverse side appeared on many coins commemorating the founding Julian line of Iulus, grandson of Venus, a motif that transformed into Biblical imagery of the Madonna.

Carotta's thorough comparison of places, names and event timelines in the lives of Julius and Jesus painstakingly establishes Julian precedents for Biblical accounts *in succinct order.* Jesus' miracle of walking on the sea is based on Julius' attempted crossing of a stormy Adriatic, saying "Do not fear, you sail Caesar in your boat, and Caesar's luck sails with us!" Carotta highlights many compelling parallels:

Life of Julius Caesar		Life of Jesus Christ
Gaius Julius Caesar	:	Jesus Christ
Gaul	:	Galilee
Rubicon River	:	Jordan River
Corfinium	:	Caphernaum
The Senate	:	The Sanhedrin
City of Rome	:	City of Jerusalem
Land of Ionia	:	Land of Judaea
Pompeius	:	John (the Baptist)
Antonius	:	Simon (Peter)
Curio	:	Andrew
Cleopatra	:	Mary Magdalene
Venus Genetrix	:	The Madonna
Nicomedes	:	Nicodemus
(Decimus) Brutus	:	Judas
(Marcus) Brutus	:	Barabbas (Cassius)
Longinus	:	(the centurion) Longinus
Lepidus	:	Pilate
Octavianus (Augustus)	:	John (the beloved disciple)
Marius (+ Iulia and Martha)	:	Lazarus (+ Mary and Martha)
"Let the die be cast."	:	"Fishermen, let (it) be cast."
"I came, I saw, I conquered."	:	"I went, washed and saw."
"I am not King, I am Caesar."	:	"We have no King, but Caesar."
"Have I saved them that they may ruin me?"	:	"He saved others; himself he cannot save."
"Do not fear, you sail Caesar in your boat..."	:	"Do not be afraid, it is I."
"Who is not on any side, is on my side."	:	"For he that is not against us is on our part."

The resemblance between Caesar's grass wreath and Jesus' crown of thorns may be a coincidence... But the fact that a statue of Caesar may have had the appearance of a pietà... [is evident, with] the inscription on the base—*Parenti Optime Merito,* 'to the most meritorious parent'—reads like a replica of that found on the temple of Jupiter—*(D)iovi(Patri) Optimo Maximo,* 'to the Father God (Jupiter) best and greatest' and which is still to be seen on our churches in the abbreviated form DOM *(Deo Optimo Maximo),* 'to the best, highest God'.

The hollow face of suffering presented by the 'Pietà of Caesar', at the Torlonia Museum (without a wreath), displays a lowered head position and sunken, baggy eyes revised to evoke pity and revenge for Caesar's murder (at left). In contrast, the only sculptural representation made during the later years of Caesar's life, excavated in Tusculum, displays a shrewd, calculating gaze, holding his chin up with pride for the many military campaigns, victories and civil accomplishments (opposite). The slight smile gracing Caesar's face reflects his notorious clemency. All emotive charisma of the living Caesar was removed from the Pietà image, while Carotta shows how the inscription became mistranslated into later Greek texts as *'chrêstos'* or *'christos'*:

It should be observed that linguistically, *parens,* 'parent' or 'father' and *creator,* in the sense of 'founder' especially a 'founder of cities', is called *ktistês* by the Greeks, while *optimus* is usually rendered *aristos*—both translations are well documented, additionally on Roman imperial coins in the East. Conversely, the words *meritus,* 'meritorious', as well as *bonus,* 'good'—whereby *optimus,* 'the best', is an intensification—can in this sense be appropriately translated by the Greek word *chrêstos,* a word whose classical pronunciation was already becoming replaced by the late Hellenistic *christos,* which is still used today. Hence, on the base of the first cult-statue of the new god Caesar, the Greek speaking people read that the divine founder of the empire was *optime meritus* which meant for them *chrêstos,* respectively *christos.* This would not surprise them, because they were used to addressing their deceased on epitaphs with *chrêste,* 'good'. For Caesar the word fit perfectly, because he was 'good': proven by his much acclaimed clemency. Indeed, the defeated Pompeius had called upon his followers to reconcile themselves to the stronger Caesar because he would be well-disposed and 'good': *chrêstos.*

Parens, optimus, meritus—ktistês, aristos, chrêstos. Three words, each of them (the last one is very telling) resembling in appearance and pronunciation that of another word, *christos,* 'anointed', which later emerged as the title of Jesus. The possibility of confusing *chrêstos* with *christos* was so easy and natural, that the spelling with an 'ê' instead of an 'i' is still to be found in some writings of the Classics (for example Tacitus' *chrestiani* which was changed to *christiani,* or Suetonius' *chresto* as well, interpreted by some as *Christus*) and also in the New Testament in various places.

But this happened later, in another context. For the moment, nobody would have gained anything by a possible confusion of *chrêstos,* 'meritorious', with *christos,* 'anointed', nor would they have taken offence, because both high priests and kings were anointed, and Caesar had been both at once—the first in very fact, the second by reputation.[9]

The Tusculum Head is a highly realistic life-size portrait of Julius Caesar thought to have been created in 46BC, less than two years before Caesar's assassination in 44BC, at the age of 55.[10] The subtle facial expression and very natural forms of the long neck have led to speculation that the stonework was carved as a copy of a wax life-cast of Caesar's face. The actual process may have been simpler still.

On display at the Museum of Antiquities, in Turin, the Tusculum Head of Caesar is composed of Luni marble, obtained from the Liguria region of northern Italy, just 5km north of Carrara, famous for its high quality marble quarries. This representation stands apart from all other portraits of the Roman cult hero, being the only representation to display Caesar's partial baldness, and even the irregularities of his skull:

> Now famous, a marble bust from Tusculum has been identified as that of Caesar by the typical saddle of the crown accentuated by the bold forehead, the angular jawline, the 'vulturine' neck, and—last but not least—by the ironic lines of the mouth. Here is the same vision and will, but the *clementia* is more concealed by a stronger sense of irony. One can see the ruler of the world advancing, and sense there is a claiming of ownership, and an inaccessibility. Before us is the Caesar of *veni vidi vici*.[11]

The confidence and intense focus of the expression captured in the Tusculum Head reveals a hidden agenda behind the subversive weakness expressed in the Torlonia Head that Carotta identifies as Caesar's Pietà. The sharp contrast between a man who "conquered the known world in sandals" and a "christened and crucified Savior in sandals" finds its very first expression in the Pietà's morose features.

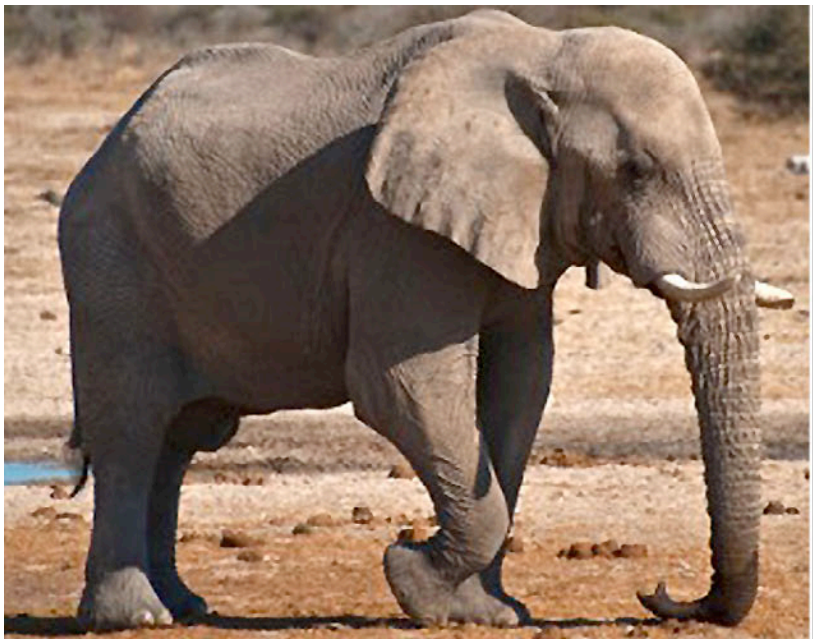
Subtle manipulations of Caesar's facial expression reveal the Tusculum Head as the original, definitive portrait of Julius Caesar, yet presents distinct surface flaws and fine discontinuities in the pedestal forms not witnessed on any of the later representations produced in stone. Treatment of the base bears evidence of a stone pedestal and a block of wood with central shaft supporting the life-cast wax head.

Retouching of the nose, eyes, eyebrows and hair was accomplished after the raw wax copy was poured, while smooth areas of skin were left largely unaltered –*to great effect*. Perhaps such minor defects were not removed from the final product to preserve the delicate slipcoat layer? Telltale casting imperfections preserved on the Tusculum Head deny the possibility this stonework was carved from a block of stone in a conventional manner, instead directly implicate a 'lost wax' method involving wax burn-out from a plaster mold before hot pouring a fine geopolymer powder mix of marble, clay, lime and water.

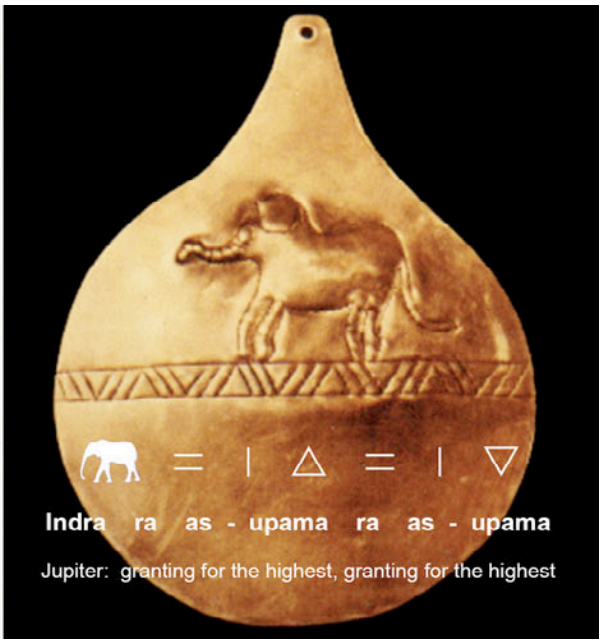
The Tusculum Head was clearly used as the model for coins struck during the final year of Caesar's life, bearing details of the original wax portrait head preserved in geopolymer marble (below). Like the later sculptures produced after the death of Caesar, profile portraits on coins were similarly reduced to idealized images that retain little semblance to his actual countenance. However, design standards adhered to by Roman minters have been overlooked, *like basic symbols presented on the $1 bill today.*

The circular coins were always outlined with the same specific circular pattern of adjoined semi-circles or circles conforming to the geometric structure of standing waves as they encircle the sphere of the Earth. *Roman coin designs confirm Roman psychoacoustic engineers were aware of the spherical shape of the planet and focal patterns of planetary resonance now identified as infrasound standing waves.*

An ancient technological hero of the people akin to the world famous modern inventor Nikola Tesla, Julius Caesar was renowned for his highly advanced implementation of especially geopositioned sites for geopolymer construction of piezoelectric temples *for infrasound resonance technologies that had electrified and illuminated domestic life in Roman cities.* This provides the most convincing explanation as to the origin of Caesar's title of 'High Priest of Jupiter' and associated elephant symbolism (above).



The Paleo-Sanskrit language and nonlinear physics underlying the psychoacoustic associations of Indra, the deified planet Jupiter, reveal the deeper Paleolithic origin of the elephant symbol as a hieroglyph, according to the Schildmann Decipherment.[12] Jupiter was signified by several sacred glyphs still in use today in diverse parts of the world, including the square, the elephant, the whale and the seven-pointed candelabra configuration later adopted by Judaic traditions as the Menorah. For Paleo-Sanskrit authors, *Jupiter's sacred number was 7* –encoding its 399-day synodic year as $7 + 7^2 + 7^3$ (7+49+343 = 399).[13]

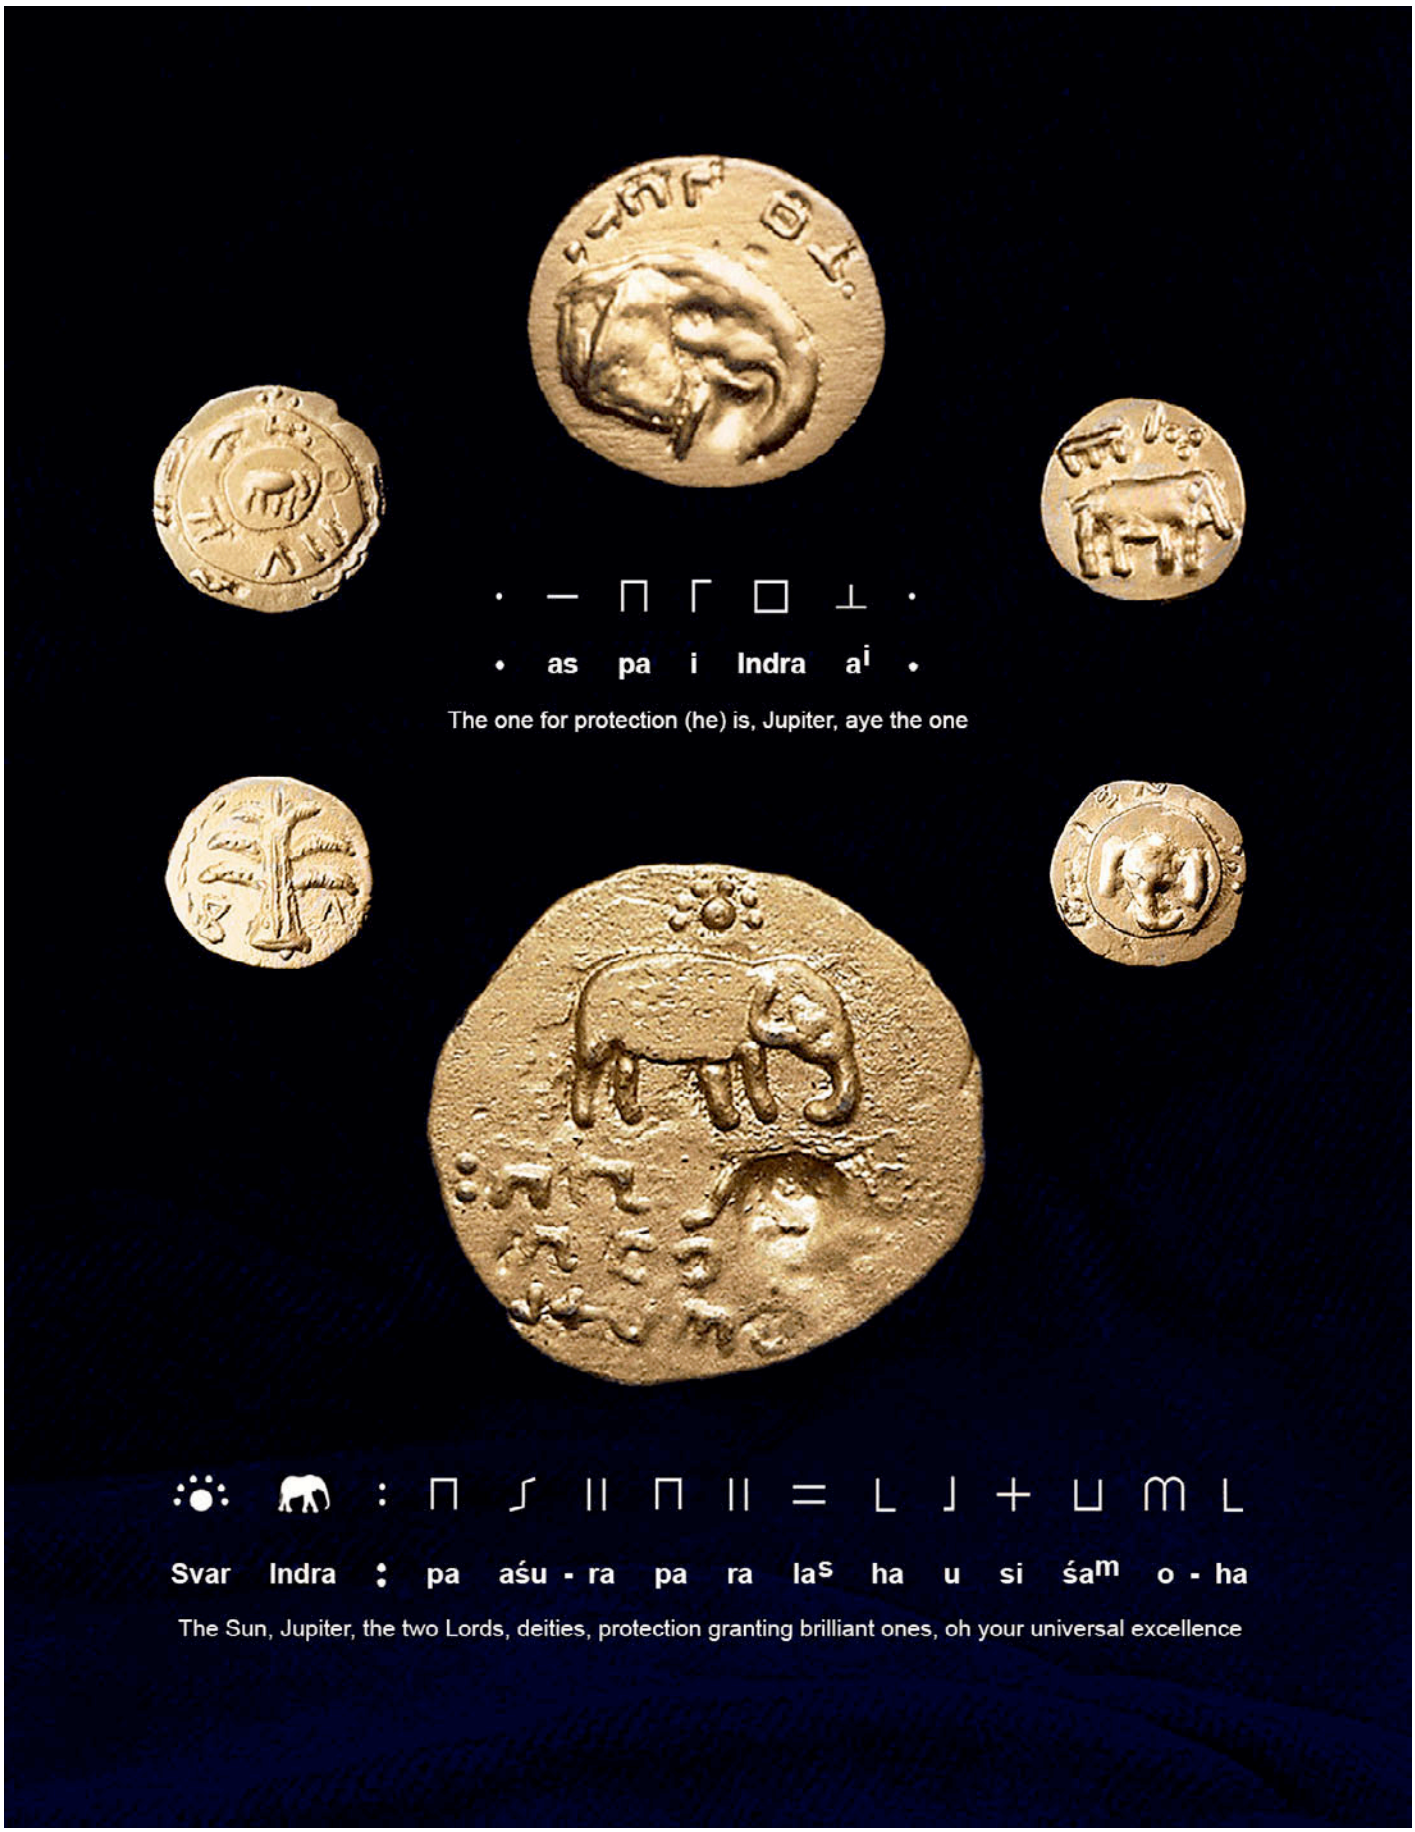


The oldest Paleolithic texts yet identified uphold Jupiter's vital influence on resonant limestone cavesites, as preserved in remarkable form on the painted geopolymer walls of Lascaux and Chauvet Caves in present-day France. Subtitling of a Megaloceros airbrushed in black charcoal at Lascaux Cave reads: *Indra* • • • • • •, meaning "Jupiter, the One, the One..."[14] A similar phrase airbrushed in red ochre paint deep within Chauvet Cave reads: *adhi ra* • • • • • •, or "Delivering granting of the one, the one..."[15]

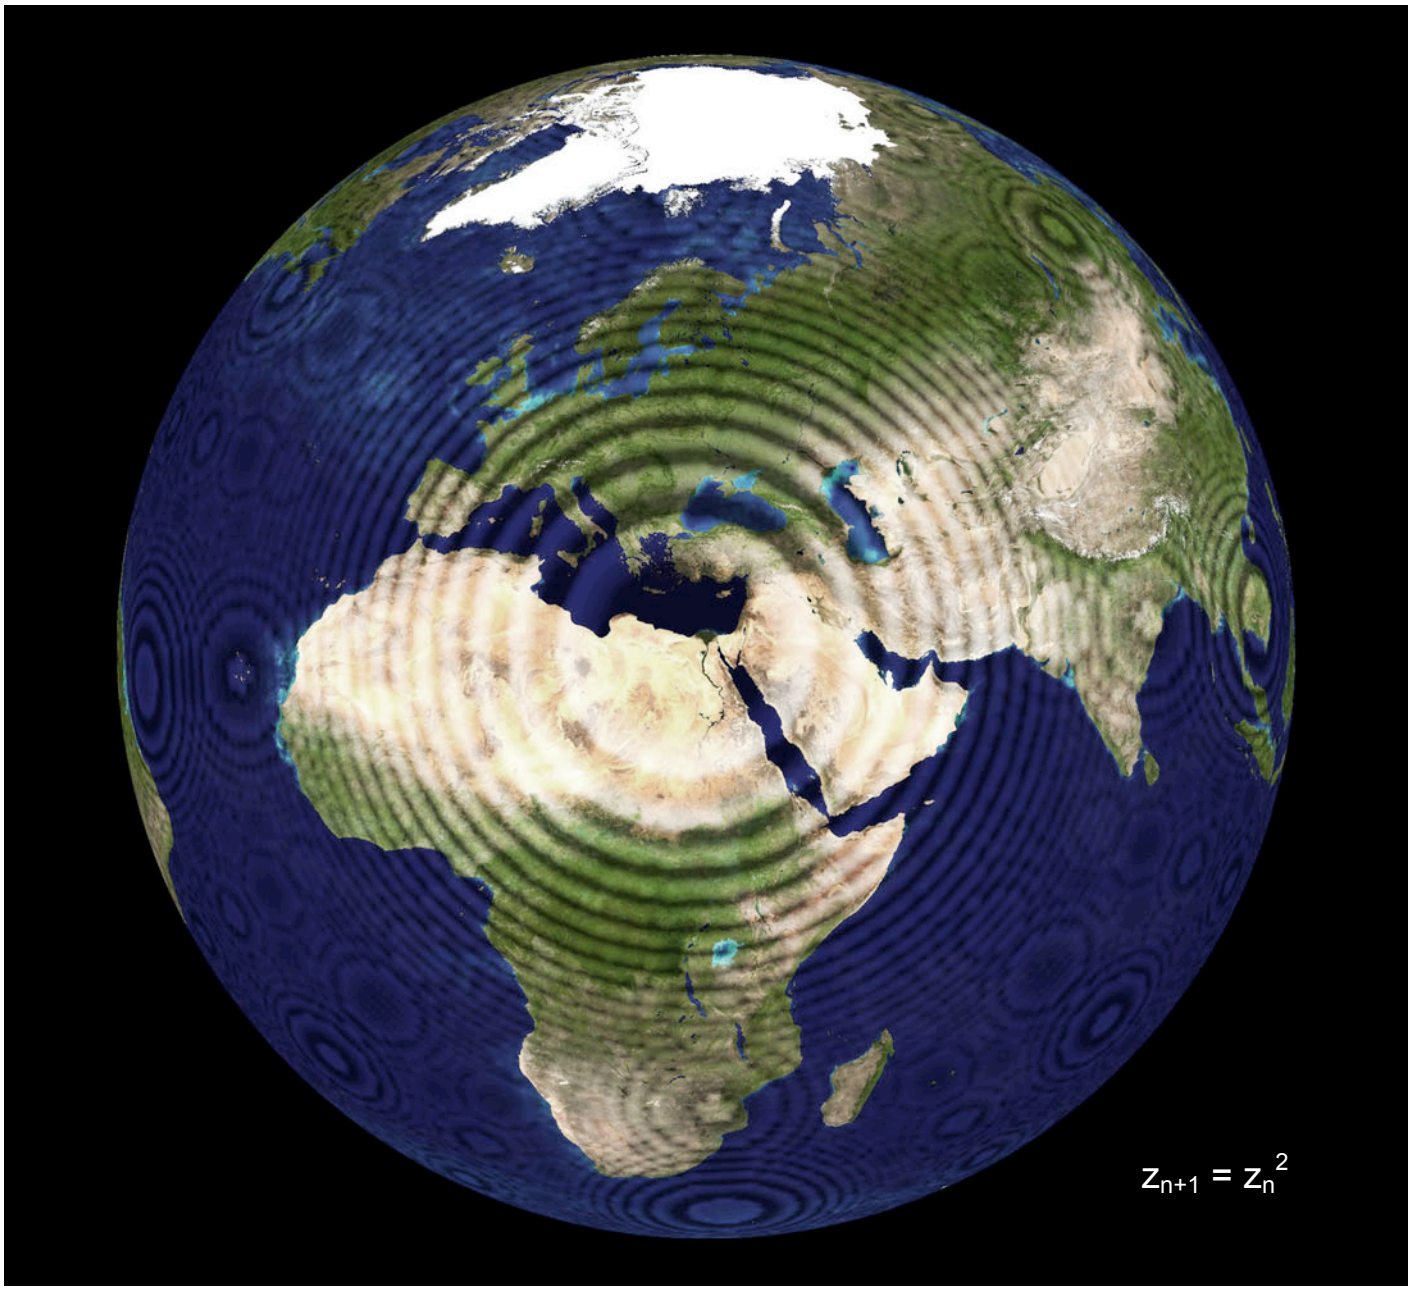
The deeper Atlantean roots of highly advanced psychoacoustic knowledge demonstrated by the great achievements of Roman monumental construction were preserved with symbolic forms intact. Roman application of such advanced physics knowledge accounts for the great respect held for Julius Caesar throughout the Empire, supporting the identification of Caesar as the founder of modern civilization.

Ancient Atlantean metalworks found in North American caves in both Mexico and the US further confirm the Paleolithic origin of the ancient elephant and palm tree symbols found on coins commemorating Julius Caesar –works produced over ten thousand years after the collapse of the advanced Paleo-Sanskrit motherculture due to a multitude of cometary impacts in the Atlantic region 12,890 years ago.[16]

Among several gold plates found by Jose Padilla at a burial site in Guerrero, Mexico in 1960 is a disc displaying the same elephant icon in profile, with its trunk raised in vocalization, vibrating the ground below the elephant's feet *representing long distance infrasound communication* (below). The droplet shape of the gold sheet references sacred Vedic water containing colloidal gold, called Soma[17]:



> Surprisingly, the disc depicts an elephant –an animal not native to Central America, but to Africa and Asia– in a standing position that is truly specific in its implications. Modern biology has only recently rediscovered the elephant's use of infrasound communication over vast distances. The ultra low vocalizations of these large pachyderms can carry around the globe coherently, and are used to send messages between herds across the great continent of Africa. Biologists have only recently filmed elephants standing with a front foot touching the ground only by the sensitive toenails, just as positioned on the Guerrero gold plate! The ancient Sanskrit artists of Oaxaca have depicted the inaudible infrasound signal as zigzag waveforms traveling through the ground to be received through the elephant's toenails [as well as through the trunk when laid on the ground].[18]

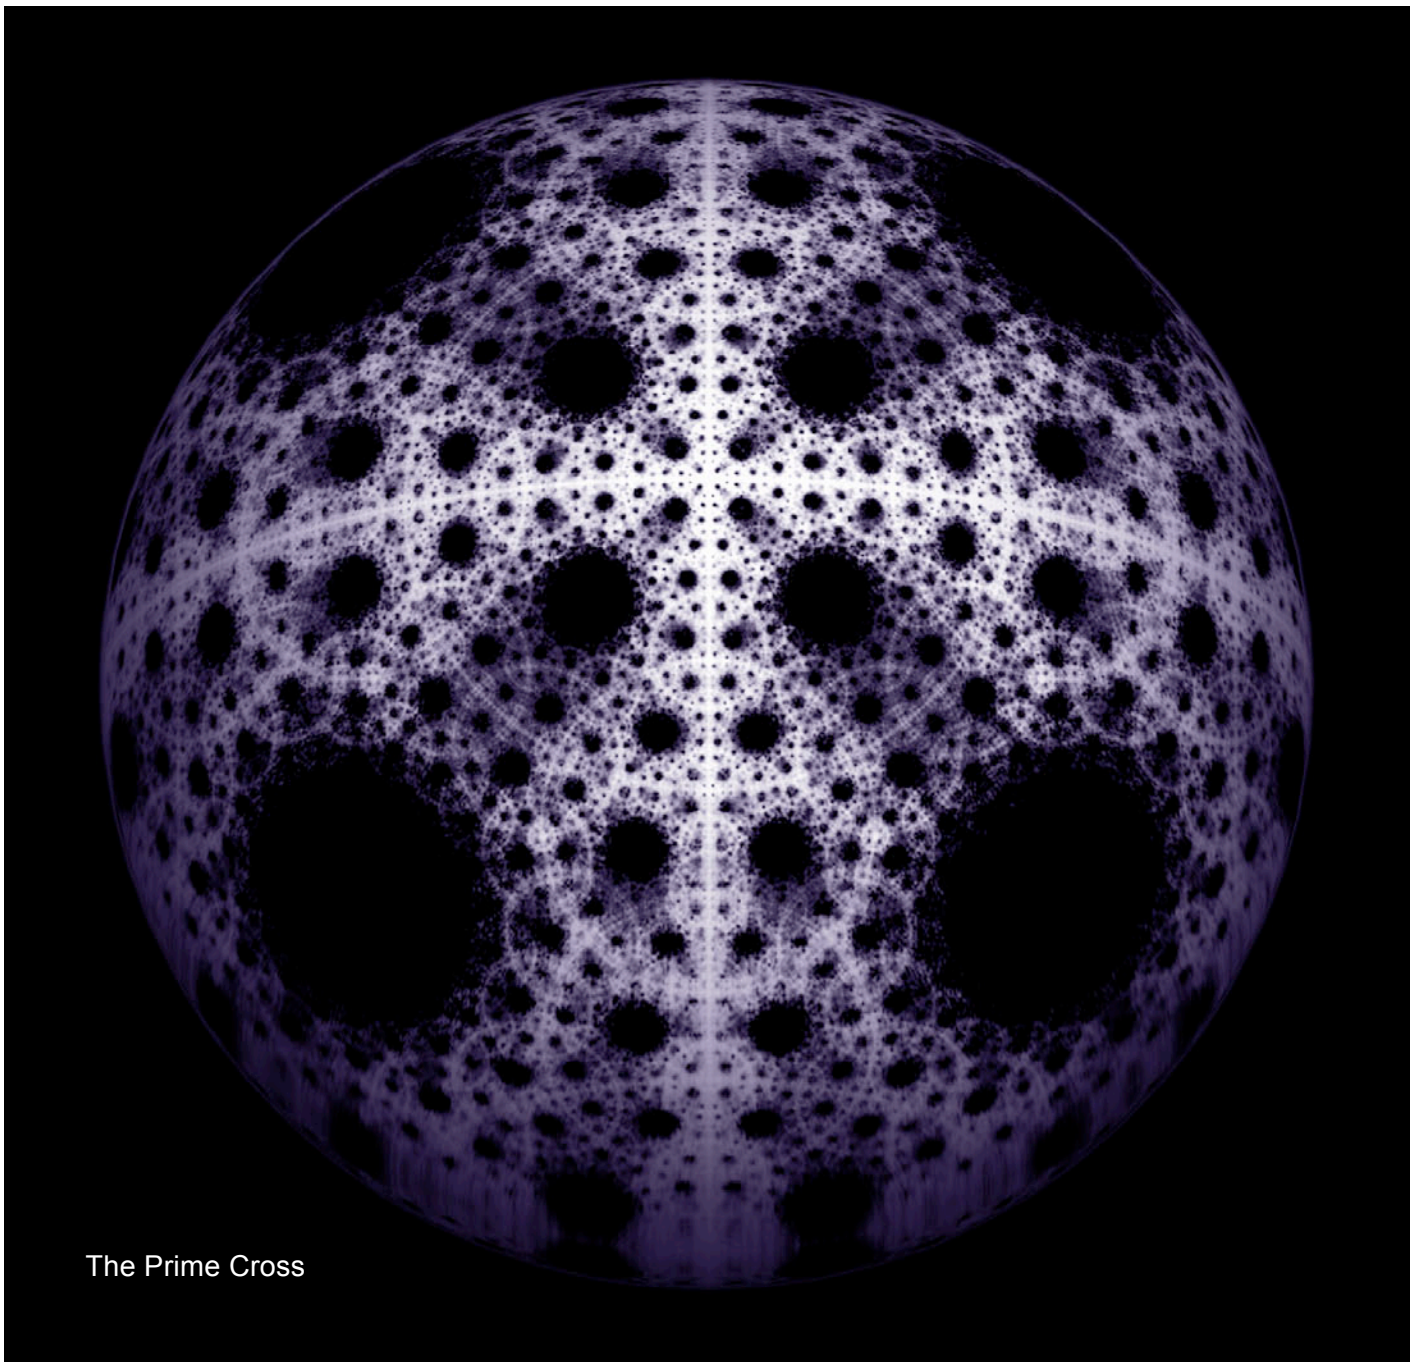


In the Paleo-Sanskrit language, the elephant hieroglyph symbolized Indra, the deified planet Jupiter that resonates deep infrasonic standing waves focused by the precisely geopositioned worldwide network of monumental pyramids and megaliths. Glyphs rendered below the elephant give the impression of ground vibrations, offering the full repeating hieroglyphic phrase: *Indra ra as-upama ra as-upama ra as-upama* , meaning "Jupiter: granting for the highest, granting for the highest, granting for the highest..." (above).

Similar Paleolithic artifacts with comparable statements praising beneficial infrasonic influences from Jupiter have also been retrieved in the US, from the Illinois Cave archive (opposite). One gold coin presenting the profile portrait head of an elephant is subtitled with Paleo-Sanskrit glyphs that read as: • *as pa i Indra ai* • , meaning "The one for protection (he) is, Jupiter, aye, the one".[19]

The elephant glyph also appears with a glyph for the Sun, with the six innermost planets of the solar system represented on a circular gold plate, reading: *Svar Indra : pa asura pa ra las ha u si sam oha* , meaning "The Sun, Jupiter, the two Lords, deities, protection granting brilliant ones, oh your universal excellence" (opposite).[20] The great abundance of Paleo-Sanskrit artifacts bearing the elephant glyph for Jupiter leaves no doubt that *Julius Caesar was High Priest of Jupiter, signified by the elephant, for his tremendous knowledge of infrasound standing waves*, as rediscovered by Nikola Tesla in 1899.[21]

• as pa i Indra aⁱ •
The one for protection (he) is, Jupiter, aye the one
Svar Indra : pa aśu - ra pa ra laˢ ha u si śaᵐ o - ha
The Sun, Jupiter, the two Lords, deities, protection granting brilliant ones, oh your universal excellence



aśu - aśu
life - life
$Z_{n+1} = Z_n^2$

Before his murder by Nazi agents in early 1943, Tesla had secretly developed monopulse radar designs using the quantum quadratic function for nonlinear standing waves: [$z_{n+1} = z_n^2$]. The quadratic standing wave function can also be used to map Earth's sphere, revealing resonant nodal geopositions enabling efficient transduction of planetary resonance for wireless power; *advanced knowledge that had also been utilized by Julius Caesar and exactly rendered in Etruscan goldwork with swastika glyphs* (opposite).

Roman temple sites confirm great circle pyramid alignments were also observed by Caesar: 'Founder of Cities' for wireless reception of infrasound. The ancient Roman city of Luna (44.06°N 10.00°E) is 1,511 miles from the apex of the Great Pyramid at Giza, a distance corresponding to 6.0% of Earth's mean circumference of 24,892 miles. This resonant geoposition is located precisely along the 44th N latitude, while its 6.0% great circle distance to Giza corresponds closely to $^1/_{16}$ of Earth's mean circumference.

The Colosseum in Rome, Italy (41.89°N 12.49°E) is located 1,324 miles from the Great Pyramid, comprising 5.3% of Earth's mean circumference. This resonant distance measurement approximates half the values of Fibonacci #131 in terms of percent of Earth's mean circumference and Fibonacci #353 in terms of miles (5.26% and 1,309 miles would accord to precisely half the F# values).

The Prime Cross

The Prime Cross spherical resonance mandala presents another visualization of the quadratic formula [$z_{n+1} = z_n^2$] for nonlinear standing waves stimulated by the Great Pyramid. The Prime Cross mandala is the mathematical basis for the sacred Rose Cross or Philae Cross. Profound knowledge of advanced bioelectrical physics offered in the final section of the last book of The Essene Gospel of Peace can now be recognized for its true brilliance, and bears powerful scientific witness to the resurgence of Paleolithic Sanskrit wisdom within the Roman Empire that compels a sharp revision of historical perspective.

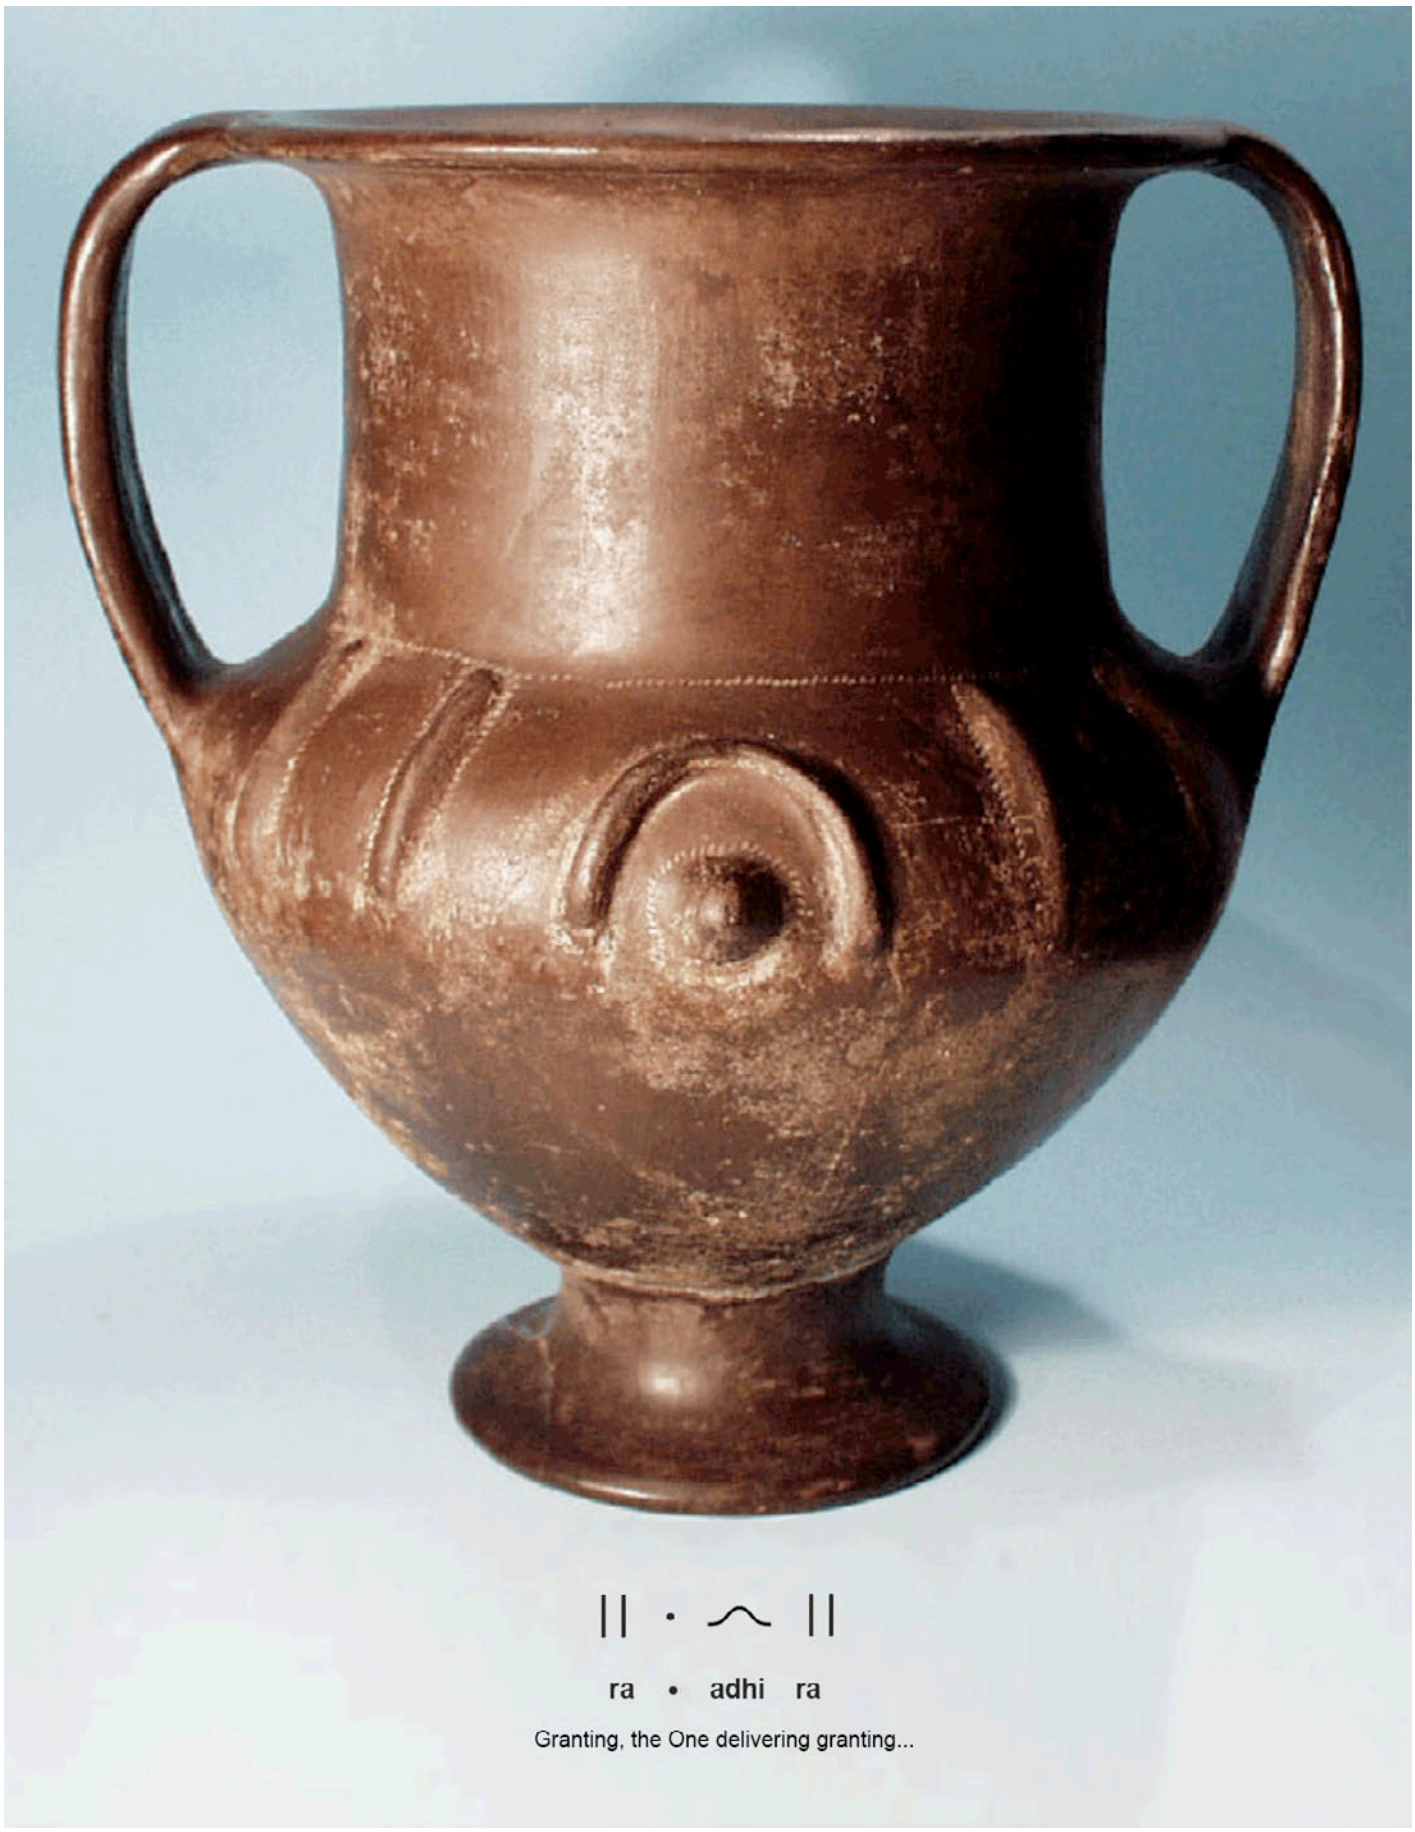
'The Holy Streams' is a mystical term that was used to describe infrasound standing wave resonance. High Vedic knowledge of Nature's symphony resonates throughout the profound words of Jesus, describing the trembling physiological state of *Kundalini awakening* experienced by Essene adepts:

> *"And as you embrace your Brother Tree, the power of the Holy Stream of Life will fill your whole body, and you will tremble before its might.*[22]

Philae Cross Gold Pendant
Byzantine Empire
~600 AD

Vedruss traditon has preserved this Paleo-Sanskrit knowledge of the powerful symboisis of human beings with trees through heartbeat resonance as a function of DNA communicaion that occurs through barefoot contact with the soil around the tree, and by providing your saliva for the seed to receive your DNA.

Paleolithic remains at the Sanctuary of Baal Hamon in Gabir, Spain reference the same resonant effect of biorhythmic synchronization once induced on a global scale by the Great Pyramid. A fragment of a cast geopolymer stone column presents Paleo-Sanskrit hieroglyphic inscriptions that read: *mi-is raua kara upama raua mi-is* , meaning "Synchrony roaring, action (of) the highest, roaring synchrony" (above).



Matching geometric signs used during the Neolithic period by the Villanovan culture of Italy also represent Paleo-Sanskrit votive statements. A blackware jug reads: • • • *ra sura sura adhi • ra* , meaning "The One, the One... granting divinity, divinity..., delivering granting (of) the One..." (opposite). Another vessel with large handles reads: *ra • adhi ra* , meaning "Granting, the One delivering granting..." (overleaf). *These linguistic references go ignored by epigraphers for they directly reinforce the monumental evidence informing the function of geopolymer pyramids: for the psychoacoustic synchronization of humanity.*

• • || 1 || 1 || ⌒ • ||

• • ra sura sura adhi • ra

The One, the One... granting divinity, divinity..., delivering granting (of) the One...

ra • adhi ra

Granting, the One delivering granting...

The Llanganates Complex

The Llanganates Complex

Located in the Ecuador's Tungurahua province, an ancient pyramid structure only a dozen miles from the active volcano has been uncovered by a small landslide caused by water cascading down one of its steeply inclined faces. Residents of the small town of Colonia Azuay, in the Rio Negro region of the Llanganates Mountains, accidentally discovered the megalithic pyramid site a few decades ago.

Expedition video by Manuel Vieira and friends obtained in 2011 and 2012 brought local attention[1], as well as later expeditions produced for worldwide media hype regarding false claims of giants associated with this ancient monumental site. Aerial imagery of the location provides surprisingly little definition of subsoil architectural features due to the dense rainforest canopy of the area, which deposits great amounts of soil over many thousands of years to obscure virtually all traces of the ancient Paleo-Sanskrit civilization.

The Llanganates Pyramid Complex, Ecuador (1.3597°S, 78.1533°W) is situated exactly 7,421 miles from the Great Pyramid, representing 29.81% of Earth's mean circumference. At this interval, infrasound has induced spontaneous piezoelectric explosions and fires in California at Death Valley[2] and Calaveras[3], and a seismic tear in the earth at Huacullani, Peru.[4] Throughout the streams cutting down into this site are timeworn remnants of piezoelectric stone walkways, ledges and refaçaded mountainsides that are highly similar to the pyramid complex simultaneously being uncovered in La Maná, Ecuador.

Llanganates Ridge Temple, Ecuador
1.3611°S, 78.1687°W

The impressive scale of this pyramid complex can only be guessed at, as all detailed satellite data and remote sensing surveys have been completely denied to the general public. Large, exposed sections of wall and foundation stones that have drawn so many visitors do not comprise a single, solitary pyramid construction, but represent the most exposed structure of a megalithic complex *cast in geopolymer basalts.*

Due west of the main pyramid is a raised, horizontal section of high ridgeline that conforms to a perfect North-South alignment, and once commanded a great view of the entire Llanganates complex during its long period of use, before the giant trees took their hold by root.

Identified here for the first time as the *Llanganates Ridge Temple* (1.3611°S, 78.1687°W), this axis-symmetric subsurface feature (above) constitutes a major megalithic monumental construction exceeding 80m in length and connected to adjacent temples below and further above by reinforced metallic geopolymer stone walkways.

No excavations or significant exploration of the Ridge Temple have been conducted, yet the extreme angle of the ridgeline assures that the soil adept has been consistently reduced along the sides of the structure over time. Streams of water divulge most visible traces of these ancient underlying mega-structures by carving pathways of least resistance as the flow downward with gravity. The clearest and most abundant examples of ancient stonework collect in the lower areas of the valleys where greater waterflow clears off larger areas of jungle undergrowth.

Many unusual forms of river stones collect at the bottom of these steep river canyons that block easy entry to these densely forested pyramid sites. Perfectly flat faces are contrasted by bulbous formations (below). Manuel Vieira captured the first significant documentary footage made public, presenting the extreme hardness and heaviness of oddly shaped stones encountered during the long river access entry hike into the Llanganates Pyramid Complex that have been observed at several other related ancient sites:

We are finding cut rocks along the way. Over there are other stones that they're removing.

What does it measure?

It measures approximately 40cm in length.

And how much do you think it weighs?

It weighs... some 10 lbs... –some 15 lbs.

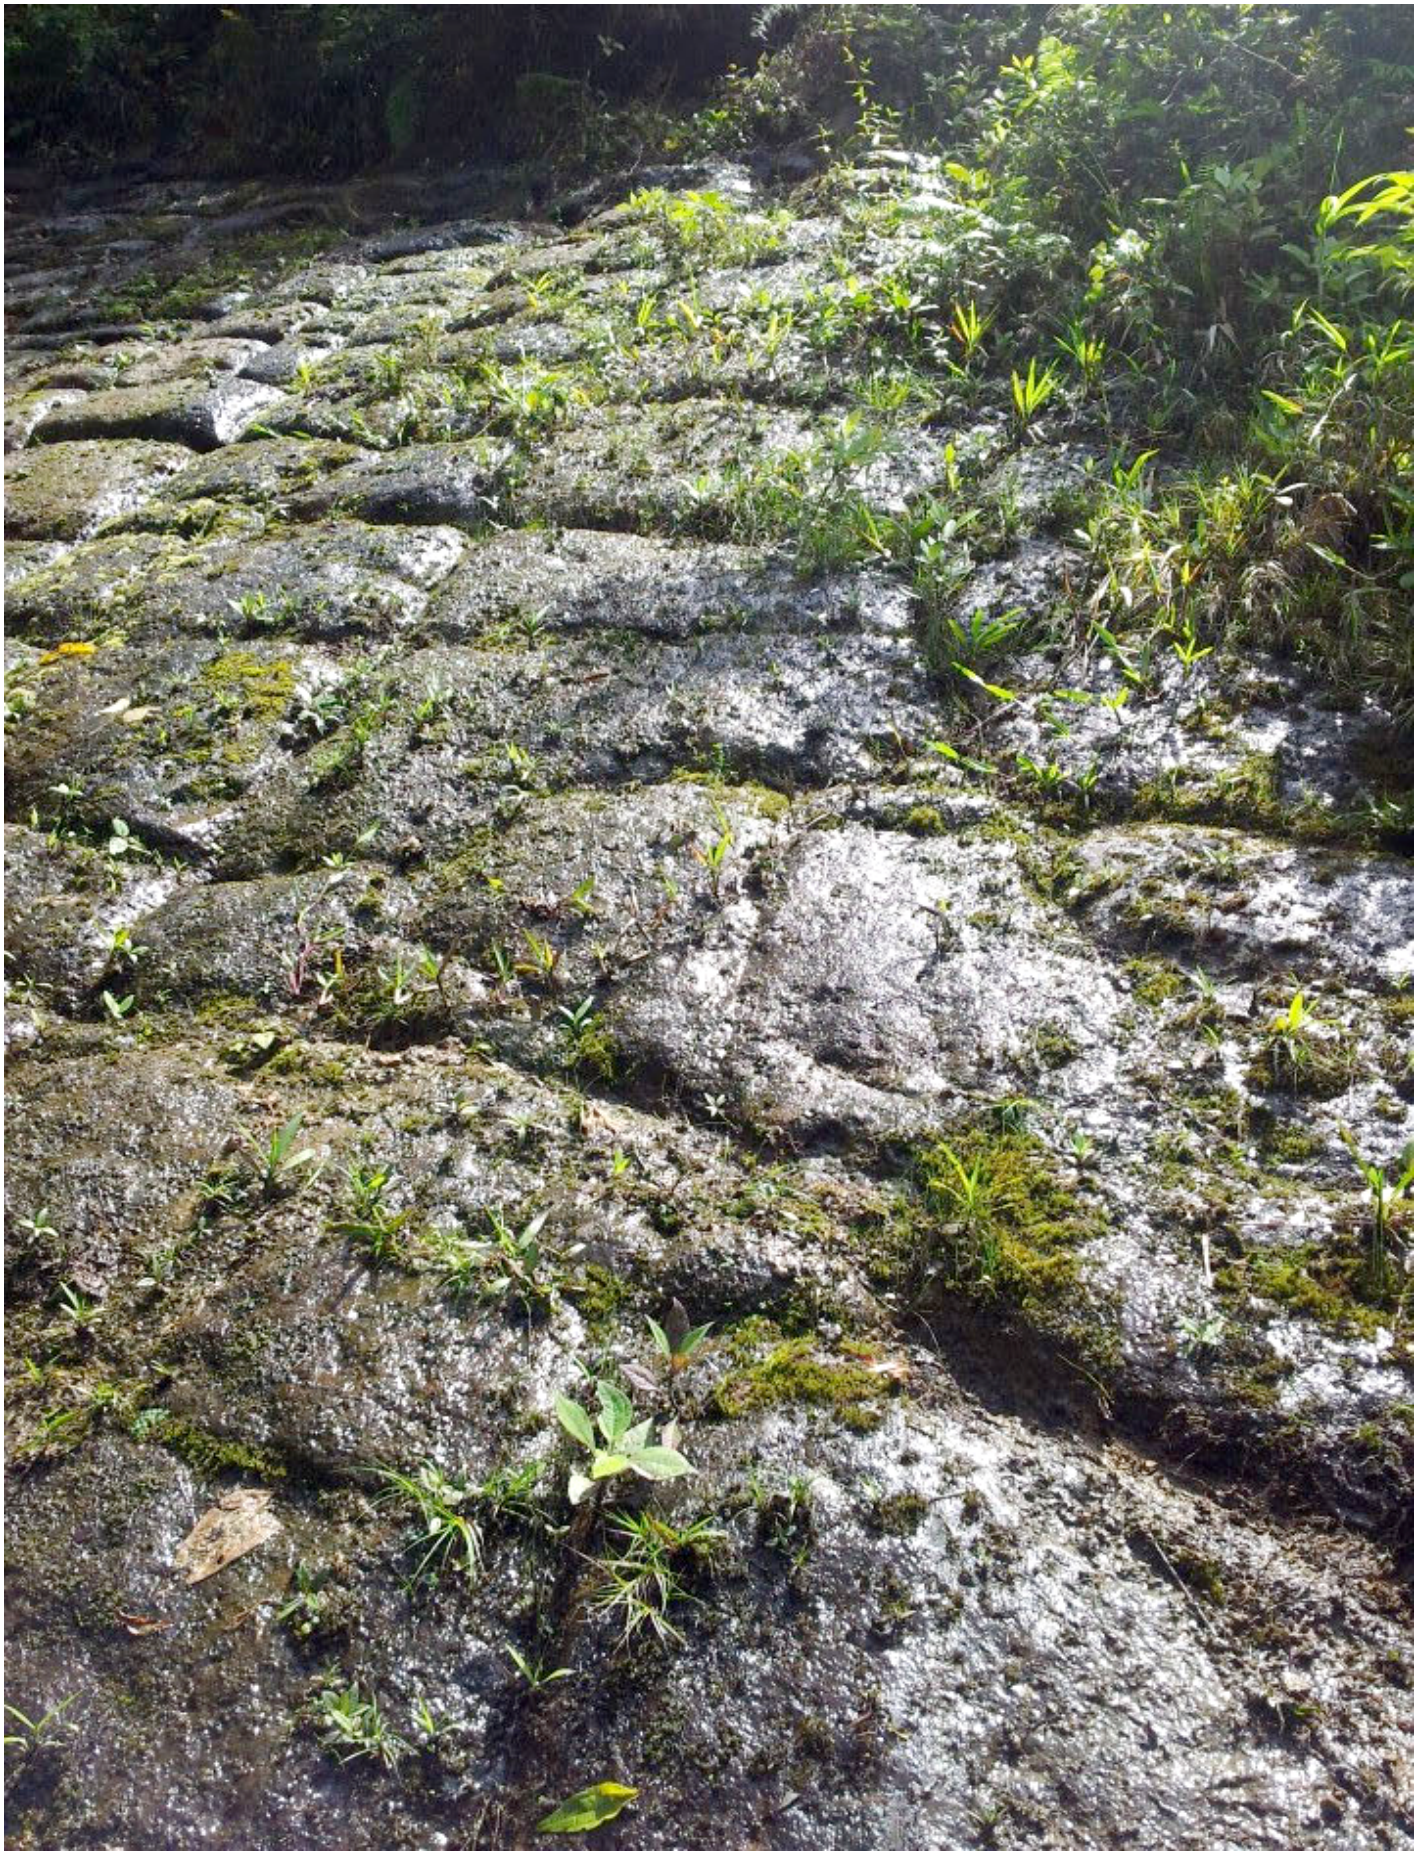
And it has the form of a 'hammer', a tool... Of these, it is the second we found in the zone, and its very heavy. It has quite a strong constitution.

This is the third 'hammer' we have found.

For grinding something, because it seems to be a mortar. It is... 25cm... by 30cm... and by 20cm. Yes... look... look... Each time we are getting close to the location that we want to arrive at: the Wall.

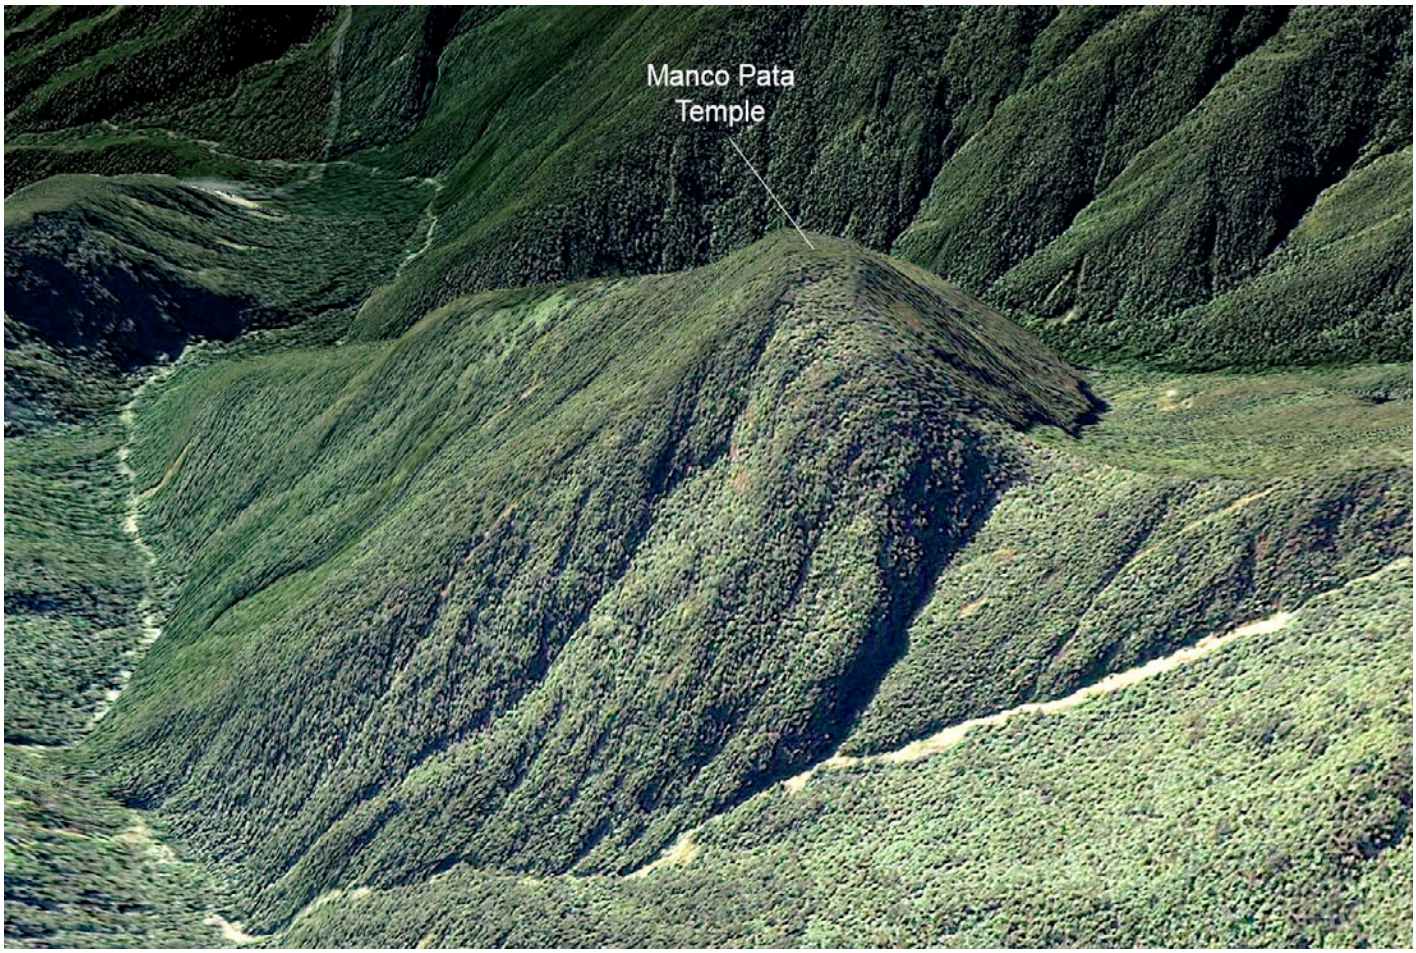
Here he has found some stones, very interesting... polished stones. One can't consider these as naturally formed stones. Straight stones, and this one looks like a water channel.

Llanganates Pyramid, Ecuador
1.3597°S, 78.1533°W

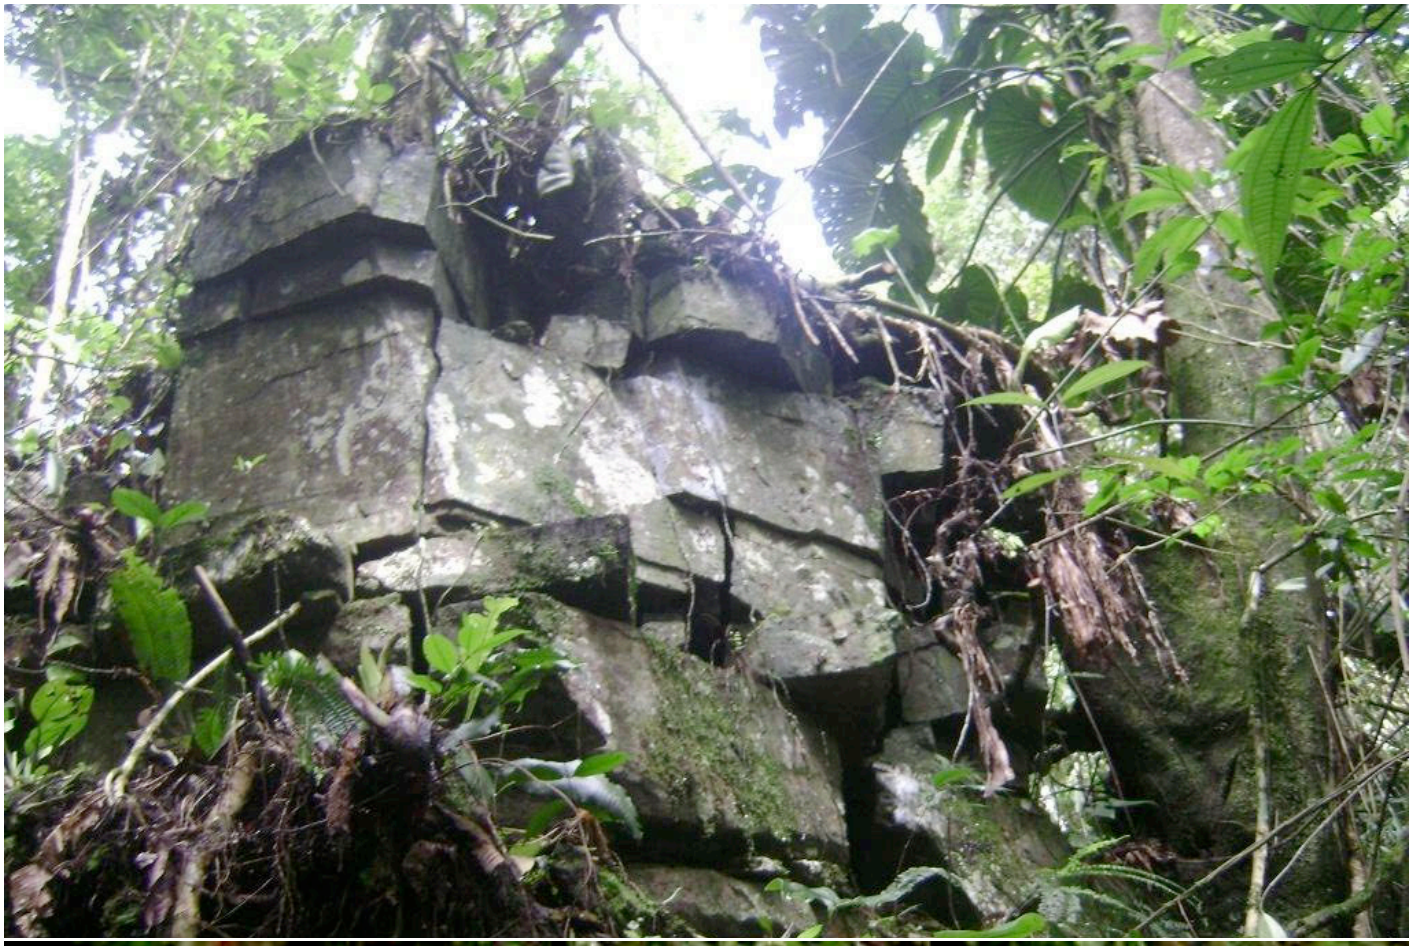


Standing along a safe, narrow landing located exactly halfway up the steadily sloping waterfall, an explorer/ filmmaker describes his immediate impression of the stark regularity of the stepped structures that fully extend from the bottom of the sheer face to the top. He describes the regular stepped features as 'grades':

> We are at the middle of the waterfall. One can observe this system of grades... One can look over the structure of the wall, the forms of stones: squared, rectangular, and made in the form of a rhombus – perfectly perpendicular.
>
> A waterfall flowing down a rock wall. A wall constructed by human beings. Very straight, no? This is the line; it goes from here, straight down below.
>
> Look at the line of the union of the stones. They are large stones of 1.5m in height. This is a vertical line of union. There are other lines of horizontal unions. And also in the form of rhomboids, on the other side.
>
> All of this, if cleaned, is more than 100m of wall covered by vegetation. This is part of conjoined archeological vestiges of a very large system of construction.
>
> It's really surprising, what we are, at this moment, having the privilege to be present [to see] in this beautiful site –for the Nature, and very interestingly, for the mysteries it raises: Who built them? With what objective? For what? Why did they make such an effort?
>
> This is the other vertical line of the wall. It's an immense wall. An immense wall of stone. And from below, uncovered by a waterfall. These are the remains of a wall, [with] stones [that have been] perfectly fitted. Look at the cuts...



The astounding scale and unexplored majesty of Ecuador's Llanganates pyramid complex is paralleled by another lost Atlantean city discovered in the high-altitude bamboo forests of the Peruvian Andes. In Cuzco Province, merely 94 miles from the megalithic stonework of Saqsaywaman Temple, local farmers in the vicinity of Unión Vista Alegre uncovered stacked sandstone blocks with regular moldwork that bear all the hallmarks of Atlantean geopolymer temple constructions. Later named the Manco Pata Fortress, the site was confirmed on video by the town mayor in 2008, and announced to the world as a major discovery.[5]



While many blocks are small, others are megalithic in scale. Closely matching the cast geopolymer sandstone walkways and pavements of the Visoko Pyramid Complex in Bosnia, piezoelectric quartz crystals comprising the sandstone blocks transduce incident infrasound standing waves from the Great Pyramid into a localized electromagnetic field encompassing the mountaintop temple site (below).

Manco Pata Temple (12.9675°S, 73.2627°W), near Unión Vista Alegre, in Cuzco, Peru, is 7,518 miles from Giza, or 30.20% of the Earth's mean circumference of 24,892 miles. This resonant great circle distance from the Great Pyramid approximates the Fibonacci ratio of 2:3:5 that accounts for the great clustering of ancient piezoelectric temples throughout the coastal and mountain regions of Peru.

Located along the 13° South latitude, the site conforms to the perfect latitudinal alignments and Fibonacci-ordered geopositions of the La Maná Pyramid Complex along 1°S, Great Pyramid Complex along 30°N, Bosnia Pyramid Complex along 43°N, the Padang Pyramid along 7°S, and so on with other sacred sites.

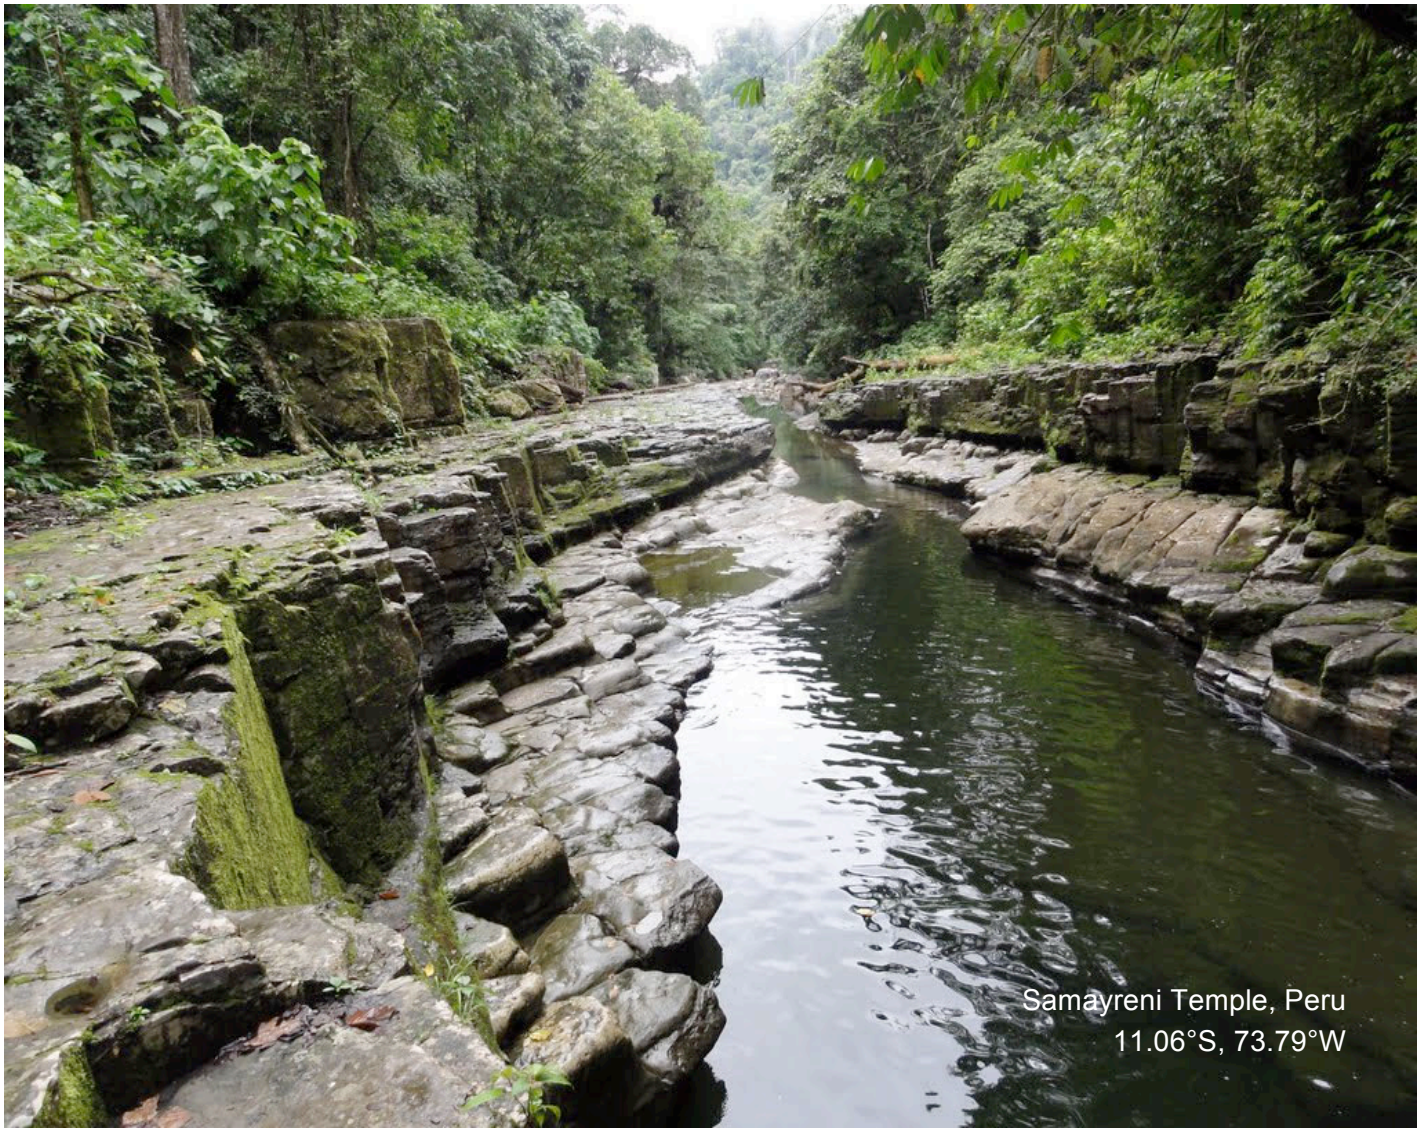
The regularly cast blocks of geopolymer sandstone uncovered at Manco Pata display the same angular symmetries observed at the pyramid complexes of the Llanganates and La Maná, Ecuador. The same characteristic orange kaolin clay-based geopolymer cement can be seen adhering to the sandstone surfaces at Manco Pata, whereas the Ecuadorian pyramids were entirely cast in artificial magnetic basalt. *Both Manco Pata and the Llanganates pyramids were produced by the Ohum Paleo-Sanskrit civilization.*

The local community of Unión Vista Alegre has voluntarily labored for thousands of hours in vine-entangled forests to uncover many of the low walls and platform pavements of this ancient sandstone temple (above).[6] The collective community effort has only been organized and accomplished because of widespread local acknowledgment of discoveries that most have had the privilege to see for themselves (above, opposite).[7]

Outside the local community, however, the overwhelming evidence of the existence of this large mountain-top platform temple has been entirely dismissed by well-paid beaurocrats, news agencies and government archeologists in Peru who blindly follow the lead cover-up executed by none other than the National Geographic Society, the notorius American government propaganda mouthpiece.

Without ever publishing any data or actually doing any analysis of the site at all –*and without even giving the location of site so as to keep it hidden*– Nat Geo showed photographs of the site in one short article[8] (which clearly depict regularly cast stone blocks stacked in perfect rows) as evidence for the its entirely natural origin. *This obvious fraud was picked up by global news and enforced by Peruvian authorities.*

The crime of obfuscation and cover-up of this Paleolithic Ohum temple site was deemed necessary by government agencies after thorough investigation by satellite surveillance and remote sensing radar to determine the configuration of ancient tunnel systems that exist below the Manco Pata platform temple.

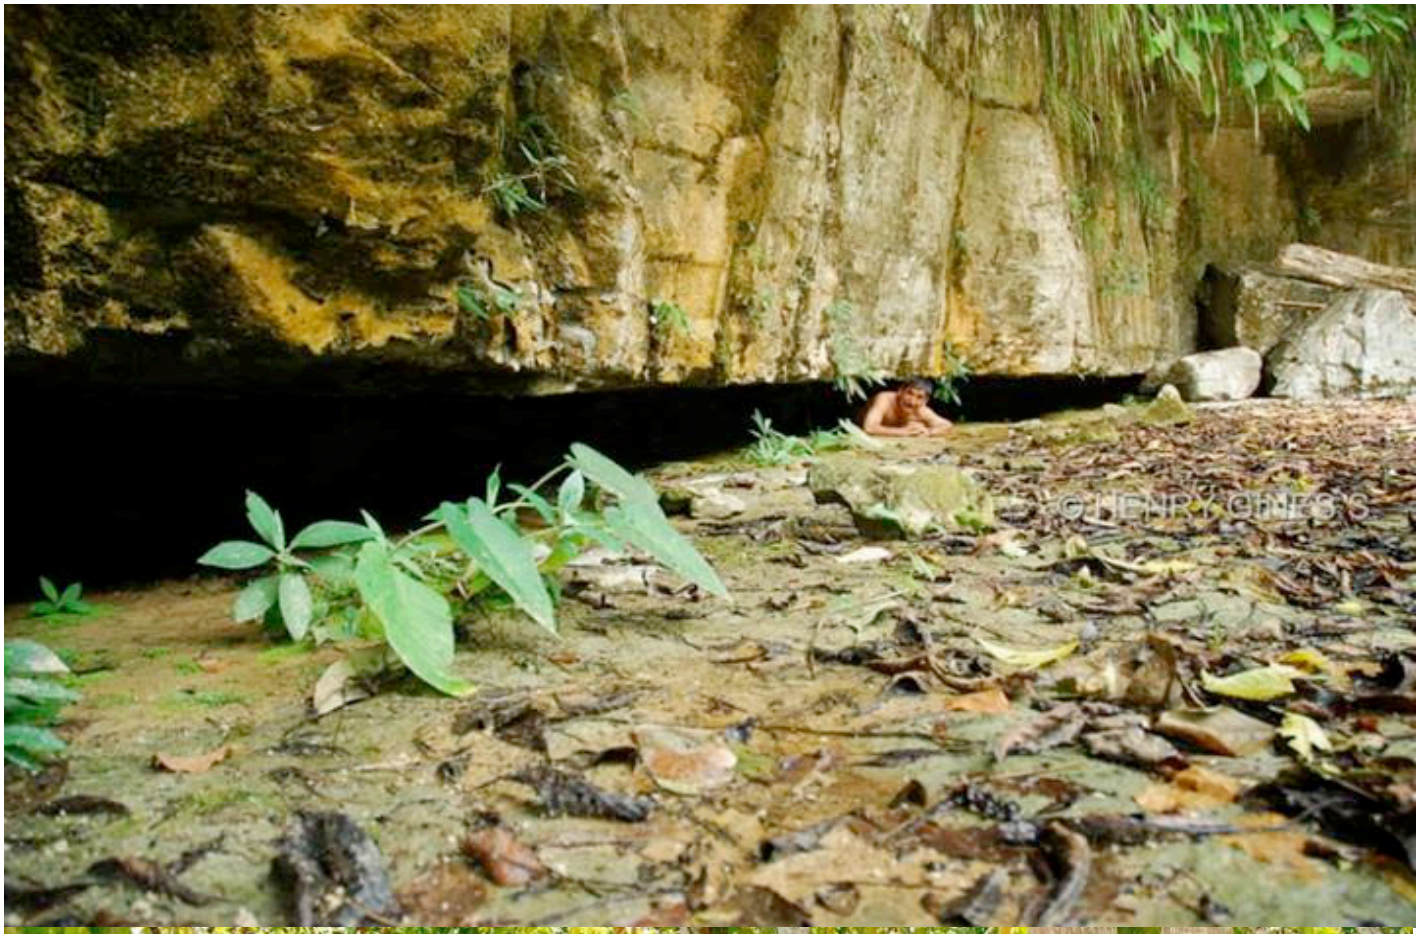


Denial of recognition by the VRAE, the regional cultural patrimony authority, has been done for the sole reason that the ruins hide multiple entrances to extensive networks of underground tunnels and chambers that were once used for bioelectrical healing of the human body through qi healing practices. Such practices are still used in secret today in parts of Southeast Asia, and only because of this strict secrecy have these advanced healing arts escaped persecution and extinction by criminal government means.

This pathetic cover-up of the Manco Pata temple discovery by National Geographic and the goverment of Peru continue the psychopathic colonial legacy of cultural destruction, theft and denial of the ancestral heritage of Andean peoples that encompasses advanced Atlantean technologies still usable to this day.

This whole situation with sacred sites in Peru reflects the desperate state of denial maintained by the Ecuadorian government concerning the La Maná Pyramid Complex, the Llanganates Pyramid Complex and the Tayos Cave Complex, all of which have been artificially cast in magnetic geopolymer basalt that can be immediately detected by a simple magnet.

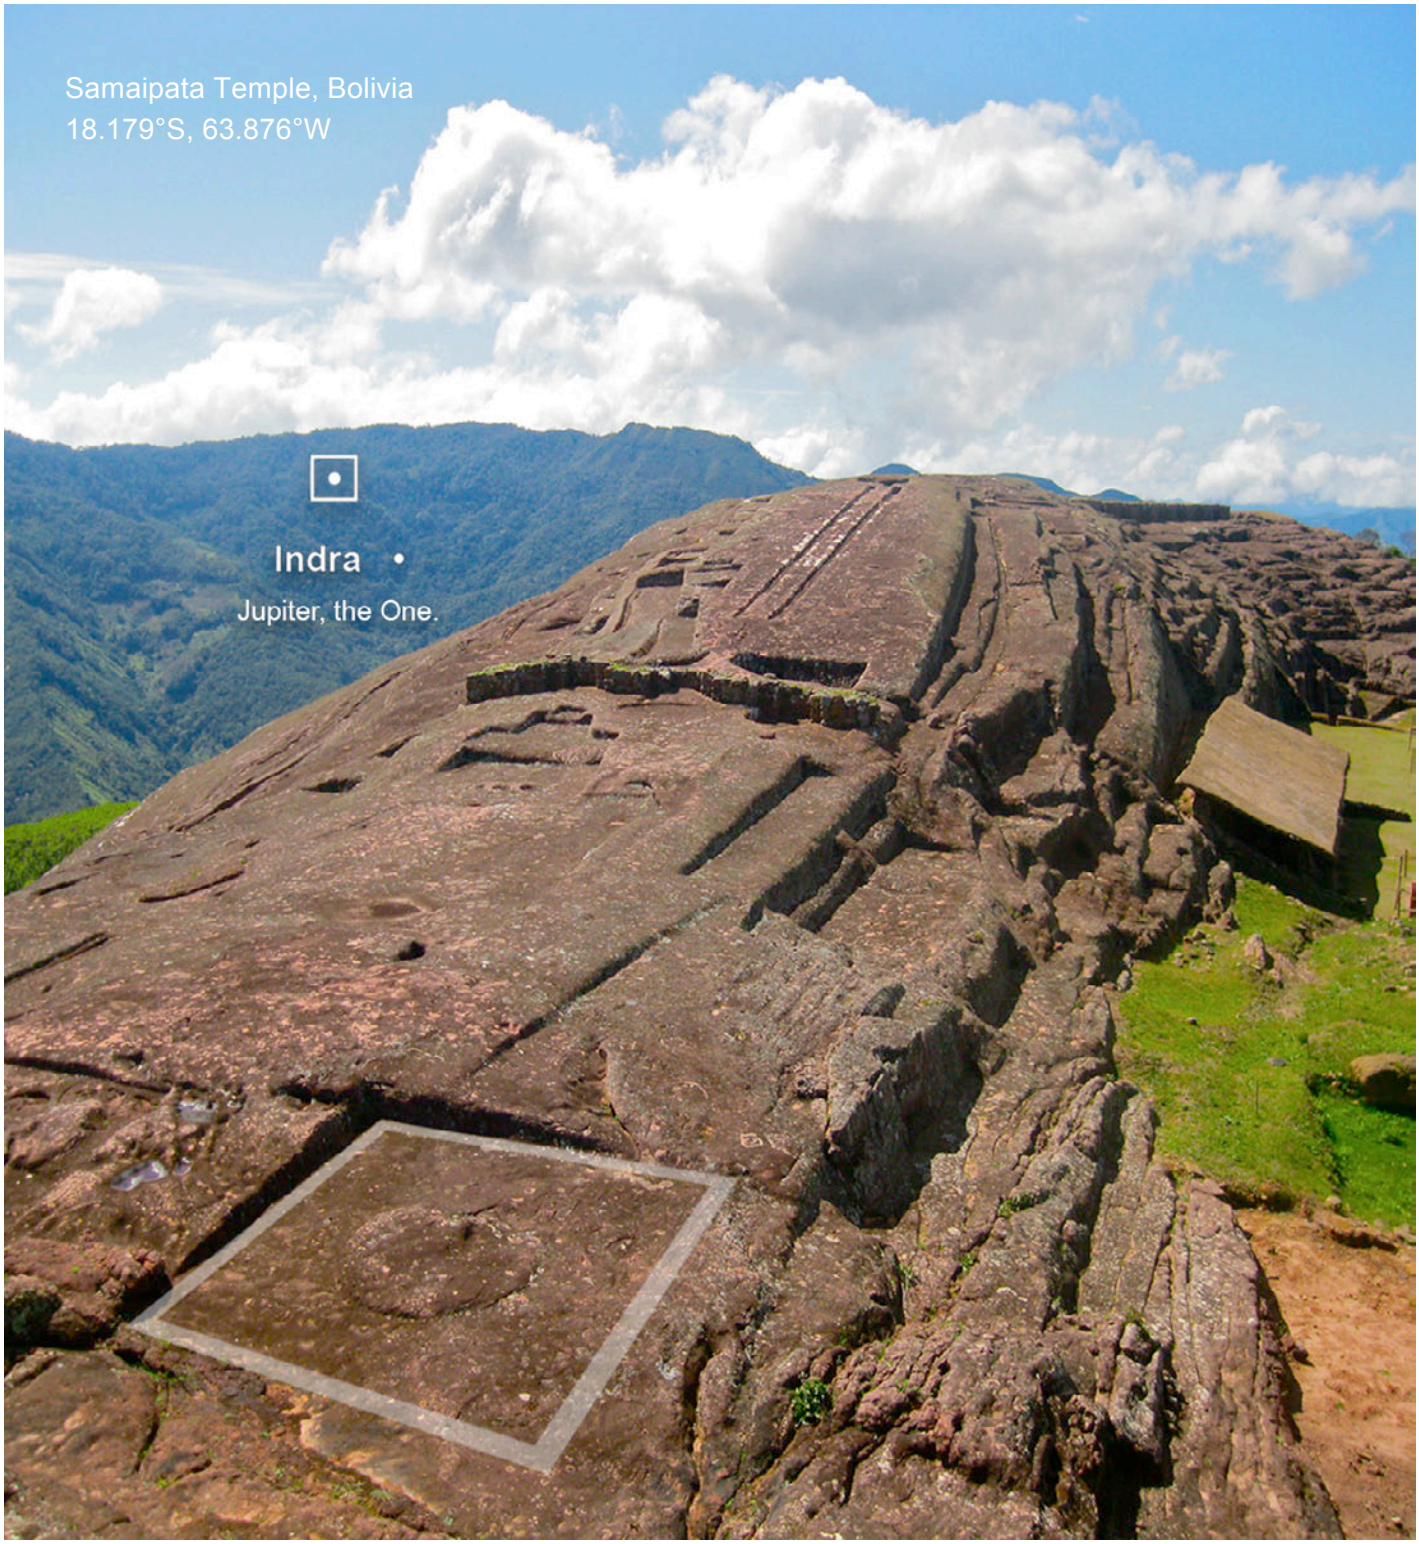
The synthetic nature of the construction materials constitutes the essential cultural factor linking the origin of all of these ancient sites with the manufacturing prowess of the Ohum Paleolithic culture that applied advanced geopolymer chemistry developed by scientists of the neighboring Atlantean civilization. *Deeper memories of the ancient ways of barefoot temple life are now reawakening in modern humanity.*



Many similar temple sites from the Paleolithic era, since fallen into ruin by disuse and covered by several millennia of soil build-up and tectonic battery, are gaining the attention of modern adventure-seekers for their unusual beauty and striking stonework. While most visitors to these sacred Paleolithic temple sites are not consciously aware of the infrasonic energies transduced at the site, yet something about the place draws them to repeated visits with friends. Some of those visitors possess past life memories that link their spirit to these ancient Ohum sites, hidden away in the Peruvian and Ecuadorian rainforests.

One of the most remarkable of these ancient Ohum sites that has not yet been identified by archeologists in Peru is the river temple complex called Samayreni. The bedrock of the river itself is entirely formed by synthetic geopolymer basalt stonework, bearing regularly repeating patterns that exactly correspond to the mould-work apparent in the Llanganates and La Maná Pyramid Complexes, both of which were built along large rivers. *In fact, large buried structures adjacent to the river comprise several monumental temples.*

Samayreni, Peru (11.06°S, 73.79°W) 7,488 miles from the Great Pyramid, or 30.08% of the Earth's mean circumference. This river temple site is precisely located along the 11th South latitude, conforming to the perfect latitudinal alignments and Fibonacci-ordered geopositions of so many other Paleolithic structures and cave systems that were especially designed for transduction of acoustic energy from the pyramids.



Paleo-Sanskrit hieroglyphic texts[9] have also been cast into large geopolymer boulders found throughout the forests in the vicinity surrounding this ancient temple city. Chakra wheels, hypnotic spirals and stacked portal imagery present embedded votive phrases praising the protection of Jupiter (overleaf).

The same Paleolithic Sanskrit script has gone unidentified at many other geopolymer temple sites in the neighboring country of present-day Bolivia, where a greater sense of the cultural significance of the ancient ways have been preserved. Annual festivals of the sun celebrate the energies that converge at sacred sites where local healers still recharge their powers today, such as the grand platform temple of Samaipata.

The entrance to the large, stepped platform structure has been cast with a large geometric dedication of the sacred site to the controlling infrasonic forces of the one-eyed plasma giant: *Indra* • , or "Jupiter, the One" (above). Despite significant erosion of its forms, the votive ligature can still be clearly discerned.

The dominant motif at Samaipata are a pair of long, geometric linear depressions in the long ramping section of the monument that gives the stark appearance of a runway or landing pad for large aerial vehicles. While giving the clear impression of a spaceport, the parallel lines are flanked by repeating lines of diamonds that confirm the linear patterns as phrases of sacred Paleo-Sanskrit hieroglyphs.

These five vertical lines of ancient votive text read: *raua ya ra* , meaning "Roaring commencing granting" (above), offering an explanation of the bioelectrical function of the temple of Indra, for focusing the infrasonic reverberations of the planet Jupiter for supplying all the necessities of advanced spiritual life.

Samaipata, Bolivia (18.179°S, 63.876°W) is 7,127 miles from the Great Pyramid of Giza, Egypt –a great circle distance comprising 28.6% of Earth's mean circumference. This geoposition maximizes the reception of infrasound standing waves amplified by all piezoelectric temples within the ancient Atlantean power grid system, thereby endowing biorhythmic synchronization of people at each temple site worldwide.

The presence of Paleo-Sanskrit language signs at each and every one of these synthetic geopolymer stone temples confirms their construction during that far-removed era of advanced technological society on our planet, calling the eyes of the whole world to redirect our attention to the underlying truths, long forgotten.

At the left side of the grand entry platform at Samaipata, opposite the square votive ligature, is a matching circular votive ligature reading: • *Indra adhi* , meaning "The One, Jupiter delivering" (above). This juxtaposition of inset square and circular patterns, as well as the worn look of the stepped geopolymer basalt platform itself, exactly match recent findings from the Baltic Sea floor. Investigation of both sites confirms the same advanced reconstituted magnetic basalt construction methods were identically applied at both sites. Both sites also give the distinct impression of a spaceport for recieving aerial visitors.

The Paleolithic origin of the Baltic Sea Monument is undeniable, as the last time sea levels were low enough to expose the entire site was ~14,000 years ago. The striking similarity between the Baltic Sea Monument and the Samaipata monumental platform in the highlands of Bolivia provides strong support for Edgar Cayce's trance assertion that the Atlanteans had shared their advanced technological knowledge of global psychoacoustics and geopolymer pyramid construction with the Ohum culture of the Andean region.

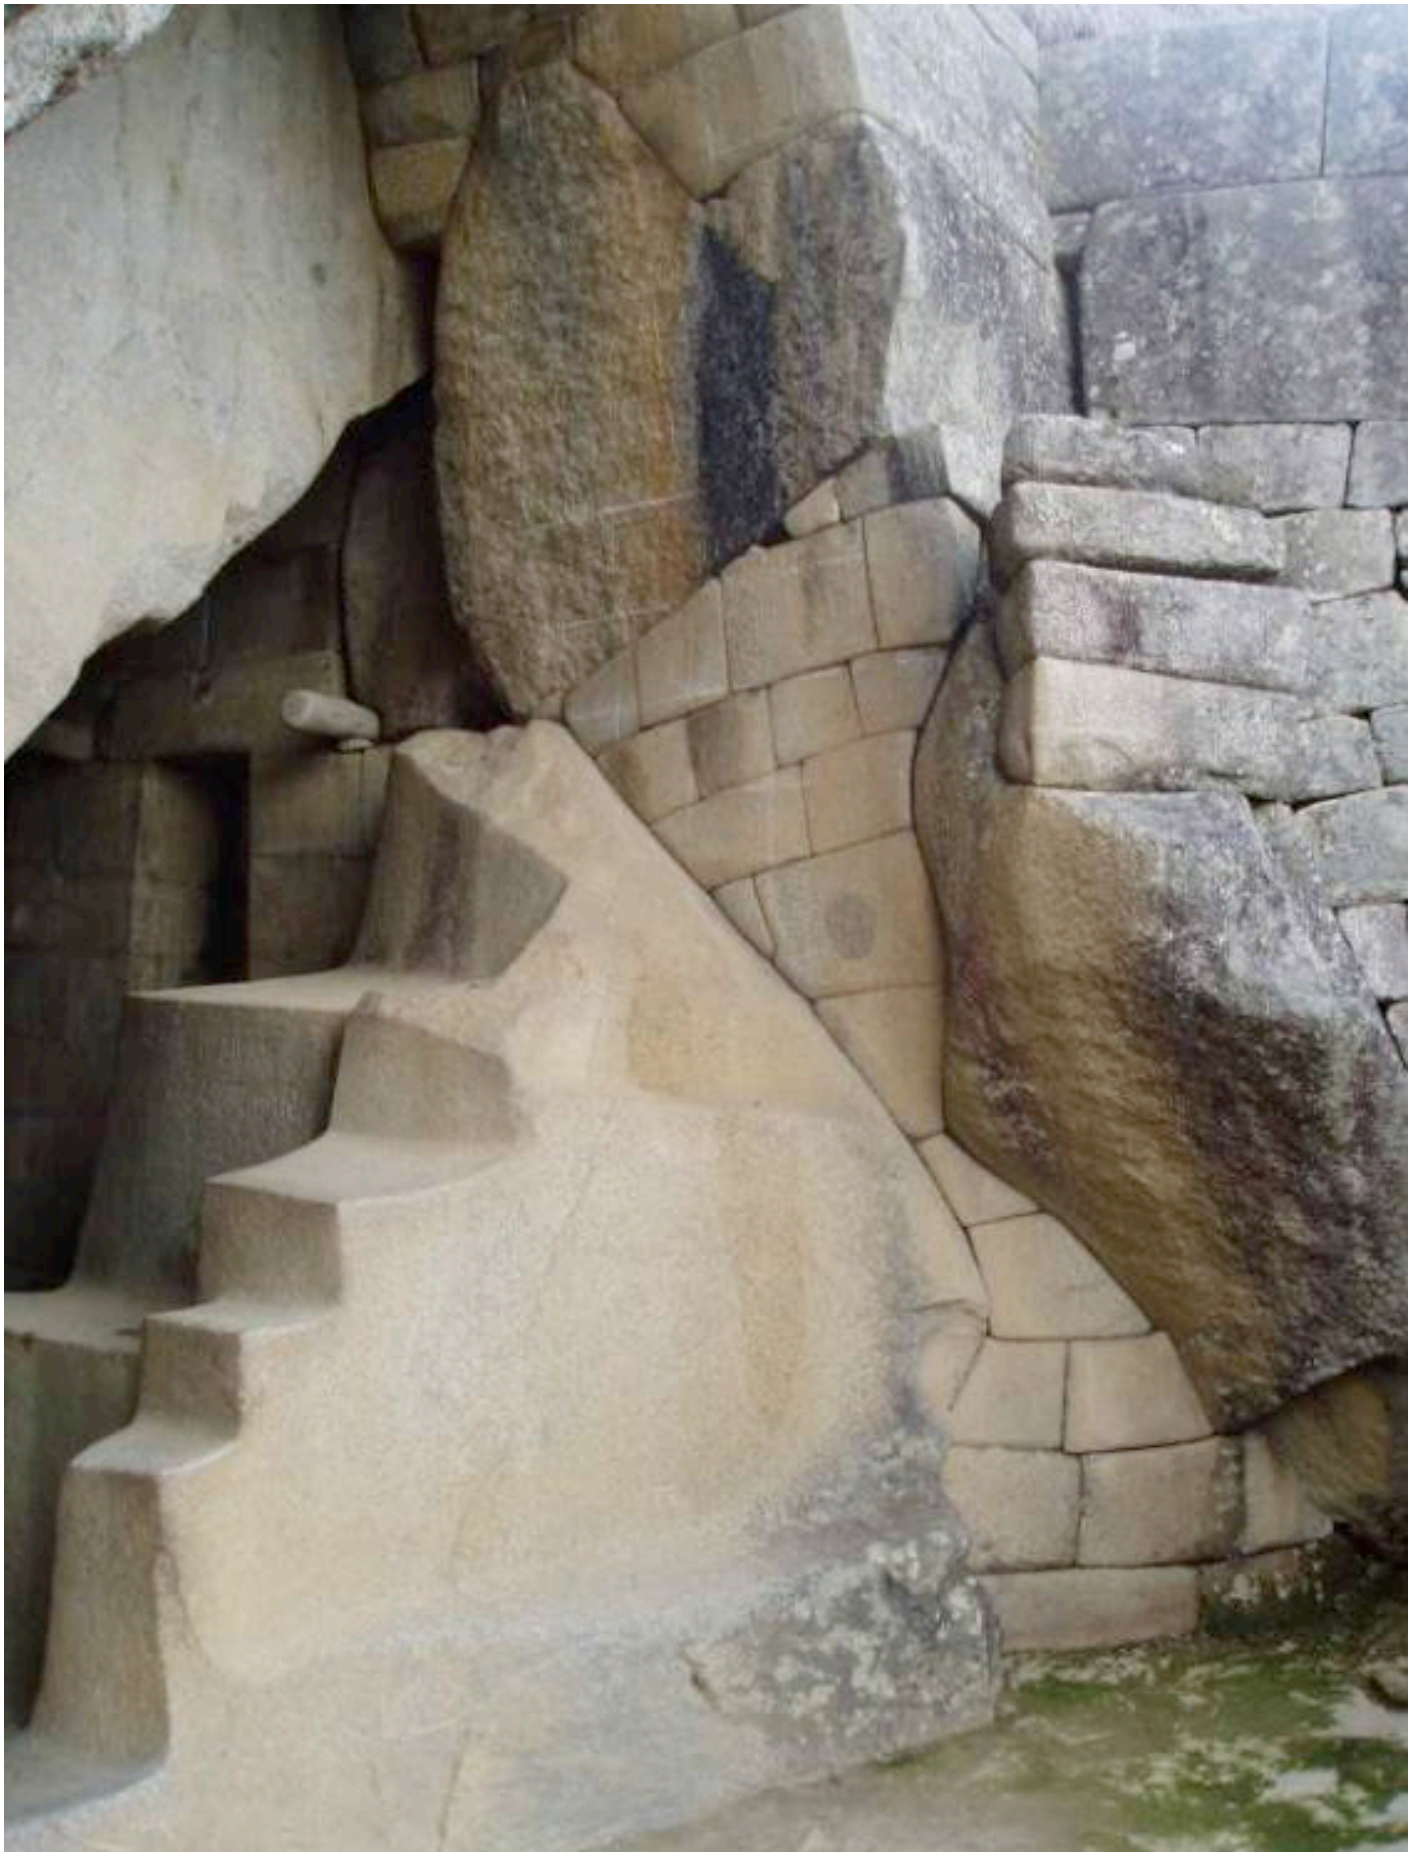
The deeply throbbing infrasound resonance that was loudly heard and felt throughout the body at all of the Atlantean temples of Jupiter was symbolized in South American psychoacoustic traditions by the roaring puma icon. The entire design of the massive walled complex at Saqsaywaman, Peru takes the shape of the puma, and the same puma motif has been cast into the stonework at Samaipata, Bolivia.

The votive puma ligature at Samaipata is formed by simple geometric shapes that convery a set of Paleo-Sanskrit glyphs that have not been previously identified as a basic form of writing, yet the enhanced evels of infrasound resonance still measurable at the sacred site today confirms the deeper meaning of the icon.

The puma, with its open mouth, signifies 'roaring', while the puma's long tail signifies 'delivering'. Taken together with the outline around the iconic animal figure, the simple votive ligature reads: *adhi raua-as* , meaning "Delivering for roaring" (above).

These breakthough translations offer nothing less than the full wealth of cultural wisdom of our Atlantean and Ohum forebearers, whose great awareness of the biorhythmic pulsations of the cosmos still play a major role in our interpretation of the electromagnetic changes unfolding at this time on planet Earth.

The great significance of the world's pyramid network has not yet been fully grasped by the great majority of humanity, who now stand poised to witness the activation process of the entire atmosphere to form an HHO plasma canopy that radically alters the properties of light received from our sun on the terrestrial surface. The world's dormant temples comprise a nonlinear power grid invented during the Paleolithic era.



The terraced cloud city of Machu Picchu (above) was not constructed by the Inka culture, but –like Saqsaywaman Temple of the Puma situated above the sacred Inka capital city of Cuzco– *predates the period of Inka rule by several millennia.* Mastery of sophisticated geopolymer stone casting techniques displayed at both sites belongs to the Atlantean Era of high civilization, with the puma symbol representing the Paleo-Sanskrit *raua* glyph, signifying the infrasonic 'roaring' of *Indra*, the plasma giant Jupiter.

According to the complex past life information obtained through trance channel Edgar Cayce, the megalithic temples of Machu Picchu and Saqsaywaman were constructed by the Ohums, an antediluvian civilization described as having occupied the region of present-day Peru, then known as the lands of Og. The Ohum civilization constructed pyramids during an extended period of largely peaceful development.

Machu Picchu (13.12°S, 72.58°W) is 7,478 miles from the Great Pyramid of Giza, Egypt, situated precisely along the Sine Wave Alignment of Ancient Sites at exactly 30.0% of the Earth's mean circumference distance, along which scores of other temples are laid out to reflect alignment with the 2:3:5 'golden' ratio.

Sacred Soma electrum water springs are still flowing from several stone fountains at Machu Picchu that were simply and exquisitely designed for both drinking and bathing, with embedded hieroglyphs reading: *Indra-as* , meaning "For Jupiter" (opposite). *Clearly, the temple network is still functioning at a low level.*

Indra - as
For Jupiter.

Inset niches beyond the main port-cullis repeat the same votive phrase: *Indra ra* , –"Jupiter granting" (above, below). Ollantaytambo, Peru (13.15°S, 72.16°W) is 7,472 miles from the Great Pyramid, corresponding to a great circle distance comprising 30.0% of Earth's mean circumference, reflecting the 2:3:5 Fibonacci ratio.

Puma Punku

Puma Punku

The highly advanced level of architectural achievement witnessed in the megalithic ruins of Puma Punku, located adjacent to the large rectangular walled enclosure temple named Tiwanaku, holds several secrets for humanity, sitting in plain sight. Both its resonant location and its artificial metallic composition contribute to the presence of electromagnetic fields surrounding the temple stones that defy simple logic.

The site of Puma Punku, Bolivia (16.55°S, 68.67°W) is 7,351 miles from the Great Pyramid at Giza, Egypt, corresponding to a great circle distance comprising 29.5% of Earth's mean circumference. Due to the resonant geopositioning of the temple within the global Atlantean pyramid network, focused infrasound standing waves[1] converge at high intensity causing weak electrical currents to be measured in the ground.

Unrecognized physical properties of the stone blocks at Puma Punku are complimented by unrecognized linguistic connections to the hieroglyphic Atlantean language, first deciphered as Paleo-Sanskrit by Professor K. Schildmann.[2] Rows of square and stepped depressions in the blocks form votive glyphs reading: *Indra Indra raua ai raua* , meaning "Jupiter, Jupiter roaring, aye, roaring..." (above).

ra - as ra pa Indra Indra
For granting, granting protection (of) Jupiter, Jupiter...

Desperate control efforts designed to obfuscate the growing awareness of the advanced technological functions of the global network of ancient monuments have been focused upon the site of Puma Punku. History channel TV star and US government disinformation agent Brien Foerster sells books and expensive site tours that distract and mislead tourists with contrived lies and entirely unscientific statements given as expert opinion without any supporting evidence, such as:

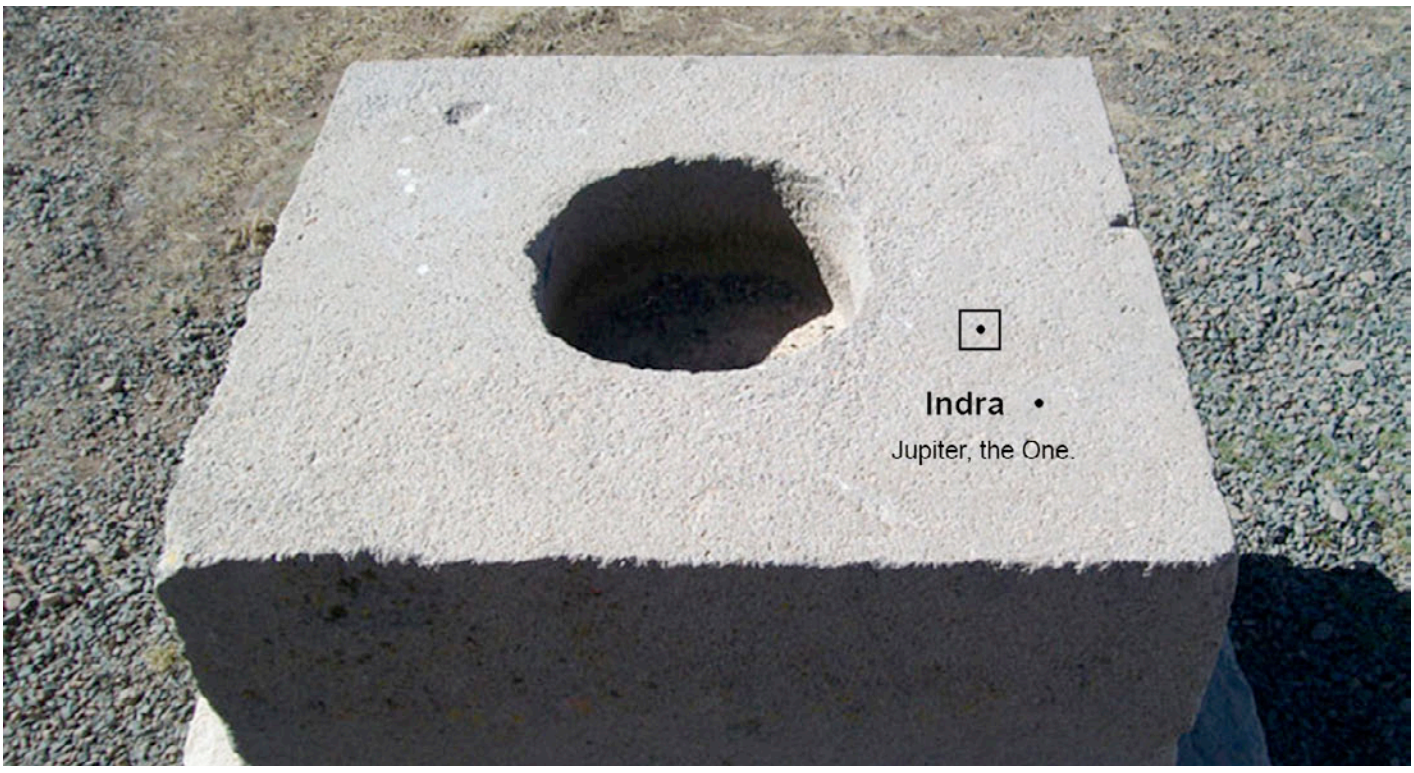
> None of the H-blocks are exactly the same size. That's a complete fallacy that some researchers have stated, as if they were produced in a factory, poured into a mold. Every one is different.[3]

Such evasive comments are designed to obfuscate the simple measurable fact that the Puma Punku blocks contain an extremely high content of magnetized metal particles has been proven by repeated compass inversions documented by multiple investigators, by erroneously suggesting the only evidence for their being cast in a mold is their form. Well, gee... maybe one of the hundreds of visitors Mr. Foerster tours around the site will someday employ a compass to expose his ignorance of their magnetized metal content.

Erroneous claims and illogical statements are purposefully employed to deny, contradict and coverup the scientific facts now becoming apparent to the general public: *Puma Punku was entirely cast in metallic geopolymer stone. This special magnetized metal content generates EM vortices measured as magnetic field inversions, often inducing the spinning of compasses and digital magnetometers in close proximity.*[4]

Microscopic analysis of the Puma Punku stones confirms the presence of fine ferromagnetic particles and pyroelectric crystals distributed evenly throughout the reconstituted andesitic or basaltic matrix, both of which are naturally comprised of piezoeletric crystals. *This exotic combination of inclusions converts localized infrasound into an electromagnetic field that envelopes each of the megalithic stone blocks.*

The square format of very large cast magnetic basalt platform reads: *Indra* –"Jupiter" (above). Many serially cast H-blocks have been arranged in rows, presenting glyph combinations forming votive ligatures reading: *ra-as ra pa Indra Indra* , meaning "For granting, granting protection of Jupiter, Jupiter..." (below).



Other synthetic stone blocks express hieroglyphic variations of the votive planetary reference to Jupiter. One perforated square example reads: *Indra Indra ra* , meaning "Jupiter, Jupiter granting" (opposite, top). Another square block with recessed squares and a circular depression forms a geometric face, repeating a similar sacred mantra: *Indra • Indra* , meaning "Jupiter, Jupiter, the One, Jupiter" (opposite, below).

Indra ra Indra
Jupiter granting, Jupiter.

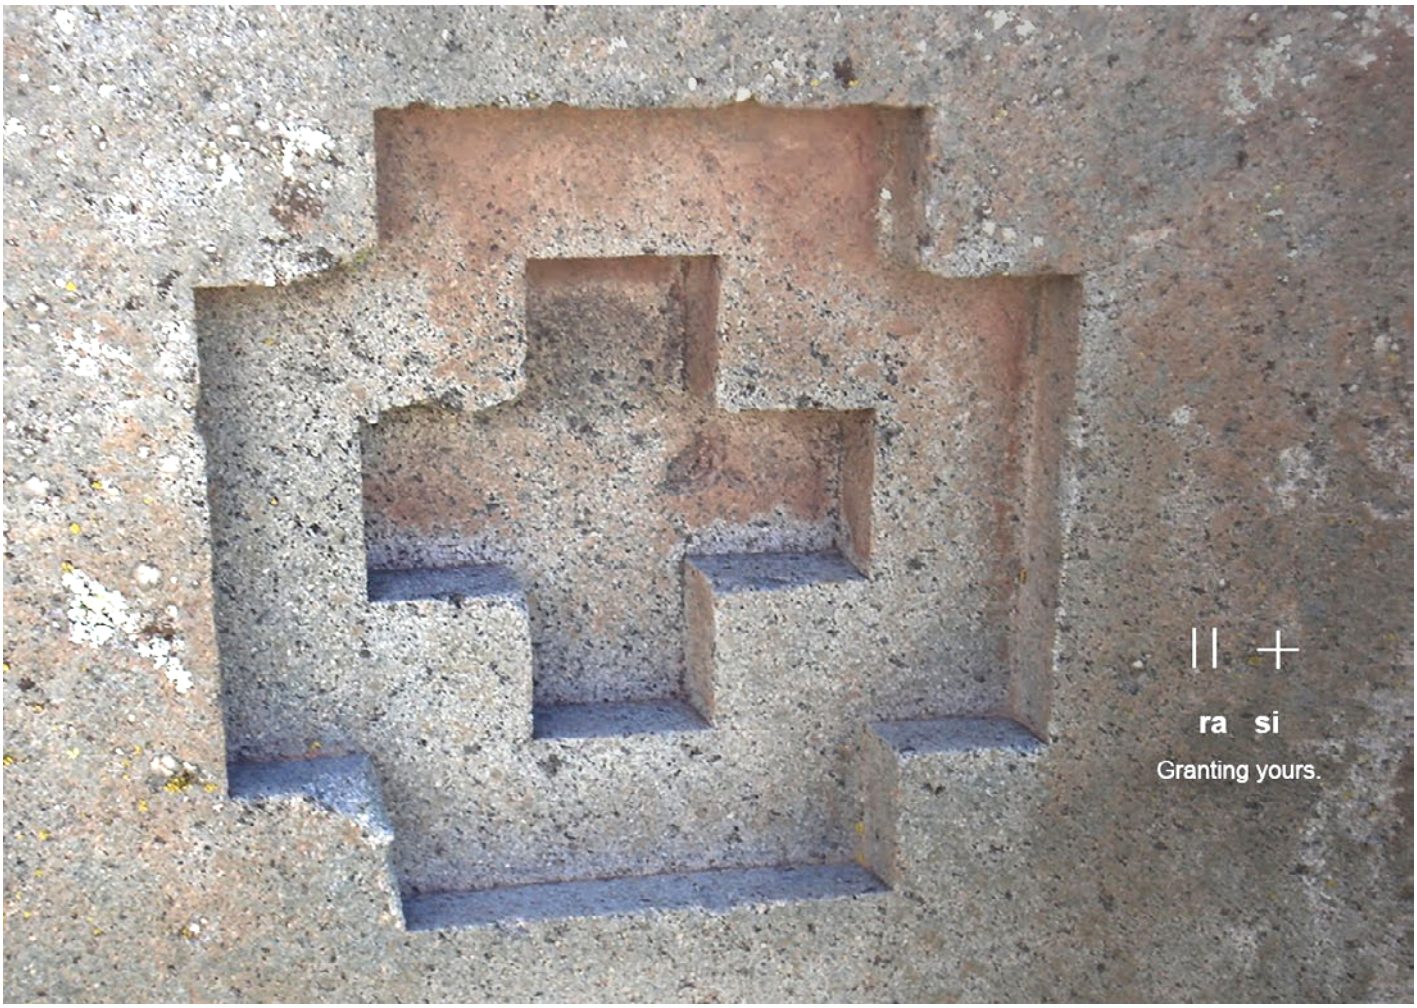
Indra • Indra
Jupiter, the One, Jupiter.

upama Indra upama
The highest, Jupiter, the highest.

Indra •
Jupiter, the One.

Another example is a stone block with recessed lines forming symmetrical triangular shapes inset into the corners of the larger square, reading: *upama Indra upama* , meaning " The highest, Jupiter, the highest" (opposite, top). The pure geometric forms of interlocking stonework at Puma Punku are rich in language.

The most immediately recognizable Atlantean votive ligature repeats a Paleo-Sanskrit votive phrase once cast in stonework throughout the world, reading: *Indra* • , meaning "Jupiter, the One" (above, opposite). This iconic sacred ligature of a square with a dot at its center has also been identified as linguistic design elements embedded in the forms of the Baltic Sea Monument and 'runway temple' at Samaipata, Bolivia.



The prime designation of *'the One'* references the unifying force of all Nature that was closely associated with the beneficial effects of the infrasound resonance of Jupiter, whose Great Red Spot reads as the numeral 1. Psychic medium Edgar Cayce emphasized the basic Atlantean 'Law of One' on March 9, 1929:

> None is convinced in that science or religious convictions are one. The first lesson for *six months* should be *One* – One – One – *One*; Oneness of God, oneness of man's relation, oneness of force, oneness of time, oneness of purpose, *Oneness* in every effort – Oneness – Oneness![5] (Reading 900-429)

ra si
Granting yours.

Indra • ra
Jupiter, the One, granting.

According to complex information provided subsequent psychic trance readings given by Cayce, the unifying concept of Oneness –*through biorhythmic synchronization* –inspired the invention of Atlantean *firestone* by Ajax of Ode ~30,000 years ago for synthesis of reconstituted liquid stone for the construction of pyramids worldwide. This same formulation of magnetic geopolymer stone was utilized by a great diversity of advanced societies that comprised the world nation of Atlantis, including the Padang Pyramid in Java, Indonesia, the Baltic Sea Monument and the Llanganates and La Maná Pyramids of Central Ecuador.

Official government denial of the global technological and cultural heritage revealed by the Paleolithic origin of the synthetic stone, and the linguistic signs embedded in its cast forms, is designed to perpetuate the ignorance of transdimensional technologies used by our ancestors and thereby prevent our renewed use of these same technologies in the present day. Hieroglyphic phrases of our ancestors clarify the profound purpose of the pyramids, in transduction of infrasound resonance for bioelectrical healing.

Many stone slabs that once stood as temple walls were inset with outlined crosses, each a ligature reading: *ra si* , or "Granting yours" (above). The same geometric ligature was rendered on gigantic wall block panels that were fractured into several pieces (opposite) during the cataclysmic destruction of Puma Punku that took place before construction of the Tiwanaku complex, which incorporated blocks from the older site.

Bearing some resemblance to glyph patterns seen on the totem-like megaliths of Axum, Ethiopia, rows of recessed and repeating ligature groups that give the appearance of false windows or portals were cast into wall blocks at Puma Punku. These false portals or doorways offer the votive phrase: *Indra ra ai raua* , meaning "Jupiter granting, aye, roaring" (overleaf). Other block panels display embedded geometric design elements containing similar votive hieroglyphic combinations, reading: *Pa ai* , meaning "Protecting, aye", or *Pa ai kar upama* , meaning "Protecting, aye, works (of) the highest" (overleaf).

𓊪 𓏏
pa ai
Protecting, aye.

Indra ra aⁱ rᵃuᵃ
Jupiter granting, aye roaring.

pa aⁱ
Protecting, aye,
kar upama
works (of) the highest.

Indra •
Jupiter, the One.
Indra ra
Jupiter granting.
Indra ya ra upama ra
Jupiter commencing granting, the highest granting.

Giant non-human figures represent the most imposing megalithic stonework of the Puma Punku phase, also resurrected during the Tiwanaku era. The giants are covered in patterns of repeating glyph ligatures reading: *Indra ya ra upama ra* , meaning "Jupiter commencing granting, the highest granting..." (opposite).

Indra ai sam raua Indra mi - is Indra pa ra - as raua

Jupiter, aye..., the universal thundering (of) Jupiter synchronizing, Jupiter..., Lord for granting roaring...

Zodiacal symbols correspond to specific astronomical dates within the concise temporal framework of a 36,666-year Precession cycle. Tunics of 3m-tall giants at Tiwanaku displaying the twin giants motif reference the Age of Gemini, spanning a period of 3,237 years, elapsing from 10,770bp to 7,533bp.

Lines of alternating lock-and-key glyphs along the top of the tunic design display the four bases of DNA in color-matched pairs. The bodies of the Gemini twins are composed of ligature groups reading: *Indra ai sam raua Indra mi-is Indra pa ra-as raua* , meaning "Jupiter, aye..., the universal thundering of Jupiter synchronizing, Jupiter..., Lord for granting roaring..." (above).[6]

Definitive zodiacal references displayed on figurative statuary from the Tiwanaku area sites supports the contention that Puma Punku was most likely built a few hundred years after the cometary cataclysm of ~11,000bp that involved several decades of atmospheric meteor explosions and impacts from a convergence of Kuiper Belt bodies drawn in by the invisible Brown Dwarf companion of our sun.

The elliptical binary orbit of 36,666.66 years duration induces resonant catastrophic subcycles every 3,666.66 years,[7] accounting for cataclysmic periods 10,999 years ago, 7,333 years ago, 3,666 years ago, *and the present cometary period marked by the closest pass of the Brown Dwarf on August 22, 2015.*[8]

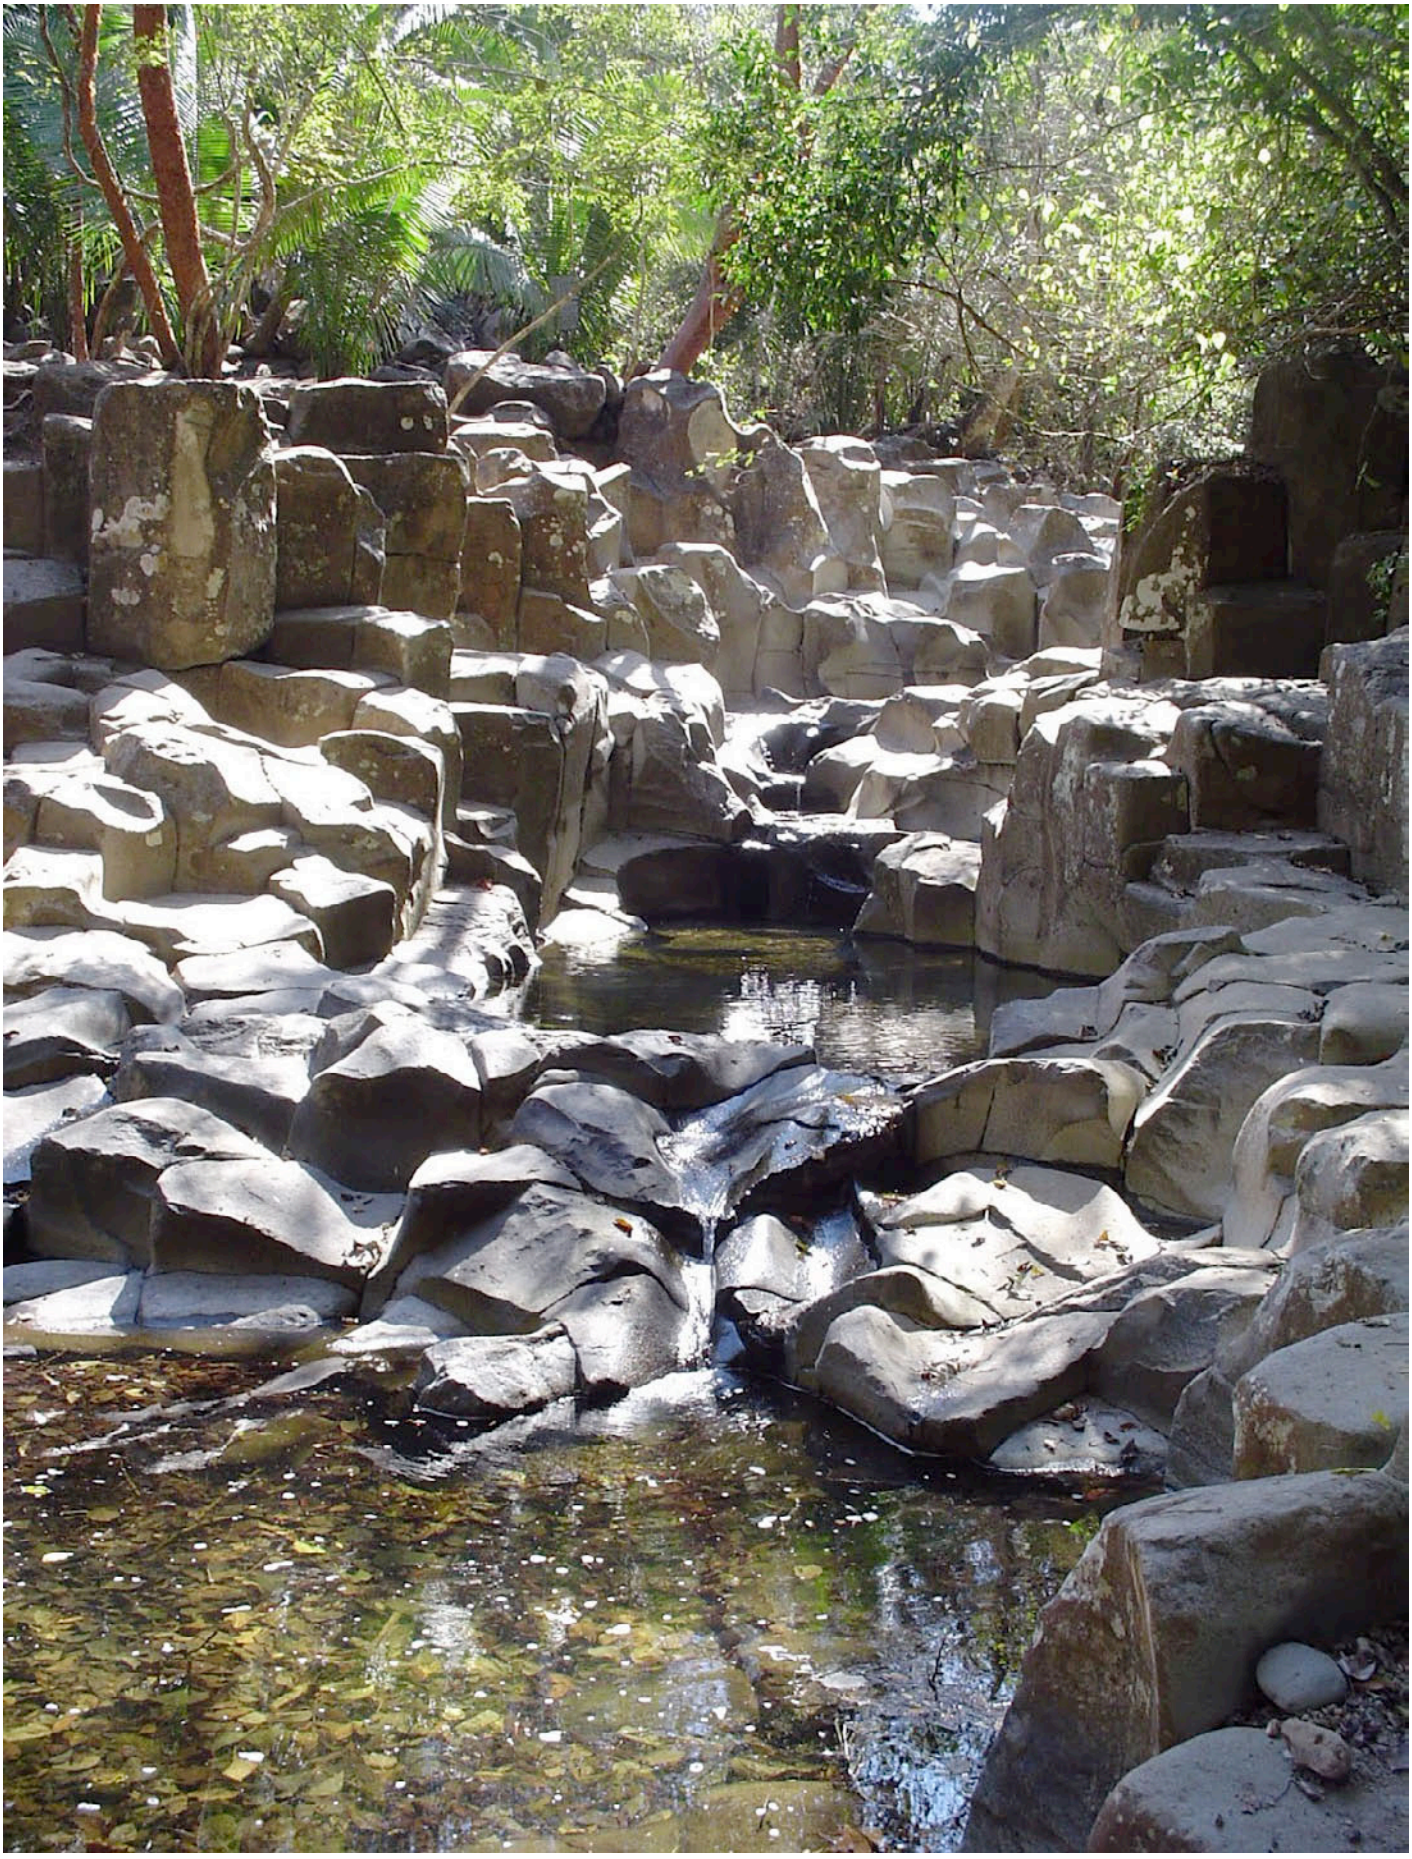
The Altavista Temple

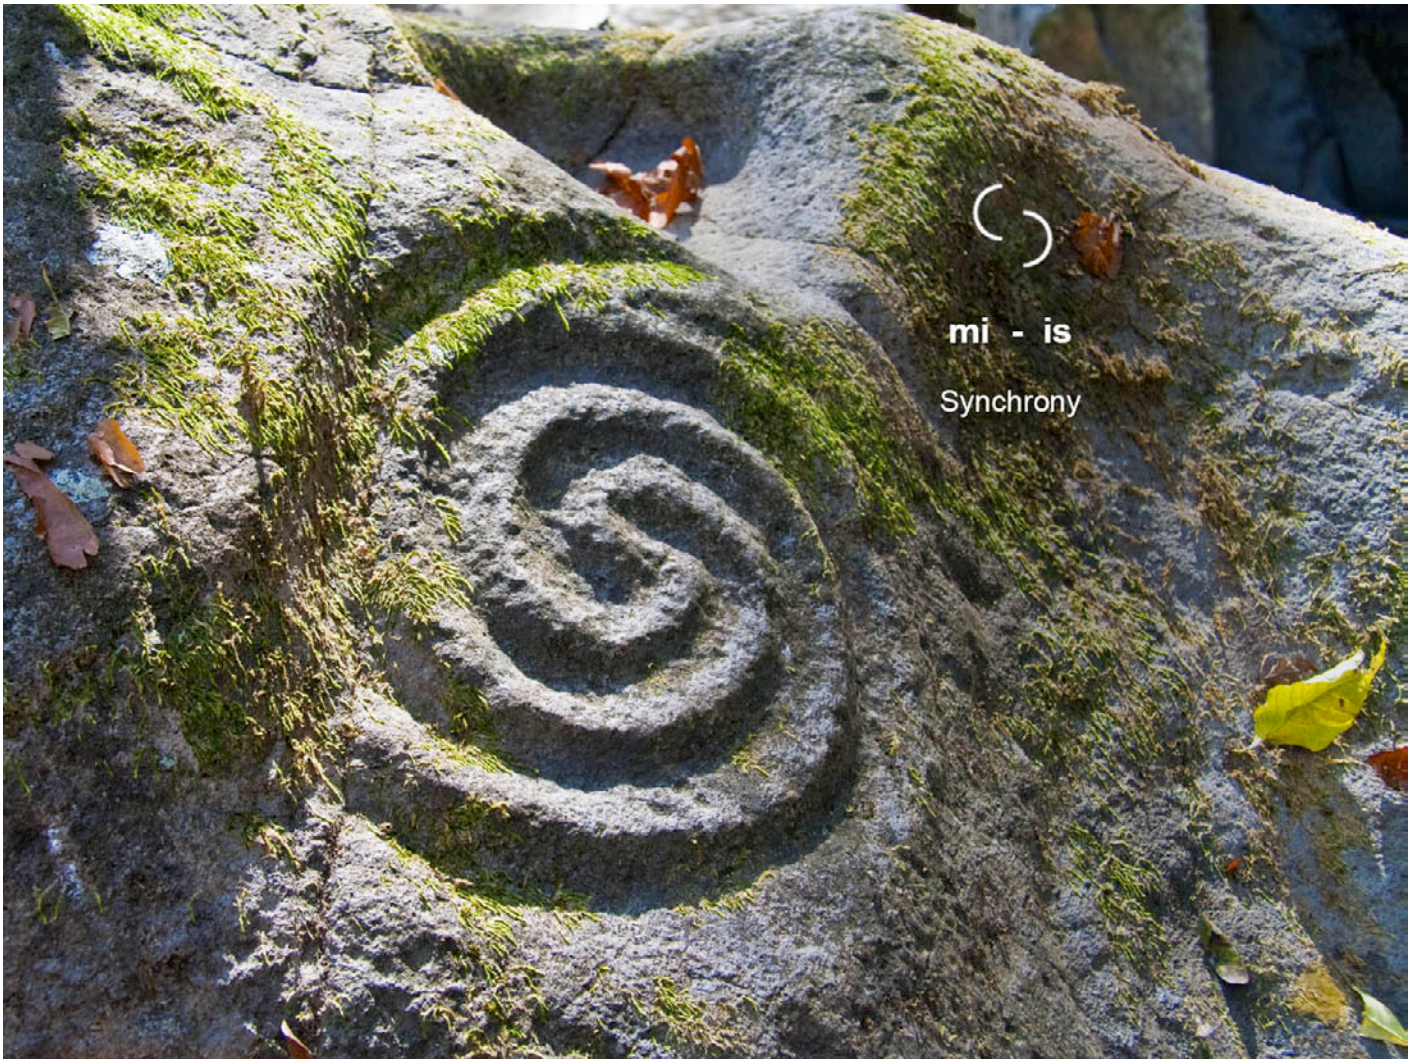
The Altavista Temple



Ancient petroglyph sites found in great abundance throughout present-day Mexico preserve compelling evidence for the Paleolithic origin of pyramid traditions and technologies still practiced by the surviving Mayan descendant culture. Advanced technological and linguistic remains have been well identified and documented at the sacred petroglyph site of Altavista, located in the coastal zone of Nayarit.

A large complex of majestic basalt stonework emerges from the undergrowth along a seasonal riverbed where one can observe a dense clustering of simple geometric designs engraved in stone. Increasing numbers of intrigued visitors to this special sacred site enjoy fresh coastal breezes rising from the Pacific, while marveling at the ergonomic forms of large interlocking stone blocks that comprise the riverbed.

For their convincing similarity to columnar basalts, most visitors never realize the synthetic origin of these megalithic blocks nor the profound psychoacoustic purpose that inspired the site's artificial construction. A careful study of the composition of these megaliths, and the complex symbols that adorn them, reveals a profound set of connections with a worldwide Paleo-Sanskrit culture now re-emerging from obscurity.[1]



Atlantean builders in all parts of the world constructed a global infrasound network as an array of piezoelectric stone temples and pyramids in perfect alignment with natural focal points of planetary resonance.[2] According to this sacred geodesic wisdom, the pools, petroglyphs and hilltop temples at Altavista, Mexico (21.07°N, 105.17°W) were built 7,880 miles from the Great Pyramid, comprising 31.66% of Earth's mean circumference, *where infrasound is efficiently transduced along the 21° North latitude.*

Pure celestial waters with gold and silver nanoparticles were generated by intense electromagnetic fields transduced from localized infrasound resonance by the piezoelectric crystalline stones.[3] Sacred Ayurvedic bioelectrification practices and barefoot lifestyles were adhered to at thousands of sites within this aligned network where the rhythms of pyramids and the planets themselves enhance human consciousness.

Waterbirthing was ceremonially undertaken in these sacred river pools by generations of Paleo-Sanskrit-speakers at this site under the beneficial influence of infrasonic synchronization by heartbeat resonance between mother and infant.[4] While most crucial during the gestation cycle, this synchronic connection was biorhythmically maintained after their physical separation as a telepathic bond. The very stone itself was considered maternal –*'the Motherstone'*– for this profound synchronization effect, and for many thousands of years was signified in textual format by the mesmerizing Paleo-Sanskrit glyph pair: ***mi-is***.

The double spiral formation is a hypnotic extension of the basic hieroglyph pair composed of nested semicircles: *mi* , meaning "waning, diminishing", and *is* for "waxing, swelling". Combined into a legible grouping known as a *ligature*, this double spiral *mi-is* petroglyph denotes "Synchrony" (above).

Spirals are the most abundant glyph ligatures recorded on these ancient geopolymer stone ruins. In fact, *every petroglyph within the Altavista temple complex is a composition of legible Paleo-Sanskrit language signs* already deciphered decades ago by epigrapher K. Schildmann.[5] Scientific recognition for all such Paleolithic cultural remnants has been denied by academic suppression of this most ancient of all known hieroglyphic languages, being the antecedent of Sumerian, Egyptian and Mayan logographic text forms.

Another iconic example of petroglyph phrases at the Altavista complex is a large sign that further conveys the resonant purpose of the sacred stone for transducing planetary resonance. The central linear figure is outlined twice to form a triplicate design that gives a sense of reverberation and denotes the *raua* glyph for "roaring", composed of three lines. Altogether the ligature reads: *raua Tridaśa* , meaning "Roaring 30 Resonances" (opposite). Indeed, scientific analyses confirm the stones themselves still reverberate with the more than 30 inaudible frequencies of infrasound resonance that comprise the planetary symphony.

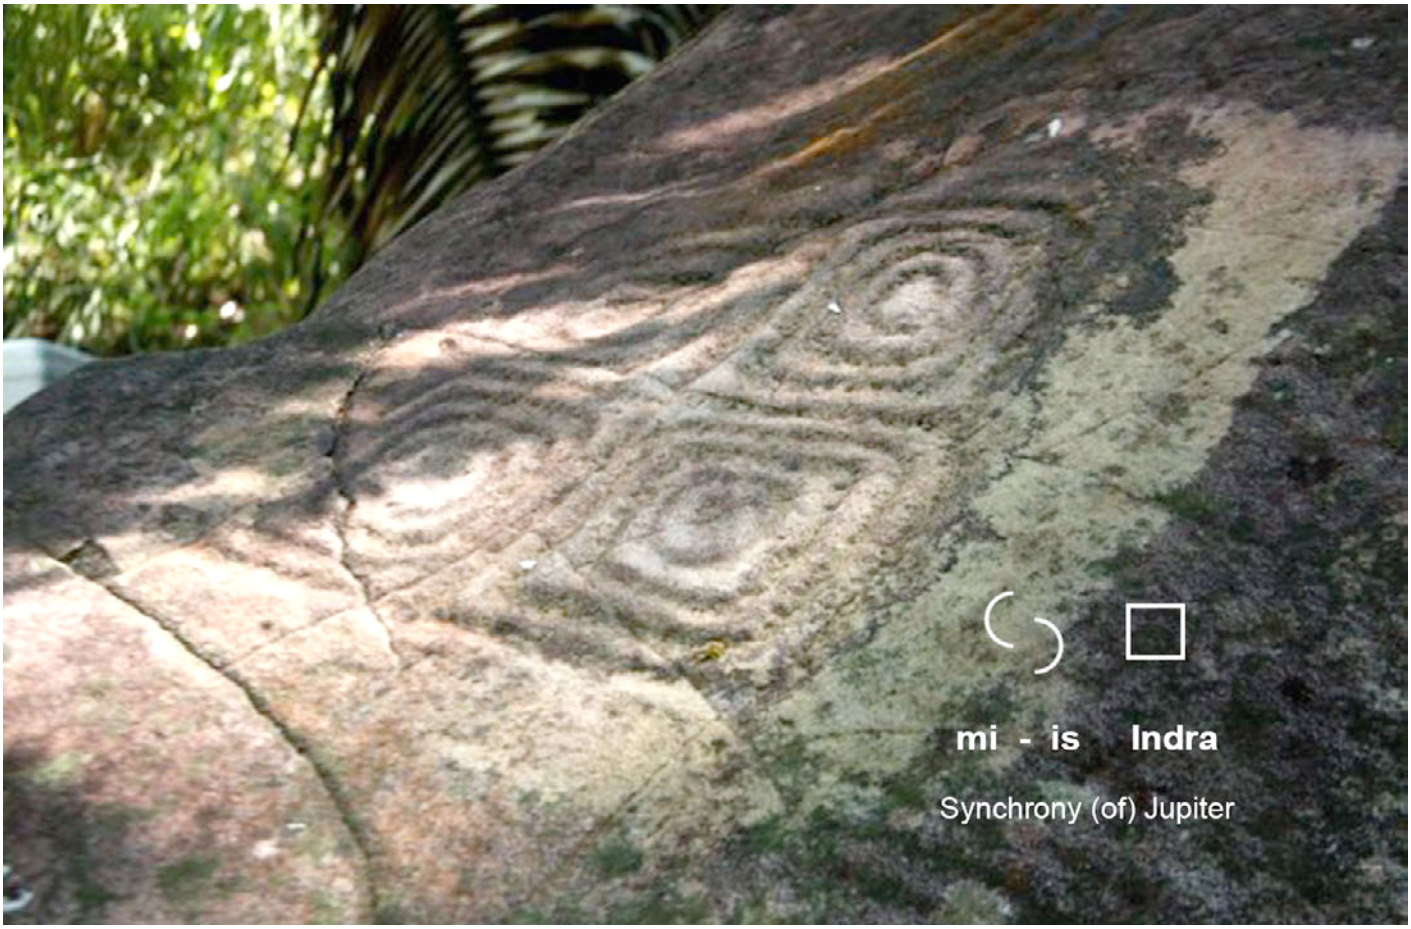
Altavista's stacked megalithic blocks present flat surfaces with smoothly rounded edges and corners that were specifically designed for comfortable seating and socializing along this controlled stretch of the river. Several dozen petroglyphs identified at this extensive temple site relate specific statements regarding the effects of psychoacoustic entrainment. A damaged, oblong rectangular block was marked with a simple repeating glyph ligature that includes the *mi-is* double spiral with another pair of hieroglyphs, altogether reading: *ra-as mi-is ra-as mi-is* , meaning "For granting synchrony, for granting synchrony" (overleaf).

𑖭𑖽𑖨𑖽𑖩𑖽𑖪
rᵃuᵃ Tridaśa
Roaring 30 Resonances

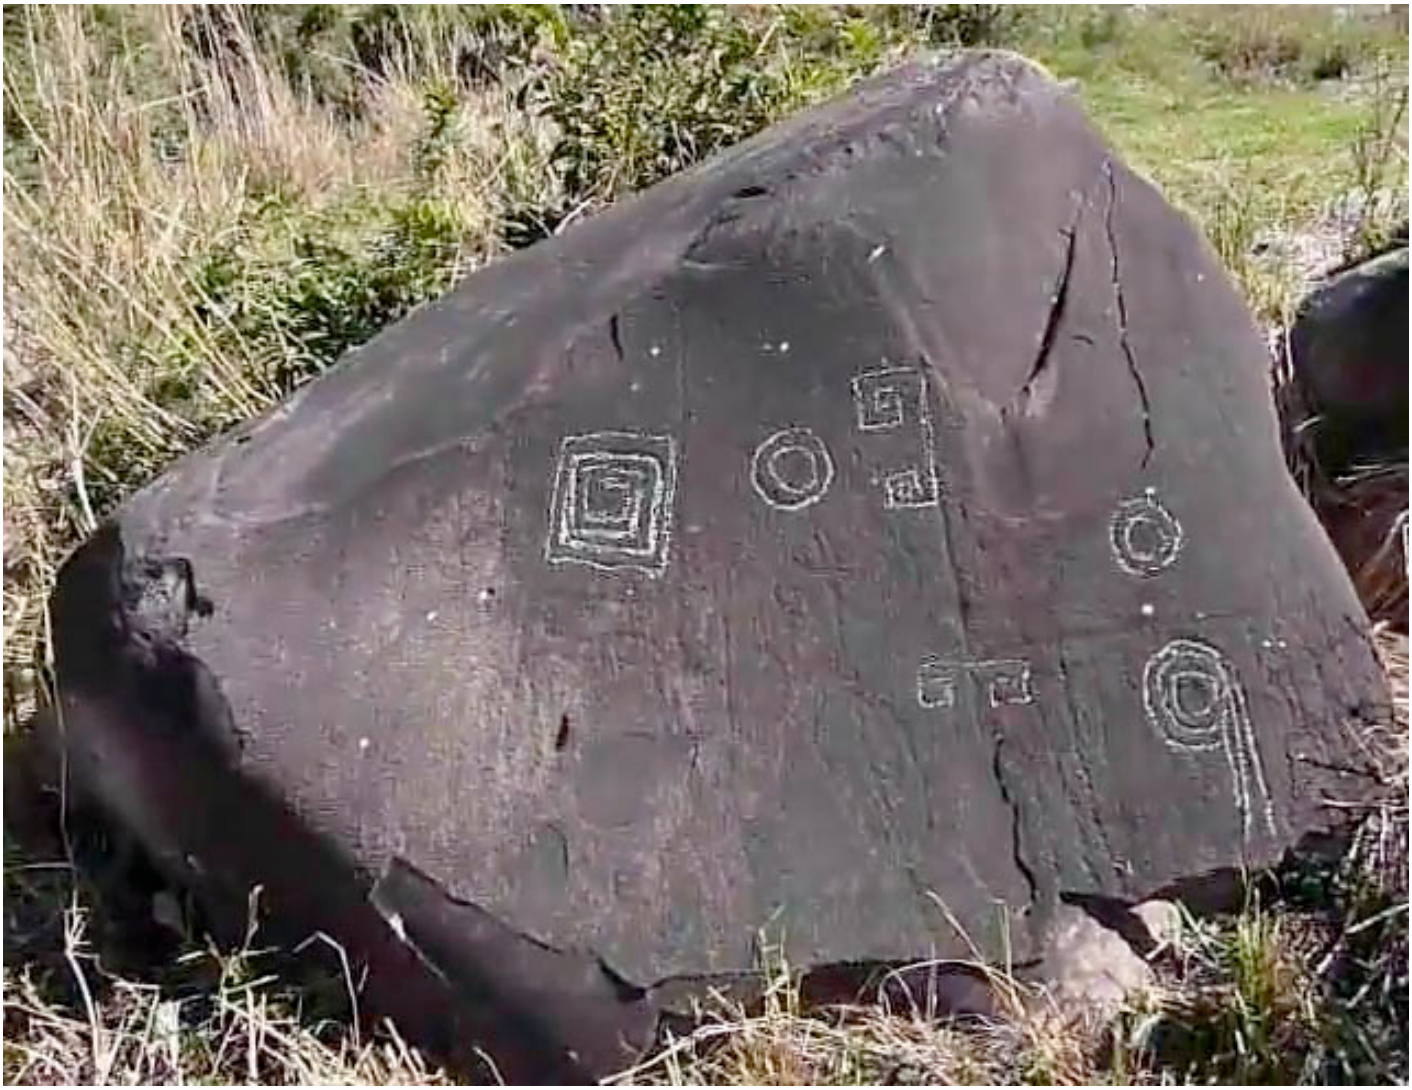
ra - as mi - is
For granting synchrony

The petroglyph of *a stick figure with arms raised* can be found in all parts of the world, yet displays a more complex expression in the Altavista rock art complex. Generally understood as signifying *cosmic receptivity*, with the figure's arms and legs taking the form of twin tuning forks, the context of the figural petroglyph at Altavista offers several interesting factors informing our interpretation.

The placement of the figure engraving demonstrates the use of resonant stone slabs for bioelectrical healing platforms (above) of the same exact type discovered in the Ravne tunnels of the Visoko pyramid complex in Bosnia.[6] The Balkan region yielded further Neolithic artifacts from the Starčevo–Criş, Cucuteni-Trypillia, Turdas-Vinca, Villanova, and Lepenski Vir cultures that include many intricate examples of *mi-is* double spiral signs for induced biorhythmic synchrony through contact with resonant stone.[7]



The far older petroglyphic figure displayed on the healing platform at Altavista represents a pictogram composed of many glyphs, providing a Paleo-Sanskrit votive phrase praising protection from the Sun and Jupiter, 'the Two': *as-vin as-vin as-vin adhi sam raua ra pa raua kar ra* , meaning "The Two, the Two... delivering (the) universal thundering, granting protection, thundering works granting" (above).



The petroglyph figure also indicates a body position and orientation for a person lying on the healing platform to receive treatment from a practitioner of the ancient qi meridian healing technique. The physical structure of the meridians and vital points of the human body, known to Ayurveda as *srotamsi* ('channels') and *marma* points, were rediscovered by B.H. Kim in 1963 using *in vivo* fluorescence microscopy as finely bundled nodal networks of translucent ductules that slowly circulate photon-trapping DNA granules.[8]

Modern Moi Pai Master John Chang demonstrated the bioelectrical healing artform on video, as well as pyrokinesis,[9] revealing the profound sacred biophysical science behind qi meridian healing that finds its roots in advanced Atlantean techniques applied in pyramid and temple chambers. Brief plasma discharges around Chang's body during electro-acupuncture sessions are a visible sign of the intense accumulation of electromagnetic energy within his body, as applied by Atlantean practitioners using healing platforms.

On the side of the geopolymer healing platform at the Altavista complex, near the position of the head as indicated by the petroglyph, is a boldly outlined sacred cross inscription that provides an explanatory ligature phrase: *raua ra-as si ra-as* , meaning "Roaring for granting yours, for granting" (above).

mi - is Indra
Synchrony (of) Jupiter

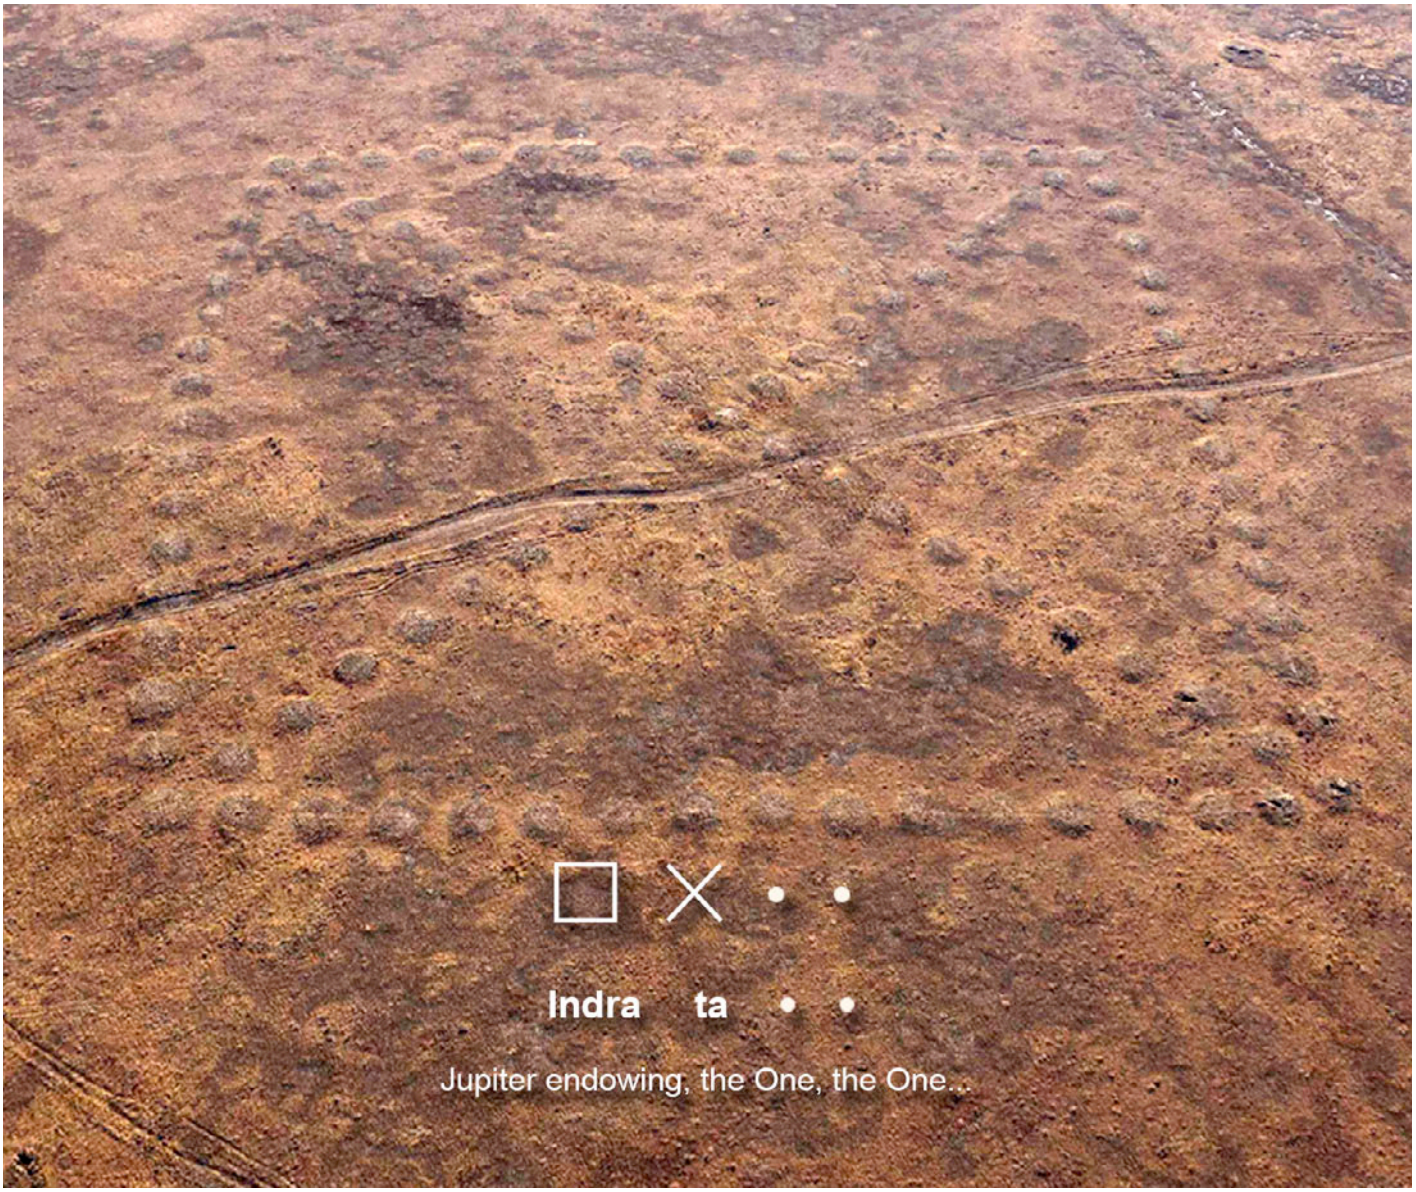
mi - is Indra
Synchrony (of) Jupiter

The Paleo-Sanskrit sacred symbol of the *square spiral* is seen in petroglyphs and ceramics on every continent of the world and was used among the later Sumerian, Egyptian, Greek, Etruscan and Roman civilizations *who had skillfully replicated Atlantean geopolymer temples for wireless power transmission*. In fact, dozens of antediluvian Paleo-Sanskrit hieroglyphs were commonly used among diverse cultures.

The square represents *Indra*, the planet Jupiter, praised as 'the One' for its Giant Red Spot and resounding infrasonic emanations that were transduced by the world's pyramid network for the benefit of humanity. A ligature combining the square Jupiter glyph and the double spiral 'synchrony' glyph forms a *square spiral*. Many examples of square spiral signs engraved in basalt at Altavista are given symmetrically in pairs or mirrored in sets of four, reading: *mi-is Indra mi-is Indra* , meaning "Synchrony (of) Jupiter..." (opposite).

Square spirals are also engraved into several massive, fractured megaliths atop the Altavista hill temple located just above the extension of artificial geopolymer riverbed. Square spirals denoting the synchrony of Jupiter are modified by the basic glyphs of a double circle, reading: • *ra* , for "The One granting" (above). The triple circle provides the basic ligature phrase: • *raua* , meaning "The One roaring", referencing the 30 frequencies of planetary infrasound used by vimana spacecraft for acoustic levitation. Amazingly, contactee Billy Meier made audio recordings of 'roaring' spacecraft resonances in the audible range.[10]

Various segments of Altavista's fine synthetic basalt petroglyph panels have been worn thin or heavily damaged during catastrophes incurred long ago, having left large areas where the outer layer has entirely cracked off. This type of surface damage feature corresponds to well known casting defects resulting from the slightly different consistency of the fine outer slipcoat layer and the bulk filling material of the core.



The bold symbol of a *square enclosing an 'X'* is marked several times on the ancient Altavista hill temple megaliths, providing an explanation as to the primary contributor of booming infrasound resonance focused at this megalithic sacred site, reading: *Indra ta* , meaning "Jupiter endowing" (above). This basic ligature clearly denotes the geometric configuration of the Great Pyramid as seen from directly above the apex, *the central point of the global mandala distribution pattern of resonant standing waves.*[11]

Translation of the remarkably preserved petroglyph texts of the Altavista temple complex confirms the profound Atlantean technology of transduced planetary resonance for psychoacoustic synchrony and bioelectrical healing. These techniques formed the impetus for a global pyramid network that awaits our renewed use, as the Magnetic Reversal of Earth restores the vital forces of planetary resonance.

Votive hieroglyphic texts from Paleo-Sanskrit sacred sites all over the world upheld Indra, the giant planet Jupiter, as 'endower of life forces'. Indeed, recent biophotonics studies confirm that the relative positions of the planets and their known cycles directly affect the intensity of ultra-weak photon emission by the human body (Popp *et al*, 2003). Scientific integration of biophotonics, phonon resonance and planetary resonance confirms the ancient Vedic concept of resonant bioelectrical qi healing as balancing the biophotonic meridians of the human body *that fluctuate in synch with the rhythms of the planets.*

Unmistakable traces of this advanced Vedic biophysical knowledge were clearly passed down to the Maya civilization, whose adepts expressed this sacred knowledge in Mayan codices well preserved to this day:

> Man does not will when he wars, loves, reaps; it is the rhythms of the great gods, the planets, that act over him and make him do. When he comprehends that by himself he can do nothing, then he can learn to serve the gods; so, he must become conscious of the rhythm of the gods.

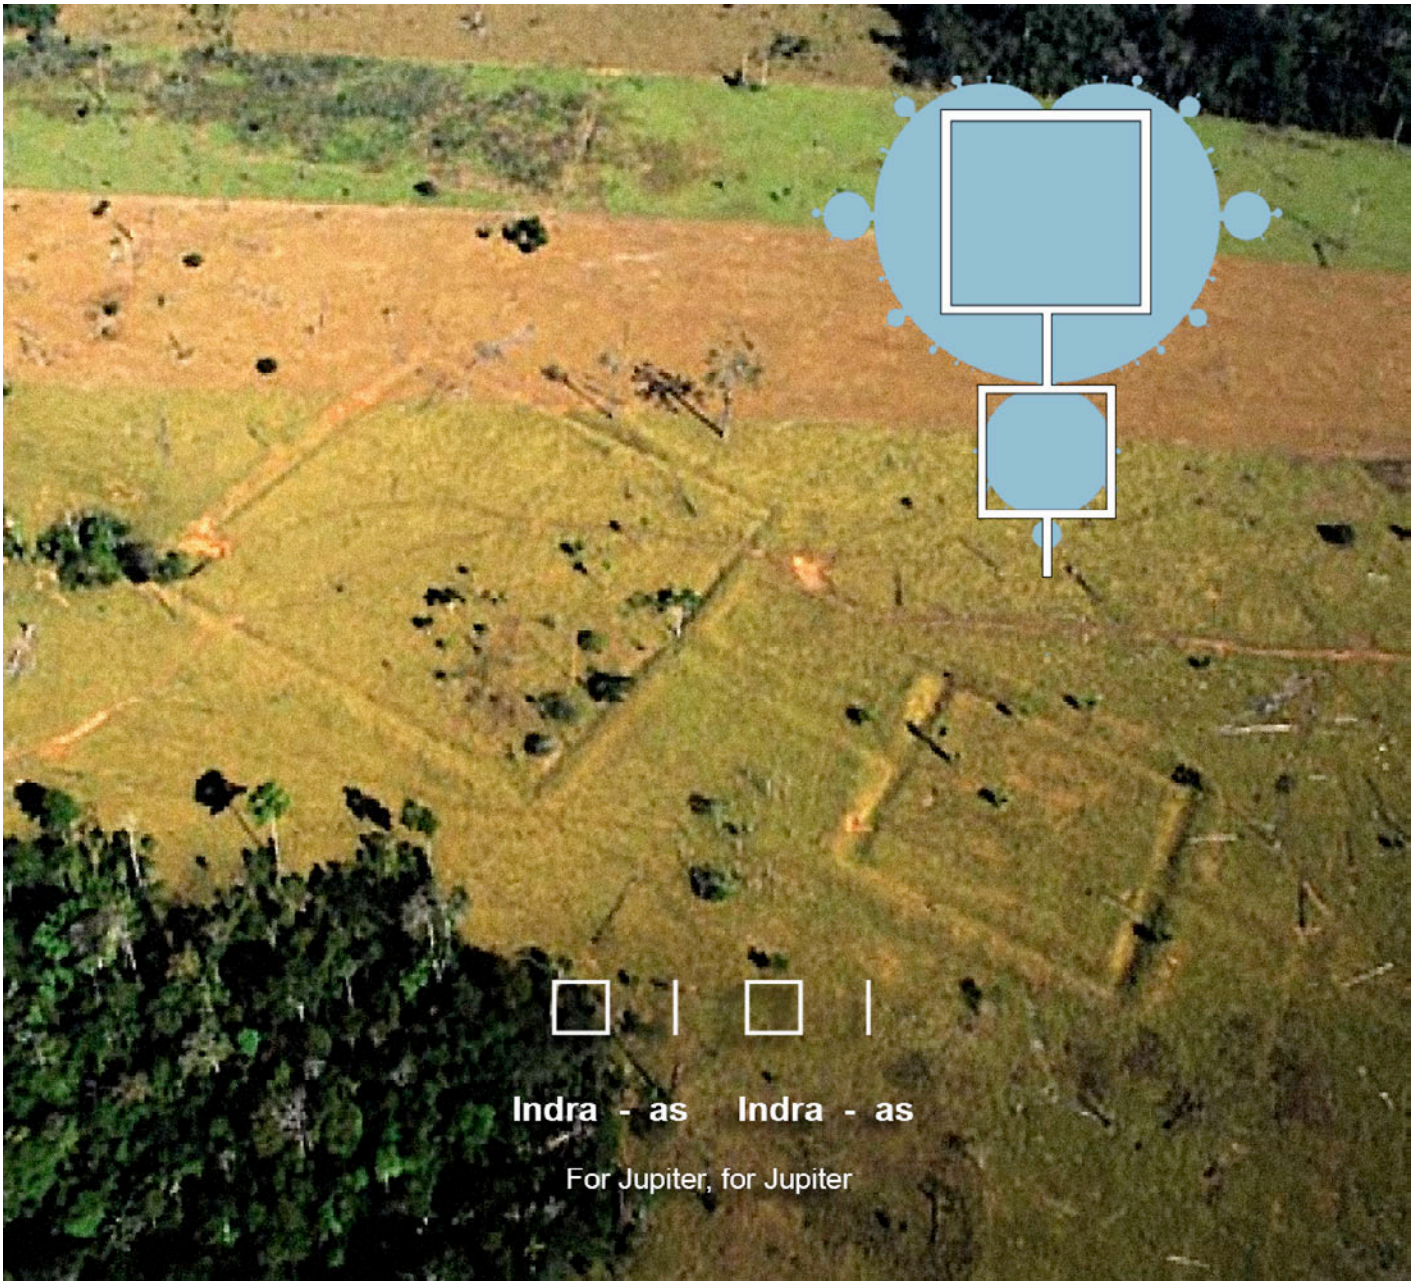
Paleo-Sanskrit petroglyphs and geoglyphs have been discovered on all inhabited continents of the world. The sign of a square bounding an 'X' was expressed by Paleolithic peoples in what is today northern Kazakhstan, revealed in aerial photography as lines composed of exactly 101 low circular mounds forming the sacred phrase: *Indra ta* • • , meaning "Jupiter endowing, the One, the One..." (above).

Another highly recognizable Sanskrit geoglyph of a square enclosing a swastika was also marked in a similar geoglyph, reading: *Indra asu-asu* , meaning "Jupiter: life–life" (overleaf). Nazi misappropriation of the swastika symbol represents just one of many subversions of the advanced Vedic physics of 'life-life'.

A large cross geoglyph perfectly aligned to the cardinal directions is composed of 41 mounds provides the simple phrase: *si* • • , meaning "Yours, the One, the One..." (contrast enhanced, overleaf), referencing the Divine force of infrasound resonance focused by the pyramids endowing lifespans exceeding 200 years.

Awareness of our scientifically advanced and unified cultural Sanskrit heritage is growing rapidly, despite mass media disinformation tactics aimed at hiding the profound Atlantean physics underlying the global distribution pattern of ancient infrasound networked temples. So-called journals of science make obvious omissions and denials concerning the clear Paleo-Sanskrit origin of huge geoglyphs[12] located all over the world that can be best viewed from the air, just as they deny the reality of ancient vimana aircraft and plasma spacecraft extensively described in the oldest books of humanity, the Vedas.[13]

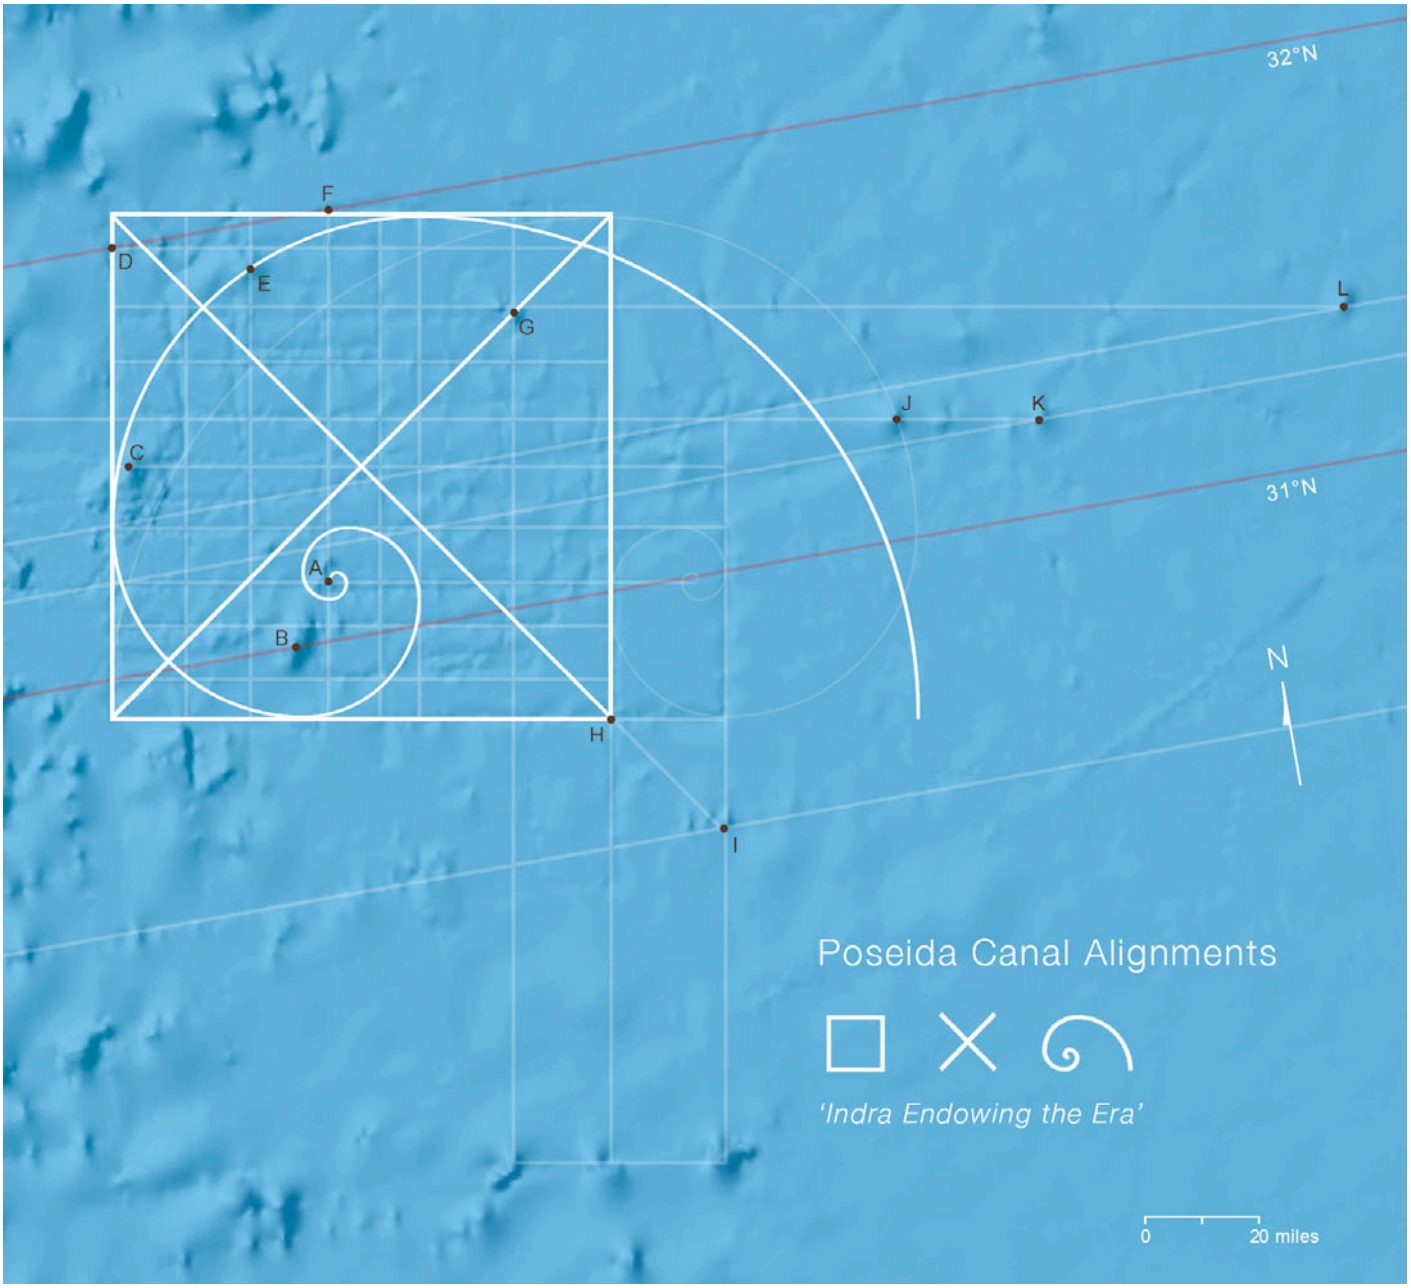
Indra aśu - aśu
Jupiter: life - life



si
Yours, the One, the One...

Amazon deforestation has exposed numerous geoglyphs from the advanced Paleolithic era of civilization, many clustered in the Branco River area of Brazil (10.217°S, 67.177°W) situated 7,065 miles from the Great Pyramid at Giza, Egypt, comprising 28.38% of Earth's mean circumference. The Paleo-Sanskrit hieroglyph of a square was set between a pair of lines forming a large earthen geoglyph that references the bioelectrical influence of planetary infrasound, reading: ***Indra ra*** , meaning "Jupiter granting" (above).

A similar votive phrase honoring the granting of Jupiter is given in the design of another geoglyph from the same area as a ligature composed of two concentric squares, also reading as: ***Indra ra***. Several other geoglyph variations based on the same design theme have been photographed by aerial surveys of clear-cut zones. *Poor protection of these Paleolithic and Neolithic ancestral sacred sites, many of which are now used for cattle grazing, reflects the same carelessness with which rainforests have been treated.*



A comprehensive study of the full extent of the geoglyphs of the Amazon basin mapping their individual geographic orientation and geometric relationships will provide an understanding of the many straight-line communal roadways that once linked many of these sites to neighboring communities, as demonstrated by research projects spearheaded by M. Heckenberger concerning existing descendant cultures today.[14]

A pair of squares for 'Jupiter' showing a Fibonacci size relationship were laid out along a central axis to reference the Mandelbrot set, a quadratic function for the spherical distribution pattern of standing wave resonance [$z_{n+1} = z_n^2 + c$] encoded by the sacred Sanskrit mandala (above). This same basic design plan defines the walled piezoelectric temples of Angkor Wat, in present-day Cambodia, located along the Sine Wave alignment of ancient sacred sites at the 19.1% Fibonacci nodal distance from Giza.

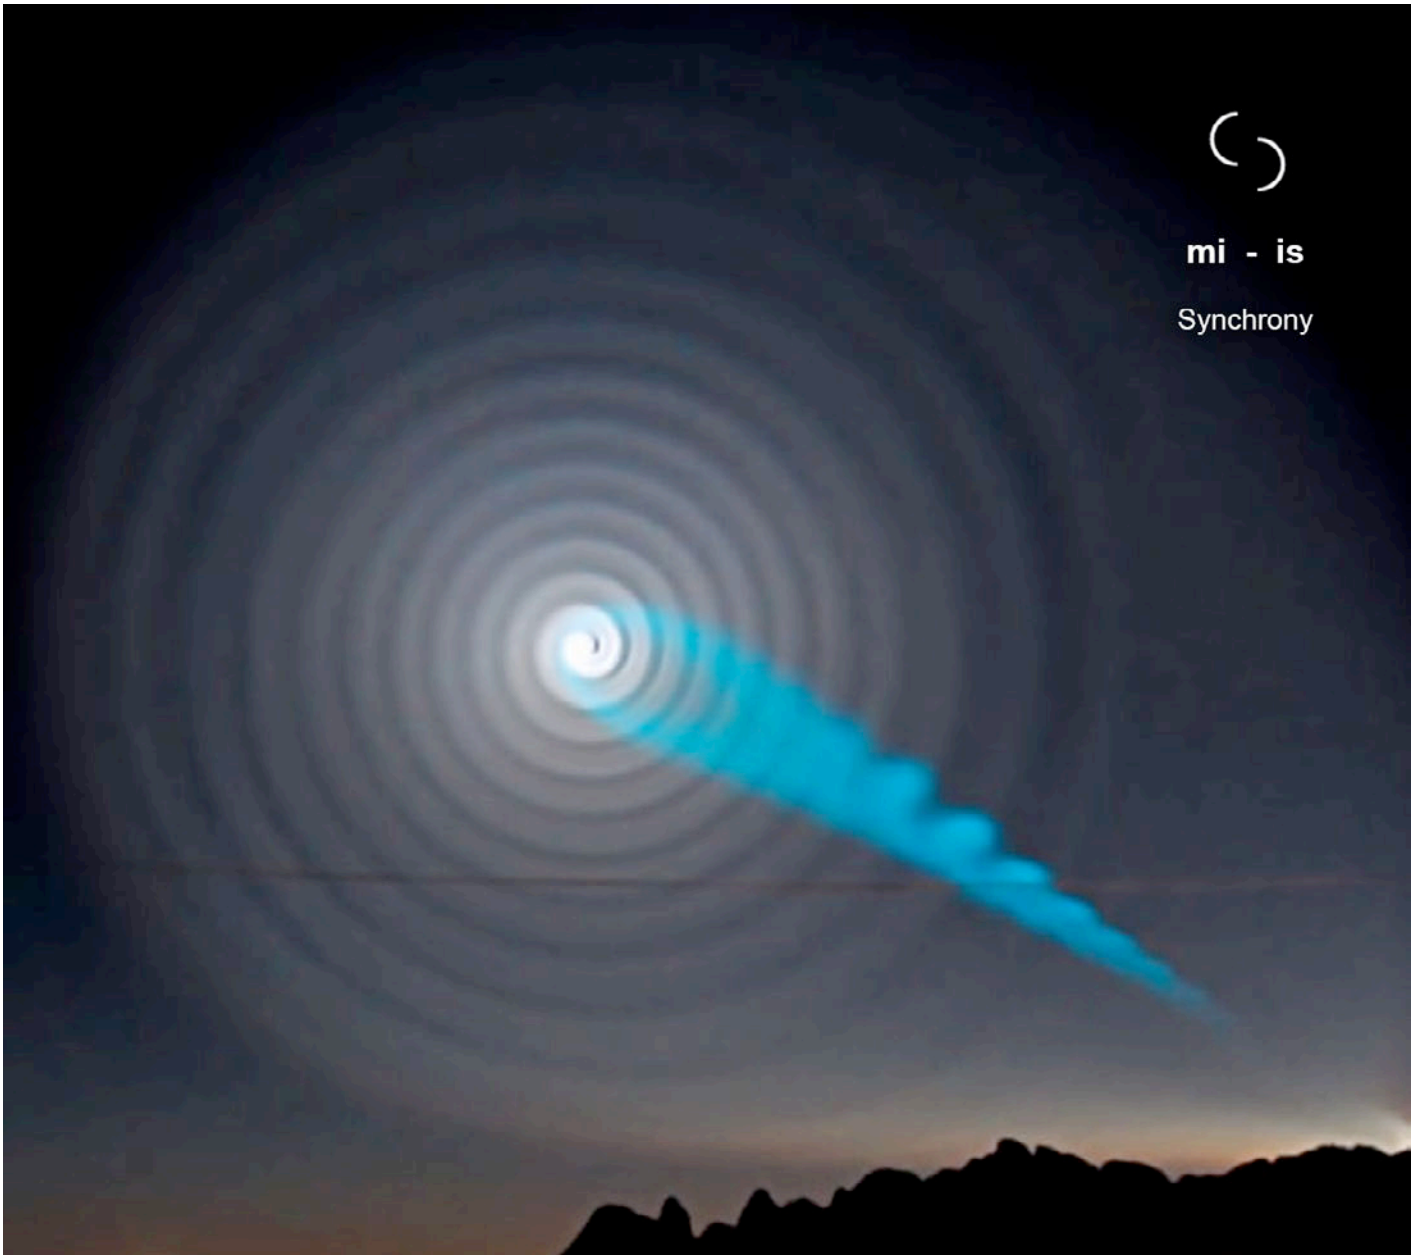
Inherently, the square structure formed by the base of the Great Pyramid, and reflected in its companion pyramids on the Giza plateau, presents the ***Indra*** glyph for 'Jupiter', with the four side breaks forming an inset 'X' pattern forming the ***ta*** glyph for 'endowing'. This essential hieroglyphic root language applied all of the basic geometric shapes as glyph signs. Representing the Great Pyramid in profile, the triangular ***upama*** glyph signified 'the highest', while the glyph for the numeral • denoted 'the Divine One'.

Among dozens of geoglyphs discovered thus far in the Amazon basin, the square glyph signifying Jupiter was repeatedly entrenched in the clay-rich soils to form the central gathering place of the community, marking their resonant alignment within the planetary field of infrasound standing waves. LIDAR mapping of the entire region will undoubtedly identify dozens of geoglpyhs still hidden below the forest canopy.

The square 'Indra' glyph was embedded on a grand scale by Atlantean psychoacoustic engineers in the design layout of the giant canal-city of Poseida as ***Indra ta cakra*** , meaning "Jupiter endowing the era" (above), described in detail by Edgar Cayce during a psychic reading on May 6, 1932 (Reading 364-12):

> This we find in that as called Poseida, or the city that was built... so that the waters of these rivers became as the pools about which both sacrifice and sport, and those necessities for the cleansing of body, home and all, were obtained, and these –as we find– were brought by large ducts or canals into these portions for the preservation, and yet kept constantly in motion so that it purified itself in its course; for, as we find, as is seen, water in motion over stone or those various forces in the natural forces purifies itself in twenty feet of space.[15]

The Atlantean canal-city of Poseida was destroyed by tectonic subsidence along with the entire Atlantic continental mass during the cometary bombardment events of 12,890 years ago (Kennett *et al.*, 2015). Now relegated to the darkness and cold of the Atlantic Ocean floor in the Madeira abyssal plain, the advanced Atlantean physics of infrasound resonance used for the electrification and purification of sacred waters was applied in an identical manner at petroglyphs of the Atlavista temple complex in present-day Mexico, just as represented by Paleolithic geoglyph sites in Kazakhstan and the Amazon.



as - raua adhi raua - as ra mi - is
For roaring delivering .., for roaring granting synchrony
raua raua raua
Roaring, roaring, roaring

By far the most famous and extensive collection of geoglyphs yet recognized was observed by aerial survey over Nazca and Palpa in present-day Peru. The overriding alignment expressed in the wide array of giant trapezoids, geomorphic and anthropomorphic figures is concisely expressed in the symmetries of the famous Hummingbird geoglyph –with the beak pointing directly toward the Great Pyramid in Egypt and the wings represented as three lines to encode the *raua* glyph for "thundering" infrasound resonance.[16]

The spider monkey geoglyph has long fascinated aerial observers (colorized for contrast, opposite). The outline representation of this spirit animal figure encodes a Paleo-Sanskrit glyph ligature that can now be read as text for the first time in our modern era. The tail provides a giant *mi-is* glyph pair 'synchrony' ligature, which, together with the limbs and body, reads: *as-raua adhi raua-as ra mi-is* , meaning "For roaring delivering..., for roaring granting synchrony" (opposite). Likewise, the tree-toed feet on a nearby geoglyph of a *predatory dinosaur* present the *raua* glyph for "Roaring" (opposite, below).

The geoglyphs of Nazca, Peru (14.83°S, 74.95°W) are located 7,673 miles from the Great Pyramid, marking a Fibonacci band resonance at exactly 30.9% of Earth's mean circumference of 24,892 miles. This resonant distance closely corresponds to the values of Fibonacci #138 and #360 in miles and percent. Perhaps the most majestic of the geoglyphs at Nazca is a humungous double-spiral *mi-is* glyph pair ligature meaning "Synchrony" (above). A nearby variation shows a square with an interior spiral geoglyph reading: *mi-is Indra* , a ligature signifying "Synchrony of Jupiter".

This quintessential Paleo-Sanskrit sacred double-spiral symbol for biorhythmic synchronization was represented in a spectacular plasma display observed throughout Northern Norway and Trøndelag on December 9, 2009. The spectacular atmospheric plasma formation event was witnessed by hundreds of residents across a wide area encompassing hundreds of miles. Despite ridiculous claims issued by Russian military sources that falsely identified the luminous show as mere rocket smoke from one of their unannounced Bulava missile test launches, the significance of this event remained unclear.

The epic demonstration of precision electromagnetic control of luminous plasma surrounding and trailing behind a discoidal 'vimana' spacecraft is supported by the known physics of superfluid plasma, as well as linguistic evidence that has not been previously considered. *The dramatic aerial display over Norway was a projection of Paleo-Sanskrit hieroglyphs that can be translated as a skywritten text message* (above).

The giant double-spiral radiating from the perimeter of the disc represents the *mi-is* glyph pair ligature signifying "Synchrony" (above). The spinning blue plasma trail left behind the transdimensional disc was purposefully formed as a double helix to represent DNA, offering the concept of "DNA synchrony", or "DNA synchronizing". This appears to be a direct reference to ongoing genetic changes in terrestrial human populations due to rising levels of planetary resonance now synchronizing global consciousness.

The awe inspiring aerial plasma message experienced and well recorded over Norway has also awakened the world to quite similar *mi-is* skyglyphs by unknown spacecraft over other parts of the world, including plasma spiral events over Chinese airspace in July of 1981,[17] August of 1987, August of 1988,[18] June of 2006, and July of 2010;[19] above Eastern Australia in June, 2010[20] and the Middle East in June, 2012.[21]

While those earlier events in Chinese airspace did not capture the attention of the whole world for poor video/photo documentation, the more recent event over Eastern Australia was recorded in high-definition (above), leaving the viewer in no doubt that something very special occurred. Such events will likely recur throughout the unfolding period of Earth's Magnetic Reversal, *proceeding to culmination in August, 2016.*

The profound message offered in these repeating hieroglyphic skywriting events is given for those ready to learn our ancestral Atlantean language and the highly sophisticated pyramid technologies now awaiting our immediate use as the growing awareness of our collective global heritage becomes widely recognized.

Sanskrit texts from the Illinois Cave archive[22] in the US, produced in the wake of cometary impact events that ended the Paleolithic period, describe the segregation of subterran and terrestrial human populations that resulted from the cataclysmic surface bombardment. *Indeed, our surface civilization is still recovering.*

The deeply trauma-induced amnesia of past lives presently experienced by humans dwelling on the surface of our planet is now lifting; offering a penetrating view of ourselves and our tragic past mistakes and terrible consequences that have yet to be considered by presently incarnated masses of humanity.

Other related aerial 'wormhole' displays were acrobatically performed in the skies and recorded on video above Tomsk, Russia in 2006[23] and on December 23, 2012.[24] Like all previous plasma formations of this type to gain public attention, these events were falsely attributed to an unscheduled Russian military rocket launch. The sophisticated HHO plasma generation and EM control of such displays far exceeds the capacity of terrestrial human technology, offering us messages from subterran civilization.

Another aerial skyglyph message of remarkable beauty that occurred in the night skies over Russia on March 7, 2011 represented an astounding octagonal falling star plasma formation with three accompanying strobing spacecraft (above). Once again, subversion of this major aerial event became the object of repeated false claims made by Russian disinformation services.[25]

This gigantic spectacle represents the luminous energy field of the living Earth, giving the ancient Paleo-Sanskrit name of our planet: *Sita* , signifying both "Earth" and "beauty". This projection exactly matches the Prime Cross spherical projection of planetary infrasound resonance[26] transduced by the Great Pyramid for the unification of humanity through heartbeat synchronization at the 1.45 Hz frequency.[27]

The Padang Pyramid

The Padang Pyramid

On the volcanically active Indonesian island of Java, an astounding architectural wonder of Paleolithic civilization is being revealed by comprehensive archeological excavations at a sacred temple mount in Cianjur, West Java, Indonesia known as *Gunung Padang*, or *'Mountain Meadow'*. Recent research at this sacred mountain site has revealed the volcanic core was refaçaded to create an immense step pyramid.

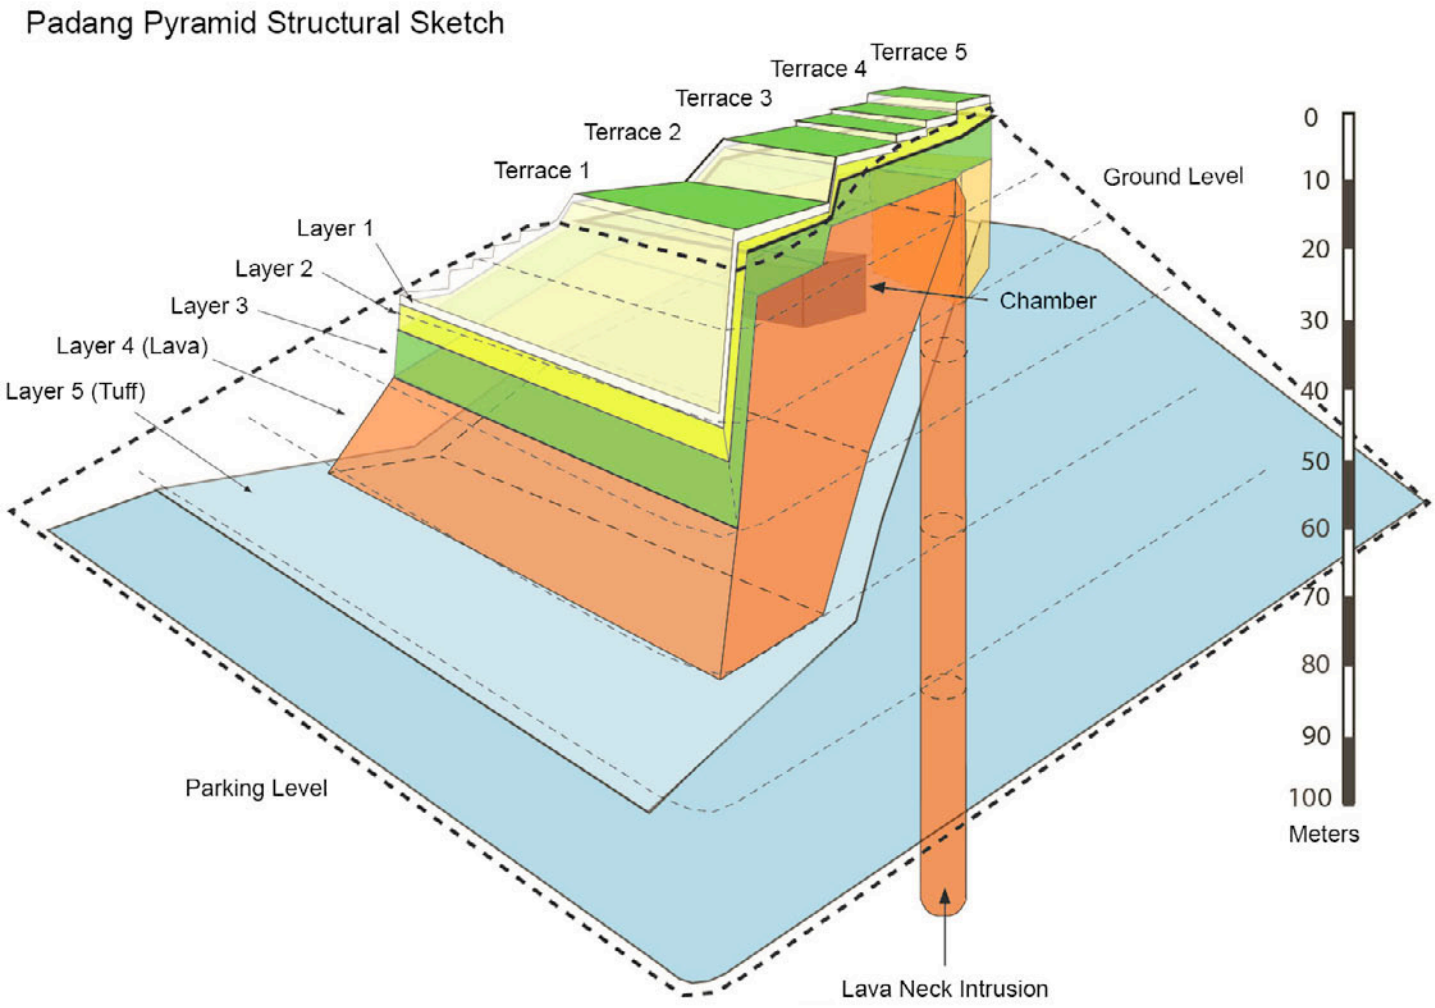
The Padang Pyramid displays precise latitudinal alignment along 7° South, reflecting the same pattern observed at other ancient pyramid and temple complexes around the world. Giza sits at 30°N, Ba'albek at 34°N, Visoko at 44°N, Stonehenge at 51°N, Cahokia at 39°N, Chaco Canyon at 36°N, Altavista at 21°N, Tula at 20°N, Sukhothai at 17°N, equatorial Cochasqui at 0°, La Maná at 1°S, Chan Chan at 8°S, Mumbahuru at 20°S and Waitapu at 36°S. Likewise, ancient sacred sites with anthropomorphic megaliths in Indonesia's Bada Valley are geopositioned along the 1° North latitude *for efficient infrasound reception.*

The Padang Pyramid in West Java, Indonesia (6.9934°S, 107.0563°E) is situated 5,630 miles from the Great Pyramid, corresponding to 22.61% of the Earth's mean circumference of 24,892 miles, along a wide band of infrasound resonance equidistant from the 20% and 25% distance bands.

This resonant 5,630-mile distance also approximates the $^{9}/_{40}$ great circle fraction shared by sites in the United States where unusual spates of spontaneous piezoelectric fires have recurred with increasing frequency –with multiple events having occurred in 2011 in New York City[1] and Brentwood, Long Island.[2] *The Padang Pyramid is locally renowned in the Cianjur region of West Java for similar infrasound-induced EM effects, including bright flashes of light and related HHO plasma orb phenomena.*

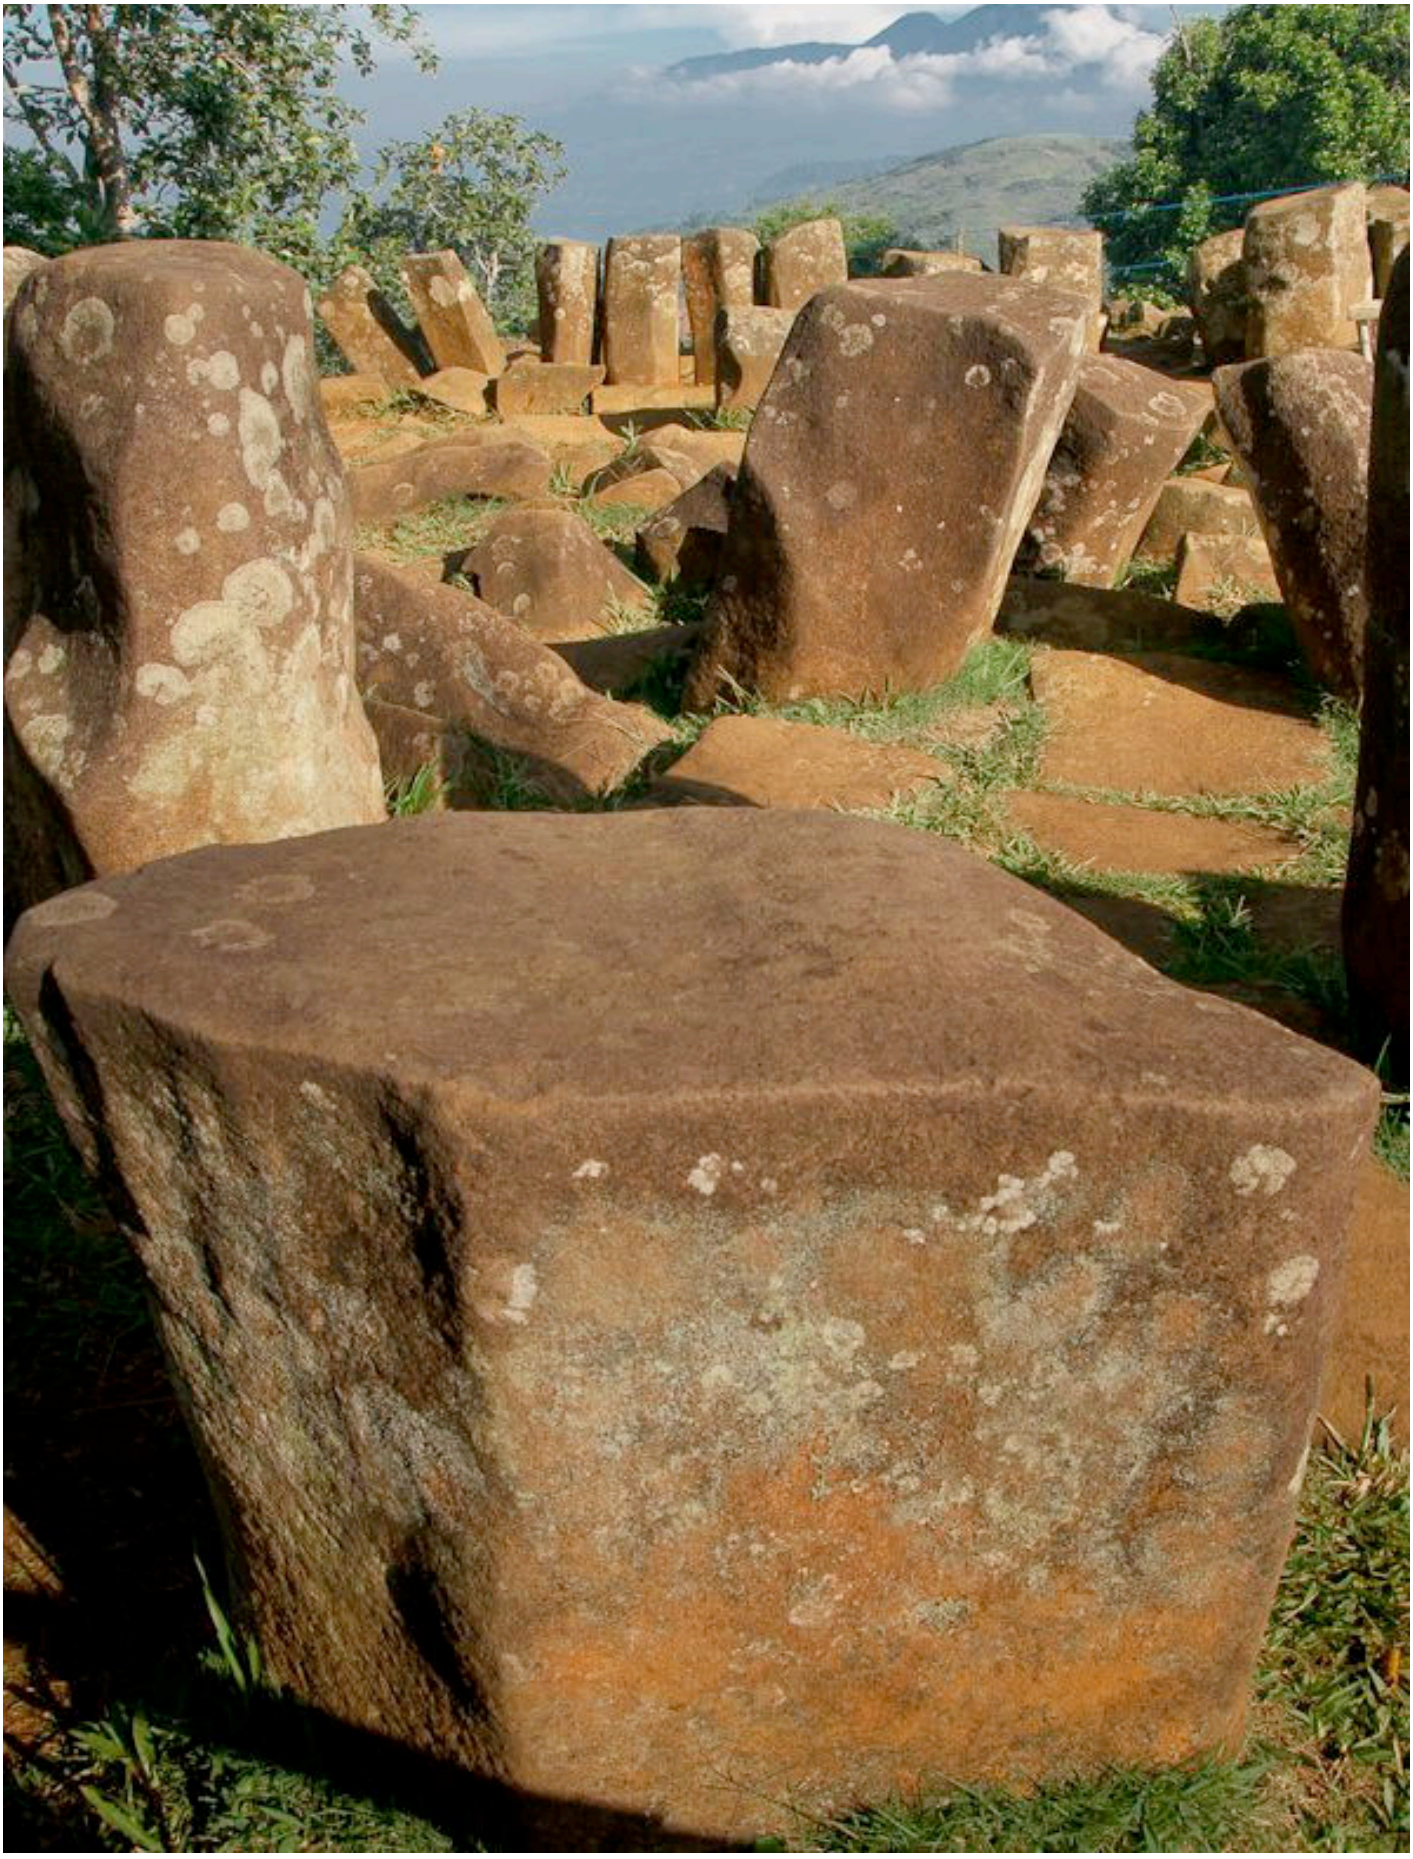
A long series of andesite steps ascend to expansive square platforms covering 3,094m^2, composed of five large ascending terraces divided into large rectangular enclosures by a series of high walls. Used as a meditative retreat by successive rulers for uncounted centuries, and visited more recently by the local community, this refaçaded volcanic mountaintop temple site is associated with the nighttime appearance of bright flashes of light, as well as small, intensely luminous spheres seen floating above the platform.

Terrace 1 presents the remains of several large rectangular walled enclosures that now lay in total ruin, having entirely collapsed on each of the five terraces during catastrophic earthquakes that followed the clustered cometary impact events of 12,890bp. The original walled enclosures of the Padang Pyramid once displayed a tight geometric configuration best appreciated from an aerial perspective (below).



Aerial imagery of the Padang Pyramid provides an ideal perspective for appreciating the tight geometric wall configurations that are not easily discernable when standing on the terrace. The complex surface forms of the many megalithic plinths strewn about the five terraces display special interlocking features that were not carved, and do not bear chisel marks, but were artificially cast in huge kaolin clay molds.

Thousands of exposed megalithic plinths atop the Padang Pyramid comprise the scattered remains of giant walled enclosures constructed in a highly distinctive header and stretcher format exemplified by the largely intact platform enclosure temples of Nan Madol preserved on the distant Micronesian island of Pohnpei. *Square buildings at both sites signify the Paleo-Sanskrit glyph for Indra, the planet Jupiter.*



Extensive research conducted at the Padang Pyramid includes dozens of archeological excavations and geophysical surveys applying core drilling, ground penetrating radar, electrical resistivity and seismic tomography to discern internal structural features of the large pyramid. Situated atop an extinct volcano, Padang Pyramid was built using lava as the primary building material that was finely pulverized, mixed with clay, fly ash and water, and cast into giant walled platforms that acted as acoustic resonators.

Showing a remarkable consistency with the contemporary Paleolithic pyramid complexes of Visoko, Bosnia and La Maná, Ecuador, the Padang Pyramid has been revealed as an artificial refaçading of a natural volcanic peak. Geopolymer casting techniques for the production of artificial sandstones, andesites or basalts have been uncovered at each of these restructured mountain pyramid sites.

Structural analyses of the Padang Pyramid have defined multiple construction phases involving different formulations of magnetic geopolymer andesite columns cast in horizontal stacks, layer upon layer, reaching 26m in height. Huge 3m-long magnetic plinths were cast atop volcanic tuff bedrock in horizontal rows for withstanding tectonic shockwaves, bound together with an orange geopolymer cement mortar.

The concealed presence of a large main chamber below Terrace 2 was identified by seismic tomography scans that effectively differentiate the layered composition of a natural lava tube, synthetic andesites and volcanic tuff formations (diagram above). The large central cavity has not been directly confirmed by geological core drilling or excavation teams, who have only begun the task of accessing the chamber by excavation of a tunnel penetrating from the western slope. *Architectural features and ancient remains within the chamber promise to resolve the many enigmas surrounding this giant Paleolithic monument.*

The gargantuan scale of the entire construction site of the Padang Pyramid is paralleled by the massive size of its constituent megaliths that divided each terrace into walled enclosures. The largest andesite plinths laying on the pyramid's terraces exceed several tons (above), raising the obvious conundrum as to how these giant blocks were moved from the quarry site at the core of the mountain.

The definitive answer to this enigmatic construction feat has been determined by prior archeological, geochemical and paleomagnetic investigations of stones from the pyramids of Giza, Egypt and Visoko, Bosnia. The unique chemistry of artificially manufactured geopolymer stones was first ascertained by J. Davidovits concerning the synthetic constitution of alumino-silicate limestones comprising the Great Pyramid, revealing the advanced ancient application of paramagnetic metals in casting pyramid blocks.

Electromagnetic functions of the piezoelectric pyramid blocks extend beyond the chemistry expertise of Davidovits, yet a broader knowledge of wireless technologies developed by the modern inventor Nikola Tesla confirms the resonant psychoacoustic use of magnetic pyramids for bioelectrical qi healing.

Clear evidence that the andesite plinths comprising the bulk of the Padang Pyramid construction were actually fabricated as cast geopolymer blocks has been preserved on many of their surfaces as small hemispherical concavities or 'cup-marks'. These circular depressions are seen on hundreds of stone plinths, yet have not been properly identified by on-site archaeologists despite their sheer abundance.

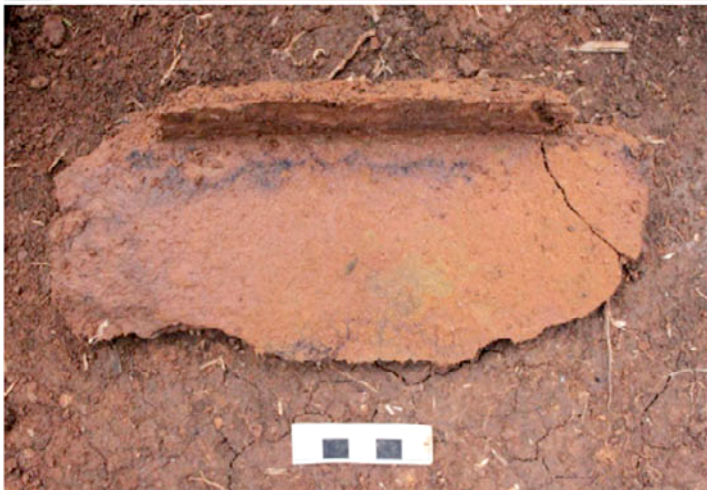
Tourists at the Padang Pyramid pose with the giant plinths for memorable photographs, often remarking and pointing out the obvious circular concavities on the stones that archeologists never seem to notice (above). Why is it that archeologists have no explanation for the abundant artificial features exhibited on these stones, and furthermore, have all apparently been trained to pretend as if they do not exist at all?

The veiled reason for this purposefully ignorant academic stance is now becoming clear to those who understand the complex function of the pyramids as accumulators of 'free energy' transduced from planetary infrasound resonance. Profit-run power corporations ensure that controlled government archeologists throughout the world reinforce mass denial of the electricity-producing and weather-regulating functions of pyramids as a globally-geopositioned infrasound network of resonant oscillators.

Repeated denials by paid-off government 'officials' maintain the faltering grip of psychopathic control over the energy resources and technologies of our planet that has dominated humanity for the nearly 13 millennia that have elapsed since the destruction of the pyramid-building Atlantean civilization. How can such an insidious longterm plan of suppression be connected with cup-marks at the Padang Pyramid?

Along with studies comparing the density and elemental composition of the megalithic plinths versus natural andesites, such unmistakable details as repeating circular cup-marks prove the megaliths at the Padang Pyramid were actually cast as synthetic stones, having been reconstituted from a geopolymer slurry mixture composed of fine black andesite sand, powdered laterite, kaolinite clay, fly ash and water. *The great variety of locking features visible on the surfaces of the megaliths reflect the same special seismic construction features documented at the refaçaded mountain pyramids of La Maná, Ecuador.*

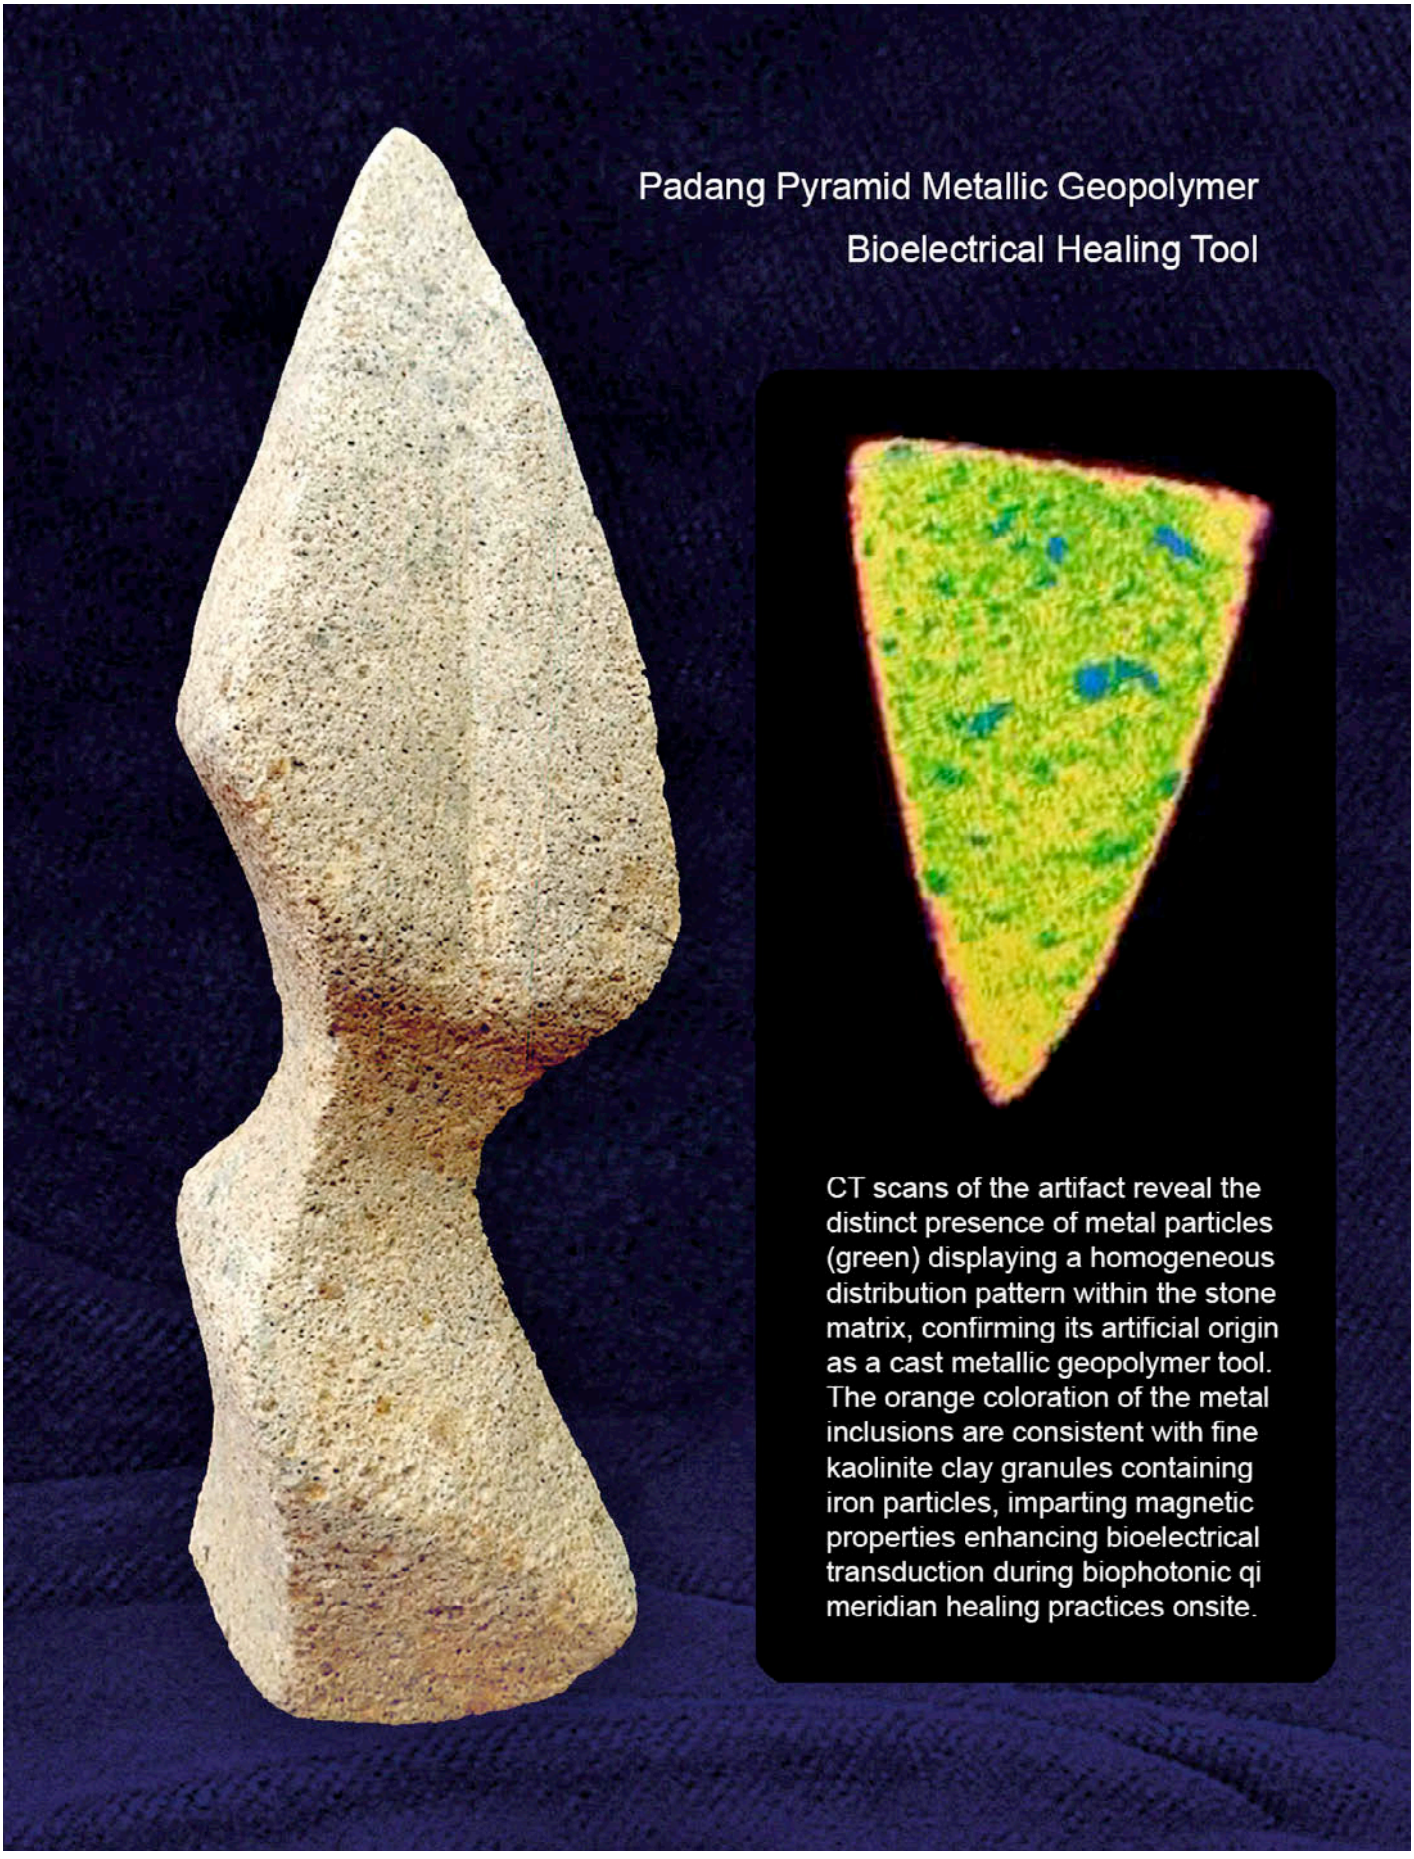
A series of archeological trench excavations were conducted in August and September of 2014 by government-approved archeologists employing the subsidized labor of military personnel. While being limited to depths corresponding to the first and second layers of the pyramid, these sites exposed and removed a great abundance of much smaller, geometrically faceted andesites that present their original, orange mold-made surfaces without the layers of bacterial and fungal growth that occurs above ground.



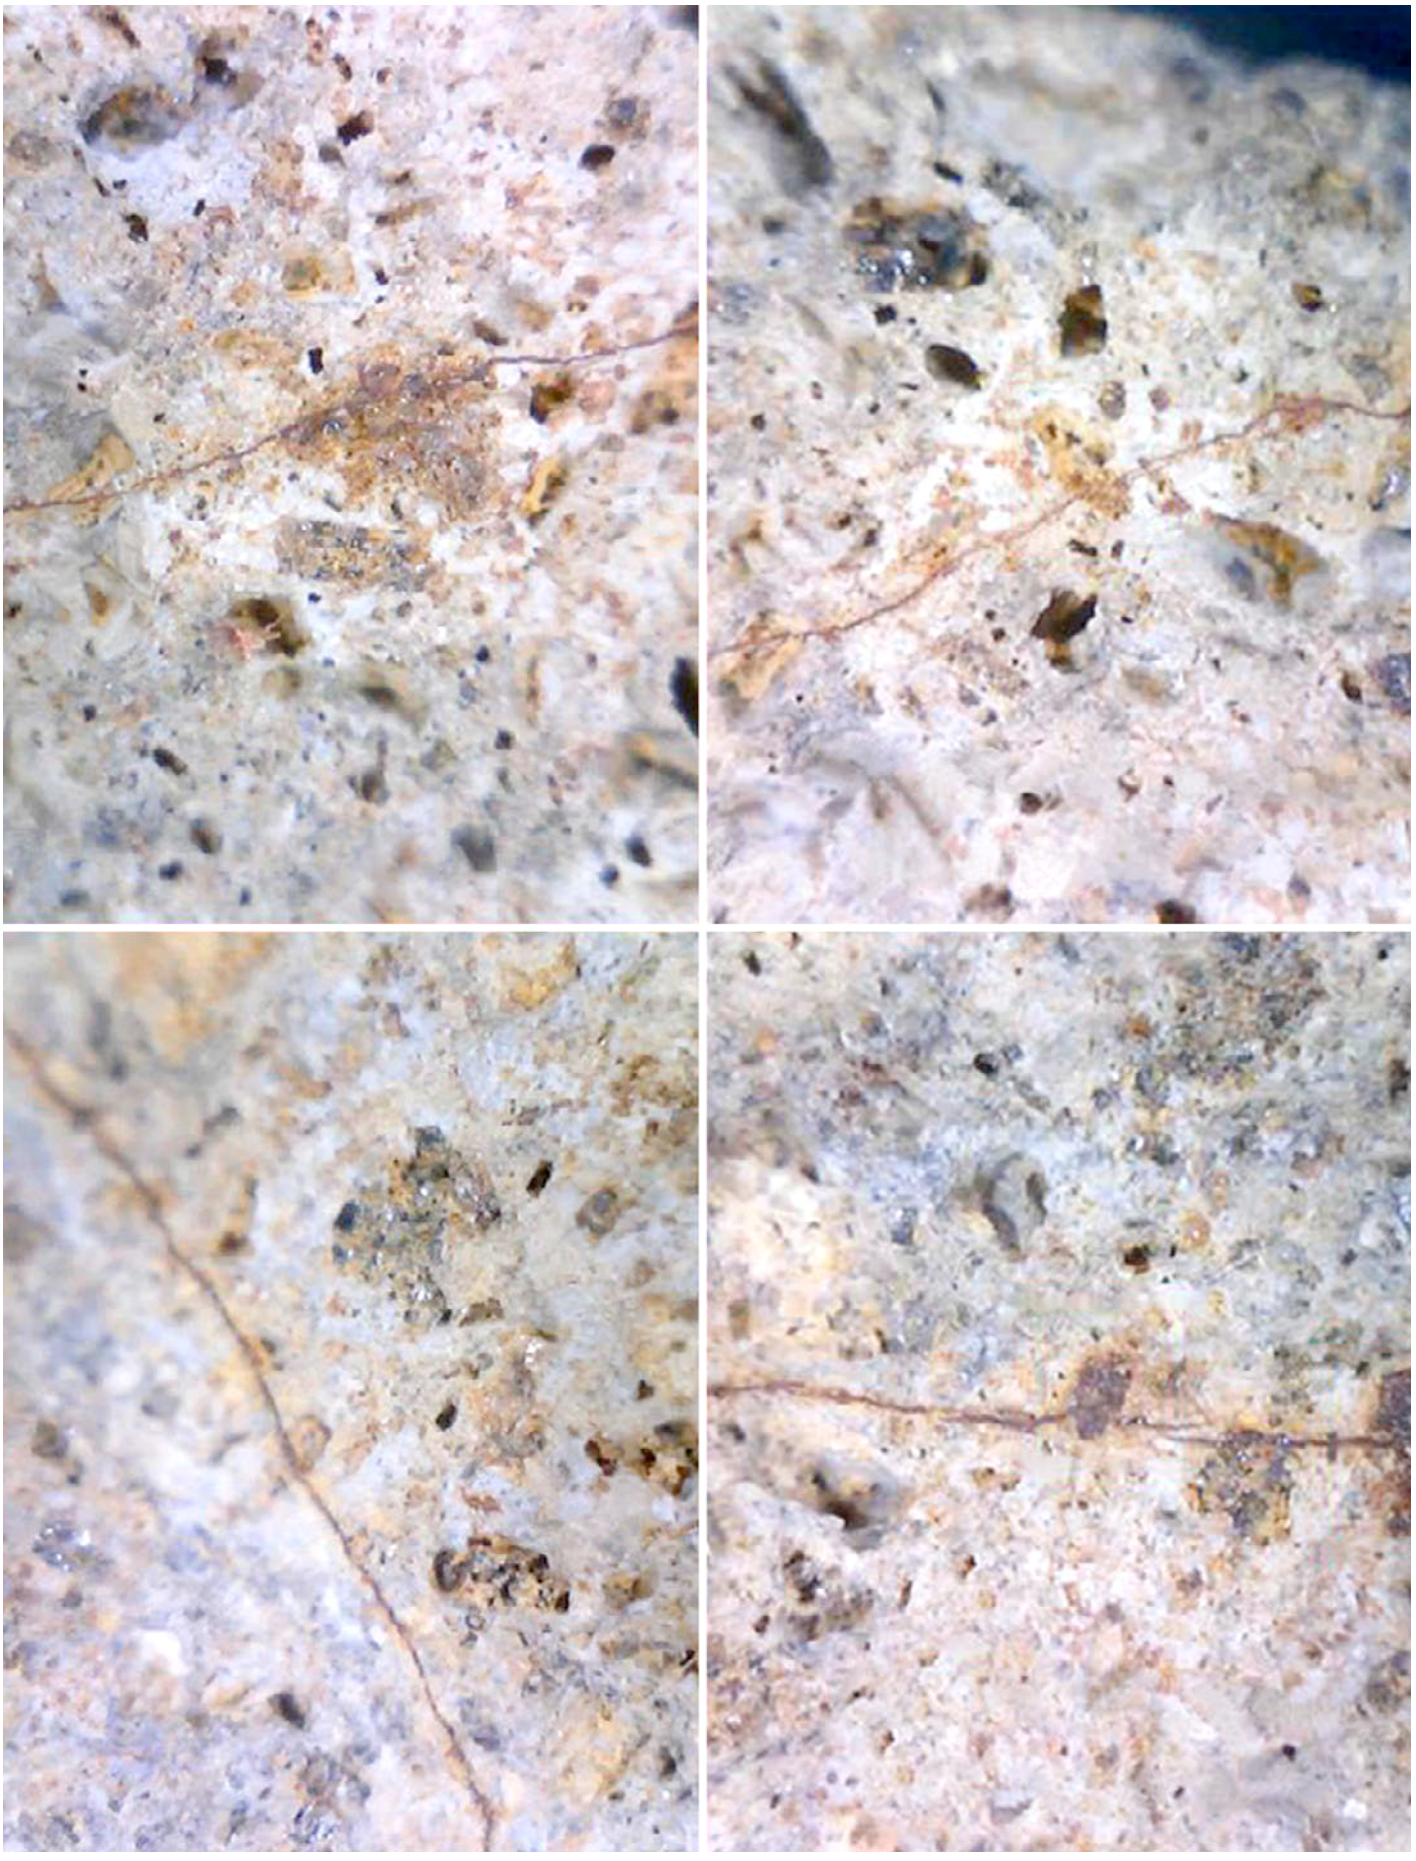
Video recorded by Youk Tanzil-Full on October 14, 2014 documented a magnetic anomaly ~1m above Terrace 1 that induced the perpetual spinning of his cellphone's digital compass indicator (still, opposite).[3] Analog magnetometers also register rotating magnetic fields *transduced from localized infrasound by piezoelectric crystals and magnetic particulate metals within the Padang Pyramid's synthetic andesites.*

As attested by the many trench excavations photographically documented on the main terraces of the Padang Pyramid, there is a noticeable lack of cup mark features to be observed on the tightly stacked andesite plinths (below). What's more, none of these mold-made foundation stones present the megalithic proportions that characterize the cup-marked plinths strewn about the surface above.

The consistent use of an orange cement binding material was also carefully documented, having been painted in thin layers between the interlocking plinths comprising the pyramid's multi-staged rectangular foundations (opposite). This simple geopolymer cement is composed of about 45% iron, 41% silica and 14% other clay minerals[4] *–identical to the kaolin clay-based cements of pyramids in La Maná, Ecuador.*



The first ancient relic to emerge from the deeper layers of excavation at the Padang Pyramid reveals the specialized biophotonic hands-on healing practices for which the megalithic mountain was designed.



The unusual stone artifact was uncovered in a large trench being excavated on one of the terraces of the Padang Pyramid (above), having apparently been designed with an ergonomic handle that can be held most comfortably in the left hand. The notable weight of the object betrays a very high density that significantly exceeds the density ranges of all natural basalt, andesite and diorite stones.

The interior composition of the hand tool artifact was investigated by CT scan, revealing fine metallic particles distributed evenly throughout the matrix of the stone (inset, overleaf). Surface micrographs of the hand tool taken at 32x magnification reveal orange colorations that suggest iron as the main constituent of the metal inclusions, while shiny grey nickel particles are also visible (overleaf). *Selective use of magnetic metals in the production of synthetic 'firestones' was also replicated in the pyramids of La Maná, Ecuador.*

Padang Pyramid Metallic Geopolymer Bioelectrical Healing Tool

CT scans of the artifact reveal the distinct presence of metal particles (green) displaying a homogeneous distribution pattern within the stone matrix, confirming its artificial origin as a cast metallic geopolymer tool. The orange coloration of the metal inclusions are consistent with fine kaolinite clay granules containing iron particles, imparting magnetic properties enhancing bioelectrical transduction during biophotonic qi meridian healing practices onsite.

These findings deny the possibility that the handheld tool was simply carved from natural stone, but confirm the object's synthetic origin as a geopolymer product cast from a liquid slurry of pulverized stone, kaolin clay, metal particles, fly ash and water. This artificial stone manufacturing technology applies the piezoelectric properties of natural stone, while fine ferromagnetic inclusions amplify EM field strength around the tool. *High metal content of the Padang Pyramid geopolymers served the same function.*
